His conduct was marked with prudence, boldness, and manliness. He banished Plutarchus, who had made himself tyrant of Eretria, and left the island secure from the attacks of Philip.

Some time after the Athenians resolved to yield assistance to the cities of the Hellespont, threatened by Philip, and the command of the fleet was entrusted to Phocion. The inhabitants of Byzantium received him, and he not only saved their city, but compelled Philip to retire from the Hellespont. Notwithstanding their success, Phocion always advised peace. His honesty, disinterestedness, and patriotism were so generally acknowledged, that he was nominated commander forty-five times without once applying for the office. He always led a simple life, and cultivated his small farm with his own hands. When the inhabitants of Megara requested an alliance with the Athenians, Phocion zealously advocated the measure, marched to the city at the head of a large body of volunteers, and rebuilt the walls. When Philip appeared in Phocis with a view to attack Attica, Phocion in vain advised peace. The battle of Chæronea proved the justness of his opinion. The Athenians disregarded the advice of Phocion, not to take part in the assembly of the Grecian states convened by Philip till they knew the intentions of the king, and in consequence found themselves obliged to furnish Philip with a quota of cavalry and galleys. This they were reluctant to do, but Phocion advised them to submit to adversity with patience. After Philip's death Phocion advised the Athenians not to expose themselves to new disasters by joining a confederacy against the young Alexander. His opinion was justified by the event. When, after the destruction of Thebes, Alexander demanded of the Athenians the deliverance of the orators who had spoken so violently against him, Phocion undertook the commission of appeasing the anger of the king with the happiest success. Alexander conceived a great affection for him, and sent him a present of a hundred talents, which he declined. The deputies found him carrying water, while his wife was baking bread. But, not to displease the king, he requested the liberation of some of his imprisoned friends.

After Alexander's death the project was formed of freeing Greece from the Macedonian yoke. Phocion disapproved the measure, though he accepted the command. The Athenians were at first successful; but Antipater soon obtained the superiority, and threatened Athens, which was instantly abandoned by the orators who had been so clamorous for war. In this pressing danger Phocion was sent ambassador to Antipater, who was encamped in the territory of Thebes, and obtained, on hard terms indeed, a promise that he would conclude a treaty without entering the territory of Attica. The terms were, that Demosthenes and Hyperides should be given up, an aristocratical government formed, and a Macedonian garrison introduced into Munychia. This last condition was long opposed by Phocion, but Antipater was inflexible. Under these hard circumstances all the efforts of Phocion (who, with other distinguished men, was then at the head of government) were directed to mitigate the heavy burdens of his country, and to turn his influence with the Macedonians to its advantage. Nevertheless, Phocion was accused of having acted against the good of his country, and of having betrayed it to the enemy. He was compelled, by clamours and accusations, to take refuge

in Phocis with Polysperchon, who soon after delivered him and other refugees to the Athenians, who demanded them. Polysperchon also sent a letter to the city, acknowledging them to be guilty of treachery. Their trial took place before the assembly of the people. Phocion, with several of his friends, was condemned to death and drank poison, B. C. 318. His countrymen afterwards repented of their injustice, and erected a statue to his memory.

PHOTIUS, a patriarch of Constantinople, who was celebrated about the middle of the ninth century for the brilliancy of his talents and the depth of his erudition. He was a native of Constantinople, and originally distinguished himself by his learning and ability as a layman; but, on the expulsion of the patriarch Ignatius by Bardas, was consecrated to the vacant see in 858. During the succeeding ten years a controversy was carried on with much acrimony between him and the bishop of Rome, each party excommunicating and anathematizing the other; the consequence of which was the complete separation of the eastern and western churches. Bardas, his patron, being at length taken off by his nephew and associate in the empire, Michael the Third, that prince was in his turn assassinated by Basilus, the Macedonian, who then ascended the throne in 866. But Photius, denouncing him for the murder, was in the following year removed to make way for the restoration of his old enemy Ignatius, and was forced to retire into banishment. On the death of that patriarch in 878, Photius, by a flattering exposition of a forged document respecting the genealogy of the emperor, acquired his favour, and, being restored, maintained himself in the patriarchal chair during the remainder of that reign; but was at length accused, on insufficient grounds, of conspiring against the new sovereign, Leo the philosopher, who sent him in 886 into confinement in an Armenian monastery, where he died in 891. This learned and intriguing prelate was the author of a *Bibliotheca*, containing an examination of 280 writers; the best edition is that of Bekker; of the "*Nomocanon*," a digest of the ecclesiastical laws, acts of councils, &c., under fourteen heads; a lexicon of the Greek language, and numerous epistles.

PIAZZI, GIUSEPPE, a celebrated director-general of the observatories at Naples and Palermo, who was born at Ponte, in the Valteline, in 1746; in 1764 entered the order of the Theatines at Milan, and studied at Milan, Turin, and Rome, under Tiraboschi, Leseur, and Beccaria. In 1770 he was appointed professor of mathematics at the new university in Malta, on the abolition of which he returned to Italy, and in 1780 became professor of the higher mathematics at Palermo. Having induced the viceroy to establish an observatory there, Piazza came to England and France to purchase the necessary instruments. The observatory was completed in 1789, and is described in Piazza's "*Della Specola Astronomica de' Registudj di Palermo*." His first observations were published in 1792. He soon after began his catalogue of stars, and dedicated the first, containing 6784 stars, to the institute at Paris. On the 1st of January, 1801, Piazza discovered the planet Ceres; in commemoration of which the king of Naples wished to strike a gold medal in his honour, but Piazza preferred that the money should be applied to the purchase of instruments for the observatory. In 1814 he completed his second catalogue, containing 7646

stars. He had also been occupied in the reformation of the system of weights and measures in Sicily. The observation of comets he always considered as useless. In 1817 the king called him to Naples to examine the plan of the new observatory there; and his last years were chiefly devoted to the subject of public education in Sicily. He died on the 22nd of July, 1826. His "*Lezioni Elementari di Astronomia*" were published at Palermo in 1817.

PICARD, JOHN, a learned French astronomer, who was a native of La Fleche. He early in life embraced the ecclesiastical profession, but in 1666 was appointed astronomer royal. He commenced the celebrated work entitled "*Connaissance des Temps*," which he continued from 1679 to 1683. Picard died in the latter year, and a fine monument was erected to his memory.

PICARD, LOUIS BENOIT, a French dramatist, who was born at Paris in 1769, and early began to write for the stage with success. The friendship of Andrieux, who assisted him with his advice, was serviceable to him, and he soon became an actor, making his debut at the Théâtre Louvois, now the Odéon, where his dramas were also represented with much applause. In 1801 he became the manager of the theatre, continuing to perform and write at the same time. He soon after (1806) withdrew from the boards, was admitted to the French academy, and entrusted by government with the direction of the opera. While at the head of the opera he ceased writing, but in 1816 resumed the direction of the Odéon, and again began to write. He died in 1829. Picard, on account of his skilful delineation of character, was called by the French *Le Petit Molière*. He was the author of more than seventy plays, besides several romances. Among the latter are "*Le Gil Blas de la Révolution*," "*L'honnête Homme*," &c.

PICART, BERNARD, a celebrated engraver, who was born at Paris in 1673. He learned the elements of his art from his father, and studied architecture and perspective under Sebastian le Clerc. As he embraced the reformed religion, he settled in Holland to enjoy the free exercise of it, where his genius produced those master-pieces in art which raised him to such eminence in his profession. He died in 1733.

PICCINI, NICCOLO, a celebrated musician, who was born at Bari, in the kingdom of Naples, in 1728, and was designed by his father, a musician, for the church. But young Piccini displayed such a decided taste for music that he was placed at the Conservatorio di Santo Onofrio, at the head of which was the celebrated Leo. After spending twelve years there he left the conservatory, thoroughly grounded in the science of music, and animated with a glowing imagination which wanted only an opportunity to show itself. The prince of Vintimille mentioned him to the director of the Florentine theatre, and Piccini set the opera "*Le Donne Dispetose*," which was performed with applause. He soon after composed "*Le Gelosie*," and "*Il Curioso del Proprio Danno*." The latter was performed with applause during four successive years, and his composition of "*Zenobia*" displayed his genius in the serious opera. In 1758 he was invited to Rome to set "*Alessandro nell' Indie*," and in 1760 appeared his celebrated "*Cecchina*, or *La Buona Figliuola*," which had an unexampled run in Italy. The following year his "*Olimpiade*," a serious opera, had the same success. In this the duet was first presented free from pedantry and techni-

cality, in the new musical form which has since been universally adopted. Piccini continued to compose for the theatres of Rome and Naples for fifteen years, during which time he enjoyed the undisputed supremacy in the public favour; but, after the appearance of Anfossi, one of Piccini's operas failed at Rome, and, in consequence of the mortification which this occasioned him, he became ill, and, after his recovery, determined to devote himself solely to the theatres in Naples. In 1776 he accepted an invitation, on very favourable terms, from the French court, and went to Paris. At that time, besides numerous oratorios, cantatas, &c., he had composed 133 operas. Being entirely ignorant of the French language, he received instruction from Marmontel, and, with his assistance, brought out the "Roland" of Quinault, which, notwithstanding the opposition of Gluck and his friends, was successful. Although Gluck and Piccini were personally reconciled, yet the war between their respective admirers continued; and, in order to compare their merits, the two rivals composed the same subject, "Iphigenia in Tauris;" in this contest Gluck had the advantage. In 1783 Piccini produced his "Dido," which is considered his *chef d'œuvre*. He had been appointed director of the royal singing school in 1782, but the revolution deprived him of his appointments, and he returned to Naples in 1791, where the king granted him a pension, and employed him on various occasions; but, having imprudently expressed revolutionary sentiments, he was exposed to much hard treatment, and finally returned to France, where he died in 1800.

PICCOLOMINI, a distinguished Italian family, the most celebrated member of which was Æneas Sylvius Bartholomæus, who, under the name of Pius II., ascended the papal throne in 1458. He was one of the most learned popes, wrote the life of the emperor Frederic III., and a history of Bohemia. He was secretary to the council of Basle, and defended the rights of the councils against the popes; but, when he was made pope, he recanted all that he had said against the extent of the papal power. His favourite plan of uniting the princes of Europe in a war against the Turks was frustrated by his death in 1464.

Octavio Piccolomini was born in 1599, became one of the distinguished generals in the thirty years' war, was a favourite of Wallenstein, who entrusted him with a knowledge of his projects when he purposed to attack the emperor; but Piccolomini betrayed him, and was one of those who were charged to take Wallenstein alive or dead. He was made prince of the empire, but disgraced his military renown by his cruelty. He died in 1656, in Vienna.

PICHEGRU, CHARLES, a distinguished general of the French republic, who was born in 1761 at Arbois, in Franche-Comte, of poor parents, was educated at that place in a monastery of the Minims, but without entering the order, as has been asserted. He afterwards studied at the college of Brienne, where he distinguished himself so much by his progress in mathematical science that the recitations of his class were entrusted to him while yet a scholar. Bonaparte was at that time his pupil at Brienne. At an early age Pichegru enlisted as a common soldier in the first regiment of artillery, and was soon made a sergeant. Towards the end of the American war his regiment was ordered to America, and he thus had opportunity of becoming acquainted with the land and sea service. After his return he was appointed sergeant-

major, and company-adjutant; and on the outbreak of the revolution he embraced its principles. He was president of the political club in Besançon when a battalion of national guards, without subordination, discipline, or commander, arriving in the city, the Besançon club proposed Pichegru as a suitable person to command them. His first care was to establish order and discipline—a task which he accomplished with energy and skill, and then led his battalion to the army of the Rhine. Here he distinguished himself so favourably that in 1792 he entered the general staff, and became colonel, general of brigade, and, in 1793, general of division. Meanwhile the reign of terror had commenced in France. Custine, Houchard, Biron, and others perished under the guillotine, and the suspicions of those in power at Paris rendered it more dangerous, at that time, to be at the head of an army than to storm an hostile battery; but Pichegru undertook the command of the forces, disorganized by the loss of the Weissenburg lines, restored discipline, and led the disheartened troops to a series of brilliant victories. To resist the numerous and better disciplined troops of the enemy, supported by an excellent cavalry, he introduced the system of sharp-shooting, and at the same time, by his skilful use of the mounted artillery, succeeded in paralyzing the tactics of the enemy. Hoche commanded at that time the right wing of the army in Alsace. In connexion with this general, and nominally under his command, although, in fact, he only followed Pichegru's plan of operation, of which he subsequently assumed the whole merit, Pichegru stormed the lines of Hagenau, on the 23rd of December, 1793, relieved Landau, and took Lauterburg.

These successes gained him the highest commendation in Paris, even from Robespierre and Collot d'Herbois. On the dismissal of Hoche, in 1794, he was appointed to command the army of the north, which disasters had reduced to a state of disorganization. Here he also restored order and discipline. After failing in the attack made by command of the committee of safety on the enemy's centre, under the prince of Cobourg, Pichegru, at his own peril, pressed forward into West Flanders, and, by thus turning the enemy's flank, gained the brilliant victories of Courtray, Montcassel, and Menin, which forced Clerfayt to a hasty retreat. He also defeated the united forces of Prince Coburg and York, between Menin and Courtray, and, to draw Clerfayt from his strong position at Thiel, he made a movement towards Ypres, near which he defeated the Austrian general. All West Flanders fell into the hands of the French, and, Jourdan having soon after gained the victory of Fleurus, Pichegru passed the Scheldt, and thus cut off Clerfayt from the English army, took Bruges, Ostend, Ghent, and Oudenarde, and besieged or blockaded Nieupoort, Sluys, Condé, Valenciennes, and Quesnoy. He then advanced to Mechlin, defeated on the 16th and 17th of July the combined English and Dutch forces, took Antwerp, drove the English beyond the Meuse, and, after a siege of three weeks, captured Hertogenbosch, then deemed impregnable. On the 19th of October, 1794, he again defeated the English at Pulbach, blockaded Grave, and occupied Hulst, Axel, Sas de Gand, and Nimeguen. The cruel commands of the convention, to spare no Englishman and to put to the sword the garrisons of Condé, Valenciennes, Landrecies, and Quesnoy, unless they immediately surrendered, were evaded by Pichegru; and on the

2nd of January, 1795, with an army destitute of almost every thing but courage, he crossed the Waal and Meuse on the ice, took Grave, Bommel Island, and Fort St. Andrew by storm, and invested Breda. Thus was Holland conquered, the Dutch army dispersed, the English obliged to embark; the hereditary stadtholder fled to England, and Pichegru entered Dortrecht and Amsterdam in triumph.

The convention now conferred on him the chief command of the army of the Rhine and Moselle; but he retained at the same time the command of the army of the north, under Moreau, and of the army of the Meuse, under Jourdan. In April 1795 he was recalled to take command of the capital, where the terrorists were making their last efforts to recover their power. Having suppressed the insurrection of the faubourgs, for which he was called in the convention "the saviour of the country," he returned to the army of the Rhine, where however his career, hitherto so brilliant, now took another turn. He entered into negotiations with the prince Condé, through Fauche-Borel, to co-operate in the restoration of the Bourbons. He was promised offices of honour, domains, and rents. But the secret was soon revealed to the French government. Pichegru's conduct as general had already excited suspicion, for, instead of improving his advantages over the enemy, he had retreated when he should have advanced. But Montgaillard, an agent in the negotiations of the Bourbons with the general, in whose hands was the correspondence on the subject, delivered up the papers to the directory, who, too weak at the moment to bring the general to an account, recalled him from the command in 1796 under the pretence of appointing him ambassador to Sweden. Pichegru declined the post of ambassador, but was blind enough not to perceive the storm which threatened him; and, instead of saving himself while it was still time, he retired to the abbey of Belvaux, near Arbois, which he purchased; where he lived in narrow circumstances till March 1797, when the electors of his department, the Upper Saone, chose him representative in the legislative body. Here he was chosen president of the five hundred, but he did not abandon his secret projects. On the contrary, he appeared at the head of the Clichy party, and incurred suspicion by his propositions in relation to the new organization of the national guards of Paris, evidently intended to overthrow the republican party. The directory, in concert with the council of elders, secretly sent for troops from the Italian army under Augereau, by whose aid, on the 4th of September, 1797, the plots of the royalists were baffled, and Pichegru, with his accomplices, was arrested and sent to the Temple. The directory published the correspondence of Pichegru with the emigrant Bourbons, particularly with Condé, part of which had been obtained through Montgaillard, and part found, by the army of the Rhine under Moreau, in the baggage of General Klingin; and, with twenty of his accomplices, he was condemned to deportation to Cayenne. The prisoners were conveyed by way of Blois to Rochefort, where they embarked. Having arrived at Cayenne, they were transported to the unhealthy wilderness of Sinamari, where most of them died of the marsh fever. Pichegru and seven others succeeded, after remaining there eight months, in escaping to Paramaribo, the capital of the Dutch colony of Surinam, in a light boat. From this place they came to

England, where Pichegru, now an avowed adherent of the Bourbons, met with a favourable reception, and was ordered to join the Austrian and Russian army under Korsakoff. But as Korsakoff, to whom Pichegru, before the battle of Zurich, had given some useful advice, which was neglected, was defeated, Pichegru returned to England, where he was often consulted both by the ministers and by the French princes.

The latter, as is well known, flattered themselves that Bonaparte would play the part of General Monck and restore the exiles to the throne; but as the grounds for this hope disappeared, it has been stated that "they determined to put the first consul out of the way; and in the execution of this plan, Pichegru and Georges Cadoudal, chief of the Chouans, with whom Pichegru had become acquainted in London, were employed. Having been landed on the French coast by Captain Wright, in January 1804, with several of the old Vendean leaders, the conspirators repaired in disguise to Paris, hoping to find there a party favourable to their views, and to engage Moreau in their plans. But the police, under Fouché, discovered the plot, and Georges was suddenly arrested. Pichegru escaped his pursuers several days, but was finally betrayed by a merchant with whom he had taken refuge, and arrested on the 29th of February, 1804. He was confined in the Temple, and a process commenced against him; but he was found one morning strangled in prison. An attempt was made to fix on the first consul the stigma of having caused the unhappy man to be tortured and then strangled; but this would have been a most wanton act of cruelty; the ordinary legal process would have resulted in his condemnation to death, as it was proved by his own confession that it had been the intention of himself and his accomplices to make away with the existing head of the state. It is more probable that, in despair at the failure of a plot equally foolish and wicked, he committed suicide by strangling himself with the silk handkerchief which was found about his neck. His body was publicly exposed the day after his death, and no traces of torture could be perceived." His private character is deserving of much praise. Disinterested in a high degree, he declined the gifts that were frequently proffered him, and his humanity to prisoners was exhibited on more than one occasion. When he was transported to Cayenne, he was so poor that his friends were obliged to sell his effects to procure him money for his voyage.

PICHLER, or PICKLER, JOHN ANTHONY, and JOHN, father and son, two artists, celebrated for their skill in gem-sculpture. The father was born at Brixen, in Tyrol, in 1700, and died at Rome in 1779, with the reputation of having restored this art to a high degree of perfection, which had sunk entirely since the times of the ancients. His son was born at Naples in 1734, and excelled his father. His Hercules struggling with the Nemean Lion, his Leander, and his Achilles, are master-pieces, acknowledged as such by all connoisseurs, and esteemed very nearly equal to the most perfect works of antiquity. Pichler lived in Rome, where he saw the emperor Joseph II., who raised him to the rank of nobility, and wished him to live in Vienna with a handsome salary; but Pichler refused this offer as well as several invitations to come to England. He died at Rome in 1791, where Rossi published a biography, subsequently translated by Boulard and Millin into French, and

published in "The Magazin Encyclopédique," with notes by Dufourny. A bust of Pichler, made by Haveston, was placed in the Pantheon.

**PICKEN, ANDREW.**—This talented writer was born at Paisley in 1788, and educated for the mercantile profession. At an early age he went to the West Indies, but finding that the business in which he was engaged was not likely to prove advantageous to his pecuniary affairs, he obtained a situation in the bank of Ireland. To the great regret of his Irish friends he subsequently removed to Glasgow and entered into business. Here he first came before the world as an author by publishing "Tales and Sketches of the West of Scotland;" a work which had great local success. In this volume appeared for the first time the pathetic story of "Mary Ogilvie," which showed no common power of combining the ordinary incidents of life into pictures of intense and harrowing interest. Among the sketches was one "On the Changes in the West of Scotland during the Last Half Century," which contained much playful satire and not a few very hard hits, that severely wounded the vanity of "the Glasgow bodies." This, combined with some other circumstances, induced the author to quit Glasgow; he afterwards removed to Liverpool, where he established himself as a bookseller.

The unfitness of literary men for business is proverbial; dwelling in the ideal world, they shrink from encountering the stern realities of life,—

"And pen a stanza when they should engross."

The mania of speculation which, in 1826, seized even on those who were deemed paragons of worldly wisdom, found too ready a victim in one to whom the world of business was as a sealed volume; he joined in some of the wild projects of the time, and lost his all. But, like Francis I., he might have boasted that honour still remained: when his books were inspected, the creditors with one voice bore honourable testimony to his integrity, and expressed their sorrow for his misfortunes. They would readily have aided him in commencing business anew, but literature had now marked him for her own, and he came to London with the manuscript of a novel, the composition of which had been the amusement of his leisure hours, and subsequently his chief consolation in difficulty and distress.

"The Sectarian," as this novel was called, was published by Colburn, and excited considerable interest at the time of its first appearance. Though the circulation of "The Sectarian" was limited, it had the effect of making the author known to the editors of the principal periodicals; and from this time Mr. Picken became a regular contributor to the leading magazines and reviews. The publication of "The Dominie's Legacy," in 1830, finally established his fame as the historian of Scottish humble life: we say the historian rather than the delineator, because the dominie speaks not of what he has imagined, but of what he has seen, felt, and understood, almost from his infancy; and we remember his characters more as those of persons that we somewhere knew, than of personages we have seen described. The work had great success, and its fame has not been injured by time. When Colburn's "Juvenile Library" was projected, Mr. Picken undertook to supply "The Lives of Eminent Missionaries;" but before his work was completed the library was at an end. The volume was subsequently published by Kidd, and two large

impressions were sold. Mr. Picken's next publication was "The Club Book," to which several of the most popular living writers contributed. The tales written by the editor were in his happiest style: that entitled "The Three Kearneys" was founded on circumstances which he had witnessed during his residence in Ireland; and it showed that Mr. Picken had thoroughly investigated the mixed character of the Irish peasantry. "The Deer-stalkers" was also a tale of great interest and was much admired. Soon after appeared a work on the Canadas, professedly a compilation; in preparing this volume Mr. Picken received very valuable assistance from his friend Mr. Galt. This was followed by "Waltham," a tale published in Leitch Ritchie's "Library of Romance." In the course of the following year was published the "Traditionary Stories of Old Families," in two volumes, designed as the first part of a series, which would embrace the legendary history of Scotland, England, and Ireland. The project excited considerable interest, and many of the most distinguished members of the aristocracy offered to aid the author by giving him access to their family papers. Before he could avail himself of the ample stores thus opened to him, he was attacked by the disease which so rapidly terminated his life. On the 10th of November, while conversing with his son, he was suddenly struck down by apoplexy. He was conveyed home insensible; after a short time strong hopes were entertained of his recovery, and the very night before his death he conversed cheerfully with his family. His wife and children parted from him full of hope, doomed however to be disappointed. On the following morning, November 23, 1833, his spirit passed away almost without a struggle. A short time previous to his death he completed the MS. of his novel, entitled "The Black Watch." It was published after his decease, and met with the success which it merited, as it is justly considered one of the best novels of the period.

**PICKENS, ANDREW,** a distinguished American revolutionary officer, who was born on the 13th of September, 1739, in Bucks county, Pennsylvania. Before his arrival at the age of manhood, his family emigrated to South Carolina. In the French war, which terminated in 1763, he made his first campaigns, having, among other services, accompanied in 1761 the expedition under Lieutenant-colonel Grant against the Cherokees as a volunteer, in conjunction with Marion and Moultrie. At the commencement of the revolution he was appointed a captain of militia, and throughout the war displayed the utmost courage, skill, and zeal, and rose by regular and rapid degrees to the rank of brigadier-general. During the period when South Carolina was overrun by the enemy, and the American cause in that quarter wore the gloomiest aspect, he was one of those who indefatigably kept up the spirit of resistance. His principal services were—in an expedition which he commanded in 1781 against the Cherokees, whom he completely subdued in a few days with an inconsiderable force, at Kettle Creek, where he defeated a large body of the British under Colonel Boyd with half their force, and secured the internal peace of the country for a considerable time by thus breaking the strength of that party—and at the battle of Cowpens, where he commanded the militia, whom he rallied after they had been broken and compelled to retreat, and brought a second time into action. He contri-

buted much to the final surrender of the British, and the congress voted him a sword. At the battle of the Eutaw Springs, he commanded, with Marion, the militia of the two Carolinas; but in the early part of the action he received a severe wound in his breast by a musket ball, which was prevented, however, from being mortal by the ball striking the buckle of his sword. After the conclusion of peace he was employed in various civil capacities. He was one of the commissioners who accomplished the treaty of Hopewell with the Cherokees, by which that portion of the state now called Pendleton and Greenville was acquired. Soon afterwards he settled at Hopewell. He was a member of the legislature, and afterwards of the convention which formed the state constitution. Under the new constitution he again occupied a seat in the legislature until 1794, when he was sent to congress. In that year also, when the militia was first organized conformably to the act of congress, he was appointed one of the two major-generals, but resigned his commission after a few years. He declined a re-election to congress, and again became a member of the legislature, in which he continued until about 1801. In that year he withdrew from public life. In all the treaties which had been made previously with the southern Indians, he had been employed by the United States as a commissioner, and on one occasion Washington had requested his attendance at Philadelphia to consult with him on the practicability and best means of civilizing the people. He continued in retirement until 1812, when he accepted a seat in the legislature. He was also solicited to serve as governor, but he declined. He died on the 11th of October, 1817, after a long life, in which he had enjoyed almost uninterrupted health in consequence of the natural excellence of his constitution, combined with early and constant temperance and activity. His character was marked by simplicity, decision, and prudence. Throughout his whole career he was distinguished for a scrupulous performance of every duty.

PICKERING, TIMOTHY, a North American officer, who was born in Salem, July 1745. He was graduated at Harvard college in 1763, and, after the usual course of professional studies, was admitted to the practice of the law. When the dissensions between the colonies and the mother country commenced, he soon became the champion and leader of the Whigs of the quarter where he lived. He was a member of all the committees of inspection and correspondence, and bore the entire burden of writing. The address which, in 1774, the inhabitants of Salem voted to Governor Gage on the occasion of the Boston port-bill, proceeded from his pen. A part of it, disclaiming any wish on the part of the inhabitants of Salem to profit by the closing of the port of Boston, is quoted by Dr. Ramsay in his "History of the American Revolution." In April 1775, on receiving intelligence of the battle of Lexington, he marched with the regiment of which he was at the time commander to Charlestown, but had not an opportunity of coming to action. Before the close of the same year, when the provisional government was organizing, he was appointed one of the judges of the court of common pleas for Essex, his native county, and sole judge of the maritime court, which had cognizance of all prize causes for the middle district, comprehending Boston, with Salem, and the other ports in Essex. These offices he held until he accepted an appointment in the army.

In 1777 he was named adjutant-general by Washington, and joined the army then at Middlebrook, New Jersey. He continued with the commander-in-chief until the American forces went into winter quarters at Valley Forge, having been present at the battles of Brandywine and Germantown. He then proceeded to discharge the duties of a member of the continental board of war, to which he had been elected by the congress. In this station he remained until he was appointed to succeed General Greene in the office of quarter-master-general, which he retained during the residue of the year, and in which he contributed much to the surrender of Cornwallis at Yorktown. From 1790 to 1794 he was charged by Washington with several negotiations with the Indian nations on the frontiers. In 1795 he was appointed secretary of state, and from that office he was removed by Adams, in May 1800. At the end of the year 1801 he returned to Massachusetts. In 1803 the legislature of that state chose him a senator to congress for the residue of the term of Dwight Forster, Esq., who had resigned, and in 1805 re-elected him to the same station for the term of six years. After its expiration in 1811, he was chosen by the legislature a member of the executive council; and during the war of 1812 he was appointed a member of the board of war for the defence of the state. In 1814 he was sent to congress, and held his seat until March 1817. He then finally retired to private life. His death took place in January 1829, in the eighty-fourth year of his age. In his manners Colonel Pickering was plain and unassuming. In public life he was distinguished for energy, ability, and disinterestedness; as a soldier, he was brave and patriotic; and his writings bear ample testimony to his talents and information.

PICTET, ADOLPHE MARCUS.—This eminent philosopher was born at Geneva in 1752. After receiving a good mathematical education, he succeeded to Saussure in the chair of philosophy in his native city. In the early part of his life he was much engaged in controversial politics. After 1814 he settled at Geneva, where he remained till his death in 1825. He is best known by his "*Essai sur le Feu*."

PICTET, BENEDICT, a learned theological writer, who was born at Geneva in 1655, of a distinguished family. Having completed his preparatory studies, he travelled through Holland and England, and taught theology in his own country with great success. His death took place on the 9th of June, 1724. He published a number of works in Latin and French, which are much esteemed. The principal of these are, "*A System of Christian Theology in Latin*," "*Christian Morality*," printed at Geneva, "*The History of the Eleventh and Twelfth Centuries*, intended as a sequel to that of Sueur," printed in 1713 (the continuator is held in higher estimation than the first author);

several controversial treatises; a great number of tracts on morality and piety, among which we must distinguish "The Art of Living and Dying Well," published at Geneva, with a number of other works.

PIGANIOL, DE LA FORCE, JOHN AYMAR DE, a learned French historian and geographer, who was a native of Auvergne. With the intention of improving himself, he travelled into the different provinces of France, and made important observations on the natural history, the commerce, and the civil and ecclesiastical government of each province. These observations were of great use to him in compiling the works he has left behind him, of which the chief are, "An Historical and Geographical Description of France," "A Description of Paris," in ten volumes (he subsequently published an abridgment of it in two volumes), and "A Description of the Castle and Park of Versailles." He died in Paris in February 1753, at the age of eighty years.

PIKE, ZEBULON MONTGOMERY, an enterprising American traveller, who was born at Lambertton, in the state of New Jersey, on the 5th of January, 1779. He entered the army while a boy, and served for some time as a cadet in his father's company, which was then stationed on the western frontiers of the United States. At an early age he obtained the commission of ensign, and some time after that of lieutenant. By a life of constant activity and exposure he invigorated his constitution, and prepared himself for deeds of hardihood and adventure. When he entered the army he had been instructed only in reading, writing, and a little arithmetic. By his own exertions he acquired almost without the aid of a master the French and Latin languages, the former of which, it appears from his journal, he was able to write and speak with sufficient accuracy for the purposes of business. To these he afterwards added a competent knowledge of the Spanish. He also studied the elementary branches of mathematics, and became skilful in all the ordinary practical applications of that science. He seems besides to have had a general curiosity, to which no kind of knowledge was without interest: he read with avidity every book which fell in his way, and thus, without any regular plan of study, acquired a considerable stock of various information. Soon after the purchase of Louisiana, the government of the United States determined upon taking measures to explore their new territory, and the immense tract of wilderness included within its limits, in order to learn its soil and natural productions, the course of its rivers, and their fitness for the purposes of navigation and other uses of civilized life, the numbers, character, and power of the tribes of Indians who inhabited this territory. With these views, while captains Lewis and Clarke were sent to explore the unknown sources of the Missouri, Pike was despatched on a similar expedition, for the purpose of tracing the Mississippi to its head. On the 9th of August, 1805, Pike embarked at St. Louis on his first expedition to the head of the Mississippi, and proceeded up the river with twenty men in a stout boat provisioned for four months; but they were soon obliged to leave their boat and proceed on their journey by land, or in canoes, which they built after leaving their large boat and carried with them on their march. For eight months and twenty days they were almost continually exposed to hardship and peril, depending for provisions upon the chase, and enduring the most piercing cold. They were

sometimes for days together without food, and they frequently slept without cover upon the bare earth or the snow, during the inclemency of a northern winter. During this voyage Pike had no intelligent companion upon whom he could rely for advice or aid, and he literally performed the duties of astronomer, surveyor, commanding officer, clerk, spy, guide, and hunter, frequently preceding the party for many miles in order to reconnoitre, or rambling for whole days in search of deer or other game for provision; and then returning to his men in the evening, hungry and fatigued, he would sit down in the open air to copy, by the light of the fire, the notes of his journey, and to plan the course of the next day. Within two months after his return from this expedition, Pike was selected by General Wilkinson for a second expedition to the interior of Louisiana, in order to acquire such geographical information as might enable government to enter into definitive arrangements for a boundary line between the newly acquired territory and North Mexico. Winter overtook the party unprovided with any clothing fit to protect them from cold and storms. Their horses died, and for weeks they were obliged to explore their way on foot through the wilderness, carrying packs of sixty or seventy pounds weight, besides their arms, exposed to bitter cold, relying solely on the produce of the chase for subsistence, and often for two or three days together without food. Several of the men had their feet frozen, and all, except Pike and one other, were in some degree injured by the cold.

After a three months' winter march, they explored their way to what they supposed to be the Red River. Here they were met by a party of Spanish cavalry, by whom Pike was informed, to his great astonishment, that they were not on the Red River, but on the Rio del Norte, and in the Spanish territory. Opposition to this force would have been idle, and he reluctantly submitted to accompany the Spaniards to Santa Fé to appear before the governor. From Santa Fé he was sent to the capital of the province of Biscay, to be examined by the commandant-general, where he was well received and entertained for some time, after which he was sent on his way home, under the escort of a strong party of horse. He arrived with his little band at Natchitoches, on the 1st of July, 1807. The most vexatious circumstance attending this unexpected sequel to his expedition was the seizure of all his papers, except his private journal, by the Spanish government. He had been furnished with a complete set of mathematical instruments, and had made frequent and accurate observations. He had thus ascertained the geographical situation of the most important points with much precision, and had collected materials for an accurate map of a great part of the country which he traversed. Pike, upon his return, received the thanks of the government, and was immediately appointed captain, shortly after a major, and upon the further enlargement of the army in 1810, a colonel of infantry. A narrative of his two expeditions, accompanied by several valuable original maps and charts, was published by him, in octavo, in 1810. Immediately after the declaration of war in 1812, Pike was stationed with his regiment upon the northern frontier; and upon the commencement of the campaign of 1813 was appointed a brigadier-general. He was selected to command the land forces in an expedition against

York, the capital of Upper Canada, and sailed from Sackett's Harbour in the squadron commanded by Commodore Chauncey. On his arrival at York with about 1700 chosen men, he immediately prepared to land. As soon as the debarkation commenced a body of British grenadiers was paraded on the shore, and the Glengary fencibles, a local force which had been disciplined with great care, appeared at another point. Large bodies of Indians were also seen in different directions, while others filled the woods which skirted the shore. General Sheaffe commanded in person. The landing was effected under a heavy fire of musketry and rifles from the Indians and British. General Pike immediately ordered a charge. After a short conflict the British fled towards their works, and the Indians dispersed in every direction. The whole force, being now landed and collected, was led on by General Pike in person to the attack of the strong works. After carrying one battery by assault, they moved on towards the main works. The fire of the enemy was soon silenced by the artillery of the assailants, when a terrible explosion suddenly took place from the British magazine, which had been previously prepared for this purpose. Large stones were thrown in every direction with terrible force, and scattered destruction and confusion among the troops. General Pike was struck on the breast by a heavy stone and mortally wounded. While the surgeons were carrying him out of the field, a tumultuous huzza was heard from the American troops: Pike turned his head with an anxious look of enquiry; he was told by a sergeant, "The British union jack is coming down, general—the stars are going up." He heaved a heavy sigh and smiled. He was then carried on board the commodore's ship, where he lingered for a few hours. Just before he breathed his last the British standard was brought to him: he made a sign to have it placed under his head, and expired without a groan.

PILATE, PONTIUS, the successor of Valerius Gratus, was in the government of Judea, A. D. 27. He is said to have been born in Spain. Pilate was procurator, or *præpositus*, of Judea; and as was sometimes the case in a small province, or in a part of a large province, discharged the office of a governor; hence he had the power of punishing capitally, which procurators did not usually possess, although Judea was a part of the province of Syria. He endeavoured to introduce the Roman standards with the image of the emperor into Jerusalem, in violation of the Jewish usages, attempted to get possession of the treasure of the temple, and put to death some Galileans in the midst of the sacrifices—an act which brought upon him the hostility of Herod, tetrarch of Galilee. When Christ had been condemned to death by the Jewish priests, who had no power of inflicting capital punishments, he was carried by them to Pilate to be executed. Pilate, seeing nothing worthy of death in him, sent him as a Galilean to Herod. Yielding to the clamours of the Jews, the Roman governor finally ordered Jesus to be executed, but permitted Joseph of Arimathea to take his body and bury it. Pilate was afterwards removed from his office by Vitellius, prefect of Syria, A. D. 37; and, according to tradition, was banished by Caligula to Gaul, where he is said to have died or committed suicide at Vienne, A. D. 40. The Scala Santa, near the church of Santa Croce in Rome, is said to be formed of the twenty-eight steps of the marble palace of Pilate, and the de-

vout therefore ascend it only on their knees. In the church itself is shown the inscription in Greek, Hebrew, and Latin, placed by Pilate on the cross.

PILATRE, DU ROSIER FRANCIS.—This ingenious Frenchman was born the 30th of March, 1756. He was first apprenticed to an apothecary there, and afterwards went to Paris for farther improvement. He applied himself particularly to the study of natural history and of natural philosophy, and had already acquired some reputation, when the discovery of M. de Montgolfier had just astonished the learned world. On the 25th of October, 1783, he attempted an aerial voyage with the marquis of Arlande, and he subsequently performed several other excursions in this way with great success in the presence of the royal family of France, of the king of Sweden, and of Prince Henry of Prussia. He then resolved to pass over to England by means of his aerial vehicle, and for that purpose he went to Boulogne, from whence he rose about seven o'clock in the morning of the 15th June, 1785; but in half an hour after he set out the balloon took fire, and the aeronaut, with his companion M. Romaine, were killed by the fall of their machine. Pilatre's social virtues and courage, which were very distinguished, heightened the regret of his friends for his loss. His merit as a chemist, and his experiments as an aeronaut, procured him some pecuniary reward, and various public appointments. He had a pension from the king, was intendant of the king's brother's cabinets of natural philosophy, chemistry, and natural history, professor of natural philosophy, a member of several academies, and principal director of the royal museum.

PINCKNEY, CHARLES COTESWORTH, a distinguished American revolutionary officer, who was born in South Carolina, and educated at Westminster school, and subsequently at the university of Oxford, in both of which institutions he enjoyed a high reputation for strength of character and proficiency in his studies. After reading law at the Temple, he returned to Carolina in 1769, but was not able to practise his profession for any length of time, the commencement of the revolution obliging him to exchange the gown for the sword. He was first appointed a captain in the continental regiments, and, soon afterwards, commander of the first regiment of Carolina infantry. When the south had been freed for a period from invasion, by Moultrie's gallant defence of the fort on Sullivan's Island, Colonel Pinckney joined the northern army, and was made aide-de-camp to Washington. In that capacity he was present at the battles of Brandywine and Germantown. When the south was again menaced with danger, he returned to Carolina, and displayed great resolution and intrepidity on the rapid and harassing march which saved that city from General Prevost, and on the subsequent invasion of Georgia, and the assault on the lines of Savannah. On the approach of the army under Sir Henry Clinton, and of the fleet conducted by Admiral Arbuthnot, he was entrusted with the command of the fort on Sullivan's Island. A favourable breeze and a flowing tide, however, enabled the fleet to sail into the port of Charleston, beyond the reach of his guns. He then hastened with a part of the garrison to aid in defending the city, and was for continuing hostilities to the last extremity, not, as he said, because he thought they would eventually be able to repel the enemy, but because "we shall so cripple the army before us, that although we may

not live to enjoy the benefits ourselves, yet to the United States they will prove incalculably great." Other counsel however prevailed, and he was made prisoner with the rest of the besieged.

Some time after the return of peace, he was placed in command of the militia of the lower division of the state, but was very soon appointed by Washington, whose confidence and friendship he enjoyed in a high degree, minister plenipotentiary to France. He resigned his commission in consequence, and sailed for Europe. The hostile feeling of the French directory towards America caused them to reject its conciliatory propositions in an insulting manner, and to order its minister out of the territories of the republic. General Pinckney immediately communicated to the government the indignities which he had received, and retired to Holland. Not long afterwards he was joined by General Marshal and Mr. Gerry, with fresh instructions to reiterate propositions to the directory for the adjustment of differences. When at length war was inevitable, and the whole United States were resounding with his celebrated sentiment, "Millions for defence, but not a cent for tribute," he returned home, having been named a major-general by Washington, who had been placed at the head of the forces raised for the protection of the American shores. Superior rank, however, was accorded to General Hamilton, who had been his junior during the revolution. Some one spoke to General Pinckney of this preference as unjust, but he briefly answered that he was satisfied that General Washington had sufficient reasons for it. "Let us," he continued, "first dispose of our enemies; we shall then have leisure to settle the question of rank." Previously to his going to France, as we should have mentioned before, he had been offered, by President Washington, several places under government of the highest importance, all of which, however, private considerations obliged him to decline. The first was that of judge of the supreme court; the next that of secretary of war, on the resignation of General Knox; and then that of secretary of state, when Randolph had been removed. He was a member of the convention which framed the constitution of the United States, and afterwards in the convention of South Carolina, assembled for deliberating upon the instrument, he contributed greatly to its adoption. He died in August 1825. As a lawyer, General Pinckney was distinguished for profound and accurate learning, and strength and ingenuity of reasoning, without having much pretension to eloquence. In his practice he was high-minded and liberal, never receiving any compensation from the widow and orphan. His literary attainments were extensive, especially his classical knowledge; and no one was a more zealous friend to the advancement of learning. For more than fifteen years before his death he acted as president of the Bible society of Charleston—an office to which he was named with unanimity by the Christians of almost every sect.

PINCKNEY, THOMAS, a major-general in the army of the United States, who was born in October 1750. He was brought to England in the year 1753, with his elder brother, the general Charles Cotesworth Pinckney, by their father, who returned in 1758, on account of the war between France and England, to Carolina, where he soon after died, leaving directions that his sons should receive the best education, were it even necessary to sell part of his

estate for that purpose. They were educated at Westminster school and at Oxford. They studied law in the Temple, and were admitted to the bar in this country. At the commencement of the revolutionary war, the brothers joined the continental army, where they rose to the rank of colonel and major. We have seen that the elder brother was aide-de-camp to General Washington, and the younger served in that capacity with General Lincoln, and then with Count d'Estaing, who commanded the French army at the disastrous siege of Savannah. He also served as aide-de-camp to General Gates, and was captured at the battle of Camden in 1780. On his recovery he was sent as a prisoner of war to Philadelphia.

During the administration of General Washington, he was offered the place of judge of the federal court, which he declined. He was then elected the second governor of South Carolina, as successor to General Moultrie, and was eminently successful in establishing the authority of the laws, which had been deranged during the long and disastrous periods of the southern war. Shortly after the termination of his office, he accepted from General Washington the mission to the British court, where he continued several years. He was then employed on a mission to the court of Spain, where he formed the treaty of St. Ildefonso, by which the free navigation of the Mississippi was secured to the United States, before its cession to France and subsequent purchase by Mr. Jefferson. The situation of his estate requiring his presence at home, he solicited his recall, and returned to America in 1796. Soon after he was elected a member of congress from Charleston district, where he generally acted with that party at the head of which was General Washington. After a few sessions he retired from public life, and devoted himself to the care of his estate and the education of his children. At the commencement of the war of 1812 he received from Mr. Madison the appointment of major-general of the sixth military district. It was under his command that the Indian war in which General Jackson distinguished himself was undertaken and brought to a successful issue. He advised the war department to subdivide his military district, extending from North Carolina to the Mississippi, as too large for one command, and recommended General Jackson to the command of a separate district to be formed in the south-west. At the return of peace he was solicited by the president to continue his services, and especially to endeavour to recover the southern property taken from the islands after the signature in Europe of the treaty of peace; but he preferred to resign his command and his connexion with public life. His private life was highly useful. The agriculture of his country received his constant attention, and he contributed to advance it by many scientific improvements. To these objects, and to his large circle of relatives and friends, he was devoted till his death, in November 1828, in the seventy-eighth year of his age.

PINDAR, one of the most energetic and sublime poets of Greece. He sang the praises of the victors in the Grecian games—those public festivals in which the most distinguished men, even kings, competed. Not only the conquerors and their fellow citizens, but all assembled Greece was celebrated in his poems, and thus they were soon spread wherever the Greek language was spoken. To understand Pindar, it is necessary to be intimately acquainted with Greek an-

tiquities; as, in the judgment of the best critics, his poems belong to the most beautiful remains of ancient literature. Forty-five are still extant—fourteen in celebration of Olympic victors, twelve of Pythian, eleven of Nemæan, and eight of Isthmian. They are all written in the Doric dialect.

Pindar was born in Bœotia, in or near Thebes, about 520 B. C. His father was a flute-player, and he is said to have been himself a masterly performer on the lyre. At an early age he was instructed in music and poetry; and for the development of his poetical talent he was especially indebted to the beautiful Corinna, who was herself a distinguished poetess, and is said to have obtained the prize more than once in the poetic competition with her friend. Little else is known with certainty of his life; even the date of his death is doubtful: according to some, he died in his sixty-fifth year; according to others, he lived to the age of eighty or ninety.

PINEL, PHILIP, a philanthropic Frenchman, who was born in 1745, at St. André, in the department of the Tarn, and studied at Toulouse and Montpellier, where he supported himself by teaching mathematics. In 1778 he went to Paris, and at first applied himself to the study of the sciences connected with medicine, but afterwards devoted himself entirely to that science itself. In 1791 he was made directing physician at the Bicetre, an insane hospital, and in 1794 at the Salpêtrière. The harsh treatment of the insane then in vogue, their chains and unhealthy dungeons, filled him with horror. He introduced gentle treatment, uniting firmness with kindness, and was the first definitely to recommend moral remedies, in his work "*Sur l'Aliénation Mentale*," and was one of the earliest to establish a regular police in the mad-houses. He also proved the existence of what he called *manie sans délire*. He placed less stress on physical treatment, and in particular he agreed with Bordeu in condemning blood-letting. In general he recommended delay. "What art cannot effect," he used to say, "time may accomplish." His pathology was founded on Condillac's system of philosophy, and was directed more to a consideration of the obvious phenomena than to a thorough insight into the nature of diseases; yet his "*Nosographie Philosophique*" formed an epoch in French medicine, as it supplied a want then generally felt. In many respects Pinel is to be considered as the precursor of Bichat, since he was the first to point out the physiological and pathological difference of the various textures. He edited for some time "*The Gazette de Santé*," and was a collaborator in Fourcroy's "*Médecine éclairée par les Sciences Physiques*," and in the great "*Dictionnaire des Sciences Médicales*." In the time of terror Pinel concealed the unfortunate Condorcet in his house. In 1823, when the school of medicine was reformed by the government, M. Pinel was removed from his post on suspicion of entertaining liberal principles; and he died three years later, at the age of eighty-one years.

PINET, ANTONY DU, lord of Noroy.—This nobleman lived in the sixteenth century, and was a native of Besançon. He was strongly attached to the protestant religion, and a bitter enemy to the church of Rome. His books, entitled "*La Conformité des Eglises Reformées de France*," and "*De l'Eglise Primitive*," printed at Lyons in 1564, and the notes which he added to the French translation of "*The*

at Lyons in 1564, and reprinted at Amsterdam in 1700, discover his sentiments. He published the last-mentioned work under this title, "*Taxe des Parties Casuelles de la Boutique du Pape*," in Latin and French, with notes taken from decrees, councils, and canons, in order to ascertain the discipline anciently observed in the church. In the dedication he assumes the tone of a declared enemy to the court of Rome. He apologises for having presented this book "to a society so holy as yours (the protestants), in which are heard only hymns, psalms, and praises, to the Lord our God; but it is proper to show to the villain his villany, and the fool his folly, lest one should be thought to resemble them." His translation of Pliny's "*Natural History*" was at one period very popular: though there are a good many errors in it, it is yet very useful, especially on account of the translator's researches and the great number of marginal notes. Pinet also published a folio edition of "*Plans of the Principal Fortresses in the World*."

PINGRE, ALEXANDRE GUI, a celebrated astronomer, geographer, and member of the academy of sciences at Paris, who was born in Paris in 1711. He distinguished himself at first as a theologian, particularly in the Jansenistic controversy; but at the age of thirty-eight he was induced to devote himself to astronomy for the purpose of fitting himself for the place of astronomer to the academy of sciences at Rouen. His observations here caused him to be chosen correspondent of the Paris academy in 1750, and in 1751 he was called to Paris by its order to erect and superintend an observatory. Here he continued his observations for forty years, and published an astronomical nautical almanac from 1754 to 1757. In 1756 he became *associé* of the academy, whose Transactions from 1753 to 1770 contain numerous papers by him. In 1757 he entered upon one of the most difficult of astronomical labours, the theory and calculation of comets; and calculated the paths of more comets than all the other astronomers of Europe together. In 1766 he calculated the eclipses of the sun and moon for a period of 2000 years, for the second edition of the "*Art de Vérifier les Dates*," with a greater degree of accuracy than Lacaille had done. In 1767 he accompanied Courtauvoux on a voyage to try the chronometers of Leroy and Berthoud, and made a report on the subject. In 1769 he made a second voyage with Fleurieu for the same purpose, and in 1771 a third with Borda. In 1769 he observed a passage of Venus over the sun's disk at Cape François (he had been prevented from observing a previous passage in 1761 by the state of the weather). In 1783 appeared his "*Cométographie*," and in 1790 he completed his "*History of Astronomy during the Seventeenth Century*." In 1786 he published a translation of the astronomical poem of Manilius. He died in May 1796.

PINKERTON, JOHN, a talented Scottish writer, who was born in Edinburgh on the 17th of February, 1758. After acquiring the rudiments of education at a small school near his native city he was, in 1764, removed to the grammar school at Lanark, kept by Mr. Thomson, who married the sister of the poet of that name. Inheriting from his father a portion of hypochondriacism, young Pinkerton was always a diffident boy, and he neither entered into competition with his schoolfellows in education, nor joined in their boisterous but healthy amusements. At school he was generally the second or third of his

class; but nothing remarkable distinguished this period except one incident:—Mr. Thomson one day ordered the boys to translate a part of Livy into English; when he came to young Pinkerton's version, he read it silently to himself; then, to the great surprise of the boys, walked quickly out of the school, but soon returned with a volume of Hooke's "Roman History," in which the same part of Livy was translated. He read both aloud, and gave his decided opinion in favour of his disciple's translation. After being six years at school, the last year of which only was dedicated to the Greek, he returned to the house of his family near Edinburgh. His father having some dislike to university education, young Pinkerton was kept in a kind of solitary confinement at home. An hour or two passed every day in attending a French teacher; and, in his eagerness to attain this language, he had totally lost his Greek, and nearly his Latin also; but soon after meeting with Rollin's "Ancient History," and observing references to the original authors, he bought the "History of Justinus," &c., and soon recovered his Latin so as to write, when he was about thirteen years of age, tolerable fragments in that language. He afterwards studied mathematics.

Intended for the profession of the law, young Pinkerton was articled to an eminent writer to the Signet, with whom he served a clerkship of five years. He did not, however, neglect the cultivation of his mind, and he wrote an elegy called "Craigmillar Castle," which he dedicated to Dr. Beattie. This production, which was published in 1776, was followed by the composition of one or two tragedies, but they were never printed.

In 1780, soon after the expiration of his clerkship, his father died; and being often disappointed in procuring uncommon books at Edinburgh, he visited London, where the size and extent of the booksellers' catalogues are said to have formed his sole motive for wishing to fix his residence. This determination was confirmed by the bankruptcy of some merchants in Glasgow, who held about 1000*l.* of his father's money, all which was lost. He accordingly went to Scotland in the spring of 1781, took up the remaining sums lying in mercantile hands, and, returning to England, settled in the neighbourhood of London in the winter of that year. In 1781 Mr. Pinkerton published, in octavo, "Rimes," as he peculiarly chose to designate some minor poems; and "Hardyknute, an Heroic Ballad; with other more approved Scottish Ballads, and some not hitherto made public, in the Tragic Style." To which were prefixed, "Two Dissertations:—On the Oral Tradition of Poetry; on the Tragic Ballad." In 1782 he published "Two Dithyrambic Odes:—On Enthusiasm; To Laughter," and "Tales in Verse," also in the same year. From his boyish days Mr. Pinkerton had been fond of collecting medals, minerals, and other curiosities; and having received from a lady in Scotland a rare coin of Constantine, on his Sarmatian victory, which she had taken as a farthing, he soon laid the foundation of a collection. These pursuits led him to see the defects of common books on the subject, and he drew up a manual and tables for his own use, which afterwards grew to the excellent and complete "Essay on Medals," the first edition of which was published by Dodsley, in two volumes, 1784. He was materially assisted in its completion by the late Mr. Southgate of the British Museum, and Mr. Douce. In

1785 Mr. Pinkerton surprised the literary world with a very extraordinary performance, entitled "Letters of Literature," under the assumed name of Robert Heron. In this work he depreciated the ancient authors in a manner which called forth the indignation of the poet Cowper; and criticised the best of the moderns with great severity. He also recommended a new system of orthography, much resembling that which his countryman, Mr. Elphinstone, endeavoured with so much zeal to introduce. Unfortunately it happened that the work was ascribed to a countryman of his, whose name was in reality Robert Heron, and who was just then coming before the public as an author. However, this book obtained for Mr. Pinkerton an introduction to Horace Walpole, through whom he became acquainted with Gibbon the historian, who recommended him to the booksellers as a fit person to translate the "English Monkish Historians," a work which, had the proposal met with encouragement, might have tended to a more generally diffused knowledge of the history of the middle ages. On the death of his patron, the earl of Orford, Mr. Pinkerton sold a collection of his lordship's remarks, witticisms, and letters, to the proprietors of the "Monthly Magazine," in which they appeared periodically, under the title of "Walpoliana," and when exhausted, the whole were reprinted in two small volumes, with a portrait of the gifted nobleman.

In 1786 Mr. Pinkerton published a work, entitled "Ancient Scottish Poems, never before in Print; but now published from the [pretended] Manuscript Collections of Sir Richard Maitland of Lethington, Knight, Lord Privy Seal of Scotland, and a Senator of the College of Justice: comprising Pieces written from about 1420 till 1586. With large Notes and a Glossary." The manuscripts were feigned to have been discovered in the Pepysian library at Cambridge.

In 1787 Mr. Pinkerton published, under the feigned name of H. Bennet, M. A., "The Treasury of Wit; being a Methodical Selection of about Twelve Hundred of the Best Apophthegms and Jests; from Books in several Languages;" a compilation pronounced to be much superior to most of the kind. It was accompanied by many just and pertinent observations, in a discourse on wit and humour, considered under the four different heads,—serious wit, comic wit; serious humour, and comic humour. The same year produced, in one volume, his well-known "Dissertation on the Origin and Progress of the Scythians or Goths, being an Introduction to the Ancient and Modern History of Europe;" and though he figured afterwards in many other walks of literature, the prejudices embalmed in that extraordinary production continued to the end to hold almost the undivided possession of his mind. He seriously believed that the Irish, the Scotch Highlanders, and the Welsh, the Bretons, and the Spanish Biscayans, are the only surviving descendants of the original population of Europe; and that in them, "their features, their manners, their history, every philosophic eye may trace the unimproved and unimprovable savage, the Celt. He maintained in every company that he was ready to drop his theory altogether the moment any one could point out to him a single person of intellectual eminence sprung from an unadulterated line of Celtic ancestry. He used to appeal boldly to history; asking what one great man the Celtic races of Wales, Ireland, or Scotland, had yet contributed to the rolls

of fame?" And it must be owned that he had studied family genealogies so indefatigably that it was no easy matter to refute him without preparation. If you mentioned Burke, "What," said he, "a descendant of De Bourg? class that high Norman chivalry with the riff-raff of O's and Macs? Show me a great O, and I am done." He delighted to prove that the Scotch Highlanders had never had but a few great captains—such as Montrose, Dundee, the first duke of Argyle—and these were all Goths: the two first Lowlanders, the last a Norman, a *de Campo bello!* The aversion he had for the Celtic name extended itself to every person and every thing that had any connexion with the Celtic countries.

In 1789 he published a collection of "Ancient Latin Lives of the Scottish Saints," a work which tended to illustrate the early history of his native country. It is now a scarce volume, no more than one hundred copies of it having been printed. This was soon after followed by a new and greatly enlarged edition of his "Essay on Medals," which has become the standard work for information on that interesting and useful subject. In the same fruitful year he published an edition of "The Bruce, or the History of Robert, King of Scotland, written in Scottish verse." In 1790 this writer again put forth some of his numismatic researches, in "The Medallic History of England to the Revolution," and published "An Inquiry into the History of Scotland, preceding the Reign of Malcolm III., or 1056; including the Authentic History of that Period," with some additional observations, containing replies to the various reviews, &c. In 1792 he edited three octavo volumes of "Scottish Poems, reprinted from scarce editions." In 1793 Mr. Pinkerton married Miss Burgess, of Odiham, Hants, sister to the bishop of Salisbury; but the union was not happy, and the parties separated. His next important literary labours were in biography, he contributing the lives to "Iconographia Scotica, or Portraits of Illustrious Persons of Scotland, with Biographical Notes," and to "The Scottish Gallery, or Portraits of Eminent Persons of Scotland, with their Characters." His talents were then directed to geography, and they produced a standard work in this branch of science. "The Modern Geography, Digested on a New Plan," appeared first in two quarto volumes in 1802; a second edition, published in 1807, consists of three; and there is an "Abridgment" in a single octavo. In 1806 Mr. Pinkerton travelled to the French capital, and on his return published his observations, under the title of "Recollections of Paris." Subsequently he was employed in editing "A General Collection of Voyages and Travels," which was extended to nineteen volumes quarto; "A New Modern Atlas," in parts; both which works commenced in 1809. For a short time "The Critical Review," with but little success, was under his superintendence. Mr. Pinkerton's last original work was "Petralogy, or a Treatise on Rocks;" but in 1814, still pursuing his attacks on the Celts, he republished in two octavo volumes his "Inquiry into the History of Scotland," together with his "Dissertation on the Origin and Progress of the Scythians or Goths." Mr. Pinkerton had of late years resided almost entirely in Paris. His appearance was that of a very little and very thin old man, with a small, sharp, yellow face, thickly pitted by the small-pox, and decked with a pair of green spectacles. Mr. Pinkerton was an eccentric, but highly industrious literary

gentleman, and his talents, though in some instances ill directed, were commensurate with undertakings of no ordinary rank in literature. Mr. Pinkerton died on the 10th of March, 1826. We subjoin his autograph.

PINKNEY, WILLIAM, a distinguished American lawyer, who was born at Annapolis, in Maryland, in March 1764. His father was a native of England, and favoured the cause of the mother country during the revolutionary struggle, while his son early avowed a decided attachment to that of his native land. After receiving such an education as the imperfect means of the country could then afford, he commenced the study of medicine; but soon relinquished it, and entered in 1783 into the office of the late judge Chace, then an eminent member of the Maryland bar. In 1786 he was admitted to practice, and soon gave indications of his future distinction. His style of speaking, however, in the outset, was entirely different from its subsequent character, being then calm and placid. In 1788 he was elected a delegate from Harford county to the convention of the state which ratified the constitution of the United States, and likewise a representative to the house of delegates. Soon after taking his seat he made an animated speech upon the report of a committee appointed to consider the laws of Maryland, prohibiting the voluntary emancipation of slaves; and in the ensuing session of 1789 pronounced another and superior discourse on the same subject. In both he breathed sentiments of the purest philanthropy. In the year just mentioned he was married, at Havre de Grace, to the sister of Commodore Rodgers, and in 1790 he was elected a member of congress; but his election was contested on the ground of his not residing in the district for which he was chosen. He made himself a powerful argument in support of his claim; but after obtaining a favourable decision, he declined the honour in consequence of his professional pursuits and the state of his private affairs. In 1792 he was chosen a member of the executive council of Maryland, and continued in that station until November 1795; when, being elected a delegate to the legislature from Anne Arundel county, he resigned his seat at the council board, of which at the time he was president.

During the period in which he attained a distinguished political rank in his state, he was so zealous and indefatigable in professional pursuits that he gradually rose to the head of the bar. His acuteness, dexterity, and ardour in the transaction of business, were combined with great readiness, spirit, and vigour in debate, and with a rich and fluent elocution, adorned with the finest imagery drawn from classical lore and a vivid fancy, the effect of which was increased by the manliness of his figure, a sonorous and flexible voice, and a general animation and gracefulness of delivery. In 1796 he was selected by President Washington as one of the commissioners under the seventh article of Mr. Jay's treaty with Great Britain. He embarked for London with his family in July of the same year, and remained absent until 1804, earnestly engaged in the business of his

mission, and also in attending to the claim of the state of Maryland for a large amount of public property invested in the stock of the bank of England before the revolution, and which had become the subject of a complicated chancery litigation. His successful exertions in the latter affair were suitably acknowledged by the state of Maryland after his return. He recommenced in Baltimore his professional labours with renewed ardour, and with no diminution of legal knowledge, as he had continued his habits of diligent study during his residence abroad, and had derived all the advantage which could be obtained from frequent intercourse with the first lawyers of England and attendance on its courts of justice. He had, besides, employed a portion of his time in supplying the defects of his early education with regard to English and classical literature; and by his application to the subject of elocution and the English language, he had added to his natural facility and fluency a copiousness of elegant diction which graced even his conversation, and imparted new strength and beauty to his forensic style.

In 1805 he was appointed attorney-general of Maryland. In the following year he was again made minister extraordinary to treat with the British government, in conjunction with Mr. Monroe, then minister resident at the British court, upon various subjects of difference between the United States and England. In 1807 Mr. Monroe returned home, and Mr. Pinkney was left in London as minister resident. His exertions to accommodate matters between the two governments terminating fruitlessly, he took his leave of the prince regent, and embarked for the United States in 1811. In September of the same year he was elected a member of the senate of Maryland, and in the succeeding December accepted the office of attorney-general, tendered to him by Mr. Madison. When war was declared between Great Britain and America in 1812, he was chosen to command a volunteer corps raised in Baltimore for local defence, which was attached as a battalion of riflemen to the third brigade of Maryland militia. He was present, and behaved with great gallantry at the unfortunate battle of Bladensburg, where he received a severe wound. After the peace he resigned his command. In 1814 a bill having been brought into the house of representatives, requiring the attorney-general to reside at the seat of government, Mr. Pinkney resigned the office. In 1815 he was chosen a member of congress from Baltimore, and delivered an able speech on the "treaty-making power."

In 1816 he was a third time invested with diplomatic functions, being appointed by Mr. Madison special minister to the court of Naples, to demand from it indemnity for the losses which the merchants had sustained by the seizure and confiscation of their property in 1809, during the reign of Murat; and also minister resident at St. Petersburg. He was induced to accept those appointments by the necessity of recruiting his mind and body, almost worn out by his intense application to professional duties. He first proceeded to Naples, where he had various conferences with the minister of foreign affairs, and addressed him an elaborate note, the answer to which, however, he could not wait for, being obliged by his instructions to repair at once to the Russian capital. He returned home in 1818. In 1820 he took his seat in congress as a senator from Maryland, and made an elaborate and powerful speech against the

clause in the bill for the admission of Missouri into the union, which prohibited the introduction of slaves into the new state. He continued also to prosecute his engagements at the bar with his wonted ardour; and to his professional zeal, indeed, he may be said to have fallen a victim. In the session of the supreme court in 1822, he had exerted himself in the investigation and argument of a cause in which he felt particular interest, at a time when the state of his health unfitted him for application to study and business. A severe attack of indisposition was the consequence; and after a period of acute suffering, during parts of which he was in a state of delirium, he expired on the 25th of February, 1823, in the fifty-eighth year of his age. It was as a lawyer that Mr. Pinkney was pre-eminent. His legal attainments were extensive and profound, and in the investigations connected with the science of jurisprudence, his powers were exerted to the most advantage. His faculty of reasoning upon legal subjects has rarely been equalled. He was, besides, enthusiastically fond of his profession, and no one was ever more ambitious of its triumphs.

PINTURICCHIO, BERNARDINO, an eminent painter, who was the disciple of Pietro Perugino, was born at Perugia in 1454. He painted chiefly in history and grotesque, but he also excelled in portraits. His chief work was the history of Pope Pius II., in ten compartments, in the library at Sienna. Others consider his work in the cathedral of Sospello his best performance. His style was effective, but he made use of too splendid colours, and introduced abundance of gilding. He is said to have died of chagrin at the following circumstance:—Being engaged to paint a Nativity for the monastery of St. Francis, at Sienna, he pertinaciously insisted that every thing should be removed out of the room in which he worked, and obliged the monks to remove a great chest become rotten from age. In the attempt it burst, and discovered a hoard of 500 pieces of gold, to the great joy of the fathers and the mortification of Pinturicchio. His death took place in 1513. He generally assisted to execute compositions of Perugino and Raphael, and received a third of the pay.

PIOMBO, SEBASTIANO DEL, a celebrated painter, who was born at Venice in 1485. His family name was Luciana. Having renounced music, of which he was very fond, for painting, he studied at first under Giovanni Bellini, and afterwards under Giorgione, whose fine colouring he imitated. Sebastiano commenced as a portrait painter, and the reputation which he soon gained in that branch induced Agostino Chigi, a rich merchant of Sienna, to take him to Rome and employ him in ornamenting his house. The delicacy of his pencil was much admired, and Michael Angelo, who seems to have been somewhat jealous of the growing fame of Raphael, encouraged him to enter into competition with that master, and even supplied him with designs, which Piombo often executed very happily, although by no means capable of lofty conceptions or sublime inventions. When Raphael had painted his celebrated Ascension, Sebastiano was induced by Michael Angelo to attempt to surpass it by the Raising of Lazarus, which is considered his greatest work. His Martyrdom of St. Agatha was also ranked among the works of the first masters. His chief merit, however, lay in single figures and portraits. His Pietro Aretino and his Clement VII. were admirable likenesses and

specimens of perfect colouring. He was high in favour with Clement, who created him keeper of the papal seals. From this circumstance he derived his surname *Del Piombo*, the seals attached to the papal bulls being at that time of lead, *piombo*. This post made it necessary for him to assume the clerical habit, and from that time he painted but little. He wrote verses, entertained learned men at his table, and only occasionally painted a portrait. He died in 1547. It also deserves to be mentioned that he invented a peculiar method of painting in oil on walls, in which manner there is a Scourging of Christ to be seen in S. Pietro in Montorio.

**PIOZZI, HESTER.**—This talented lady was born in 1740, at Bodville in Carnarvonshire, and received a good classical education from her father and the learned Dr. Collyer. In her twenty-fourth year she married Mr. Thrale, who was celebrated for his connexion with Dr. Johnson, the latter frequently spending the principal part of the year in the hospitable mansion of his friends. Boswell, in his life of Johnson, says that “the doctor had a very sincere esteem for Mr. Thrale as a man of excellent principles, a good scholar, well skilled in trade, of a sound understanding, and of manners such as presented the character of a plain English squire. As a false notion has prevailed that Mr. Thrale was inferior, and, in some degree, insignificant, compared with Mrs. Thrale, it may be proper to give a true state of the case from the authority of Johnson himself, in his own words:—‘I know no man (said the doctor) who is more master of his wife and family than Thrale; if he but holds up a finger he is obeyed. It is a great mistake to suppose that she is above him in literary attainments; she is more flippant, but he has ten times her learning; he is a regular scholar, but her learning is that of a school-boy in one of the lower forms.’ Perhaps Johnson, who appears to have had a rooted dislike to the assumption of literary talent by a woman, with whatever justice her pretensions might be urged, was a little too severe upon his friend, whose attainments were unquestionably very far beyond those of the ladies of her time. Nothing (continues Boswell) could be more fortunate for Johnson than his connexion with this family. He had at Mr. Thrale’s all the comforts and luxuries of life; his melancholy was diverted, and his irregular habits lessened by association with an agreeable and well-ordered family. He was treated with the utmost cordiality, and even affection. The vivacity of Mrs. Thrale’s literary parties roused him to cheerfulness and exertion, even when they were alone; but this was not often the case, for he found here a constant succession of what gave him the highest enjoyment:—the society of the learned, the witty, and the eminent in every way, who were assembled in numerous companies, called forth his wonderful powers, and gratified him with a degree of admiration to which no man could be insensible.”

Mrs. Piozzi, in her anecdotes of Dr. Johnson, gives the following account of her first interview with that literary Colossus:—“The first time I ever saw this extraordinary person was in the year 1764, when Mr. Murphy, who had been long the friend and confidential intimate of Mr. Thrale, persuaded him to wish for Johnson’s conversation, extolling it in terms which that of no other person could have deserved, till we were only in doubt how to obtain his company, and find an excuse for the invitation. Dr. Johnson liked his new acquaintance so much, however, that from

time to time he dined with us every Thursday through the winter, and in the autumn of the next year went to Brighton, whence we were gone before his arrival, so that he was disappointed and enraged, and wrote us a letter expressive of anger, which we were very desirous to pacify, and to obtain his company again if possible. Mr. Murphy brought him back again to us very kindly, and from that time his visits grew more frequent, till in the year 1766 his health, which he always complained of, grew so exceeding bad that he could not stir out of his room in the court he inhabited for many weeks together—I think months. Mr. Thrale’s attentions and my own now became so acceptable to him that he quitted his close habitation in London and came with us to Streatham, where I undertook the cure of his health, and had the honour and happiness of contributing to its restoration.” It appears that during the interval of Dr. Johnson’s sojourn in Mr. Thrale’s family, many differences arose between him and Mrs. Thrale’s mother. Previous to her death, however, which happened in 1773, the doctor and this lady were perfectly reconciled, and he consented to write an inscription for her tomb a few years afterwards. Whatever petty squabbles might have arisen out of the overbearing and impatient manners of Johnson, it is quite certain that this family contributed, for fifteen years, to the prolongation and comfort of his life; and when the benevolent master of this social circle sank into the grave, the remembrance of his kindness was acknowledged by the living object of his regard, with the confession, that with him were buried many of his hopes and pleasures; that the face upon which he had looked for the last time had never been turned upon him but with respect and benignity; that he obtained from him many opportunities of amusement, and turned to him as a refuge from disappointment and misfortune. The death of Mr. Thrale took place on the 4th of April, 1781. The death of this worthy and hospitable man was a serious loss to Johnson, who, although he could not foresee all that afterwards happened, was sufficiently convinced that the comforts which Mr. Thrale’s family afforded him would now in a great measure cease. “He, however, continued to show a kind attention to his widow and children as long as it was acceptable; and he took upon him with a very earnest concern the office of one of the executors, the importance of which seemed greater than was usual to him, from his circumstances having been always such that he had scarcely any share in the real business of life. His friends were in hopes that Mr. Thrale might have made a liberal provision for him for life, but he bequeathed him only two hundred pounds, which was the legacy left to each of his two executors.” The death of Mr. Thrale, who was wont, when occasion required, to overrule by some gentle observation the domineering and tyrannical spirit which Dr. Johnson evinced in conversation, left him, as it were, virtual monarch of the fireside; and the consequence was, that he began to exercise his unlimited power of insulting Mrs. Thrale’s friends to so annoying an extent that it was extremely difficult for her to find any body with whom he could converse, without living always on the verge of a quarrel, or of something too like a quarrel to be at all agreeable. Several instances of his severity towards her friends have been detailed by her, and admitted by Boswell, which must have rendered his society rather a nuisance than an acquisition. “Mr. Thrale,” says Mrs.

Piozzi, in her anecdotes, "had a very powerful influence over the doctor, and could make him suppress many rough answers; he could likewise prevail on him to change his shirt, his coat, or his plate, before it became indispensably necessary to the comfortable feelings of his friends. But as I never had any ascendancy over Dr. Johnson, except just in the things which concerned his health, it grew extremely perplexing and difficult to live in the house with him when the master of it was no more; the worse, indeed, because his dislikes grew capricious; and he could scarce bear to have any body come to the house whom it was absolutely necessary for me to see. Two gentlemen I perfectly well remember dining with us at Streatham in the summer of 1782, when Elliot's brave defence of Gibraltar was a subject of common discourse: one of these persons, naturally enough, began talking about red-hot balls thrown with surprising effect; which Dr. Johnson having listened to, 'I would advise you, sir (said he with a cold sneer), never to relate this story again; you can scarce imagine how very poor a figure you make in the telling of it!' Our guest being bred a quaker, and a man of extremely gentle disposition, needed no more reproofs for the same offence; or if he did speak again, it was in a low tone of voice to the friend who came with him. The check was given after dinner, and before coffee. When in the evening, however, our companions were returned to town, and Dr. Johnson and I were alone, he observed, 'I did not quarrel with those fellows.' 'You did perfectly right,' said I, 'for they gave you no cause of offence.' 'No offence!' (returned he, with an altered voice), 'and is it nothing to sit whispering together when I am present, without even directing their discourse towards me, or offering me a share in the conversation?'"

Nor were these disagreeables of unfrequent occurrence: to release herself from them altogether without positively offending the doctor, Mrs. Thrale took advantage of an unsuccessful lawsuit, and pleaded her pecuniary inability to remain longer in London or its vicinity. "I had been crossed in my intention of going abroad," says this lady in her anecdotes, "and found it convenient for every reason, of health, peace, and pecuniary circumstances, to retire to Bath, where I knew Dr. Johnson would not follow me, and where I could for that reason command some little portion of time for my own use,—a thing impossible while I remained at Streatham or at London, as my horses, carriage, and servants, had long been at his command, who would not ride in the morning till twelve o'clock, perhaps, and oblige me to make breakfast for him, till the bell rung for dinner, though much displeased if the toilet was neglected; and though much of the time we passed together was employed in blaming or deriding, very justly, my neglect of economy, and waste of that money which might make many families happy. The original reason of our connexion, his particularly disordered health and spirits, had long been at an end, and he had no other ailments than old age and general infirmity of body. Veneration for his virtue, reverence for his talents, delight in his conversation, and habitual endurance of a yoke my husband first put upon me, and of which he contentedly bore his share for sixteen years, made me go on so long with Dr. Johnson; but the perpetual confinement I will own to have been terrifying in the first years of our friendship, and irksome in the last; nor would I pretend to support it without

help when my coadjutor was no more. To the assistance we gave him, the shelter our house afforded to his uneasy fancies, and to the pains which we took to soothe or repress them, the world, perhaps, is indebted for the three political tracts, the new edition and corrections of his dictionary, and for the poets' lives, which he would scarce have lived, I think, and kept his faculties entire to have written, had not incessant care been exerted at the time of his first coming to be our guest in the country; and several times after that, when he found himself particularly oppressed with diseases incident to the most vivid and fervent imaginations. I shall for ever consider it as the greatest honour which could be conferred on any one, to have been the confidential friend of Dr. Johnson's health, and to have in some measure, with Mr. Thrale's assistance, saved from distress at least, if not from worse, a mind greatly beyond the comprehension of common mortals, and good beyond all hope of imitation from perishable beings."

This statement, apparently candid and free from the invidiousness imputed by Boswell to Mrs. Thrale, was in all probability perfectly warranted by the behaviour of Dr. Johnson, whose repulsive manners are described as being endured with far less forbearance by the wife of his biographer.

"The death of Mr. Thrale," says Boswell, "made a very material alteration with respect to Johnson's reception in that family. The manly authority of the husband no longer curbed the lively exuberance of the lady; and as her vanity had been fully gratified by having the Colossus of literature attached to her for many years, she gradually became less assiduous to please him." There is great want of generosity in these insinuations. The yoke imposed upon Mrs. Thrale, from the earliest stage of her connexion with Dr. Johnson, appears to have been by no means voluntary; and although her respect for him induced her, through a long series of years, to the great inconvenience of herself and family, to retain him as an inmate in her house, humour his caprices, and contribute to his comfort by the most minute and even affectionate attentions, there could be no satisfactory reason why, when duty to her husband no longer required the sacrifice, she should for his sake quarrel with the whole circle of her acquaintance, and subject herself to his peevish and unqualified animadversions upon her conduct, simply because his genius commanded her admiration, and the moral points of his character obtained her respect. It is impossible to blame her with any degree of justice for desiring to get rid of so troublesome a tax upon her time and attention.

She seems to have formed a proper estimate of his good qualities; but there was no tie between them which could warrant the expectation that she was to sacrifice her comfort and happiness exclusively to his convenience. Desirous, however, of retaining his good opinion, she bore her thralldom without open complaint, and waited patiently until an opportunity presented itself for her to obtain her release, without paining the feelings of Dr. Johnson; and her continued correspondence with him, so long as her letters appeared to give him any pleasure, is a proof that she was actuated by no unkind sentiments towards him. Epistolary intercourse of a very cordial description was kept alive between Mrs. Thrale and the doctor until her second marriage, with Signior Piozzi, a native of Florence, and a music-master of

the city of Bath, when an expostulation on the part of Johnson, implying his disapprobation of this step, seems altogether to have dissolved their friendship.

On the 6th September, 1784, Mrs. Piozzi set out with her husband on a continental tour through France, Italy, and Germany; and passing through Calais, Boulogne, Montrieu, Amiens, Chantilly, &c., arrived at Paris, where they remained, however, but a short time. After having inspected the principal objects of curiosity in the French capital, Mr. and Mrs. Piozzi proceeded to Lyons, Turin, Mont Cenis, Novalesa, Monte Cavallo, Novi, Genoa, Pavia, and Milan, where they took up their winter quarters. From this place they passed on to Venice, by way of Padua, Mantua, Verona, &c. From thence, on the 21st of May, 1781, they returned up the Brenta in a barge to Padua. They next visited Ferrara, the city celebrated for the confinement of Tasso, in the hospital for lunatics there; and subsequently Bologna and Florence, where they took up their abode for some time on the banks of the Arno. During her stay here Mrs. Piozzi formed an acquaintance with several English persons of both sexes; and among others, Messrs. Merry, Parsons, and Greathead, of Della Cruscan notoriety; in conjunction with whom she printed a volume of miscellaneous prose and verse, entitled "*The Florence Miscellany*," of which a few impressions only were struck off, as presents to the poetical friends of the authors.

On September 12th, 1785, Mrs. Piozzi and her husband left Florence and its attractions, and visited Lucca, Pisa, Leghorn, and afterwards Rome, where they remained long enough to investigate all the sublime antiquities of that queen of cities.

Their next place of resort was Naples, where they descended to view the subterranean cities of Herculaneum, Pompeii, and Portici, having first inspected all that was worthy of their notice above ground. They then returned to Rome, and soon after came back to England. Shortly after her return she published an account of her travels in two volumes, and about ten years after this publication Mrs. Piozzi put forth a work entitled "*British Synonymy, or an Attempt at regulating the Choice of Words in Familiar Conversation*," in two octavo volumes, of which Mr. Gifford in his "*Baviad and Mæviad*," spoke with unjust severity. "To execute such a work," says he, "with any tolerable degree of success, required a rare combination of talents; among the least of which may be numbered, neatness of style, acuteness of perception, and a more than common accuracy of discrimination; and Mrs. Piozzi brought to the task a jargon long since become proverbial for its vulgarity, an utter incapability of defining a single term in the language, and just as much Latin as sufficed to expose the ignorance she so anxiously labours to conceal."

The earliest regular exploit of Mrs. Piozzi in authorship, however, was her crown octavo volume of "*Anecdotes of Dr. Johnson*." These were published in 1786. Two years afterwards she gave to the world a collection of letters to and from our great moralist. The letters had been written between the years 1765 and 1784. Her anecdotes, from her intimate knowledge of the individual whose character they were intended to illustrate, could not fail of being interesting and valuable.

This lady passed the last fifteen years of her life at Clifton, near Bath, and died after a short illness on

the 2nd of May, 1821. As a specimen of her style as a poetess we give the following lines:—

"Thy mansion splendid, and thy service—plate;  
Thy coffers filled with gold; well! what of that?  
Thy spouse the envy of all other men;  
Thy children beautiful and rich: what then?  
Vigorous thy youth, unmortgaged thy estate;  
Of arts—the applauded teacher; what of that?  
Troops of acquaintance, and of slaves a train;  
The world's prosperity complete; what then?  
Prince, Pope, or Emperor's thy smiling fate,  
With a long life's enjoyment; what of that?  
By Fortune's wheel toss'd high beyond our ken,  
Too soon shall following time cry—Well, what then?  
Virtue alone remains, on virtue wait,  
All else I sweep away—but what of that?  
Trust God, and time defy—Immortal is your date."

PIRANESI, JOHN BAPTIST, a celebrated architect, engraver, and antiquary, who was born at Venice in 1720. He studied under the brothers Valemani, who were painters possessed of high reputation in Rome. After three years' residence in that city, his father wished him to return to Venice, and on his expressing a disinclination to do so, threatened to withdraw the small allowance he made him of six Spanish piasters per month. Piranesi answered that Rome was the home of his affections, that he could not exist but among the monuments of her magnificence, and that, rather than give up his residence there, he would prefer to give up the allowance. The father very shortly after carried his threat into effect, and a complete estrangement took place between Piranesi and his relations. In the mean time Piranesi exerted himself to the utmost to compensate himself for the withdrawal of his father's favour, and in 1741 published his first work on the triumphal arches, bridges, inscriptions, temples, amphitheatres, and other monuments of Greek and Roman architecture, which he dedicated to Bottasi, a celebrated antiquary. The work was favourably received by the public; it was the first attempt to treat architecture in engraving with skill and taste, and the strangers in Rome, especially the English, with alacrity hastened to procure the engravings. Notwithstanding this, however, he had great difficulty, with the utmost economy, to find the means of subsisting for many years, and purchase the materials necessary for the prosecution of his favourite studies. Some little assistance, however, he found about this time in the fortune which he obtained with his wife. To his friends he mentioned his intention of marrying, because it would enable him to procure the means of beginning his work on Roman antiquities; and the whole history of his courtship, as it appears to have been given in an account by himself, must be considered equally characteristic and amusing.

At the very first interview he asked her hand in marriage; and though his ardour frightened her at first, he contrived to obtain the consent of all parties to the celebration of their nuptials within five days afterwards. After the ceremony, he placed beside her dowry his finished plates and his unfinished designs, observing their whole fortune was before her, but that in three years her portion should be doubled. He continued his labours, and kept his word. They went to reside in the house afterwards occupied by the celebrated Thorwaldsen, and seem to have lived on the whole happily, though his notions of the rights of a husband and father, founded on those of the *pater-familias* of the Romans, were no doubt carried to the extreme.

Every year now witnessed an immense addition to

his labours. Remarkable for his ability as an engraver, for which he is principally entitled for his eminence in the history of the arts, he was as singular in his mode of execution as for the originality and boldness of his designs. He is said to have generally drawn his design upon the plate itself without any or the slightest preparation, completing it for the most part upon the spot, and performing the whole of the operation by the agency of the aquafortis alone, with but very immaterial assistance from the engraver's tool; and it is said to have been a favourite plan with him, having previously selected the particular object of study so as to have his mind well imbued with the minutiae of the buildings, to complete his designs of the vast architectural piles at the period of the full moon, and effect those bold and masterly productions which have so deservedly obtained the admiration of the world. In the course of about forty years, the period of his professional life, he published nearly 2000 plates, each of inimitable excellence, and both in number and magnitude superior to what has been left us by any other artist.

Among his many splendid works we may mention his "*Antichità Romane*," or Roman Antiquities, comprised in 218 plates of atlas paper, commencing by a topographical view of ancient Rome, made out from the fragments of a most curious antique plan of that city, found in the pavement of the temple of Romulus, and now preserved in the museum at the capitol. These, with the descriptions in Italian, were published in four volumes folio. "*Fasti consulares triumphalesque Romanorum, ab urbe condita, usque ad Tiberium Cæsarem*," "*Del Castello dell' acqua Giulia, e della maniera in cui anticamente si concedevano e distribuivano le acque*," "*Antichità d' Albano, e di Castel Gandolfo*," "*Campus Martius Antiquæ Urbis*," with descriptions in Italian and Latin plates, "*Archi trionfali antichi, Templi, ed Anfiteatri, esistenti in Roma, ed in altre parti d' Italia*," "*Trofei d' Ottaviano Augusto*," "*Della Magnificenza ed Architettura de' Romani*." This great work appears to have been occasioned, in great measure, by some dialogues published in 1755, entitled "*The Investigator*." These, containing many calumnies against the ancient Romans, had been interpreted to Piranesi, and inflamed his ardent spirit to this mode of vindication. "*Architettura diverse*," "*Carceri d' invention*," plates full of the most wild but picturesque conceptions, executed in the most splendid style of art. The exact time of his death is not known, but it is believed to have taken place in the year 1780.

PIRON, ALEXIS, a French dramatist, who was born in 1689, and educated at Dijon, which was his native city. He was intended for the profession of the law, but owing to a reverse of fortune which his friends experienced he was obliged to accept the post of clerk to a financier, whom he quitted to go to Paris, where he was employed as a copyist, with a salary of forty sous a day. This irksome situation he soon relinquished, and it was with difficulty that he obtained the payment of his salary. He was next engaged to write for the theatre of the Comic Opera, and his first piece was "*Arléquin Deucalion*," composed in two days. His success induced him to persevere, and after writing several pieces, he produced in 1738 his *chef-d'œuvre*, "*Métromanie*," a comedy, which Laharpe characterizes as excelling in plot, style, humour, and vivacity almost every other composition of the kind; Piron afterwards wrote "*Fernand Cor-*

*tes*," a tragic drama, and some other pieces acted at the theatre De la Foire. In the latter part of his life he made repeated attempts to gain admission into the French academy; but the satirical effusions in which he had indulged himself made him so many enemies among the academicians that he was finally rejected. He revenged himself for his disappointment by calling the academy *Les invalides du bel esprit*, and composed the humorous epitaph.

"Ci-gît Piron, qui ne fut rien,  
Pas même académicien."

The king however, at the solicitation of Montesquieu, gave Piron a pension of 1000 livres. His death took place in 1773. His *bon mots* were collected and published in one volume, and his "*Poésies Diverses*" were printed at Neufchatel.

PISISTRATUS, an Athenian citizen, who usurped the sovereignty of his country. He was of noble descent, which he himself derived from Codrus, the last king of Athens, and inherited from his father, Hippocrates, a large fortune. He received from nature those qualifications which give influence to an individual—facility of speech and uncommon vigour of understanding. To these he had added all the learning of his time. On entering public life he lent his eloquence to the plans of Solon, his maternal relation, for exciting the Athenians to recover Salamis, and accompanied the lawgiver in the successful enterprise against that island. By nature ambitious, he pursued the policy which has so often succeeded in democracies: he gained over the lower class of the citizens by his affability and unbounded liberality. He relieved their burdens, laid open his gardens for their use, provided for the sick, and caused the dead to be buried. In all his harangues he was the advocate of civil equality and a democratic constitution. Solon saw through his policy, and expressed his apprehensions of the result. They were but too soon verified. One day Pisistratus appeared in the marketplace with several slight wounds which he had inflicted on himself, and called upon his fellow-citizens to defend him against certain alleged enemies, who had, as he said, attacked his life on account of his adherence to the democracy.

An assembly of the people was immediately summoned, in which one of his friends proposed that a guard should be given him for the security of his person. This proposal was approved, notwithstanding the opposition of Solon. A body-guard, by the aid of which he possessed himself of the citadel of Athens, was given him. He disarmed the multitude, and was now the master of the city, while Solon departed from his enslaved country. But, though Pisistratus by the manner in which he obtained his power, drew upon himself the reproach of tyranny, his use of power was by no means tyrannical; for no lawful prince ever showed more moderation or more regard for the welfare of the people. He made no attempt to abolish the wise laws of Solon, but confirmed and extended their authority. He always showed the greatest respect for the lawgiver, but his endeavours to induce him to return to Athens were ineffectual. The sovereignty of Pisistratus was not, however, secure. Megacles, who was the head of an hostile party, left Athens with his family, and entered into a correspondence with a third party, for the purpose of overthrowing the power of Pisistratus. Their project succeeded, and Pisistratus was compelled to leave the

city. But Megacles soon became dissatisfied with the party to which he had united himself, and offered to reinstate Pisistratus if he would marry his daughter. This proposition he immediately accepted. His return was effected by a stratagem which gives a striking proof of the credulity of the people. A female of majestic stature was arrayed in the armour of Minerva, and it was proclaimed that the goddess herself had brought back Pisistratus. He entered the city with her in a solemn procession, seated in a magnificent car, and was again established without opposition. This fact is related by Herodotus, who calls it ridiculous. Pisistratus married, as he had promised, the daughter of Megacles, but did not live with her as his wife, as he had already a family. To revenge this insult, Megacles again formed a hostile party, which appeared so formidable to Pisistratus that he retired voluntarily to Eretria.

Here he occupied himself with the education of his sons, and took measures to recover his power. In the eleventh year of his second banishment he entered Attica at the head of an army. Many Athenians, who were dissatisfied with the democracy and remembered his early benefits, joined him. After having surprised and dispersed the troops sent against him, he entered the city and made himself master, for the third time, of the sovereignty without bloodshed. Pisistratus continued to rule with his former mildness; but in order to weaken the popular party, he adopted a measure which was very useful to the state. He forced many of the idle inhabitants to leave the city and cultivate the country around, which by these means was covered with corn-fields and olive plantations. He exacted from every one the tenth part of his income and earnings, and thus increased the revenue of the state, which he expended in splendid public buildings. He also endeavoured to advance the intellectual cultivation of the Athenians. He established a public library, and collected and arranged the poems of Homer. As he well knew how tyranny was hated, he carefully concealed his power under the exterior of a private citizen. He submitted, like others, to the sentence of the Areopagus, before which he was accused of murder, and conducted himself with as much prudence as clemency. In this way Pisistratus exercised the sovereignty, not as the oppressor but the father of his country, which scarcely ever enjoyed a longer term of peace and prosperity. He died 527 B. C., leaving two sons, Hippias and Hipparchus, to inherit his power, who were not, however, able to preserve it.

PISO, a surname common to many Romans of the Calpurnian family. Lucius Calpurnius Piso, when consul, subdued the seditious slaves in Sicily, and proposed the law *de repetundis*, concerning restitution in case of extortion, in order to put limits to the avarice of the magistrates in the administration of the provinces. He distinguished himself as prætor in Sicily (where the purchase of provisions had been committed to him during a scarcity of corn at Rome) by a rare disinterestedness, so that he received the honourable appellation of *Frugi*, the honest. Another Piso afterward filled the office of consul with Gabinius in Cicero's time, and showed himself particularly hostile to that great man, who, in a speech which still remains to us, spoke violently against him. Still later lived the Piso who, under Tiberius, was prefect of Syria, and distinguished himself for his pride, as well as for his odious conduct towards the noble Ger-

manicus, the adopted son of Tiberius, whom he is said to have taken off by poison.

PITS, JOHN, an English biographer, who was born at Alton in Hampshire, about 1560, and educated at Oxford, after which he travelled for some years on the continent, and died in 1616. He was the author of several works, the principal of which is entitled, "*Relationum Historicarum de Rebus Anglicis, seu de Academiis et Illustribus Angliæ Scriptoribus.*"

PITT, CHRISTOPHER, a celebrated English poet, who was born at Blandford in 1699, and in 1714 was sent to Winchester school, after which he removed to New college, Oxford. Having entered holy orders, he was presented to the rectory of Pimperm in Dorsetshire, where he passed the greater part of his life in the performance of his clerical duties and the pursuits of elegant literature. The work by which he is best known is his translation of Vida's "*Art of Poetry*," which Tristram's splendid edition had then made popular. In this translation he distinguished himself both by its general elegance, and by the skilful adaptation of his numbers to the images expressed, a beauty which Vida has with great ardour enforced and exemplified. His general benevolence procured him general respect, and he passed a life placid and honourable, neither too great for the kindness of the low, nor too low for the notice of the great. The success of his Vida animated him to a higher undertaking; and in his thirtieth year he published "*A Version of the First Book of the Æneid*," and he some time afterwards added three or four more, with an advertisement, in which he represents himself as translating with great indifference, and with a progress of which himself was hardly conscious. Soon after he published "*A Complete English Æneid*."

Pitt, engaging as a rival with Dryden, naturally observed his failures, and avoided them; and as he wrote after Pope's Iliad, he had an example of an exact, equable, and splendid versification. With these advantages, seconded by great diligence, he might successfully labour particular passages, and escape many errors. "If the two versions are compared," says Dr Johnson, "perhaps the result would be, that Dryden leads the reader forward by his general vigour, and Pitt often stops to contemplate the excellence of a single couplet; that Dryden's faults are forgotten in the hurry of delight, and that Pitt's beauties are neglected in the languor of a cold and listless perusal; that Pitt pleases the critics, and Dryden the people; that Pitt is quoted, and Dryden read." He did not long enjoy the reputation which this great work deservedly conferred, for he died in 1748, and was buried at Blandford.

PITT, WILLIAM.—This distinguished statesman was born on the 28th of May, 1759. His father, the celebrated earl of Chatham, bestowed the greatest care on his education, and in his twenty-second year he entered the arena of politics as a member of the house of commons. Soon after he commenced his political career we find his attention directed to a reform in parliament. He observed that there existed in many parts of the kingdom an arrangement of election franchise totally disproportionate both to the number and property of their locality. This inequality was founded neither on alleged merits nor property on the part of the electors. In a considerable number of boroughs there was not only a paucity of voters, but the few that enjoyed franchises were in

such a state as to render them in a great measure dependent on individuals. As there were evidently very great abuses in the administration of affairs, and as parliament appeared in many instances to have sanctioned measures detrimental to the country, it was natural to impute the conduct of part of the majorities to the corrupt influence of the crown and the efficacy of ministerial seduction. To remove the supposed source of evil, many patriotic men projected a reform in parliament. Lord Chatham had been favourable to an alteration in this department of the constitution: his son formed the same general opinion. He therefore resolved to propose some plan for meliorating the representation. Aware, however, of the delicate ground on which he trod, he proceeded very cautiously. Intending to investigate facts before he drew a conclusion or constructed schemes, he confined himself to a motion that a committee should be appointed to enquire into the state of the representation in parliament and to report their sentiments to the house. This was, however, negatived.

We find at this period that Lord Shelburne, though a man of considerable political knowledge, and particularly distinguished for an intimate acquaintance with foreign affairs, yet found from the great talents of his opponents, who were ranked under Lord North in one division, and under Mr. Fox in another, that without some accession of political strength he should be incapable of retaining his situation. Despairing of a re-union with those from whom he had so lately separated, he made overtures to the party which he had uniformly opposed. Mr. Pitt, who now accepted office under government, candidly bestowed a just tribute of praise on Lord North, but declared his determination never to be a member of a ministry in which that statesman should bear a part. Various reports were now spread concerning the intention of both the respective parties and individual members; all eyes were turned to the approaching meeting of parliament. Parliament having met on the 9th of July, 1783, for the first time after the change, Mr. Fox undertook to explain the motive of his late resignation. It had (he said) been understood by Lord Rockingham's friends that Lord Shelburne had, on coming into office, acceded to their measures; that he had sacrificed his own opinion respecting the independence of America to the sentiments of his colleagues; but Mr. Fox found that totally different principles were adopted, which he would not then detail, and thought it his duty to resign. He pledged himself, when circumstances would admit of a particular statement of his reasons, to prove that they were well founded. Mr. Pitt arraigned the conduct of the late secretary of state in the severest terms. It was evident, he said, from the whole tenour of the right honourable gentleman's speeches, that he was more at variance with men than with their measures. He denied that he had adduced any public ground on which his resignation was justifiable. He deprecated the fatal consequences of dissension. He conjured the people to give the ministers their confidence till they had shown that they did not deserve it; and he pledged himself in the most solemn manner, that whenever he saw things going wrong he would first endeavour to set them right; but, failing in that effort, he should be the first to relinquish his present political connexions. In consequence of the censure passed on the peace by the resolutions of the house of commons on the 21st of February, 1783, Lord Shel-

burne quitted his office of first commissioner of the treasury, and the chancellor of the exchequer declared publicly in the house, that he only held his place till a successor should be appointed to fill it. A ministerial interregnum ensued, which lasted till the beginning of April. Mr. Pitt then acquainted the house that he had resigned his office of chancellor of his majesty's exchequer. On the 2nd of April a new administration was announced, of which the following persons formed the cabinet: the duke of Portland, Lord North, Mr. Fox, Lord J. Cavendish, Lord Kettel, Lord Stormont, and the earl of Carlisle.

On the 7th of May Mr. Pitt made a motion respecting the reform of parliamentary representation; the mode intended the previous year of examining the subject by a committee was accounted too general, he therefore designed to bring forward specific propositions. The object of the first was to prevent bribery at elections, the second proposed to disfranchise a borough which should be convicted of corruption; but that the minority of votes should be recompensed; his third proposition was, that an augmentation of the knights of shires, and representatives of the metropolis, should be added to the state of the representation. He left the number for future discussion, but said he should recommend one hundred. The arguments both for and against a parliamentary reform were nearly the same as in the preceding session, but the supporters constituted a smaller proportion; the majority against the reform were 293 to 149. It was in this session that the consideration of India affairs first afforded Mr. Dundas an opportunity of completely exhibiting his powers and habits. During the administration of Lord North his abilities were but imperfectly known, because occasion had admitted of only partial exertion. He was distinguished as a clear, direct, and forcible reasoner, but he had not yet shown his abilities as a statesman. In the Indian enquiry he manifested the most patient, constant, and active industry to investigate; penetrating acuteness to discover the nature and situation of affairs, enlarged views to comprehend their tendency, and fertile energetic invention to devise regulations both for correction and improvement.

Parliament assembled on the 11th of November, and soon afforded an opportunity of considering the views of administration. His majesty's speech was short, but extremely comprehensive; it noticed the treaties of peace, the state of the East India affairs, the means of recruiting the national strength, afforded by the peace, and the revenue at large. The primary importance of these objects was undeniable, and an address, consonant to the speech, was unanimously passed in both houses. Mr. Pitt expressed his high approbation of the ends proposed by government, though he made some animadversions on the tardiness of ministers in not having been further advanced with measures for the accomplishment of such momentous purposes. On all these grand subjects he counselled them to bring forward great, efficient, and permanent systems, as he highly applauded the ends which they professed to seek; he trusted the means which they would devise would be equally meritorious, in which case they should have his warmest support. Mr. Fox, impressed with the very highest idea of Mr. Pitt's talents, declared nothing could afford him more satisfaction as a minister, or proud exultation as a man, than to be honoured with the praise and support of Mr. Pitt.

On the 18th of November Mr. Fox moved for leave to bring in his East India Bill. Its objects were to vest the whole affairs of the company in commissioners to be appointed by parliament. The first most strenuous and powerful opposer of the bill was Mr. Pitt. The reasons which he urged against it were reducible to two heads. The proposed scheme, he said, "annihilated chartered rights, and created a new and immense body of influence unknown to the British constitution. He admitted that India wanted reform, but not such a reform as broke through every principle of equity and justice. The bill proposed to disfranchise the members and confiscate the property of the East India Company; it required directors and trustees, chosen by proprietors, on the behalf of those constituents, and, under their control, to surrender all lands, tenements, houses, books, records, charters, instruments, vessels, goods, money, and sureties, to persons over whom the owners were to possess no power of interference in the disposal of their own property. On what principle of law or justice could such a confiscation be defended? The rights of the company were conveyed in a charter, expressed in the clearest and strongest terms that could be conceived. It was clearer, stronger, and better guarded, in point of expression, than the charter of the bank of England; the right by which our gracious sovereign held the sceptre of these kingdoms was not more fully confirmed, nor further removed from the possibility of all plausible question. The principle of this bill once established, what security had the other public companies of the kingdom? What security had the bank of England? What security had the national creditors, or the public corporations? or indeed, what assurance could we have for the great charter itself—the foundation of all our privileges, and all our liberties? The power, indeed, was pretended to be created in trust, for the benefit of the proprietors. No! but to a majority of either house of parliament, which the most drivelling minister could not fail to secure with the patronage of about two millions sterling, given by this bill. But the proposition was still more objectionable in another way; it was calculated to increase the influence of the minister to an enormous and alarming degree. Seven commissioners, chosen ostensibly by parliament, but really by administration, were to involve in the vortex of their authority the whole treasure of India. These, poured forth like an irresistible torrent upon this country, would sweep away our liberties and all we could call our own." The combined force of philosophy, eloquence, and poetry, was employed by Mr. Burke, in supporting this grand project of his friend, and it was on this occasion that he made his celebrated speech on the extent and bounds of chartered rights. The fate of the bill is well known—it passed the commons, but was rejected by the lords.

On the 18th of December, at twelve at night, his majesty sent a message to the two secretaries of state, intimating that he had no farther occasion for their services, and directing that the seals of offices should be delivered to him by the under-secretaries, as a personal interview would be disagreeable. Early the next morning letters of dismissal, signed Temple, were sent to the other members of the cabinet. Immediately the places of first lord of the treasury and chancellor of the exchequer were conferred on Mr. Pitt—thus terminated the coalition administration,

owing its downfall to Mr. Fox's East India bill. By the dismissal of ministers the country found itself in a new situation; about to be governed by an administration which a very powerful majority in the house of commons thwarted. The new prime minister was a young man, in the twenty-fifth year of his age, supported by no family influence nor political confederacy; meanwhile addresses were pouring in from all quarters to the sovereign, to testify the highest satisfaction at the dismissal of the old and the appointment of the new administration.

On the 12th of January, 1784, in the midst of the measures taken by opposition to prevent a dissolution of parliament, Mr. Pitt, being pressed to give the house some satisfactory assurance that it would not take place, refused, declaring that "he would never compromise the royal prerogative, nor bargain it away in the house of commons." Two days later Mr. Pitt moved for leave to bring in his East India bill, which was, however, rejected by a majority of 222 to 214. While this bill was pending the proposition that a minister ought not to continue in office without the support of the commons was carried in that house by 205 against 184; but in the house of peers Lord Thurlow insisted that this was a peremptory order which the house of commons had no right to issue in contravention of the law of the land; for that nothing short of an act of parliament, formally passed by the three states, had the power of suspending any part of the statute or common law of England.

Mr. Pitt, on the 18th of February, informed the house that the king had not, in compliance with the resolution of the commons, dismissed his ministers, and that the ministers had not resigned. Impartial men had desired a coalition which should comprehend the chief talents of both sides: with this view a considerable number of independent gentlemen met at the St. Alban's Tavern, on the 26th of January, and drew up an address, recommending an union of parties. This being signed by fifty-three members of the house of commons, was presented by a committee to the duke of Portland and to Mr. Pitt. The duke of Portland answered, he should be happy in obeying the commands of so respectable a meeting, but that the greatest difficulty to him was Mr. Pitt's continuance in office. Mr. Pitt also expressed his readiness to pay attention to the wishes of the meeting, and co-operate with their intentions to form a stronger and more extended administration, if it could be done consistently with principle and honour. In the further progress of the discussion the duke of Portland proposed, as a preliminary step, that Mr. Pitt should resign, in compliance with the resolution of the house of commons. Mr. Pitt declared that it was inconsistent with his principles and sentiments to resign his ministerial capacity in the present circumstances. The duke of Portland offered the same preliminary repeatedly, in different forms; but Mr. Pitt still held it inadmissible, and the duke of Portland continued to insist on it as an indispensable step; the negotiation therefore was suspended. Mr. Fox and Mr. Pitt expressed their sentiments to the house, both appearing impressed with a sense of the benefits that might accrue from an united administration, but neither would relinquish their respective principles. Mr. Fox insisted that it was unconstitutional in Mr. Pitt to hold his place after such a vote of the house of commons; that therefore he must resign. Mr. Pitt

insisted that it was not unconstitutional, and would not consent to resign—resignation would be the virtual admission of a control in the house of commons which he denied them to possess. The reciprocal communications between the duke of Portland and Mr. Pitt were continued, and his majesty even sent a message to the duke, desiring that he and Mr. Pitt should have an interview for the sake of forming a new administration; this step, however, failed to produce the desired effect.

The address for the removal of ministry was presented to the king on the 25th of February, but every attempt to induce the sovereign to sacrifice his choice of servants highly approved of by his people, to the mere will of the coalition party, unsupported by any constitutional reasoning, was unavailing. On the 9th of March they appeared to have considered themselves as vanquished. Thus terminated a contest between a powerful confederacy in the house of commons and the executive government, supported by the confidence which the nation reposed in the talents and character of the principal minister. A man less powerful in reasoning would have yielded to allegations so confidently urged, to sophistry so plausibly supported, or even to the very authority of such illustrious names. A minister, however, endowed with intellectual superiority, unless also resolutely firm, would have rather conceded what he knew to be right than maintain a contest with so numerous, forcible, and well-disciplined a host, though he knew them to be wrong.

On the 24th of March, 1784, parliament was prorogued, and the next evening it was dissolved by proclamation. In the new parliament a very considerable number of members friendly to Mr. Pitt was returned, more than 160 of the former having lost their seats. As far as popular opinion can be a test, it was decidedly in favour of him and against his opponents. The first ministerial efforts of Mr. Pitt were directed to finance. On the 2nd of June he brought in a bill for the more effectual prevention of smuggling; this passed. The commutation act was his next measure. It had appeared before the committee on smuggling, that only 5,500,000 pounds of tea were sold annually by the East India company, whereas the annual consumption of the kingdom was believed to exceed 12,000,000; so that the contraband traffic in this article was more than double the legal. The remedy which the minister devised for this evil was to lower the duties on tea to so small an amount as to make the trade wholly unprofitable, and consequently not worth the pursuit. The rate of freight and insurance to the shore was about twenty-five per cent., and the insurance on the inland carriage about ten per cent. more, in all thirty-five per cent. The duty on tea, as it then stood, was about fifty per cent. so that the smuggler had an advantage over the fair dealer of fifteen per cent. As this regulation would cause a deficiency in the revenue of about 600,000*l.* per annum, he proposed to make it good by an additional window tax. This tax he said would not be felt as an additional burden, but ought to be considered as a commutation, and would prove favourable to the subject. But the principal benefit which he expected from this measure was the absolute ruin of the smuggling trade, which subsisted almost entirely on the profit of teas. Another benefit would be the timely and necessary relief it would afford to the East India Company. By this regulation they would

find a vent for 13,000,000 instead of 5,000,000 pounds of tea, and would be enabled to employ twenty more large ships in their service. This bill passed by a majority of 148 to 40.

Mr. Pitt now found himself necessarily engaged in the laborious business of winding up the accounts of the war, and he was compelled by the burden of floating debt, and the general state of the national finances, to negotiate a loan, though in time of peace; but as this measure was unavoidable, in order to make the terms as favourable as possible, instead of granting enormous profits to private or political favourites, he disposed of it to the best bidders. The principle of impost with which he set out was to bear as lightly as possible on the poorer classes. On the 2nd day of August, 1784, the session was ended, by a speech from the throne, in which his majesty expressed his warmest thanks for the eminent proofs exhibited by parliament of zealous and diligent attention to the public service. Parliament met on the 26th of January, 1785, and Mr. Pitt again introduced his plan for a reform. Desirous, as the minister professed himself, of such a change in the representation as he conceived most consistent with the principles, and conducive to the objects of the constitution, he was aware of the danger of essays of reform unless very nicely modified and circumscribed. The leading principle was that the choice of legislators should follow such circumstances as give an interest in their acts, and therefore ought, in a great degree, to be attached to property. This being established, it was obvious, that as many very considerable towns and bodies either had no vote in electing representatives, or had not the privilege of choosing a number proportioned to their property, it would be necessary to disfranchise certain decayed boroughs. In the relations between government and the subject it was a manifest rule in jurisprudence on the one hand, that the interest of a part must give way to the interest of the whole; but on the other, that when such a sacrifice is required from a subject, the state should amply compensate individual loss incurred for the public good. Guided by these maxims, Mr. Pitt proposed to transfer the right of choosing representatives from thirty-six of such boroughs as had already fallen, or were falling into decay, to the counties and to such chief towns and cities as were at present unrepresented; that a fund should be provided for the purpose of giving the owners and holders of the boroughs disfranchised an appreciated compensation; that the acceptance of this recompence should be a voluntary act of the proprietor, and, if not taken at present, should be placed out at compound interest, until it became an irresistible inducement to such proprietor; he also projected to extend the right of voting for knights of the shire to copyholders as well as freeholders, but his propositions were negatived by a majority of 248 to 174.

Parliament was this year principally occupied in forming arrangements for a commercial intercourse between Great Britain and Ireland. In the year 1780 the trade of Ireland had been freed from the hurtful restrictions by which it had long been shackled. In 1782 the independence of Irish parliaments had been established. It remained for the legislature of the two countries to arrange a system of commercial intercourse, which might best promote the advantage of parties so nearly connected. Mr. Pitt, having received assurances of the disposition of the body of the Irish parliament to settle their com-

mercial intercourse on the basis of reciprocity, proposed a plan under two general heads:—First, Britain was to allow the importation of the produce of our colonies in the West Indies and America into Ireland. Secondly, there should be established between the two countries a mutual exchange of their respective productions and manufactures upon equal terms.

On the 29th of March, 1786, Mr. Pitt brought forward his plans for the reduction of the national debt. The committee had been appointed early in the session, in order to investigate and exactly ascertain the public income and expenditure, and strike the balance; the result of the investigation from the income of the year 1785 was,—income, 15,379,132*l.*; expenditure, 14,478,181*l.*; so that a surplus of more than 900,000*l.* remained, and on this basis Mr. Pitt formed his scheme. He proposed that by taxes neither numerous nor burdensome, the balance might be raised to a million: by a succinct and clear view of our finances he demonstrated that excess of income beyond expenditure was in the present and following years likely to increase; but in making his calculations he had contented himself with concluding that it would not decrease. This million was to be appropriated inalienably to the gradual extinction of the national debt. Several savings of expense and increase of revenue, especially through the customs from the suppression of smuggling, would add to the national income; annuities would also fall into the same fund; the accumulated compound interest added to these sources would, in twenty-eight years, if properly managed, produce an annual revenue of 4,000,000 to the state. For the management of this fund commissioners were to be appointed to receive 250,000*l.* quarterly, with the full power of employing it in the purchase of stock. In choosing persons to be entrusted, Mr. Pitt proceeded on the general principles, which had been already exhibited in his India bill, that in circumstances which required new delegation of executorial power, the trust should be vested in men whose official situation presumed their competency to the execution of the commission; the speaker of the house of commons, the chancellor of the exchequer, the master of the rolls, the governor and deputy governor of the bank of England, and accountant-general, were gentlemen whose nomination he recommended. After illustrating his calculations, and the advantages of his scheme, he compressed the substance into the form of a motion. On this subject Mr. Sheridan took a leading part in opposition, and Mr. Fox proposed that in a future loan the commissioners might accept of as much of it as they could pay from the public money in their hands; and thus, besides a prevention of that amount of the future debt which would be equivalent to the redemption of the part, the public would be gainers by the profits which would accrue from such a loan. The bill containing the original principle and plan, though with some modification of the latter, passed through both houses and received the royal assent.

The session terminated on the 11th of July. It was in this interval of parliamentary duties that Mr. Pitt matured his noble design of changing the contentious system which had so long prevailed between England and France. The means of inducing the two countries to pursue objects so conducive to their mutual benefit, he thought would be commercial intercourse which should reciprocally increase the

value of production and labour. Before he formed his scheme for promoting an intercourse between the two chief nations of the world, he made himself thoroughly acquainted with the state of facts, the actual productions, and the probable resources of the respective countries. For commercial information and science, especially the history and actual state of modern trade, no man exceeded Lord Hawkesbury. Mr. Eden's acuteness and conversancy with every subject of commerce and diplomatic experience rendered him a most valuable auxiliary in digesting and composing the plan at home, and the ablest agent for negotiating and concluding an advantageous agreement with France. He accordingly repaired to Paris, where he conducted and completed the desired arrangements with the ministers of Louis. The treaty in question established reciprocal liberty of commerce between the two countries. The subjects of each power were to navigate and resort to the dominions of the other, without any disturbance, except for transgressing the laws. The prohibitory duties in each kingdom, by enhancing the price, had reciprocally discouraged the sale of their principal commodities; these were now modified to the satisfaction of both by a tariff. The wines of France, to be imported into England, were subjected to no higher duty than the productions of Portugal; the duties on brandies, and various other articles, were to be lowered in proportion; and the commodities of Britain were to be equally favoured in France. On the same basis of reciprocity were the articles respecting disputes between the mercantile, maritime, or other subjects of the two countries, and various details of civil, commercial, and political intercourse, to be adjusted; the right of revising this treaty after the term of twelve years, to propose and make such alterations as the times and circumstances should have rendered proper or necessary, was reserved. In a treaty formed on the basis of reciprocal freedom of trade, the advantage to the contracting parties was, and necessarily must be, in the compound rates of their resources and skilful industry. At first sight, from the climate and soil of France, the balance of commercial benefit appeared in favour of that country, and so many politicians reasoned with much plausibility; but Mr. Pitt had considered the relative circumstances, and justly concluded that the French industry and skill were much more inferior to the British industry and skill, than the French soil and climate were superior to ours; and thus, that greater benefit would accrue to this country from the freedom of trade: experience justified this conclusion.

On the 4th of February the treaty was submitted to parliament. After the minister had explained and supported the object, spirit, and provisions of this treaty, numbers of the opposite side attacked it on a variety of grounds. Mr. Fox, in particular, maintained that France was the inveterate and unalterable enemy of Great Britain; no mutual interest could possibly eradicate what was deeply rooted in her constitution. The intercourse which this treaty would produce must be extremely hurtful to the superior national character of England. The nearer the two nations were drawn into contact, and the more successfully they were invited to mingle with each other, in the same proportion the remaining morals, principles, and vigour of the English national mind would be enervated and corrupted. The minister himself controverted Mr. Fox's position, that France was unalter-

ably the enemy of the country. The existence of eternal enmity was totally inconsistent with the constitution of the human mind, the history of mankind, and the experience of political societies. Every state recorded in history had been at different times in friendship or amity with its several neighbours. During the greater part of the seventeenth century profound peace had subsisted between France and England; there was nothing improbable in an idea that such a system might again prevail; but should war again arise, would the treaty deprive us of our national watchfulness or our accustomed strength? On the contrary, as it must enrich the nation, it would also prove the means of enabling her to combat her enemy with more powerful effect; but it was now much less likely that our resources should be called for such a purpose than at former periods. The treaty underwent many and various discussions in its passage through the two houses, and was approved by a great majority of both; and on the 8th of March an address was presented from the lords, the commons testifying their joint approbation of the treaty with France.

In 1792 an association was established, the declared object of which was to procure what is commonly called a reform in parliament and to shorten the period of its duration. Several respectable members of the house of commons patronized this association, which assumed the title of the Friends of the People, and lent it the credit of their names. Lord Lauderdale, Mr. Grey, and Mr. Sheridan, were said to be the principal founders and directors of it. It was in consequence of a resolution which was adopted by this society that Mr. Grey came forward with a notice of his intention to move for a parliamentary reform at some period in the subsequent session. Mr. Pitt observed that if ever there were a time when the subject of a parliamentary reform ought not to be agitated, the present was that period. The part which he had himself formerly acted upon a similar occasion was well known to the house. When he had himself proposed a parliamentary reform the complexion of the times was different in every respect from what it then was. Real grievances were practically felt, and a direct contrariety existed between the opinions of the people. The country was in a state of actual distress, a national bankruptcy dreaded, and the public mind almost bordering on absolute despair. In this situation something he had conceived ought to be attempted to counteract such alarming evils, by restoring to the people that confidence in parliament which they seemed to have lost. A parliamentary reform had appeared to him adequate to such an effect; a measure which at the time would have satisfied the nation, and was not likely to have gone beyond its declared object. The case, he remarked, at present was widely different. By the blessing of Providence we enjoyed an unexampled state of political happiness; and the gloom which had brooded over the public mind had completely dispersed. It was impossible by any attempt at reform to make the nation easier or happier. On the other hand much real evil might attend it; the security of all the blessings we possessed might be shaken to the very foundation. For such was the temper of too many reformers out of doors, that moderate measures were not likely to satisfy them; they wished not to preserve, but to subvert the constitution. Such were his principal objections to the time when this subject was brought forward;—objections

which he thought sufficiently accounted for the altered line of conduct he proposed to pursue, still retaining his opinion of the propriety of a parliamentary reform whenever it might seem attainable without danger or mischief. He complained that, instead of coming forward at once with some specific proposition on the subject, Mr. Grey had given an indistinct notice, which would naturally agitate the public mind for a considerable period and set to work many dangerous and designing theorists. Of this latter description he conceived some of that society to be, with which he grieved to find a man of Mr. Grey's talents and character unhappily connected. The aim of such people was nothing less than to destroy the British constitution, and to erect on its ruins that mad system which had been misnamed liberty in another country. Notwithstanding the informality of the proceeding, the debate was carried to a considerable length, several members strongly expressed their disapprobation of the society in which the measure had originated. Lord North and Mr. Windham, in particular, sided on this occasion with Mr. Burke, and opposed the arguments of their friends in opposition.

It was now that the great difference of opinion which led to the ultimate division of the members of opposition took place. The societies denominated the Friends of the People, the corresponding societies and other "affiliated" clubs were in their utmost activity employing all the arts of the press to assail every class of men with addresses to their passions, their prejudices, or their interests. "The Rights of Man," by Thomas Paine, was particularly pressed into circulation. About the same period the members of the revolution society published their proceedings and correspondence. In these the revolution of France was not only praised in general terms, but that leading maxim of it, the sacred duty of insurrection, particularly applauded. Our revolution in 1688 was considered as imperfect. The final completion of this glorious work, it was said, was only to be hoped from an imitation of the conduct of France, and our specific grievances were stated to be "royal prerogatives injurious to the public interest, a servile peerage, a rapacious and intolerant clergy, and a corrupt representation."

On the 11th of May Mr. Fox moved for the repeal of some particular statutes against the dissenters. Mr. Pitt opposed the measure, as he said it seemed acknowledged on all hands, that no practical evils had ever happened, or were likely to happen, from the laws in question, and as danger might possibly accrue from the repeal of them; the motion was negatived by a majority of seventy-nine. The royal proclamation against the dispersion of seditious writings was now issued, and being laid before the house, and an address of approbation moved, it was opposed by Mr. Grey with much warmth, and the proclamation itself condemned in severe terms as a measure insidious and pernicious. The "diligent enquiry," enjoined by the proclamation after the authors and distributors of wicked and seditious writings, could only tend to establish an odious and arbitrary system of espionage. Mr. G. strongly intimated his belief that the real object of the proclamation was merely to discredit the late association in the view of the public. This Mr. Pitt disclaimed in very explicit terms; and expressed his high respect for many of the members of the association in question, declaring "that he

differed from them only in regard to the time and mode which they had adopted for the attainment of their object." The association in question, he said, did not come within the scope and purview of the proclamation, which was levelled against the daring and seditious principles which had been so assiduously propagated amongst the people, under the plausible and delusive appellation of "The Rights of Man." Several members of opposition, particularly the marquis of Titchfield, Lord North, Mr. Windham, and Mr. Anstruther, delivered their sentiments in support of the address, impressed with the persuasion that a line of conduct had lately been adopted in this country which required the utmost attention and interference of government.

The French revolution continued to engage the attention of Great Britain, but government still resolved to avoid all interference in the internal affairs of France. The French now declared war against Austria and Prussia, and the king was deposed.

During the recess of 1792 the public ferment greatly increased in this country. The efforts of the revolutionary emissaries became more strenuous in London and in the other great cities. On the 7th of November an address from several patriotic societies in England was presented at the bar of the convention, containing, in addition to the accustomed complimentary expressions, reflections upon the government and constitution of their own country. The president of the convention, in his answer, used expressions full of respect and complacency; copies of the address were ordered to be sent to all the armies and departments of the republic. A royal proclamation was issued December 1, 1792, announcing "that notwithstanding the late proclamation of the 21st of May, the utmost industry was still employed by evil-disposed persons within the kingdom, acting in concert with persons in foreign parts, with a view to subvert the laws and constitution; and that a spirit of tumult and disorder thereby excited had lately shewn itself in acts of riot and insurrection; and that these causes moving him thereto, his majesty had resolved forthwith to embody part of the militia of the kingdom." On the same day another proclamation was issued for convening the parliament (which stood prorogued to the 3rd of January, 1793) on the 13th of December; the law requiring that, if the militia be drawn out during the recess of parliament, and this it can only be in case of invasion or actual insurrection, parliament shall be assembled within the space of fourteen days. On the 13th of December parliament was assembled; and the king stated his various reasons for his present measures. Notwithstanding the strict neutrality which he had uniformly observed in the wars now raging on the continent, he could not, without concern, observe the strong indications of an intention in the French to excite disturbances in other countries; to pursue views of conquest and aggrandisement, inconsistent with the balance of Europe, to disregard the rights of neutral powers, and to adopt towards his allies, the states-general, measures neither conformable to the public law, nor to the positive articles of existing treaties; he had therefore found it necessary to make some augmentation of his army and navy. Notwithstanding the facts already detailed, Mr. Fox, at the head of a small but able band, ridiculed and reproached the apprehension of any tendency towards revolution existing in the people of this country. Mr.

Pitt being absent, in consequence of his having vacated his seat by the acceptance of the wardenship of the cinque ports, till then held by the earl of Guildford (Lord North), Mr. Burke was the principal opponent to Mr. Fox in parliament.

We must, however, pass over any further historical relation of events till the discussion of the alien bill on the 4th of January, 1793. Mr. Pitt's speeches upon this and a subsequent motion for an address to the king, while they explain all the transactions of the time, will illustrate more peculiarly his own powers of mind and the sentiments he entertained on passing events. Upon the alien bill, he said, that he felt himself called upon to speak on the present occasion, though, from the circumstance of his absence on former debates, the ground of discussion had already been pre-occupied. A right honourable gentleman (Mr. Fox) had assumed, as a principle, that no bill of this sort ought to be brought forward, except upon some ground of positive circumstances upon which it was founded being stated in the preamble. If he was called upon to state the particular ground upon which the bill was founded, the only difficulty which he should find was, that these grounds were in themselves far greater than the magnitude of the measure. If he should only state, that by some extraordinary occurrence, some unforeseen and inevitable calamity of nature, great numbers of foreigners had come into this country without the means of subsistence, without being brought for any purposes of commerce, or without any possibility of discrimination, even this he should consider as affording a sufficient object of jealousy and attention, but when it appeared that these came from a country whose principles were inimical to the peace and order of every other government, and though many of them, no doubt, had fled here in order to find a refuge from the sword of persecution, there was but too much reason to suspect, among these had mingled emissaries for prey, regard for our own interests, and for the safety of the country, enforced the necessity of peculiar vigilance. In addition to all these circumstances, we find that in the councils of that country from which these persons had come, there had been adopted a system of propagating, by every means of art and force, principles inimical to the government of every country, and that they were now actually carrying on a war against the established government of other countries, under the specious pretext of promoting the cause of freedom; but he now came to the climax of all. In this country itself there had been found persons who proposed the same principles with those maintained in the councils of that neighbouring state, and held out the model of their government as an object of applause and imitation; who had industriously propagated, and publicly avowed, that they acted with them in concert; that they had held a correspondence with affiliated societies of jacobins; they had presented addresses to the convention, and had there been received, encouraged, and cherished, and had in return met with offers of fraternity and succour. Was there then not reason to suppose, that persons might have been sent to this country with a view of carrying on that concert? Was not this obvious to the understanding and feeling of every honourable gentleman present? Yet after all that had been stated, there are some who pretend to tell us, that they fear no internal alarm, that they see no cause of danger. Notwithstanding

the general sentiments of the country, and of that house, they have the hardihood to treat the whole as the effect of ministerial artifice. Had ministerial artifice made those who had hitherto acted upon a system of opposition, now concur in the opinion of this danger? Had it made all the members in that house, except ten or fifteen, agree in the same sentiment? He should now shortly point out what were the leading circumstances of the present time. What had they seen? They had seen within two or three years a revolution in France, founded upon principles which were inconsistent with our own, and with every regular government; which were hostile to hereditary monarchy, to nobility, to all the privileged orders, and to every sort of popular representation short of that which would give to every individual a voice in the election of representatives. Writings had been published in this country, holding out this government as an object of envy and a model of imitation, decrying every other form of government as founded in injustice, and inconsistent with the unalienable right of man; representing this new scheme as holding out relief to the poor, inculcating a more pure and simple system of morals, and enlarging the circle of social happiness.

"How far it deserved this character its own practice would best prove. Societies had been formed in different manufacturing towns in this country, upon the model of the jacobin societies in France, where the utmost art and industry had been employed to inflame the passions and mislead the judgment of the lower classes, and where the doctrines inculcated might be supposed to be attended with the worst effect. These societies carried on correspondence with the societies and councils of France, and received from them invitations of support. In addition to all this, we have seen a code of the laws of nations adopted in France, hostile to every other government, a system of anarchy and ambition, setting at defiance all regular authority, and treating as unlawful every thing which has been sanctioned by the laws of other countries. Their new code of the laws of nations went to establish their government wherever they should carry their arms. As their ambition was unbounded, so the anarchy, which they hoped to establish, was universal. From the conduct which they had already exhibited, a judgment might be formed of the future course which they would pursue. Under the specious pretext of promoting the cause of freedom, they had shown no scruple to annex the territories of their neighbours to their own dominions, and to force upon the inhabitants of the countries which they had entered, that freedom which they were unwilling to receive, and of which, certainly, the state of their own country did not afford a very flattering specimen. Their own declarations had shown that their views were not confined to particular countries, that their object was every where to propagate their own system by all the means which art, industry, or force could supply. When there were men in this country connected with a people actuated by such principles, and pursuing such a system, it surely became a matter of the most serious consideration. Such being the state of circumstances, he put it to the hearts, consciences, judgments, and understandings of gentlemen present, whether there was not serious ground of alarm? Such was the general view of affairs; combined with which there was a necessity of taking some measure against that influx

of foreigners which had poured into the country. While all that house and all the country agree with respect to the existence of danger, there were ten or fifteen members who completely denied it; but even these could not agree with regard to the degree of its non-existence. In this respect they were inconsistent with themselves. A right honourable gentleman (Mr. Fox) who, though he had spoken last, was first to be attended to; though he disapproved of the principles upon which the French acted—though afraid of the progress of their arms, was not afraid of the progress of their opinions in this country. On this score he apprehends nothing, though it was particularly the interest, and had always been the policy of the French to sow divisions in those countries against which they entertained views of hostility—a policy which, in the present instance, could not be better answered than by propagating their sentiments. The opinions that right honourable gentleman had stated were not to be opposed by force; they were to be resisted, first by neglect and contempt, the mode of which he seemed most to approve; secondly, by argument and reasoning; and last, by prosecution; which, however, he did not greatly commend. He would only ask, what sort of opinions were those to which the right honourable gentleman had alluded? Serious and conscientious opinions, founded upon sober and dispassionate reasoning, he would own, had a claim to the utmost indulgence, and ought always to be treated with deference; but surely, with regard to wild and violent notions, assuming the name of opinions, but tending by overt acts to overturn every established government, and to introduce anarchy and confusion, a different mode of conduct was to be observed. Those opinions which the French entertained were of the most dangerous nature; they were opinions produced by interest, inflamed by passion, propagated by delusion, which their success had carried to the utmost excess, and had contributed to render still more dangerous. For, would the right honourable gentleman tell him that the French opinions received no additional weight from the success of their armies? Was it possible to separate between the progress of their opinions and the success of their arms? It was evident that the one must influence the other, and that the diffusion of their principles must keep pace with the extent of their victories. He was not afraid of the progress of the French principles in this country, unless the defence of the country should previously be undermined by the introduction of these principles. A noble lord (Earl Wycombe) had said, that if a war should take place, the blame of that war must entirely belong to ministers. He would here beg to refer to the conduct of France. It had first denied the obligation of a treaty, which, though sometimes called absolute, had been considered as the corner stone of the balance of Europe, and repeatedly renewed; which had been coeval with the establishment of Dutch freedom, and was, in fact, necessary to the existence of the independence of Holland—a treaty in which France could have no concern, except in fulfilment of its own stipulation, to guard it against infringement; and which could only be a matter of question between the sovereign of the Dutch republic and the sovereign of the Austrian Netherlands. France could only have one of two motives for interference—either as assuming to act as sovereign of the Netherlands, or because she has proclaimed a new code of the law of nations, by

which she presumes to dictate to every country, and to model every government by her own standard. Could we then, in this country, without resigning the spirit of independent Britons, and the faith due to an ally, submit to so insolent and unjust a claim as that of opening the Scheldt on the part of the French? But they affected, upon their present system, to despise all treaties, and to regard the one in question as extorted by avarice and consented to through despotism. The second circumstance to which he should call their attention was the decree of the 19th of November. By this decree the French engaged to assist all people in procuring their freedom—such a freedom, he supposed, as they themselves enjoyed. We have seen, said he, French freedom in definition, we have seen it in illustration, and have now an opportunity to compare the theory with the practice. Their conduct in Flanders afforded a specimen of the nature of their freedom. They had there endeavoured to propagate their doctrines, but finding the inhabitants not disposed to give them so favourable a reception as they could have wished, they had taken the method of inculcating opinions of freedom by force. Their general had issued a proclamation, that whoever should not embrace the tree of liberty should be cut off as a wretch unfit to live. The noble lord talked of their having given an explanation with respect to this decree. What sort of explanation had they given? They had stated that it was not their intention to assist a few individuals, but only to interfere in cases where a great majority of the people should be disposed to shake off their government; so that, in fact, it was their intention to promote rebellion in other countries, and to declare war against all established governments. This sort of war was an inexpiable war against all legitimate power, and which was only to terminate in its extinction. Formerly the splendour of conquest had, in some measure, been pursued with a respect which had been paid to the government and rights of the conquered. The Romans were careful to preserve the government, the habits, and customs of the nations which they had vanquished, considering that as the best security for their conquests. For the present age had been reserved the idea of a war of extirpation—a war which should tend to annihilate whatever had been held most dear, or found most valuable. This was a sort of war which had never been carried on even by despots, and which was only exemplified in the conduct of those modern republicans who held out a system of what they called freedom and happiness. One honourable gentleman (Major Maitland) had declared that the whole of the danger which had been held out, and the consequent alarm which had been excited in the country, was a mere delusion, effected by the artifices of ministry. That honourable gentleman had at the same time stated, that the uniform misconduct of ministry since they came into power was sufficient to have occasioned all the mischiefs which had been described, and to bring any country into a state of the greatest calamity. If this was the case, he, for one, could not but rejoice that all these mischiefs, and all this calamity, amounted to nothing more than delusion. In reply to the marquis of Titchfield, who had accused ministers of tardiness, Mr. P. asserted, that it was not till very lately the proceedings had assumed sufficient importance to justify ministerial interference. It was curious that other gentlemen in opposition had brought a directly contrary charge, by

accusing ministers of too great precipitation. It was only the retreat of the duke of Brunswick, and the success of the French arms, with the consequences that had followed, events so rapid and unexpected, which it was impossible to foresee, and which defied even the smallest conjecture, that rendered the danger so imminent, and the necessity of preparations so urgent on the part of this country. It was not till lately that the opening of the Scheldt had occurred, an infringement of the stipulations of treaties, and an invasion of our allies, the Dutch, which rendered it absolutely necessary for this country to interfere, more especially as it seemed to open the way for farther violations of treaty and more extended acquisitions of conquest. It was not till the 19th of November that the decree had passed, which menaced hostility to every government, and the principles of which every nation in Europe was interested to oppose. He trusted it would appear from attention to these circumstances, that as soon as the danger could be ascertained, measures had been taken to meet it, and that there had been no want of vigilance, precaution, and activity, on the part of ministers. He trusted that they would all concur to meet the present emergency by suitable measures, to obviate the danger by the most effectual means which could be devised, and unite their strength for two great objects—the safety of the country and support of the constitution.” The bill was then read a third time, and passed.

On the 24th of January, 1793, intelligence arrived in London of the melancholy catastrophe of Louis XVI. His majesty immediately notified to M. Chauvelin that the character with which he had been invested at the British court, and of which the functions had been so long suspended, being now entirely terminated by the death of his most Christian majesty, he had no longer any public character here, and that within eight days he must quit the kingdom. The French rulers, by a decree of the convention of the 1st of February, 1793, declared war against Great Britain with acclamation, and soon after against Holland, which their forces were ready to invade. Upon the very same day that France declared war against Great Britain, the British parliament was engaged in discussing a message from the king concerning the papers which had passed between M. Chauvelin and the minister for foreign affairs. On this occasion Mr. Pitt, who had now resumed his seat in parliament, made an eloquent harangue. Adverting at the commencement of the speech to the melancholy catastrophe which had just taken place in France, he represented it “as an event so full of grief and horror, that he wished it were possible to tear it from their memories, and expunge it from the page of history, and remove it for ever from the observation and comments of mankind;—but that event was unfortunately passed, and the present age must be for ever contaminated with the guilt and ignominy of having witnessed it. In this dreadful transaction they saw concentrated the effect of those principles, pushed to their utmost extent, which set out with dissolving all the bands by which society was held together; principles established in opposition to every law, human and divine, and which, presumptuously relying on the authority of wild and delusive theories, rejected all the advantages of the wisdom and experience of former ages, and even the sacred instructions of revelation. While, therefore,

he directed their attention to this transaction, he paid not only a tribute to humanity, but he suggested to them a subject of much useful reflection. No consideration indeed could be more connected with a country like this, or of a greater importance, than what tended to avert such transactions as had taken place in that neighbouring state. Here, where a monarch formed an essential part of the government, clothed with inviolability which was essential to the exercise of the sovereign power; where the legislature was composed of a mixture of democracy and aristocracy, and where, by the benefits of this system, we had been exempted from those mischiefs which in former ages had been produced by despotism, and which were only to be exceeded by those still more horrid evils which in the present time had been found to be the fruits of licentiousness and anarchy. Mr. Pitt then proceeded to remark on the different papers which had been laid on the table, and printed for the use of the members. It would appear from the first paper, that the system on which his majesty had uniformly acted was founded on the very principles which had afterwards dictated the necessity of his making preparations. His majesty had declined taking any part in the internal government of France, and had made a positive declaration to that effect. When he took that wise, generous, and disinterested resolution, he had reason to expect that the French would in return have respected the rights of himself and his allies, and most of all, that they would not have attempted any internal interference in this country. A paper on the table contained on their part a positive contract to abstain from any of those acts by which they had provoked the indignation of this country. In this paper they disclaimed all views of aggrandizement; they gave assurances of their good conduct to neutral nations; they protested against their entertaining an idea of interfering in the government of the country, or making any attempts to excite insurrection; upon the express ground (stated in the paper) that such interference and such attempts would be a violation of the law of nations, they had themselves, by anticipation, passed sentence upon their own conduct; and the event of this discussion would decide whether that sentence would be confirmed by those who had actually been injured. During the whole summer, while France had been engaged in the wars with Austria and Prussia, his majesty had in no shape departed from the neutrality which he had engaged to observe, nor did he, by the smallest act, give any reason to suspect his adherence to that system. But what, he would ask, was the conduct of the French? The first instance of their success in Savoy had been sufficient to unfold the plan of their ambition. They had immediately adopted the course to annex it for ever to their own dominions, and had displayed a resolution to do the same wherever they should carry their arms. That they might not leave any doubt of their intentions, by a formal decree, they had stated their plan of overturning every government, and substituting their own; they threatened destruction to all who should not be inclined to adopt their system of freedom, and by a horrid mockery offered fraternization; where it was refused they were determined to employ force, and to propagate their principles, where they should fail to gain assent, by the mouths of cannon. They established, in the instructions to the commissioners whom they appointed to enforce the decree with re-

spect to the countries entered by their armies, a standing revolutionary order that instituted a system of organizing disorganization. And what was the reason which they assigned for all this? 'The period of freedom,' said they, 'must soon come; we must then endeavour, by all means in our power, to accomplish it now; for should this freedom be accomplished by other nations, what then will become of us?' For justly might they entertain doubts for their safety. They had rendered the Netherlands a province, in substance as well as name entirely dependent on France. That system, pursued by the jacobin societies, in concert with their correspondents, had given a more fatal blow to liberty than any which it had ever suffered from the boldest attempts of the most aspiring monarch.

"What had been the circumstances which had attended the triumphal entry of General Dumourier? Demonstrations of joy inspired by terror, illuminations imperiously demanded by an armed force. And when the primary assembly met to deliberate, in what circumstances did they assemble? With a tree of liberty planted amidst them, and surrounded by a hollow square of French soldiers; a situation surely equally conducive to the ease of their own thoughts, and the freedom of their public deliberations. And what had happened even since the French had professed their intention of evacuating the territories which they had entered, at the conclusion of the war? A deputation had been received from Hainault requesting that it might be added as an eighty-fifth department. And how had this deputation been received? Had the request been rejected? No, it had only been postponed till a committee should be able to prepare instructions how those nations who should be desirous of the same union should be able to incorporate themselves with France in a regular and formal manner, till the preliminaries should be settled by which it should subject to its government and add to its territories every country which should be so unfortunate as to experience the force of its arms, and to give to its wild and destructive ambition only the same limits with those of its power. It was matter of serious consideration how far such a conduct not only ought to rouse the indignation, but might tend to affect the interests of this country. To show how the French had behaved with respect to neutral nations, he need only refer to their decree of the 19th of November, which had already been so often mentioned and so amply discussed. He then read that passage in which the French grant fraternity to all those people who should be desirous to gain their freedom, and offer them assistance for that purpose. By the bye, he remarked, that to grant fraternity was a curious state of equality, and that none might be at a loss to know to whom the French nation were disposed to grant this relationship of younger brothers, they had ordered the decree to be printed in all languages, by which it might be perceived that they intended the favour for all nations who chose to accept of it. Some pretended explanations had indeed been given of this decree, but of all these explanations he should say nothing but what had already been stated by the noble secretary of state, that they contained only an avowal and a repetition of the offence. The whole of their language, institutes, and conduct, had been directed to the total subversion of every government. To monarchy particularly they had testified the most decided aver-

sion, and so violent was their enmity that they could be satisfied with nothing less than its entire extermination. The bloody sentence, which the hand of the assassin had lately carried into execution against their own monarch, was passed against the sovereigns of all countries. Were not their principles intended to be applied in their effects to this government? No society in this country, however small in number, however contemptible, however even questionable in existence, had sent addresses to their assembly, in which they had expressed sentiments of sedition and treason, which had not been received with a degree of theatrical extravagance, and cherished with all the enthusiasm of congenial feeling. Need he then ask if England was not aimed at by this conduct, and if it alone was to be exempted from the consequences of a system, the profession of which was anarchy, and which seemed to aspire to establish universal dominion upon the ruin of every government? From what had passed in a former part of the evening, he understood that it would be urged that the Dutch had made no formal requisition for the support of this country, in order to resist the opening of the Scheldt by the French, and to enable them to maintain their right to the exclusive navigation of that river. He granted that no such formal requisition had been made. But might there not be prudential reasons for not making this requisition on their part very different from those which should induce this country to withhold its support? When the French opened the Scheldt, the Dutch entered their solemn protest against that invasion of their rights, which left them at liberty at any time to take it up as an act of hostility. If, from the sudden progress of the French arms and the circumstance of their forces being at their very door, they either from prudence or fear did not think proper to take it up as an immediate commencement of hostilities, because they had been timid, would England think itself at liberty to leave its allies, already involved in a situation of imminent danger, to that certain ruin to which they were exposed in consequence of a system, the principles of which threatened also destruction to England, Europe, and to the whole of mankind? Thus in all those three assurances which they had given of their intention to reject any system of aggrandizement, to abstain from interfering in the government of any neutral country, and to respect the rights of his majesty and of his allies, they had entirely failed, and in every respect completely reversed that line of conduct which they had so solemnly pledged themselves to adopt. Whatever they had offered under the name of explanations, contained nothing that either offered any compensation for the past, or was at all satisfactory with respect to the future. On the 27th of December M. Chauvelin, on the part of the executive council, had presented the note complaining of the decree of the 19th of November. On the 31st of December a member of that executive council (minister of the marine) addressed a letter to all the friends of liberty in the sea-ports; from which he would now read some passages. 'The king and his parliament mean to make war against us. Will the English republicans suffer it? Already these free-men show their discontent, and the repugnance which they have to bear arms against their brothers, the French. Well! we will fly to their succour; we will make a descent in the island; we will lodge there fifty thousand caps of liberty; we will plant

there the sacred tree, and we will stretch out our arms to our republican brethren: the tyranny of their government will soon be destroyed.' He called the attention of the house to this declaration, which distinguished the English people from the king and the parliament, and to the nature of that present which was meant to be made them. While such declarations were in force, what could be thought of any explanations which were pretended to be given, or what credit was due to the assertions that they entertained no intentions hostile to the government of this country? From all these circumstances he concluded that the conduct and pretensions of the French were such as were neither consistent with the existence or safety of this country, such as that house could not, and, he was confident, never would acquiesce in. Unless you will then recede from your principles, or they withdraw, a war must be the consequence. As to the time, the precise moment, he should not pretend to fix it—it would be left open to the last for any satisfactory explanation, but he should deceive them if he should say that he thought any such explanation would be given, or that it was probable that a war could be avoided.

The intelligence of the French declaration of war having been received on the 11th of February, a message announcing the war was delivered to the house. Mr. Pitt stated what had occurred since his majesty's last message, and proceeded to notice those grounds which had served as a pretence for the declaration of war. When his majesty had dismissed M. Chauvelin, what were then the hopes of peace? He was by no means sanguine in such hopes, and he had stated to the house that he then saw but little probability that a war could be avoided. Still, however, the last moment had been kept open to receive any satisfactory explanation that might be offered; but what, it might be asked, was to be the mode of receiving such explanation? When his majesty had dismissed M. Chauvelin, eight days had been allowed him for his departure; and if during that period he had sent any more satisfactory explanation, still it would have been received. M. Chauvelin, however, instantly quitted the country without making any proposition. Another agent had succeeded (M. Marat), who on his arrival in this country had notified himself as the *charge d'affaires* on the part of the French republic, but had never during his residence in the kingdom offered the smallest communication. What was the next event which had succeeded? An embargo was laid on all the vessels and persons of his majesty's subjects who were then in France. This embargo was to be considered as not only a symptom, but as an act of hostility. It certainly had taken place without any notice having been given, contrary to treaty, and against all the laws of nations. Notwithstanding this violent and outrageous act, such was the disposition to peace in his majesty's ministers that the channels of communication even after this period were not shut. A most singular circumstance happened, which was the arrival of intelligence from his majesty's minister at the Hague, on the very day when the embargo became known here, that he had received an intimation from General Dumourier that the general wished an interview, in order to see if it were yet possible to adjust the differences between the two countries, and to promote a general pacification. Instead of treating the embargo as an act of hostility, and forbearing from any communication,

even after this aggression, his majesty's ministers, on the same day on which the embargo was made known to them, gave instructions to the ambassador at the Hague to enter into a communication with General Dumourier. But before the answer of government could reach the ambassador, or any means he adopted for carrying the object proposed into execution, war was declared on the part of the French against this country. He must again revert for a moment to the embargo. He then stated that a detention of ships, if no ground of hostility has been given, is in the first place contrary to the law of nations: in the second place, there was an actual treaty between the two countries provided for this very circumstance; and this treaty (if not set aside by our breach of it, which he should come to presently) expressly said, that 'in case of a rupture time shall be given for the removal of persons and effects.' Mr. Pitt then entered into an examination of the articles of the French declaration, which he proved to consist of the weakest pretexts. Of all the reasons he ever heard for making war against another country, that of the French upon this occasion was the most extraordinary: they said they would make war on us—first, because we loved our own constitution; secondly, because we detested their proceedings; and, lastly, because we presumed to grieve at the death of their murdered king. Thus would they even destroy those principles of justice and those sentiments of compassion, which led to reprobate their crimes and to be afflicted at their cruelties. Thus would they deprive us of that last resource of humanity—to mourn over the misfortunes and sufferings of the victims of their injustice; they would not only endeavour to destroy our political existence, and to deprive us of the privileges which we enjoyed as subjects of the most excellent constitution, but they would eradicate our feelings as men; they would make crimes of the sympathies which were excited by the distresses of our common nature; they would repress our sighs and restrain our tears. He now came to his conclusion.—We, said he, have in every instance observed the strictest neutrality with respect to the French: we have pushed to its utmost extent the system of temperance and moderation; we have held out the means of accommodation; we have waited till the last moment for satisfactory explanation. These means of accommodation have been slighted and abused, and all along there has appeared no disposition to give any satisfactory explanation. They have now at last come to an actual aggression by seizing our vessels in their ports without any provocation given on our part; without any preparations having been adopted but those of necessary precaution, they have declared, and are now waging war. Such is the conduct which they have pursued, such is the situation in which we stand. It now remains to be seen whether under Providence the efforts of a free, brave, loyal, and happy people, aided by their allies, will not be successful in checking the progress of a system, the principles of which, if not opposed, threaten the most fatal consequences to the tranquillity of this country, the security of its allies, the good order of every European government, and the happiness of the whole human race. Messrs. Fox, Burke, and Sheridan then spoke, and the first gentleman moved an amendment; the address was, however, voted without a division.

On the 17th of June, 1793, Mr. Fox moved certain

resolutions, expressing the request of the house that his majesty would take the earliest opportunity of procuring peace. Mr. Pitt opposed the address in a long speech. He said he did not hesitate to declare the motion the most impolitic and preposterous, and only calculated to amuse and delude the people, by holding out the possibility of peace when, in reality, it was impossible. "You have seen," said Mr. Pitt, "yourselves and all Europe attacked—when you have seen a system established, violating all treaties, disregarding all obligations, and, under the name of the rights of man, uniting the principles of usurpation abroad, tyranny and confusion at home, you will judge whether you ought to sit down without some security against the consequences of such a system being again brought into action. And this security, it appears to me, can only be obtained in one of three modes:—first, that these principles shall no longer predominate; or second, that those who are now engaged in them shall be taught that they are impracticable, and convinced of their own want of power to carry them into execution; or third, that the issue of the present war shall be such as, by weakening their power of attack, shall strengthen your power of resistance. Without these you may indeed have an armed truce, a temporary suspension of hostilities; but no permanent peace; no solid security to guard you against the repetition of injury and the renewal of attack. The present motion can only tend to fetter the operations of war, to delude our subjects, to gratify the factious, to inflame the discontented, to discourage our allies, to strengthen our enemies. What could be the effect of any negotiation for peace in the present moment? It is not merely to the character of Marat, with whom we would have to treat, that I object; it is not to the horror of those crimes, in every stage, rising one above another in point of enormity; but I object to the consequences of that character, to the effect of those crimes. They are such as render negotiation useless, and must entirely deprive of stability any peace which could be concluded in such circumstances. All the crimes which disgrace history have occurred in one country, in a space so short, and with circumstances so highly aggravated as outrun thought and exceed imagination. Should we treat with Marat before we had finished the negotiation, he might again have descended to the dregs of the people from whom he sprung, and have given place to a still more desperate villain. But if the motion can answer no good purpose, can it answer no bad one? Might it not serve to encourage the French? What the honourable gentleman reserved as the last part of his argument seemed to have this tendency, the conclusion which he drew of the necessity of a peace from the situation of the country. If we are really come to that period of distress, we must indeed submit to the decrees of Providence with such resignation as we would submit to the sacrifice of our independence. If the period of our ruin is come, we must prepare to meet the fate which we cannot avert; we cannot meet it in any shape more dreadful than that which is proposed by the motion of the honourable gentleman. But our situation is not yet so desperate. With respect to the embarrassment of credit, and the consequent interruption of commerce, I may safely say that none have watched it more carefully than myself, none can have felt it more anxiously. The honourable gentleman states the means of relief which

have been adopted by the legislature as, in his opinion, a proof of the extent of the calamity: for my part, I have formed a very different conclusion. The effect of the relief held out by the legislature, even before it was experienced, was completely to restore confidence and vigour to commerce—a proof that the embarrassed state of credit was only temporary, and, in great measure, accidental. The present motion, by magnifying the inconvenience which we have sustained into a calamity, is calculated to give a false impression, and give to what at most could only be the object of apprehension at home, all the mischievous consequences of a real distress abroad. It is calculated to discourage our allies and inspire our enemies with confidence. Having thus given my opinion as a member of parliament, there are some allusions which have been made to me as a member of the cabinet, which I am called upon to notice. I have only to say, that if there is any difference in opinion between me and other members of the cabinet, I can only assure him that I am the most determined to oppose the grounds and principles upon which this motion is founded. I have spoken at much greater length than at first I intended; but on this subject, whenever it occurs, I find it impossible to keep those bounds which I had prescribed to myself, prompted as I am to enlarge by the dearest feelings and principles of my heart, affection and gratitude to my sovereign, and that duty which I owe as a member of the community."

In this year the united Irishmen first assembled, and the Scotch convention of delegates. As their purposes were known, we shall pass over the current events, till the meeting of parliament on the 21st of January, 1794. Mr. Fox moved an amendment to the proposed address recommending his majesty to treat, as speedily as possible, for a peace with France, upon safe and advantageous terms, without any reference to the nature or form of the government that might exist in that country. Mr. Pitt said, that the present war had not been hastily and rashly engaged in, but after due deliberation and mature conviction. It had been the opinion of the majority of that house, and of the great body of the nation, that it was undertaken upon grounds strictly defensive; and that the nation were equally compelled to engage in it by the obligations of duty and the urgency of necessity. As to the objects of the war, they had frequently been brought forward in the course of last session, and unless it can be shown that we were originally mistaken, that they were not proper objects of contest, or that they are already gained, the obligations and necessity which originally induced us to undertake the war, operate with equal force at the present moment. He had placed the termination of the war upon two circumstances; first, the being able to procure a peace upon terms likely to render it secure and permanent; and secondly, an indemnity suitable to expense incurred by carrying on the war. He had always asserted, that if a peace could be made upon terms of security to this country, no consideration of the detestable characters of the ruling men in France, or of the crimes and horrors with which they were sullied, ought to influence this country to reject such terms. From the nature of the French government there could be no dependence on the characters of whom it was composed. The shifting of persons took place like the shifting of scenes; but this change of persons produced no alteration in the conduct of

the drama; the principles and proceedings still continued the same, or only were distinguished in their progress by increased gradations of enormity. On the 21st of May a new government, more dreadful in its character, and more fatal in its effects, than any which preceded it, had taken place—this was the revolutionary government—one of the leading features of which was the abolition of religion. The extinction of religious sentiment was intended to pave the way for the introduction of fresh crimes, and entirely to break asunder those bands of society which had been already loosened. A second measure of this government was the destruction of property; a precedent which tended not less to destroy all ideas of justice than the former to extinguish all sentiments of piety. These crimes, however, they contrived to convert into sources of revenue. From the pillage of the churches—from the destruction of property—from the confiscation of the effects of those who were condemned, they derived the means for conducting their military operations. They pushed every resource to its utmost extent: resources so desperate afford in themselves the most certain symptoms and indications of the approaching decay of that system with which they are connected. If then such be the system, if such the means of its support, what prospect can there be of either stability or permanence to the present order of things? "As to the question of the honourable gentleman," continued the chancellor of the exchequer, "whether I am never to make peace with the jacobins it is extremely difficult to answer; and it would be neither prudent nor rational in me to give him any definitive reply in the present moment. The question of pursuing the war must, in every instance, depend upon the convenience with which it can be carried on to ourselves, and of that you must be best qualified to judge. The honourable gentleman's motion is certainly couched in very general terms, and such as might take in every thing that I have contended for. It recommends to his majesty to conclude a peace whenever it can be done upon safe and advantageous terms, without any reference to the nature and form of government which may exist in France. I likewise am of opinion that a safe and advantageous peace ought to be concluded; but that the security and benefits of that peace must depend upon the establishment of a government essentially different from the present. But though the motion, from the general terms in which it is expressed is calculated to gain no precise object, it is yet capable of much mischief; it means and says that this house entertains sentiments different from those expressed by his majesty in his speech. It holds out to our allies that they are no longer to consider us as eager in the cause, while it must impart encouragement and confidence to our enemies. The honourable gentleman has said that a treaty with the French government would afford us as good a security for the continuance of peace as that which we derived from the treaty of Ryswick or Utrecht. He then, in his usual way, entered into a declamation against kings, and said that we might place equal dependence on the good faith of the present government of France, as on that of the court of Louis XIV. This I expressly deny; and I affirm, that had that king even succeeded in his ambitious projects to their full extent, what we should then have suffered might have been considered as a deliverance, compared with what must be the consequence of success attending

the present French system. All the splendour of his court, all the abilities of his generals and discipline of his armies, all the great exertions which he was enabled to make, proceeded from a high sentiment of honour. No such principles actuate the conduct of the present French rulers. They have contrived to banish all restraints, and with an ambition more insatiable they have at their disposal means of destruction much more formidable than that monarch ever possessed in the plenitude of his power. The honourable gentleman has inaccurately stated, that I attach the same degree of importance to the restoration of monarchy in France as to the destruction of the present system; this is by no means the case. I attach importance to the restoration of monarchy from an opinion that in the present state of France some settled form should take place, in which the greater part of the people may be disposed to concur. This ancient government I consider as affording the best materials upon which they could work in introducing any change into the fabric of their constitution: besides, as I have thought it incumbent, in any interference which I proposed in the internal affairs of that country, to consult chiefly the happiness of the people, monarchy appeared to me the system most friendly to their true interests. But there is one part of the argument of my noble friend to which I must particularly call your attention, and which, independently of every other consideration, precludes even the possibility of our treating with France in the present moment. A decree has been passed by the convention forbidding to treat with any enemy till they have evacuated the territories of the republic; and on the 11th of April it was again decreed, that those persons should be punished with death who should propose to treat with any power which should not have previously acknowledged the independence of the French nation, and the unity and indivisibility of the republic, founded upon liberty and equality. Are you then to withdraw your armies, to deprive yourself of the co-operation of your allies, to forego all your acquisitions, to give up Condé, Quesnoi, Tobago, Fort Louis, all the factories in the East Indies? Should you consent to do all this; should you even hasten to send an ambassador to treat with the convention, and the right honourable gentleman (Mr. Fox), I believe, on a former occasion volunteered himself for that purpose, you not only must acknowledge the unity and indivisibility of the French republic, but you must do so in their own way. You must acknowledge it as founded on liberty and equality. You must subscribe to the whole of their code, and by this act sanction the deposition of your sovereign and the annihilation of your legislature. It may be said that they would not insist upon all this to its full extent; but of this I can have but little confidence when I compare their past declarations and their conduct. To whatever pitch of extravagance they may have reached in what they have said, the absurdity of their expressions has in every instance been surpassed by the outrages of their conduct."

In the month of February 1801, Mr. Pitt unexpectedly resigned, and on the 16th he thus assigned his reasons. "When I took the liberty of stating that the insinuations thrown out by an honourable gentleman this night were unfounded, my idea was, alluding to that charge, that I had not suggested any rumours injurious to my sovereign, to whom I am, perhaps, more than any man in his dominions, bound by

gratitude, duty, and affection. In saying this, however, I did not mean to say that the ground assigned by rumour was not the ground of my resignation, much less did I decline any explanation. But it is somewhat a new doctrine that a man cannot, consistently with his duty, resign a high and responsible situation without giving all the reasons which determined him on that line of conduct. Where this system of duty is established I know not. I have never heard that it was a public crime to retire from office without explaining the reason. I therefore am not aware how it can be a public crime in me to relinquish, without assigning the cause, a station which it would be the ambition of my life and the passion of my heart to continue to fill, if I could do so with advantage to my country, and consistently with what I conceive to be my duty. As to the merits then of the question which led to my resignation, though I do not feel myself bound, I am willing to submit them to the house. I should rather leave it to posterity to judge of my conduct, still I have no objection to state the fact:—I and some of my colleagues in office did feel it an incumbent duty upon us to propose a measure on the part of government, which, under the circumstances of the union so happily effected between the two countries, we thought of great public importance, and necessary to complete the benefit likely to result from that measure; we felt this opinion so strongly that when we met with circumstances which rendered it impossible for us to propose it as a measure of government, we felt it equally inconsistent with our duty and our honour any longer to remain a part of that government. What may be the opinion of others I know not; but I beg to have it understood to be a measure which, if I had remained in government, I must have proposed. What my conduct will be in a different situation must be regulated by a mature and impartial review of all the circumstances of the case. I shall be governed (as it has always been the wish of my life to be) only by such considerations as I think best tend to insure the tranquillity, the strength, and the happiness of the empire."

Having thus traced Mr. Pitt through his long career of ministerial duties, it remains for us to view him in the less active and responsible condition of a member of the house of commons. In the new administration Mr. Addington was the inheritor of Mr. Pitt's honours; and it was understood that he was in some sort recommended by Mr. Pitt, and that he expected Mr. P.'s support. Previous to that gentleman's quitting the treasury, he produced the estimate of supply and the ways and means, the former including a loan of 25,400,000*l*. The taxes were laid on tea and sugar, upon paper a duty of ten per cent. additional, and various other articles. Inquiries were proposed into the expedition to Ferrol and Cadiz, and also concerning the convention of El-Arish, which, if observed by England, it was said might have prevented the necessity of sending troops to Egypt; but all these motions were negatived by the usual very great majorities. In the course of the session new regulations were made for encouraging the importation of wheat, American flour, and rice, to lessen the growing pressure of scarcity; and on the 1st of July the house rose. In the session which immediately succeeded the change of ministers, we find Mr. Pitt the friend and supporter of Mr. Addington. Mr. Pitt's speeches were short upon every occasion, and

were principally in defence of the measures of his administration. On the opening of the session, on the 29th of October, 1801, the speech from the throne announced the favourable conclusion of the negotiations begun in the last session of parliament. It expressed much satisfaction that the differences with the northern powers had been adjusted, and that the preliminaries of peace had been ratified between us and the French republic. As the provision for defraying the expenses which must unavoidably be continued for some time, and maintaining an adequate peace establishment, could not be made without large additional supplies, all possible attention should be paid to such economical arrangements as might be consistent with the great object of security to his majesty's dominions; and concluded with eulogiums on the naval and military operations of the last campaign and the glorious issue of our expedition to Egypt. Mr. Pitt said but a few words; he was however on the side of administration. It was on this occasion that the Grenville party separated from their late friends, by openly declaring their disapprobation of the peace.

During the remainder of the session Mr. Pitt spoke very little in the house. He continued on the side of administration, who also derived much support from the adherents of Mr. Fox. Lord Grenville and his party were now as decidedly their enemies. On the 25th of June, 1802, parliament rose. Ministers were popular, not less from the circumstance of peace being concluded under their auspices than from the well-founded belief which every where existed of their moderate views, their strict economy, and their unsullied integrity. No event of importance occurred during this year, but the decree of the French government, which created Bonaparte consul for life, and the consequent change in the French constitution. Early in the year 1803, Colonel Despard and his associates were brought to trial. The British ministry seemed to be well acquainted with the hostile intentions of Bonaparte, though no symptom of a breach was manifested till the month of March, except an increased naval and military establishment. Not long after the session commenced, an overture was made by Mr. Addington, first to admit Mr. Pitt to an equal share of power with himself, nominating Lord Chatham as the ostensible prime minister; and finding this not satisfactory, it is said, Mr. Addington voluntarily proposed to reinstate Mr. Pitt in his former offices, and to accept himself a subordinate employment. Mr. Pitt, however, it is asserted, declined, unless he had a *carte blanche*, allowing him the sole nomination of every member of the cabinet; such a proposal was deemed unreasonable by the other party, and the negotiation terminated. In March two messages from his majesty were delivered to parliament, which formally announced the great preparations in the enemy's ports, and the discussions which were pending between the English and French governments. In May these discussions terminated unfavourably, and the respective ambassadors were recalled. The papers relative to the causes of the rupture were immediately submitted to both houses. On the 23rd of this month an address to the king being moved, Mr. Pitt delivered his opinions, in reply to Mr. Erskine, at great length. He said, that upon the justice and necessity of the grounds on which we were compelled to enter into the war, he thought it almost impossible that the house should

not be unanimous. In those transactions which had most immediately produced our present situation, the learned gentleman himself (Mr. Erskine) appeared, notwithstanding some doubts which he had thrown out on particular points, to admit, upon the whole, that there was such clear evidence of views of aggression and hostility on the part of France, as justified this country in retaining Malta for its own security. This he maintained to be the first great point on which the question turned; and he contended that the whole of Sebastiani's report, and the circumstances of his mission to Egypt, the express and deliberate avowal by Bonaparte himself, of his views and intentions in a formal conference with Lord Whitworth, and the information of the same intentions through the official channel of the minister for foreign affairs, afforded the clearest and most indisputable evidence that the first consul had formed the determination, even while Malta was yet in our hands, of resuming his hostile projects against Egypt; that the pursuit of such a project was an undeniable act of hostility against this country, and aimed at some of its most important interests; that it was, besides, a direct violation both of the letter and spirit of the treaty of Amiens itself, under pretence of which treaty alone our evacuation of that island was demanded. With respect to the avowal of his design by the first consul himself, he referred to Lord Whitworth's account of the meeting in his despatch of the 21st of February, which took place by the express appointment of the first consul—that it was therefore evidently prepared and deliberate. In the course of this conversation the first consul did not attempt to disguise his ultimate views upon Egypt; and in a subsequent conversation with M. Talleyrand, it was expressly admitted that the acquisition of Egypt had been, and still was, a favourite object of the first consul. To all the evidence founded on these several documents he had heard but one argument proposed—the improbability of the French government thus disclosing its views, if it really entertained them. He thought, however, that the difficulty of accounting for the disclosure was removed, by referring to the new and peculiar policy which had marked the conduct of France from the very beginning of the revolution. Where any measure was in contemplation more flagrant and atrocious than another, instead of carefully concealing it till the moment of execution, it had, on the contrary, been studiously announced beforehand; that the object of this policy had been gradually to familiarize men's minds to that which at first they could scarcely even believe; and that their schemes, which, in the first instance, were received with horror, and would have been opposed with indignation, came afterwards to be contemplated with neglect and indifference; and, in the end, such as it was hopeless and impossible to resist. He therefore put it to the house, whether, after having observed this practice, it was possible for us to be so credulous and childish as to act on the belief that Bonaparte would abandon the projects he had formed, only because he had himself told us he would persist in them; and he wished the house to consider what was to be our future conduct, if, after all the warnings given us, we were now to surrender Malta out of our hands, and the attack upon Egypt were to follow in six or in twelve months afterwards. If the question were closed here, Mr. Pitt observed that, for the reasons he had given, he was prepared to maintain, that on these grounds alone

the war was both just and necessary, and such as ought to call forth the utmost exertions of parliament and the nation in its support. But so far was this from being the case, that there were not any one of the leading transactions subsequent to the treaty of Amiens to which his majesty's declaration referred, which was not, in his opinion, as far as justice was concerned, a clear and evident cause of war; and such as would have been acted upon, if there were sufficient means of co-operation on the continent, in almost every period of the history of this country. He here alluded to the annexation of Piedmont to the transaction respecting the German indemnities, where the French government, with an arrogance, he believed, unprecedented in the history of Europe, had presumed to dictate to all Germany the detailed mode of arranging those indemnities—to the violence offered to Switzerland, on which he thought it the less necessary to dwell, because he believed the conduct of France towards that unfortunate and devoted country had excited one universal sentiment of detestation—and lastly, to the continuance of the French armies in Holland. After dwelling on these points it was impossible to contend that they were not symptoms of that deliberate system of ambition and encroachment which had been thus uniformly pursued towards others, and which was now directed to a quarter where it immediately affected our separate interests, and was in direct violation of the treaty with this country itself. He here drew a strong picture of the continued and rapid succession of the acts of violence and oppression which, during this period, had desolated so many of the countries of Europe; and after comparing the irresistible force and overwhelming progress of the French ambition to those dreadful convulsions of nature, by which provinces and kingdoms were consumed and buried in ruins, he asked whether we could contemplate those scenes of havoc and destruction without reflecting how soon that torrent of liquid fire might direct its ravages against ourselves? Having closed his review of what had passed on the continent, he would next refer to two points which appeared in the correspondence. The first was the demand which had been made by the French government, respecting the restraints on the liberty of the press and the expulsion of the French emigrants now remaining in the country. On this it was unnecessary to enlarge, because the insolence of the proposition was sufficiently felt, and because it had been at the time resisted by his majesty's ministers on grounds which were stated with great force and ability in one of the papers on the table. The second point related to the commercial agents; the indignity and outrage which attended their mission was one of which it was difficult to speak with composure. The French government had made a formal proposition to send persons of this description, who had never been found necessary even when a commercial treaty subsisted, at a time when not only there was no such treaty, but when, as appears from the papers on the table, the commercial intercourse of his majesty's subjects with France was suffering every degree of violence and oppression.

This proposition had naturally and wisely been refused. The French government then proceeded clandestinely to send these agents in the train of their ambassadors; and not content with this breach of the law of nations, they afterwards addressed to them instructions under the official character in which they

had received admittance; and the object of these instructions was to direct them to take measures in time of peace for ascertaining the soundings of ports, and for obtaining military information of districts; acts for which they would have been hanged as spies in time of war. He maintained, therefore, that all these indignities and insults, as well as the encroachments and violences of which he had before been speaking, on the continent, must enter deeply into our consideration in judging of the character and ultimate views and policy of our enemy. They must decisively confirm us in the resolution to employ, without hesitation, the most vigorous and determined resistance; he felt convinced that there never was an occasion on which it more clearly became the indispensable duty of parliament to concur with his majesty in the declaration of the necessity and justice of the war in which we were engaged, and to assure him of firm and effectual support. But in giving these assurances he trusted that other gentlemen felt impressed with the same sense which he did of the awful importance of the engagement into which they were preparing to enter, and that they considered those assurances not as formal words of ceremony or custom, but as a solemn and deliberate pledge on behalf of themselves and the nation whom they represented. For his own part, although he regarded the war as a war of necessity, and one which we could not decline without surrendering both our security and our honour, he should enter upon it with little hopes of ultimate success if these sentiments were not deeply impressed on the minds of parliament and the people. The scale of our exertions could not be measured by those of former times, or confined within the limits even of the great, and, till then, unexampled efforts of the last war. Some system far more vigorous and effectual than any even then adopted would be found necessary, both in our finances and in the preparation for national defence. He was persuaded that it could only be by providing in the outset means adequate to the whole extent of these purposes, that could ensure the best chance either of bringing the contest to a speedy conclusion, by convincing the enemy of our sufficiency to maintain it, or could meet its continued exigencies, if necessary, without the annual recurrence of growing and accumulated embarrassments. We had not an option at this moment between the blessings of peace and the dangers of war. From the fatality of the times, and the general state of the world, we must consider our lot as cast by the decrees of Providence in a time of peril and trouble—he trusted the temper and courage of the nation would conform itself to the duties of that situation—we should be prepared collectively and individually to meet it with that resignation and fortitude, and at the same time with that active zeal and exertion, which, in proportion to the magnitude of the crisis, might be expected from a brave and free people; and we should reflect, even in the hour of trial, what abundant reason we have to be grateful to Providence for the distinction we enjoy over most of the countries of Europe, and for all the advantages and blessings which national wisdom and virtue have hitherto protected, and which it now depends on perseverance in the same just and honourable sentiments still to guard and to preserve. Such were the sentiments of Mr. Pitt upon the causes and consequences of the war.

From the occasional opposition which Mr. Pitt had made to government, it was now evident that he was

dissatisfied with the general measures of Mr. Addington's administration. A motion which he made in the month of March for an inquiry into the state of our naval force, very fully discovered that this dissatisfaction was of no ordinary extent. He proposed a series of motions for an address to his majesty, praying that he would be pleased to give orders for laying before the house a variety of documents relative to the state of our naval force in the years 1790, 1801, and 1803. Dissatisfied with the measures which ministers had adopted for the defence of the country, Mr. Fox, on the 23rd of April, moved, that it be referred to a committee to revise the several bills which had been passed during the last and present sessions of parliament, for the defence of the country, and to consider of such further measures as may be necessary to render the said defence more complete and permanent. He supported his motion in a very long and able speech; Mr. Pitt argued on the side of Mr. Fox, and went into a direct and bitter opposition. He expressed the most decided disapprobation of the measures of government. The spirited exertions which had been made to organize the strength of the country were not, he said, to be ascribed to the direction and energy of ministers. No one measure could they claim as their own; no one measure had they improved and perfected; but many they had weakened and destroyed by their incongruities. Whatever, then, the spirit and zeal of a free and brave people may have been under the sense of danger, ought fairly to be separated from the tardiness, languor, and imbecility of ministers, in every thing of which they have assumed the direction.

The first public intimation that a change in his majesty's government was in agitation was indirectly communicated to the house of lords by Lord Hawkesbury. On the 30th of April a resignation of part of the ministry took place; and it is said that a communication from his majesty was made to Mr. Pitt on the 3rd of May, through the medium of the lord chancellor. The high office of chancellor of the exchequer was at this time offered to Mr. Pitt; but the tender is reported to have been made with an express stipulation against the revival of the catholic question, and the admission into the cabinet of the great leader of the old opposition. On the 7th of May an interview took place between his majesty and Mr. Pitt, upon which occasion his majesty is said to have expressed no objection to Lord Grenville, Earl Spencer, Mr. Windham, or indeed to any of their friends, with one exception. Upon this point his majesty's resolution was unalterably fixed. A few hours after the interview Mr. Pitt communicated the result to Lord Grenville. His lordship, it had been stated, immediately observed to Mr. Pitt, that without including Mr. Fox in the administration, and without a complete abandonment of the principle of exclusion, not a single member of the new opposition would accede to any new ministerial arrangements. It may be proper to mention that the leading members of the new opposition were the lords Grenville, Minto, Fitzwilliam, Carlisle, and Spencer; Mr. Fox, Mr. Windham, Mr. Grenville, and Mr. Elliot. When the personal objection to Mr. Fox was stated to him, and the firm determination of those with whom he had lately acted, not to form any part of an administration from which he was to be excluded, he is reported to have expressed his desire to see his majesty surrounded by a strong administration, and wished the members of

the old and new opposition not to be influenced by any personal feeling, but consult only the good of the country. Notwithstanding this liberal advice they refused to accept of power without the support of his official co-operation. An explicit declaration of the sentiments of those with whom Lord Grenville acted was formally made to Mr. Pitt, in a letter dated the 8th of May, 1804, of which his lordship is universally believed to be the author. The sentiments of Mr. Pitt on the subject of the formation of the ministry were expressed in the debate on the measure which he afterwards proposed for the augmentation of the public force. The choice of ministers, he said, rested wholly with the crown. It was the undisputed prerogative of his majesty to select and leave out whom he pleased. This was one of the essential fundamental points of our monarchical constitution. With a direct reference to Lord Grenville and several persons for whom he had great affection and esteem, he expressed his regret that they had declined the assistance and co-operation which he had wished to obtain. He reminded them of the favourable opinions they had lately entertained of him when, thinking higher of him than he did of himself, they had called for his return to office, singly and unconditionally, and said, that circumstance alone would re-inspire them with confidence and command their support. His allusion to Mr. Fox was marked with less personal and public regret; for it seems Mr. Pitt doubted whether his admission into the cabinet would, at the same time that it might communicate energy to his majesty's councils, contribute to produce that decided unity of operation which appeared to be so exceedingly desirable. Sincere as he was in his wishes for an extended administration, Mr. Pitt said, that the radical difference of associates which this question had discovered, led him to doubt whether it could have been achieved with any permanent or beneficial effect—an union of elements so discordant might, be conceived, have produced an effect very different from what was hoped and intended. Mr. Pitt again became chancellor of the exchequer, and other places in the administration were filled by lords Hawkesbury, Harrowby, Melville, Camden, and Messrs. W. Dundas and Canning, to the exclusion of the friends of Lord Grenville, Mr. Addington, and Mr. Fox.

*Pitt*

The new administration having taken their seats, some efficient measures with regard to military force were expected, and indeed the residue of the session was almost wholly devoted to this subject. On the 5th of June Mr. Pitt submitted to the house a motion for raising a permanent military force, and for the gradual reduction of the militia. The ballot was abolished: the whole task of supplying the quota of men thus rested upon the parish officers, and a time for non-compliance was established. No measure produced longer discussion than this, and it was finally carried by a majority of forty-two, notwithstanding the opposition of the Grenvilles, the Foxes, and the Addingtons. Little of importance to the subject of these annals passed during the session.

But we must now hasten to the close of the life of this extraordinary man. His health had long been declining under the fatigues incident to incessant at-

tention to public business. He had been to Bath for the benefit of the waters, and returned to London for the purpose of attending the meeting of parliament, when his disorder increased to an alarming degree. His nervous system was so shattered as to deprive him for weeks together of sleep. Water in the chest and extraordinary debility of the stomach supervened.

On Tuesday, the 21st of January, 1806, his disorder was so aggravated that all expectation was at an end. It became necessary for his physicians to declare an opinion, and that Mr. Pitt himself should be made acquainted with his imminent danger. The bishop of Lincoln, his tutor and friend, who had constantly attended him, fulfilled the painful office with firmness. Mr. Pitt was hardly sensible:—this dreaded shock had scarcely power to dissipate his lethargy; but after a few moments he waved his hand, and was left alone with the bishop. He had desired that some papers should be brought to him, to which his signature was necessary; and after he had settled all worldly concerns, he desired to receive the sacrament from his venerable friend, and it was accordingly administered. Some time passed in the solemn duties of religion. His will was made in a calm interval between this time and the following day. He had signified a desire to write a few lines, but his exhausted condition deprived him of the power. The physicians now thought proper to discontinue medicine. During the morning of Wednesday repeated enquiries were made after him, and a statement of his danger was transmitted to his majesty, to his relations, and most of his friends; Lady Hester Stanhope, his niece, and Mr. James Stanhope, had an interview with him on Wednesday morning, and received his last adieu; his brother, the earl of Chatham, took his last farewell in the afternoon. The bishop of Lincoln continued with him all night. The mortal symptoms were now ap-

proaching to a crisis. His extremities were already cold, and his senses began to fail. As a last and desperate effort to protract life, blisters were applied to the soles of his feet; they restored him to something of sensation and recollection, but they could arrest nothing of the progress of death. It is said that he continued clear and composed till a short time before his dissolution, which took place without a struggle, at half-past four on the Thursday morning, of the

24th of January, 1806, and the last words that trembled on his lips were "Oh! my country!"

A very fine monument was erected to the memory of Mr. Pitt in Westminster Abbey. It was executed by Mr. Westmacott, and is represented in the previous engraving.

PIUS VI.—The life of this pope is one of the most interesting biographies of modern times. His secular name was John Angelo Braschi, and he was born in 1720. He was the last male representative of a noble family of Cerena, the ruin of whose fortunes drove him from the place of his nativity, which he never revisited till after his elevation to the papedom. He followed the profession of the law for some years in Rome with no very brilliant success, but with more reputation for subtlety than eloquence. He was at last created a prelate by the cardinal Rezzonico, nephew of the reigning pope Clement XIII.,—a barren and nominal dignity, and chiefly of value as designating those who are intended for more substantial preferment. The pope had a taste for magnificence, and his nephews a strong desire to make their fortunes. Braschi was first employed as an architect, and afterwards made grand treasurer to the church. On the accession of Clement XIV. the treasurer was suddenly called to account; and though he disguised his mismanagement under a formidable array of ciphers and calculations, he was immediately dismissed. The new pope, however, could not help making him a cardinal, this being a reward to which all who have served in the office of treasurer are legally entitled. Ganganelli showed his displeasure, however, by awarding a very scanty pension to the new cardinal. In modern as well as in ancient Rome the affectation of imbecility is often the mask of the most determined ambition; and Braschi, in that mother-land of intrigue, appears to have acted on the model of the elder Brutus. Without counterfeiting absolute incapacity, he held out the appearance of the most contented and unpretending mediocrity. He passed his time with persons of irreproachable morals and inferior talents; and, without affecting any austerity or zeal for religion, displayed in all his conduct a quiet submission to its authority. He neither sought to distinguish himself by a passion for literature like Lambertini, nor for the arts like Rezzonico, nor for the liberality of his philosophical opinions like Ganganelli. His poverty, and the simplicity of his life, disarmed all suspicions of his ambitious designs; and while his friends predicted nothing for him but a life of quiet insignificance, his more aspiring brethren either overlooked him in silent contempt or reckoned upon him as a safe and pliant auxiliary in their own struggles for distinction. The death of Ganganelli in 1775, and the proceedings of that conclave which raised him to the papedom contrary to the wishes and intentions of most of its members, at once disclosed the objects and the fruits of this long dissimulation. We may here briefly detail the way in which one of this body is raised to the papal chair. The number of cardinals is generally about seventy—seldom more than two or three under or over. Of these the greater part are altogether insignificant and passive and mere tools in the hands of a few active leaders. These efficient persons again are generally divided, when a conclave is held into two regular factions or parties; the one consisting of those who had held office in the time of the last pope—the other of those who had been raised into consequence by his immediate predecessor; for as popes

proaching to a crisis. His extremities were already cold, and his senses began to fail. As a last and desperate effort to protract life, blisters were applied to the soles of his feet; they restored him to something of sensation and recollection, but they could arrest nothing of the progress of death. It is said that he continued clear and composed till a short time before his dissolution, which took place without a struggle, at half-past four on the Thursday morning, of the

are generally elected in advanced life, their partisans survive them for a long time, and acquire, by experience and management, an influence quite equal to that which belongs to the recent possessors of authority. A third interest in conclaves, and often the most considerable of any, is that of the foreign cardinals, who represent the political views of the catholic states to which they respectively belong. Since the middle of the sixteenth century, when the supremacy of the holy see first began to be questioned, the catholic powers have commonly insisted on the papal election being made on the principle of the balance of power,—and France, Spain, and Portugal have always claimed and exercised the power of interposing with an absolute *veto* against any individual nomination. It is enough to exclude any candidate that the representative of any of these powers shall announce “*Il mio Re non lo vuole.*” Austria substantially enjoys the same right, though it is not formally recognised. Since the time of Adrian VI., who was obtruded by Charles V., all the popes have been Italians. The cardinals, who are all settled in that country, are resolute not to give themselves a foreign master; and the states that must otherwise contend for the preference are generally content with the compromise. The only other general principle seems to be, that the choice shall fall on one with talent enough to save the office from degradation and abuse; but not of that commanding genius that would defy control or disdain assistance. Constitutionally, the pope is a very absolute sovereign; but in practice he is generally but the head of an oligarchy.

In 1775 the great question in the catholic church was the restoration or continued suppression of the Jesuits. That extraordinary body had no doubt become formidable to the holy see itself; but, on the whole, it was the decided wish as well as the manifest interest of the church, to restore them. They had been by far the most powerful champions of the catholic faith, and had done the most to restore it to its ancient influence and splendour; while no small part of the great wealth which they collected in the cities of Europe, and their great establishments in Asia and America, found its way to Rome and helped to maintain the pomp of the Vatican as well as to gratify the cupidity of the more powerful cardinals. On the other hand, all the temporal princes of Europe insisted on their suppression; and Ganganelli, probably recollecting the example of our Henry VIII., had thought it prudent to comply. He was now no more; and it was the great object of the catholic sovereigns to prevent him from being succeeded by one of greater enterprise and resolution; while all those who shared in the devoted and insatiable ambition of the priesthood were anxious above all things for the restoration of this dominant order. It was by availing himself of the eagerness of these two parties that Braschi became Pius VI. The cardinal Rezzonico, his first patron, was the great advocate of the Jesuits; and knowing the secret ambition and boldness of Braschi's character, privately proposed to use his great influence in raising him to the pontificate provided he would rescind the act of their suppression. The proposition was accepted; and their manœuvres were begun with all those refinements of duplicity which have so long distinguished the policy of Italian intriguers. The night before the conclave was assembled, Braschi, by the advice of his patron, went secretly to the ambassadors of all

the catholic sovereigns then in Rome; and after alarming them with tales of Rezzonico's zeal for the Jesuits which was sufficiently well known, and of the efforts he would make to get himself elected, assured them, that if they would give their aid and influence to himself, he would undertake for ever to defeat the schemes of Rezzonico and all his adherents. Their excellencies knew too little of the real character of their visitor to think this the most feasible way to effect the object in view, but had no hesitation in promising that their *veto* and their influence should be employed in support of that party which was most able and willing to keep down the obnoxious order. After the conclave is once assembled, its members can hold no avowed communication with the external world till the great work of election is concluded; nor is it easy to learn with precision what takes place during their long seclusion. It is known, however, that as the concurrence of a certain number is indispensably necessary, and all the suffrages are given in sealed writings, it is usual for the opposite parties mutually to try their strength, and to mask their own designs, or penetrate those of their opponents, by a long series of tentative or preparatory elections, in which the pretended favourites are always so multiplied as that none shall have any chance of uniting the requisite number of voters, while, at the same time, something may be learned or concealed by the different combinations which are exhibited in their results. These, which take place every morning, are denominated, *pro forma* elections, and the votes given in them are said to be *in honorem*. Braschi, as an insignificant and unlikely person, at first received many of these contemptuous compliments. At last Rezzonico began to raise him to importance by pretending to reveal to his own party the secret of his nocturnal visit and alarming engagements to the foreign ministers; and hinted, at the same time, that the only safe way to counteract him would be, to raise him (Rezzonico himself) to the envied dignity. The foreign cardinals, seeing this strong verification of Braschi's private communication, and considering that he alone had pledged himself to keep down the Jesuits, immediately offered him all their support to avert the impending danger; while Rezzonico was no sooner apprized of their accession than he contrived, late at night, and after all danger of communication was over, to slip into the hands of his own partisans a circular, in which he informed them “that the ingratitude and perfidy of Braschi had disgusted even his corruptors, who were aware that they could never carry through the election of a man so abandoned; but that they had fixed upon another deserter from their party, whom he could not then venture to name, but on whom all their votes would be bestowed the morning following. To counteract this new plot, it was therefore necessary that they should act with caution; and as Braschi would be abandoned by his new friends on the morrow, and would probably have no votes whatever, the safest course, in the mean time, would be for them all to give their suffrages to him.” The votes were accordingly given; and both parties, acting under this double delusion, were equally astonished, when, upon opening the seals, it appeared that Braschi had obtained his election. The new pope, however, proved false to his friend Rezzonico, as well as to all the rest, and never took a single step towards the restoration of the Jesuits.

As soon as the prize was within his reach, the

mask was dropped, and the bold and ambitious character of the pope was disclosed. From the first hour of his elevation he assumed the tone of an absolute prince, and ruled more independently of his cardinals than any other pope on record. When asked on what footing he wished his household to be established, instead of replying with the affected humility of his predecessors, he answered at once, "On the footing of a sovereign." Since the disgraceful reign of Alexander VI., and the oppressive one of Adrian VI., no pope had ventured to take a name to which the number *six* must attach. But the new pope despised all augury; and boldly took the appellation of Pius the *Sixth*—a boldness which, it is said, he bitterly repented in the days of his disasters and decline. In the meantime, however, he was so little under the influence of those fears that he scandalized the whole catholic world "by ascending the papal chair bare-headed, and with his hair powdered." The popes wear generally a cap or bonnet, called the *Papalina*, which formed an indispensable part of their costume. His toilette, of course, was copied by all the gay ecclesiastics; and the ancient canons, which regulated the priestly vestments, fell into alarming neglect. Those were follies, no doubt—and not the follies of a lofty nature. But it is not true that they were united in this instance with the vices that often attend them. Pius VI. was a coxcomb in his dress, but he was not profligate or licentious in his habits—nor is there any justice in ascribing to his supposed lenity towards vice that general relaxation of private morality of which the age in which he lived may so justly be accused. The truth is, that luxury, and the corruptions to which it gives birth, had by this time attained such a head in all the civilized parts of Europe, that to have affected to treat every case with rigour would only have increased the scandal without diminishing the sin. The destruction of liberty, and the increase of commerce, had co-operated to produce this evil: the former, by depriving the wealthy and noble of any other occupation or pursuit but that of pleasure; and the latter, by supplying in increased abundance the means of these gratifications.

There have long been at Rome two magistrates called the Vicario and the Viceregente, who exercise the office of censors, and have power to call before them all individuals of either sex whose conduct gives occasion to scandal. Pius judged that the public discussion of such matters must do more harm than good to society. He knew also that the powers of these censors were often abused. He felt, in short, that the institution was no longer suitable to the age, and certainly did what he could to abate the activity both of this tribunal and of the inquisition.

In another matter he gave still more offence, that was in his endeavours to prevent the abuse of sanctuary—under which the churches and the houses of ambassadors had become the common resort of assassins and all sorts of malefactors. The privilege itself he could not entirely abolish, but he instituted so vigilant a police as very frequently to intercept it; and now and then struck at notorious offenders with "a vigour beyond the law." The impunity which hired murderers continued to experience during his reign is to be ascribed much more to the abuse of the diplomatic privilege than to any neglect of the sovereign.

Pius was a patron of genius, but preferred the fine arts to literature or science; and he was neither a

very learned nor a very impartial patron. His greatest weakness was in patronizing or tolerating the Arcadians. The name is not very celebrated we believe in this country, yet all the curious are aware that there has existed at Rome for 150 years an academy or corporation of poets under that appellation. It was set on foot at a time when such affectations were more tolerated; but for many years it had become a reproach and a nuisance and had filled Italy with its shepherds and affiliated societies, into which any one who could produce a sonnet and a sequin found easy admittance, obtained the *brevet* of poet, a pastoral name, and a grant of lands in some romantic district of the ancient Arcadia.

Rezzonico did much for the arts by founding the museum which was called Clementino; and Pius also ventured on another work which no artist since Bramanti and Michael Angiolo had had the courage to contemplate. A sacristy was wanting to St. Peter's, but on the only spot on which it could be erected stood an ancient temple of Venus. Pius threw it down and raised the sacristy in its place.

The enormous sums he expended in these undertakings showed but little regard to the comfort of his successor; and though elective sovereigns can hardly be expected to attend much to economy, there are very few even among the popes who have carried this abuse so far as Pius VI.

The creditors of the apostolic chamber at this period were partly the subjects of the pope, and partly other Italians, chiefly the Genoese; they received three per cent. interest. There was at that time the most unlimited confidence in the Italian governments, which they owed to their antiquity—to the peace which all Italy had enjoyed for half a century—and, above all, to the punctuality with which they fulfilled their engagements in matters of finance. Even after the French had passed the Alps money continued to be poured into the public funds; and Rome, being at a distance from the seat of war, and considered as a sacred city, appeared the most secure place of deposit for the capitals of individuals. Notes of the value from 2*l.* to 3*l.* had long been in circulation, but Pius greatly increased the number and issued at the same time notes for very small sums. The effect was immediate: a depreciation instantly took place, which was met and increased by new issues of still falling paper. The people, in whose hands it was hourly losing value, found themselves beggared in the midst of plenty; and, while the annuitants and stockholders were ruined, the bankers amassed such riches as enabled them to purchase estates and titles of nobility. Pius, however, went on with his buildings, and, to defray the expenses, established manufactories to be supported by government; but as there was no capital or habits of industry, and as all who had any money were eager to secure it on land, the experiment ended in increasing the disorder of the finances. The next project was the extension of agriculture, which certainly appeared in some respects more inviting. Of that vast tract of country which is called the *Agro Romano*, the whole of which is capable of culture, hardly a fourth part is cultivated: the rest is abandoned from the want of capital and population. Its low situation and the stagnant moisture, extending over so great a surface, frequently infects the air and thins the population of the adjoining districts. Pius VI. was advised to advance money to the proprietors to enable them to build houses

and procure implements to be given to such inhabitants of the bordering mountains as would agree to quit their steril lands and descend into the plain. Instead of adopting this easy and practicable plan of improving the Agro Romano, Pius undertook a project which might have suited the Roman emperors in the period of their prosperity. He exhausted all his efforts and all the resources of his paper money in attempting to drain the Pontine marshes. He did succeed in part, and more perhaps might have been done had he entrusted the management to better hands. But the project in itself appears hopeless; the sources of much of the water being below the level of the sea. By means of canals, however, and a great number of drains, the water was drawn off from the higher parts of the surface into the lower marshes: but the stirring of the soil, chiefly composed of putrid vegetable substances, corrupted the atmosphere, and the infection of the mal-aria, which formerly had but slowly insinuated itself among the neighbouring inhabitants, now rapidly extended its ravages, and the population of Piperno, Sezza, and Sermonetta, who had formerly enjoyed at least intervals of health, were now constantly exposed to its deadly influence. Pius slackened his exertions but laid open the Via Appia, one of the most striking monuments of ancient Roman greatness, and still extremely beneficial to commerce. The small portion of the marsh that had been made capable of cultivation was, however, thought of sufficient importance to be reduced to an ecclesiastical fief, with which he invested his nephews, the two sons of his sister, to whom he gave the name of Braschi.

The discussion and recrimination attending the suppression of the Jesuits had unveiled the secrets of the corruptions of the catholic church and the fatal effects of the supremacy of the popes over the powers of Europe. The Jansenists maintained that the successors of St. Peter had no right to temporal power; and Joseph II. placed Jansenists in all the churches and universities of Italy that they might there propagate that doctrine. The grand duke Leopold adopted the same policy, and the court of Naples refused the ancient right of vassalage to the pontiff. Pius attributed the conduct of the catholic courts more to the ministers than the sovereigns,—and more to the sophism of a few philosophers than to the real cause, the progress of the principles of liberty: and vainly imagining that his presence would excite such veneration among the people that the rebellion of the prince against his authority would be immediately checked by his appearance, he determined to go to Vienna in the hope that, if he could bring over the emperor to his views, he would have nothing to fear from the spirit of reform elsewhere. His departure was only announced at Rome, when he was some miles on his way, by the ringing of bells. He travelled in the simplest style, with no other suite than three bishops, one secretary, four servants, and not a single cardinal. It is supposed that he affected this simplicity on account of an ancient prophecy of the twelfth century, in which Pius VI. is described as a pilgrim, with the title of *Peregrinus Apostolicus*.

He was met some miles from Vienna by the emperor, who begged him to quit his coach, and placed him at his right hand in his own carriage. Instead of conducting him to the archiepiscopal palace, where the pope had ordered apartments, and a sort of ecclesiastical court to be prepared for him, Joseph

lodged him in an imperial palace, and appointed him a guard of honour and chamberlains, who watched all his motions. After having exhausted his patience in vain expedients, Pius VI., in a very short letter, written with his own hand, peremptorily demanded a private conference with the emperor at a certain day and hour. He might have refused this; for, in a letter, the tone of which does more honour to his frankness than his politeness, and of which we give a literal translation, he had already told the pontiff that he could only promise him at Vienna the honours of hospitality. "Since your holiness," said the emperor, "is determined to come to Vienna, I can only assure you of the reception and veneration suitable to your dignity. For if your holiness expects to settle affairs with me, they may appear questionable at Rome, but are already decided at Vienna; and in that case the journey would be useless. My decisions are always guided by reason, equity, humanity, and religion; and above all, by the counsels of wise, honest, and enlightened persons: and for the holy chair and your holiness, I have the devotion of a true apostolic catholic; and I implore your paternal benediction." Dreading, however, an open rupture, Joseph agreed to the interview. Pius conducted himself with much dignity, and foreseeing the inutility of entreaties, he confined himself to reasonings and exhortation. He urged the former concessions of the monarchs, their obedience to the pontiffs, the divine right, and the bulls of his predecessors, the imminent dangers of religion from a general rebellion, of which the monarchs themselves set the example to their people. Joseph was fully prepared with the arguments of the Jansenists against all the ancient maxims of divine right. The emperor treated as forgeries those charters which in the middle age had enriched the priests and monks with the spoils of nations and of kings; and as to the royal concessions, he alleged that having been extorted by force and cunning, in periods of gross ignorance, there was no injustice in retracting them in better times—that the corruption of religion had its source in the church itself, and that the only way to purify it was for the priests to recur to the practice of the apostles, which they had quitted for the purpose of ambition, and that it was in fact the priests who had at all times fomented the revolt of subjects against their legitimate sovereigns.

Joseph II. fatally experienced the truth of this last observation a few years after. We are little inclined to believe that he died by poison, and still less that Pius VI. had any share in his death. But the prince de Ligne, who witnessed his last moments, asserts that he died broken-hearted on account of the revolt of the nobles and bishops of Brabant; and from the conduct of the higher clergy at the commencement of the French revolution, it can hardly be doubted that, if they had agreed to bear their share of the necessary taxes, the noblesse would have followed the example, and the revolution would have been either prevented or rendered far less terrible.

The effects of this journey were more disastrous than can be well explained by any thing that occurred in it; or rather it coincided with other causes of discontent which had been for some time increasing. In certain states of the public minds, the absence of the sovereign, or the slightest miscarriage in his design, may be fatal to his popularity. Pius travelled in the same modest style on his return into Italy, except at Cesena, where he drained their little treasury for the

expense of his fetes; in return for which he promised them several public institutions, which he never had the means of establishing. All this added nothing to his popularity. He had left Rome, dreaded by all his subjects, and he returned despised. Even the populace mocked at his benedictions, and cried out for bread. He endeavoured to appease them by arbitrarily reducing the price of grain, which ruined the proprietors; and at last, by making the weight of his arbitrary power fall on the great, he succeeded in changing contempt into hatred. He constantly changed his ministers, and sought by new acts of severity to stifle the clamours produced by acts of tyranny, which now daily multiplied. The disgrace of Cardinal Rohan, and of the church in general, had filled his heart with bitterness and melancholy sentiments. In signing his name, he frequently stopped to meditate on the fatal number VI., and said to his favourite secretary Nardini, I fear the church will have no pope after I am gone. In the vast church of St. Paul, *extra muros*, there is a long series of medallions, the portraits of all the popes, and there only remained one vacant space for that of Pius VI. These omens had not escaped the populace; and though Pius affected to laugh at them, he was not the less alarmed in his heart. At last the revolution, and the advance of the French in Italy, forced him to assemble the cardinals, that the ruin of the church might not be imputed to him alone. Some members of this consistory proposed conciliatory measures, others were eager for a crusade against France; a third party maintained that it would be sufficient to place the fortresses and frontiers of the ecclesiastical territory in a state of defence, and obtain the assistance of the English fleets in the Mediterranean, without troubling themselves about their neighbours. Cardinal Albani was of opinion that they ought to avoid as much as possible mingling the affairs of the church with their political arrangements; and that by sacrificing their ecclesiastical quarrels and pretensions, all the princes of Italy might be united in an armed confederation, offensive and defensive; and that the pope, for the future, should rather consider the common safety than his individual pre-eminence.

If Pius had pursued the policy of Gregory VII., who united all the states of Italy in their resistance to foreign powers, it is probable that their subjection might have been at least retarded, and their humiliation less certain. The Italians were the only natural defenders of the church and of Rome: while the pope alone, by means of his religious influence, had the power to found and consolidate a durable confederation. But instead of this, the policy of Pius seems to have been to foment dissensions among the other states, and this system was persevered in, even on the approach of Bonaparte, when there was no longer any chance of safety but in a vigorous union. Each little state, dreading the French, and distrusting its neighbours, prepared to purchase for itself a partial peace. Piedmont alone made a long resistance. Yet the people in general were far from approving of the French revolution; they had been for centuries accustomed to their governments, such as they were; and had little desire, and little notion indeed of any better. The love of liberty prevailed only among a part of the *tiers état*, which in Italy, as every where else, form the most enlightened part of the nation; but which, though apt enough to be most inflamed by political theories, is incapable of acting

with effect, unless supported by the strength of the populace or the influence of the nobility. Besides, in Italy they had been long condemned to silence, and did not abound in wealth. Such of the nobles as could do it with impunity, or thought themselves able to govern their fellow-citizens, declaimed loudly at first in favour of the new political philosophy; but no sooner had the revolution actually begun than, alarmed by the sacrifices demanded of them, they basely deserted the cause they had so warmly adopted. The authority of the pope was now fast expiring; and he in vain endeavoured to check the progress of superstition and forbid the secret conspiracies against the French.

Aided, rather than checked, by fanaticism, and the secret conspiracies instigated by Cardinal Ruffo and Cardinal Zelada, Bonaparte advanced. The army of the pontiff fled; and Berthier, encamping on the heights of Mount Maria, summoned Pius to surrender Rome or see it bombarded. He solicited an armistice, and made a present to Berthier. Berthier gave him time to send ambassadors, who went with Azara, the Spanish minister, as mediator to Bonaparte, who granted him peace; and the pope ceded the three legations of Bologna, Ferrara, and Ravenna, with all their territories, together with a part of the Romagna, anciently called Emilia. Bonaparte signed this treaty at Tolentino, from whence he did not advance to triumph at the capitol, though he bestowed its crown on his son while in his cradle. Before the frosts of the north had shown that the genius and power of Napoleon were among the precarious gifts of fortune, the Italians had flattered themselves that he would one day transfer the seat of empire to Rome, as the only city from whence he could dictate to Europe.

The plains of Italy were not only the noblest theatre of Napoleon's military glory, but it was there also that he acquired the reputation of a genius born, not merely to conquer, but to reform and govern nations. When he conquered Italy, he kindled the flame of liberty in the place of religious fanaticism. He maintained the right of insurrection for the people that he might be invited to assist in driving from their thrones those princes who, incapable of defending their subjects, in fact merited their fate. He showed clemency to those who had been induced to revolt against him through the intrigues of the priests and nobles, while he profited by their tumults by laying impositions on the cities and churches.

While he was still but a general, and engaged in organizing the Cisalpine republic, many of the most clear-sighted Italians believed that Bonaparte's project then was, to make himself master of a great part of Italy, and to govern it as an independent prince, without risking his fortune and fame by again venturing among the storms of the French revolution; and the pains which he took to awaken the spirit and military valour of the Italians certainly gave rise to that conjecture. However, from the moment of his first victory in Italy to the hour when he signed his abdication at Fontainebleau, he never ceased to keep the new governments of Italy, their laws, and even their opinions, under the direct influence of France.

The changes which now took place in Italy were such as no imagination could conceive. Venice, which had obtained peace as a sovereign power, by a public treaty signed by Bonaparte, was, after fourteen centuries of independence, made over to Austria by a

secret treaty, signed at the same time by the same individual. The revolts set on foot by the Jesuits ceased in Lombardy the moment it was formed into a republic. But the pope was unable to restrain them in Rome, and some cardinals, by opposing treason to treason, only provoked and hurried on that revolution they wished to avoid. The directory sent emissaries to Rome to tamper with some patricians who were known to be irritated against the priests, and money and arms were distributed among the malcontents. In the meantime the police, without the knowledge of the pope, raised a tumult for the purpose of massacring the French and the conspirators. The French general Duphot, who was believed to be the chief of the revolutionists, was killed by some of the pope's soldiers. This was the signal for the populace to fall on the French and the revolutionists. Joseph Bonaparte, at that time ambassador, escaped with difficulty. But the result is easily foreseen. Military possession was taken of Rome—all negotiation was in vain—and Pius was seized in his bed, forced into a carriage along with a prelate, a senator, and a servant, and was thus, at the age of eighty, and in the twenty-third year of his pontificate, conducted out of his territories in the midst of a powerful soldiery. On beholding the tricolour flag waving over the capitol, he said with a sigh: "This is the anniversary of the day on which I was raised to the chair of St. Peter. I have before had similar warnings from heaven to think seriously and weep bitterly over my errors, which have hastened the ruin of my people."

On his arrival at Sienna an earthquake threatened the ruin of the city, and, instead of taking advantage of this event as directed against his oppressors, he attributed it to his own wrongs towards God; and issued a bull, in which, after releasing his subjects from their oath of allegiance, he recommended docility and submission to the laws of Providence and to the new government. He was conducted to the convent of the Chartreuse, near Florence, where, through the mediation of the grand duke of Tuscany, he was for some time permitted to remain; but he was not destined long to enjoy this repose. The French directory, pursuing its career, in a few months wrested his dominions from the grand duke, and conducted Pius into France. He was carried through the most populous cities of Italy in open day, but his presence excited neither alarm nor anger. No one made a movement to insult him, but no one breathed a sigh for his fate. The directory, however, fearing the effect of his presence among the French, did not permit him to proceed beyond Mount Cenis, and shut him up in the fortress of Briançon; but the advance of the allies in Piedmont soon forced him into a new prison, and he was lodged in the citadel of Valence. A young man, the count de Labrador, who accompanied him as commissioner of the king of Spain, exerted himself for the relief of the pontiff; and a French lady bestowed on him the cares and consolations which were necessary in one so worn down by age and infirmity. But the vicinity of Valence to Avignon, which before the revolution had belonged to the holy see, roused afresh the suspicions of the directory, and they ordered Pius to be transported to Dijon. This was a severe blow; but, on being ordered to quit his pontifical habit, he summoned all his courage. He had always worn it; and requesting to be carried in his chair, in full canonicals, before the French commissioners, he said:—"I am ready to follow you: I have

forgotten that I was one of the monarchs of the earth: but the ministry to which Providence has called me ought not to finish but when I shall have rendered up my account to my Eternal Judge."

Pius VI. died at Valence in France, on the 29th of August, 1799. In 1802 his body was removed to Rome, where it was buried with great ceremony and splendour.

PIUS VII.—This pope was the successor of Pius the Sixth during his confinement in France. He was born in 1740, and made a cardinal in 1785, to which was added the bishopric of Imola. Having conciliated the favour of Napoleon, he was raised to the papal chair in 1800, and on the 15th of July in the following year he signed the concordate, which terminated the schism of the Gallican church. In 1804 he went to Paris to assist at the coronation of Bonaparte, and he afterwards refused to confer a similar favour on Louis XVIII. By a decree of the 17th of May, 1809, the French emperor put an end to the temporal power of the pope, uniting his territories to the French empire, and Pius himself was detained a prisoner in France. In 1812 he was removed to Fontainebleau, where Napoleon obliged him to accede to a new convention, which he signed in January 1813, by which he promised to confirm the bishops; but the emperor having, contrary to agreement, proclaimed the concordate before its completion, Pius, whose consent had been entirely conditional, refused to concur in any concordate that should not settle all disputed points. He was therefore treated as a prisoner. In 1814 the pope was released, and restored to the possession of all the papal territories except Avignon Venaissin, in France, and a narrow strip of land beyond the Po. Although attached to the old hierarchal policy, as appears from his bulls and briefs against the distribution of the bible, against catholic Switzerland, &c., yet none of his plans for restoring the old state of things, except the revival of the Jesuits, were successful. The concordates with France, Bavaria, and the Two Sicilies, and the convention with Prussia, were, however, triumphs of the policy of the Roman court. His administration, which was moderate and wise, was much indebted for its character to Cardinal Consalvi, his intimate friend and minister. Rome became again not only the refuge of fallen princes and proscribed families, but the seat of the fine arts. Pius VII. died in consequence of a fall on the 6th of July, 1823, and was succeeded by Leo XII. This pope in his disposition was remarkable for mildness and benevolence.

PIUS VIII., FRANCIS XAVIERO CASTIGLIONE.—This pope was born at Cingolia, a small town in the states of the church, in 1759, of poor but respectable parents. He was early distinguished for his industry, talents, and learning; and having entered the church young, passed through all the orders of the hierarchy, having been created cardinal by Pius VII., and on the 31st of March, 1829, was unanimously elected pope by the conclave of cardinals on the death of Leo XII. Pius VIII. died December 1830, and was succeeded by Clement XVI.

PIZARRO, FRANCIS, a celebrated Spanish adventurer who was born about the close of the fifteenth century. He occupied the very humble post of swineherd at Truxillo, when the spirit of adventure, which at that period pervaded all classes in Spain, induced him to join in an expedition to Panama, which at first proved unfortunate. He, however, embarked

again, in conjunction with several other adventurers like himself, on the 12th February, 1526, and on the twentieth day after their departure discovered the fertile coast of Peru. They were yet too weak to attempt the invasion of an empire so populous, and Pizarro contented himself with carrying back, by means of an amicable intercourse, such specimens of the wealth and civilization of the country as might invite others to accede to the enterprise. Unable to bring the governor of Panama to adopt his views, he returned to Spain, and explaining to that court the magnitude of the object, obtained every grant of authority he could wish, but no other assistance; and being left to his own resources, could have effected nothing had he not been assisted with money by Cortez, just then returned from Mexico. It was February 1531 before he and his associates were again able to sail for Panama on their great undertaking, and then their whole armament consisted only of three small vessels and one hundred and eighty soldiers, thirty-six of whom were horsemen. When they landed in Peru, as they had the imprudence to attack the natives instead of conciliating them, they were at first exposed to famine and several other calamities. Pizarro, however, had the good fortune to enter Peru when the forces of the empire were divided by an obstinate civil war between Huascar the legitimate monarch, and Atahualpa his half-brother. By degrees understanding the state of the country, Pizarro engaged to be the ally of Atahualpa, and under that pretence was permitted to penetrate unmolested to Caxamalca, twelve days' journey within the country. He was received pacifically and with state as the ambassador of a great monarch, but, taking advantage of the unsuspecting good faith of Atahualpa, he made a sudden attack and took him prisoner. The exaction of an immense ransom, the division of which served to invite new invaders; the disgraceful breach of faith by which the king was kept a prisoner after his ransom was paid, and the detestable murder of him a short time after under the infamous mockery of a trial; with the insults superadded by bigotry to make him die a Christian, without being able to comprehend that faith; all contribute to accumulate disgrace upon the head of the treacherous and unfeeling conqueror, and form such odious additions to the reproachful scenes acted by the Spaniards in America which nothing can obliterate. Pizarro, favoured by the distracted state of Peru which now increased, and reinforced by more soldiers from Spain, proceeded to his conquests, and on the 18th of January, 1535, laid the foundation of Lima, called by him and his countrymen Ciudad de los Reyes. In 1537 he found a new enemy in his original associate Almagro, who, claiming Cuzco, the ancient capital of Peru as belonging to his jurisdiction, got possession of it. This, and other advantages gained by him, at once distressed and roused Pizarro. They came to an engagement in 1538, in which Almagro was defeated and taken prisoner, and, after an interval of confinement, was tried and executed. This was the last of the successes of Pizarro; the son and friends of Almagro conspired against him, and in June 1541 he was assassinated by them in his palace, making a most resolute defence well worthy of his long-trying courage; but the glory he justly acquired by military talents, courage, and sagacity, were disgraced by the indelible stains of perfidy and cruelty.

PLANTA, JOSEPH.—This gentleman was born

in the Grisons of Switzerland on the 21st of February, 1744. His father, the rev. Andrew Planta, resided in England for many years as minister of the German reformed church in London; and under him Mr. Planta received the first part of his education. It was completed afterwards in foreign seminaries; at Utrecht, under the learned professor Sexius and others for a short time, and at Gottingen. He also took early opportunities of visiting France and Italy, with a view to add the knowledge of those languages to that of German, which he already possessed. Having completed his studies, he accepted the employment of secretary to the British minister at Brussels. He was however shortly after recalled by the demise of his father, in 1773, to the care of his widowed mother and family. Mr. Planta, sen., had been honoured with the task of instructing Queen Charlotte in the Italian language; which probably facilitated the appointment of his son, soon after his death, to the office of assistant-librarian in the British Museum, where in 1775 he was promoted to be one of the under-librarians. In 1774 he was elected a fellow of the royal society, and soon after, by the recommendation of the president, Sir John Pringle, was appointed to conduct the foreign correspondence of the society. In 1776 he was chosen one of the ordinary secretaries of the society, on the death of Dr. Maty; having already distinguished himself by a learned and curious memoir on the *Romansh* language, spoken in the Grisons. This, though a philological tract, received the peculiar honour of being inserted in the Transactions of the society. Strong reasons are there adduced by Mr. Planta for the opinion that the *Romansh* was, at an early period, the general language of France, Italy, and Spain; from which the more modern dialects of those countries have been formed by gradual refinement. But the Grisons, unconquered and unrefined, continued still to use it, after the lapse of nine centuries. After this, by the resignation of Dr., afterwards Bishop Horsley, Mr. Planta became the senior secretary, in which situation it was a part of his duty to draw up abstracts of all the communications made to the society, to be read before the members attending their public meetings. This task he performed with great accuracy for upwards of twenty years.

In June 1778 Mr. Planta was united in marriage to Miss Elizabeth Attwood, whose death, in 1821, proved the first interruption to his domestic happiness. In 1788 he was appointed paymaster of exchequer bills, which office he held till his resignation of it in the year 1811. On the death of Dr. Morton, in 1799, Mr. Planta was appointed by his majesty to succeed him in the honourable office of principal librarian to the British Museum; and certainly a person more qualified to fill it with distinguished ability could not have been found. By his perfect knowledge of their respective languages, he was enabled to converse with all foreign visitors, and, by his polished manners, gave satisfaction to every one.

When the Swiss republics appeared to be finally extinguished by the encroachments of Bonaparte, Mr. Planta drew up a complete "History of the Helvetic Confederacy," from its origin, which was published in 1800. It was compiled from the best authorities, but principally, as the preface avows, from the masterly work of Müller. Its accuracy and fidelity obtained for it a considerable share of public approbation. After the restoration of that country,

in 1815, Mr. Planta resumed his enquiries, and from the best recent documents drew up a short supplemental history, entitled "A View of the Restoration of the Helvetic Confederacy, &c." This was separately published in 1821.

Amidst his other occupations, however, Mr. Planta never remitted his labours for the institution over which he presided. The former "Catalogue of the Cottonian MSS." in the museum, by Dr. Smith, being found extremely defective, Mr. Planta went through the whole collection with the utmost care; and in 1802 gave to the public a new catalogue, in a large folio volume, which leaves nothing further to be wished. At length, as he found himself advancing in years, Mr. Planta successively resigned his other employments, retaining only his situation in the British Museum, which he ably filled to the end of his life; his powers of mind being less impaired than his bodily strength, even after he had passed his eightieth year.

Mr. Planta left no surviving offspring except his son, whose studies he had anxiously superintended, while he gave him every advantage of the best public education. Nor was it a small addition to his happiness, that he lived to see this son advanced, by fair and honourable exertions, to distinguished offices under the government.

**PLANTAGENET.**—The name of a distinguished line of English kings. The most celebrated of the sovereigns bearing this name will be found in their alphabetical order, and the only subject who need be enumerated in the present place is John Plantagenet, duke of Bedford. He was the third son of Henry the Fourth, and was created earl of Kendal and duke of Bedford for life in 1414, and these dignities were confirmed to him and his heirs male for ever. The life and actions of this great man have occupied no inconsiderable place in history. In 1404 he was made constable of England, governor of Berwick, warder of the East Marshes, with a grant in fee of the lands of the attainted Henry Earl Percy of Northumberland, and the use of the New Tower at the entrance of Westminster Hall, for himself and his council. On the restoration of Earl Percy he obtained a grant of 3000 marks per annum as an equivalent. He was governor of Guernsey, Jersey, Alderney, and Sark. In 1416 he was made admiral of England, Ireland, and Aquitaine, protector and lord lieutenant during the king's absence. In the same year he gained a victory over the French fleet off Southampton; and he raised the siege of Roxburgh in the following year. In 1420 he was with Henry V. at the surrender of Melun, and two years after he was godfather to Henry VI., in the first year of whose reign (the same year) he was created regent of France. In 1424 he gained the victory of Verneuil, and took the duke of Alençon prisoner. The duke crowned King Henry VI. in Paris on the 7th of December, 1431. He died in Paris on the 14th of September, 1435, and was buried in Rouen cathedral, where his monument is still to be seen. When Charles VIII. visited this tomb, some noblemen who accompanied him solicited him to give orders for the destruction of the monument of the ancient foe of France, but the monarch answered with a better spirit, "Let him rest in peace, now he is dead; it was when he was alive, and in the field, that France dreaded him."

His first wife was Anne, daughter of John duke of Burgundy, who died in 1432, and is buried in the

Celestines church at Paris. The duke had a very magnificent palace in Paris, in the quarter of Tournelles, on the spot where the palais royal now stands. His second wife was Jacquetta, daughter of Peter of Luxembourg, earl or county of St. Paul. She was only seventeen years old at the time of her marriage, and surviving the duke, married Sir Richard Widville, knight, afterwards Earl Rivers, and lord treasurer; and became the mother of Elizabeth Widville Lady Grey, who married Edward IV., and of Anthony Earl Rivers, who was beheaded by the tyrant Richard III. There appears to be no stain on this great man's character, either with respect to valour, wisdom, integrity, or humanity. The treatment of Joan of Arc—if he was the principal in it—was the fault of an age which believed in witchcraft. There are in existence magnificent portraits of this duke and duchess in a celebrated illuminated missal, or book of offices, well known to antiquaries as "Gough's Bedford Missal." It was executed as a present from the duke and duchess to the young king Henry VI., at the time of his coronation. It abounds with illustrations and miniatures; and the execution and colouring is very beautiful. The duke is represented kneeling in a yellow-flowered robe, his countenance is a perfect English one, with a very honest and open appearance, and rather a mild expression. Before him stands St. George, a commanding figure, dressed in the violet and ermined mantle of the order of the Garter, and with a red cross on his breast. Behind him is his armour-bearer, with a shield and a red-cross banner. The duchess is kneeling in like manner before St. Anne, with the virgin and the infant Jesus; the duchess's face and figure are elegant, and the group has a soft and sweet expression. In both these paintings there are several other figures, and much architectural scenery; the portrait of the duke of Bedford is pronounced by the illustrator of the missal to be the finest work of art of the same date in Europe.

**PLATOFF, COUNT GENERAL.** — This celebrated hetman of the Cossacks, was born in the southern part of Russia about 1763. He was one of the veteran warriors whose exploits against the common enemy engrossed, a few years since, the attention of Europe, and a view of whose person was sought after with the greatest earnestness by persons of all descriptions in this country. The honest ardour with which this brave and loyal chief led on his irregular bands reflects immortal honour upon his memory, and will hand his name down to posterity as one of high rank among the glorious heroes of his day. Nothing could more strongly prove his personal detestation of the ravager of his country than his promising his daughter in marriage to any man who would bring Napoleon a prisoner to his camp.

The following observations may serve to elucidate his life and character: "We have not yet received any particulars relating to the precise time, or to the particular disease, which deprived the world of so bright an example of military virtue as the late hetman Platoff. But we know from unquestionable authority, that he was in a declining state in the autumn of the last year, 1817. About that time we were informed from Tcherkask, that his excellency was then far from well. The fatigues of the campaign of the year 1812 began to manifest their effects after the stimulus of martial ardour, and that of tra-

velling had subsided; the state of exhaustion was, in proportion, extreme; and he laid himself upon his bed of thickly-gathered laurels to rest, and to find refreshment; but the attempt was in vain. Nature had been over-tasked,—and he sleeps in death. We must all remember this hero of the Don, pursuing the enemies of his country like ‘the blast of the desert.’ We must all remember him in his visit to England, mild of aspect, and gentle in manners—more like the patriarch of his people than the champion of nations, winged with the energy of youth in its prime vigour. Only a few months have intervened between the death of this venerable chief of the Cossacks, venerable in years and in honours, and the death of Prince Alexander Scherbattoff, his second in command, a man in the meridian of his days, and of his comprehensive services to Russia, who had also to date the germs of his fatal illness from the victorious fields of 1812. These two illustrious warriors had the satisfaction of sharing, side by side, the dangers and the glories of that campaign. They have both died victims to its severity; and both will have a tomb in every brave heart, a memorial that must exist when marble monuments are no more. But the reputation of a consummate general was not the only excellence in the character of the hetman of the Cossacks. During the investment of the invader’s territory by the allied troops, and their consequent inroads upon the French country, he heard that near one of the spots destined for pillage might be found the residence of Thaddeus Kosciuszko, late general of the Poles, who lived there in the occupation and seclusion of a peasant. Platoff despatched a party of his Cossacks to protect the person of that unfortunate nobleman.” Platoff died in 1818.

PLATO, a learned Greek philosopher, who was the founder of the academic sect bearing his name. He was born at Athens about 430 B. C., and is said to have been descended from a royal line by his father’s side, and from Solon by his mother. He studied philosophy under Socrates, whose example and doctrines he followed, and whose death and virtues he frequently commemorated. When he lost this great master he travelled over Greece, and visited Magna Græcia, where he was attracted by the fame of the Pythagorean philosophy and the learning of its professors. From thence he went to Egypt, to study geometry, and afterwards to Persia, to consult the Magi. On his return to Athens he taught in the groves of Academus, where his lectures were attended by the most learned and illustrious of his countrymen. He continued during forty years to preside at the head of this academy, devoting his time to the instruction of his pupils, and the composition of those dialogues which have been the admiration of every age and country. These studies were only interrupted to accept the invitations of the tyrant Dionysius, whom he persuaded to become the father of his people and the friend of liberty. On his return the Athenians wished to honour him with the administration of government, but he preferred a life of contemplation and the study of philosophy. The fame of his learning and wisdom drew disciples to him from all parts, and ambassadors were sent from several kings, earnestly requesting that he would prescribe forms of government for their dominions.

He was simple in his manners, and temperate in his habits, and so unassuming in his pretensions to distinction and honour, that he once resided during

the celebration of the Olympic Games, without making himself known, in a family who accompanied him to Athens. Being a native of that place, they requested him to show them the great philosopher Plato, little suspecting that in their simple guest they had entertained that illustrious character. But while his reputation gained him many admirers, it raised him many rivals and enemies. Diogenes, the cynic, jealous of the fame, and despising the politeness and fine taste of Plato, seized every opportunity of insulting him. Dining one day at his table with other company, he trampled upon the tapestry with his dirty feet, uttering this severe sarcasm, “I trample upon the pride of Plato,” to which Plato calmly replied, “with the greater pride of Diogenes.” Another anecdote of Plato is told to exemplify his extraordinary command of temper. One of his friends remarked that his enemies were busily engaged circulating reports to his disadvantage: he is said to have replied, “I will live so that none shall believe them.” Plato died at the advanced age of eighty-one.

The works of this great philosopher, which were very numerous, were mostly written in the form of dialogues. These were so celebrated for elegance, melody, and sweetness of style, that he was called the Athenian Bee, in allusion to the following circumstance, which was considered a presage of his future eloquence. When he was an infant, his father went with his wife and child to sacrifice to the Muses, and while they were performing the divine rites a swarm of bees came and distilled their honey on Plato’s lips. Cicero held him in such estimation that he exclaimed in the warmth of panegyric, “that if the gods had spoken Greek, they would have used Plato’s language;” and he made him so implicitly his guide in wisdom and philosophy as to declare “he would rather err with Plato than be right with any one else.”

It is from the writings of Plato, chiefly, that we are to form a judgment of his merit as a philosopher, and of the services which he rendered to science. No one can be conversant with these without perceiving that his diction always retained a strong tincture of that poetical spirit which he discovered in his first productions. This is the principal ground of those lofty encomiums, which both ancient and modern critics have passed upon his language. The accurate Stagyrte describes it, as “a middle species of diction, between verse and prose.” Some of his dialogues are elevated by such sublime and glowing conceptions, are enriched with such copious and splendid diction, and flow in so harmonious a rhythmus, that they may truly be pronounced highly poetical. Most of them are justly admired for their literary merit: the introductions are pertinent and amusing; the course of the debate, or conversation, is clearly marked; the characters are accurately supported; every speaker has his proper place, language, and manners; the scenery of the conference is painted in lively colouring; and the whole is, with admirable art, adorned and enlivened by those minute embellishments which render the colloquial mode of writing so peculiarly pleasing. Even upon abstract subjects, whether moral, metaphysical, or mathematical, the language of Plato is often clear as the running stream, and in simplicity and sweetness vies with the humble violet which perfumes the vale. In these beautiful parts of his works, it has been conjectured, not without probability, that Socrates and Lysias

were his models. At other times, however, we find him swelling into the turgid style, a tincture of which he seems to have retained from his juvenile studies, and involving himself in obscurities, which were the offspring of a lofty fancy, or were borrowed from the Italic school. Several ancient critics have noticed these blemishes in the writings of Plato. Dionysius Halicarnassensis particularly censures Plato for the harshness of his metaphors and his bold innovations in the use of terms, and quotes from his "Phædrus" examples of the bombast, the puerile, and the frigid style. The same inequality, which is so apparent in the style of Plato, may also be observed in his conceptions. Whilst he adheres to the school of Socrates, and discourses upon moral topics, he is much more pleasing than when he loses himself with Pythagoras in abstruse speculations. The dialogues of Plato, which treat of various subjects, and were written with different views, are classed by the ancients under the two heads of didactic and inquisitive. The didactic are subdivided into speculative, including physical and logical; and practical, comprehending ethical and political. The second class, the inquisitive, is characterised by terms taken from the athletic art, and divided into the gymnastic, and the agonistic; the dialogues termed gymnastic were imagined to be similar to the exercise, and were subdivided into the maieutic, as resembling the teaching of the rudiments of the art; and the peirastic, as represented by a skirmish, or trial of proficiency. The agonistic dialogues, supposed to resemble the combat, were either endeictic, exhibiting a specimen of skill; or anatreptic, presenting the spectacle of a perfect defeat. Instead of this whimsical classification, an arrangement of the dialogues, taken from the subjects on which they treat, would be much more obvious and useful. They may not improperly be divided into physical, logical, ethical, and political.

The writings of Plato were originally collected by Hermodorus, one of his pupils; they consist of thirty-five dialogues, and thirteen epistles. They were first published by Aldus Manutius at Venice, in 1513. The subsequent editions of Ficinus and Serranus are the most valuable; but the notes and interpretations of both are to be read with caution as not representing Plato's sentiments with fidelity. The *Deux Ponts* edition of 1781 is a copy of the Greek of Serranus, and the Latin of Ficinus. Of "The Dialogues of Plato," an edition was published by Foster at Oxford, in 1745, and in 1771 Etwall published, at the same place, "The Alcibiades," and "Hipparchus;" to which he prefixed the life of Plato by Olympiodorus, and the introduction of Albinus. "The Euthydemus" and "Gorgias" were also published at Oxford in 1784, by Dr. Routh, president of Magdalen college. There are many English translations of the Dialogues. Mr. Taylor published a translation of the whole works of Plato, with copious notes, &c. The following translation from Plato's "Amatory Poetry" is by Moore:—

"Why dost thou gaze upon the sky?  
Oh! that I were that spangled sphere,  
And every star should be an eye,  
To wonder on thy beauties here!

"In life thou wert my morning star,  
But now that death has stol'n thy light,  
Alas! thou shinest dim and far  
Like the pale beam that weeps at night."

PLAUTUS, MARCUS ACCIUS, a Roman comic writer, who was born at Sarsina, in Umbria, and flourished about 200 B. C., at which period he was the

manager of a company of players in Rome. Aulus Gellius states that for some time he was in a very destitute condition, and was compelled to earn his livelihood by turning a mill. If this be true he must have possessed an inexhaustible fund of gaiety, since, even in a condition so unfavourable to poetry, he composed many clever comedies. About twenty of them, principally entire, have come down to us. The names are either borrowed from the persons of the piece, as Amphitryon, who was the husband of Alcmena, mother of Hercules; Curculio, or the Corn-Worm; Epidicus, Pseudolus, Stichus, the names of slaves; Menæchmi, the name of a pair of twins; Miles Gloriosus, or, the Braggart Soldier; Captivi, or, the Two Captives; Mercator the Merchant, &c. Plautus's merit consists in having introduced into the Latin language the plays of Diphilus, Epicharmus, and others, by translations or imitations, and by this means contributed to improve and enrich it. The ancients praise his pithy, antique language; and, according to Varro, the Muses, if they had spoken Latin, would have used the language of Plautus. The wit and sententiousness of the old comedian were no less admired. Much may be learned from Plautus of the language of conversation and common life, although much of it is obsolete and not to be imitated. Much, too, is vulgar, the jests often low, and sometimes obscene. The subject of his pieces is frequently an obscene story humorously treated. In general his dialogue has more merit than his plots and dramatic action.

PLAYFAIR, JOHN, an eminent natural philosopher and mathematician, who was born at Bervie, near Dundee, in 1749. His father was a minister of the church of Scotland, and young Playfair, who was educated at the university of St. Andrew's, succeeded his father in 1772. Soon after his settlement in an obscure country parish as a member of the church of Scotland, an event occurred in the life of Mr. Playfair that contributed not a little to confer novelty, variety, and even affluence, during the latter part of his existence. Mr. Ferguson of Raith, a gentleman of considerable landed property and influence, made a liberal offer to him to educate his two sons, which necessarily produced a resignation of his clerical preferment and a removal to Edinburgh. While there his merits were so well appreciated that, when Professor Ferguson resigned the chair of moral philosophy to Mr. Dugald Stewart, Mr. Playfair was very properly selected to preside over the mathematical class of the university. Soon after this, on the establishment of the royal society by charter from the king, he was also nominated to be secretary. He contributed many valuable papers to the *Transactions* of this northern institution, and in 1796 published his "Elements of Geometry." This was followed by a new edition of Euclid, but truth forbids us to pronounce its superiority over that of his countryman, the ingenious Simpson.

At a later period he was busily employed in the generous task of defending the character and displaying the merits of a man whose discoveries and experiments have thrown a lustre over the first of our northern universities. When Professor Leslie was about to be appointed to a chair, a clergyman full of zeal, but devoid of discretion, accused him before the patrons of having once uttered certain doctrines in a lecture approximating to materialism. Several of his

brethren joined in the persecution; but Playfair, who had been bred to and obtained preferment in the church of Scotland, victoriously refuted the charge. It was the triumph of genius over superstition!

In 1812 appeared his "Outlines of Natural Philosophy;" and soon after this he enjoyed the pleasure of beholding a nephew whom he had adopted obtaining the prize for and carrying into execution the plan for building the new college at Edinburgh. When the supplement to the "Encyclopedia Britannica" was first meditated at Edinburgh, the most eminent men in that city were selected to compose the different articles of which the new volumes consisted. Accordingly, on the appearance of the first, it was preceded by a masterly dissertation from the pen of Dugald Stewart, F.R.S.S., "On the Progress of Metaphysical, Ethical, and Political Philosophy, since the Revival of Letters in Europe." To another portion of this work was appended "A General View of the Progress of Mathematical and Physical Science, since the Revival of Letters in Europe, by John Playfair, Professor of Natural Philosophy, &c. &c." The only praise aspired to by this very learned man in the work alluded to is that arising "from clearness and precision." In the course of his dissertation he not only gives a history of the sciences, but also brief biographical sketches of the men by whom they were either cultivated or repressed. On those occasions he expresses himself with great freedom and boldness, as well as with a very considerable share of ingenuity. "Tycho Brahe," he observes, "was of a noble family in Denmark; he belonged to a class in society elevated, in the opinion of that age, above the pursuit of knowledge, and jealous of the privilege of remaining ignorant with impunity." He animadverts, with a just severity, on the jealousy with which the court of Rome watched the progress of improvement, and remarks, "how grievous it is to observe the head of the Christian church in that and the succeeding age, like the 'Anarch old' in Milton, reigning in the midst of darkness, and complaining of the encroachments which the realm of light was continually making on his ancient empire."

In 1816 Professor Playfair repaired on a scientific mission to Italy, and spent a considerable time in visiting and examining the Alps. Soon after his return to Edinburgh his health began to decline, notwithstanding which he at this very period made some scientific discoveries concerning the rays of the sun. At length, while enjoying a high degree of fame, and a very extensive reputation, Mr. Playfair was snatched away from his pupils, his friends, and the learned and scientific circle of society around him; but he died like a philosopher. Finding his end approach, on the evening of the 19th of July he assembled his sisters and nephews around his bed-side, and after a succinct statement of his affairs, he took his leave of them with great affection, notwithstanding the agonies endured by him. About two next morning the pain wholly ceased, and he soon after expired in the presence of his afflicted relatives, on July 20, 1819.

The following account of the character and merits of the late professor Playfair has been attributed to the pen of a celebrated man of letters in the northern metropolis:—"It has struck many people, we believe, as very extraordinary, that so eminent a person as Mr. Playfair should have been allowed to sink into his grave in the midst of us,

without calling forth almost so much as an attempt to commemorate his merit; and that the death of a man so eminent and so beloved, and at the same time so closely connected with many who could well appreciate and suitably describe his excellencies, should be left to the brief and ordinary notice of the daily obituary. No event of the kind certainly ever excited more general sympathy; and no individual, we are persuaded, will be longer or more affectionately remembered by all the classes of his fellow-citizens; and yet it is to these very circumstances that we must look for an explanation of the apparent neglect by which his memory has been followed. His humbler admirers have been deterred from expressing their sentiments by a natural feeling of unwillingness to encroach on the privilege of those whom a nearer approach to his person and talents rendered more worthy to speak of them: while the learned and eloquent among his friends have trusted to each other for the performance of a task which they could not but feel to be painful in itself, and not a little difficult to perform as it ought to be, or, perhaps, have reserved for some more solemn occasion that tribute for which the public impatience is already at its height. We beg leave to assure our readers that it is merely from anxiety to do something to gratify this national impatience that we presume to enter at all upon a subject to which we are perfectly well aware that we are incapable of doing justice; for of Mr. Playfair's scientific attainments, of his proficiency in those studies to which he was peculiarly devoted, we are but slenderly qualified to judge; but we believe we hazard nothing in saying that he was one of the most learned mathematicians of his age, and among the first, if not the very first, who introduced the beautiful discoveries of the latter continental geometers to the knowledge of his countrymen, and gave their just value and true place in the scheme of European knowledge to those important improvements by which the whole aspect of the abstract sciences has been renovated since the days of our illustrious Newton. If he did not signalize himself by any brilliant or original invention, he must at least be allowed to have been a most generous and intelligent judge of the achievements of others, as well as the most eloquent expounder of that great and magnificent system of knowledge which has been gradually evolved by the successive labours of so many gifted individuals. He possessed, indeed, in the highest degree, all the characteristics both of a fine and powerful understanding, at once penetrating and vigilant, but more distinguished, perhaps, for the caution and sureness of its march than for the brilliancy or rapidity of its movements, and guided and adorned through all its progress by the most genuine enthusiasm for all that is grand, and the justest taste for all that is beautiful in the truth or the intellectual energy with which he was habitually conversant.

"To what account these rare qualities might have been turned, and what more brilliant or lasting fruits they might have produced, if his whole life had been dedicated to the solitary cultivation of science, it is not for us to conjecture; but it cannot be doubted that they added incalculably to his eminence and utility as a teacher; both by enabling him to direct his pupils to the most simple and luminous methods of inquiry, and to imbue their minds from the very commencement of the study with that fine relish for the truths it disclosed, and that high sense of the

majesty with which they were invested that predominated in his own bosom. While he left nothing unexplained or unexplained to its proper place in the system, he took care that they should never be perplexed by petty difficulties, or bewildered in useless details, and formed them betimes to that clear, masculine, and direct method of investigation, by which, with the least labour, the greatest advances might be accomplished.

"Mr. Playfair, however, was not merely a teacher, and has fortunately left behind him a variety of works, from which other generations may be enabled to judge of some of those qualifications which so powerfully recommended and endeared him to his contemporaries. It is, perhaps, to be regretted that so much of his time and so large a proportion of his publications should have been devoted to the subjects of the Indian astronomy and the Huttonian theory of the earth. For though nothing can be more beautiful or instructive than his speculations on those curious topics, it cannot be dissembled that their results are less conclusive and satisfactory than might have been desired; and that his doctrines, from the very nature of the subjects, are more questionable than we believe they could possibly have been on any other topic in the whole circle of the sciences. To the first, indeed, he came under the great disadvantages of being unacquainted with the Eastern tongues, and without the means of judging of the authenticity of the documents which he was obliged to assume as the elements of his reasonings; and as to the other, though he ended, we believe, with being a very able and skilful mineralogist, we think it is now generally admitted, that that science does not yet afford sufficient materials for any positive conclusion; and that all attempts to establish a theory of the earth must, for many years to come, be regarded as premature. Though it is impossible, therefore, to think too highly of the ingenuity, the vigour, and the eloquence of those publications, we are of opinion that a juster estimate of Mr. Playfair's talent, and a truer picture of his genius and understanding, is to be found in his other writings; in the papers, both biographical and scientific, with which he has enriched the Transactions of our royal society; his account of De Laplace, and other articles which he is understood to have contributed to the 'Edinburgh Review;' the outlines of his lectures on natural philosophy; and, above all, his introductory discourse to the supplement to the 'Encyclopedia Britannica,' with the final correction of which he was occupied up to the last moments that the progress of his disease allowed him to dedicate to any intellectual exertion.

"With reference to these works we do not think we are influenced by any national or other partiality, when we say that he was certainly one of the best writers of his age; and even that we do not now recollect any one of his contemporaries who was so great a master of composition. There is a certain mellowness and richness about his style which adorns without disguising the weight and nervousness which is its other great characteristic; a sedate gracefulness and manly simplicity in the more level passages, and a mild majesty and considerate enthusiasm where he rises above them, of which we scarcely know where to find any other example. There is great equability too and sustained force in every part of his writings. He never exhausts himself in flashes and epigrams, nor languishes into tameness or insipidity; at first

sight you would say that plainness and good sense were the predominating qualities; but, by and by, this simplicity is enriched with the delicate and vivid colours of a fine imagination, the free and forcible touches of a most powerful intellect, and the lights and shades of an unerring and harmonising taste. In comparing it with the styles of his most celebrated contemporaries, we would say that it was more purely and peculiarly a written style, and therefore rejected those ornaments that more properly belong to oratory. It had no impetuosity, hurry, or vehemence—no bursts or sudden turns or abruptness, like that of Burke; and though eminently smooth and melodious it was not modulated to an uniform system of solemn declamation like that of Johnson, nor spread out in the richer and more voluminous elocution of Stewart; nor still less broken into the patchwork of scholastic pedantry and conversational smartness which has found its admirers in Gibbon. It is a style, in short, of great freedom, force, and beauty; but the deliberate style of a man of thought and of learning; and neither that of a wit throwing out his extempores with an affectation of careless grace, nor of a rhetorician, thinking more of his manner than his matter, and determined to be admired for his expression, whatever may be the fate of his sentiments.

"His habits of composition, as we have understood, were not perhaps exactly what might have been expected from their results. He wrote rather slowly, and his first sketches were often very slight and imperfect, like the rude chalking of a masterly picture. His chief effort and greatest pleasure was in their revisal and correction, and there were no limits to the improvement which resulted from this application. It was not the style merely, or indeed chiefly, that gained by it. The whole reasoning, and sentiment, and illustration, were enlarged and new modelled in the course of it, and a naked outline became gradually informed with life, colour, and expression. It was not at all like the common finishing and polishing to which careful authors generally subject the first draughts of their compositions, nor even like the fastidious and tentative alterations with which some more anxious writers essay their choicer passages. It was in fact the great filling in of the picture, the working up of the figured web on the naked and meagre woof that had been stretched to receive it; and the singular thing in this case was, not only that he left this most material part of his work to be performed after the whole outline had been finished, but that he could proceed with it to an indefinite extent and enrich and improve as long as he thought fit without any risk either of destroying the proportions of that outline or injuring the harmony and unity of the design. He was perfectly aware too of the possession of this extraordinary power, and it was partly, we presume, in consequence of it that he was not only at all times ready to go on with any work in which he was engaged without waiting for favourable moments or hours of greater alacrity, but that he never felt any of those doubts and misgivings as to his being able to get creditably through with his undertaking, to which we believe most authors are occasionally liable. As he never wrote upon any subject of which he was not perfectly master, he was secure against all blunders in the substance of what he had to say, and felt quite assured that, if he was only allowed time enough, he should finally come to say it in the very best way of

which he was capable. He had no anxiety, therefore, either in undertaking or proceeding with his tasks, and intermitted and resumed them at his convenience, with the comfortable certainty that all the time he bestowed on them was turned to good account, and that what was left imperfect at one sitting might be finished with equal ease and advantage at another. Being thus perfectly sure both of his ends and his means, he experienced in the course of his compositions none of that little fever of the spirits with which that operation is so apt to be accompanied. He had no capricious visitings of fancy, which it was necessary to fix on the spot or to lose for ever; no casual inspiration to invoke and to wait for; no transitory and evanescent lights to catch before they faded. All that was in his mind was subject to his control and amenable to his call, though it might not obey at the moment; and while his taste was so sure that he was in no danger of overworking any thing that he had designed, all his thoughts and sentiments had that unity and congruity that they fell almost spontaneously into harmony and order; and the last added incorporated and assimilated with the first, as if they had sprung simultaneously from the same happy conception.

"But we need dwell no longer on qualities that may be gathered hereafter from the works he has left behind him. They who lived with him mourn the most for those which will be traced in no such memorial, and prize far above those talents which gained him his high name in philosophy, that personal character which endeared him to his friends, and shed a grace and dignity over all the society in which he moved. The same admirable taste which is conspicuous in his writings, or rather the higher principles from which that taste was but an emanation, spread a similar charm over his whole life and conversation; and gave to the most learned philosopher of his day the manners and deportment of the most perfect gentleman. Nor was this in him the result merely of good sense and good temper, assisted by an early familiarity with good company and consequent knowledge of his own place and that of all around him; his good breeding was of a higher descent, and his powers of pleasing rested on something better than mere companionable qualities. With the greatest kindness and generosity of nature he united the most manly firmness and the highest principles of honour, and the most cheerful and social dispositions with the gentlest and steadiest affections. Towards women he had always the most chivalrous feelings of regard and attention, and was beyond almost all men acceptable and agreeable in their society, though without the least levity or pretension unbecoming his age or condition: and such, indeed, was the fascination of the perfect simplicity and mildness of his manners, that the same tone and deportment seemed equally appropriate in all societies, and enabled him to delight the young and the gay with the same sort of conversation which instructed the learned and the grave. There never, indeed, was a man of learning and talent who appeared in society so perfectly free from all sorts of pretension or notion of his own importance, or so little solicitous to distinguish himself, or so sincerely willing to give place to every one else. Even upon subjects which he had thoroughly studied he was never in the least impatient to speak, and spoke at all times without any tone of authority; while, so far from wishing to set off what he had to

say by any brilliancy or emphasis of expression, it seemed generally as if he had studied to disguise the weight and originality of his thoughts under the plainest form of speech and the most quiet and indifferent manner: so that the profoundest remarks and subtlest observations were often dropped, not only without any solicitude that their value should be observed, but without any apparent consciousness that they possessed any. Though the most social of human beings, and the most disposed to encourage and sympathize with the gaiety and joviality of others, his own spirits were in general rather cheerful than gay, or at least never rose to any turbulence or tumult of merriment; and while he would listen with the kindest indulgence to the more extravagant sallies of his younger friends, and prompt them by the heartiest approbation, his own satisfaction might generally be traced in a slow and temperate smile, gradually mantling over his benevolent and intelligent features, and lighting up the countenance of the sage with the expression of the mildest and most genuine philanthropy. It was wonderful, indeed, considering the measure of his own intellect, and the rigid and undeviating propriety of his own conduct, how tolerant he was of the defects and errors of other men. He was too indulgent, in truth, and favourable to his friends, and made a kind and liberal allowance for the faults of all mankind, except only faults of baseness or of cruelty, against which he never failed to manifest the most open scorn and detestation. Independent, in short, of his high attainments, Mr. Playfair was one of the most amiable and estimable of men, delightful in his manners, inflexible in his principles, and generous in his affections; he had all that could charm in society or attach in private; and while his friends enjoyed the free and unstudied conversation of an easy and intelligent associate, they had at all times the proud and inward assurance that he was a being upon whose perfect honour and generosity they might rely with the most implicit confidence in life and in death; and of whom it was equally impossible that, under any circumstances, he should ever perform a mean, a selfish, or a questionable action, as that his body should cease to gravitate or his soul to live."

*John Playfair*

PLAYFAIR, WILLIAM, a distinguished draughtsman and mechanic, who was born near Dundee in 1759, and at a very early age discovered a strong predilection for mechanical science. He was bound apprentice to a millwright, the celebrated John Rennie being his fellow apprentice. He afterwards went to Birmingham, and was employed by James Watt as a draughtsman. He remained there some time, and then went to the continent, where he distinguished himself by several useful inventions.

The political opinions of Mr. Playfair were not very favourable to the French revolution, and happening to express himself somewhat freely on the subject, he provoked the enmity of Barrere, who obtained an order for his arrest; apprized, however, of his danger, he succeeded in making his escape to Holland, and thence to England. On his return to London,

Mr. Playfair projected a bank, to be called the Security Bank, in which Mr. Hartsinck, formerly in the celebrated house of the Hopes at Amsterdam, and the Rev. Mr. Hutchinson, became partners. This bank was opened in Cornhill; its object was to divide large securities into small ones, and thus to facilitate the negotiation of small loans. Unfortunately, however, sufficient attention was not paid to the nature of the security, and bankruptcy ensued. From this period we have only to consider Mr. Playfair as a literary man, whose life, like that of most authors, was much chequered.

On the restoration of the Bourbons Mr. Playfair went again to Paris, and there conducted *Galignani's* English newspaper, until driven away by a prosecution for some insignificant libel. From that time he existed in London by essay-writing and translating. His constitution, however, being broken up, and his means having become precarious, anxiety of mind completed what bodily indisposition had begun, and on the 11th of February, 1823, he died in Covent Garden, in the sixty-fourth year of his age.

PLAYFORD, JOHN, a musician, who was born in 1613 in London. In the year 1665 he published "An Introduction to the Skill of Music," which appears to have been in a great measure extracted from Morley's "Introduction," Butler's "Principles of Music," and other works on the subject. It is divided into three books: the first containing the principles of music, with directions for singing; the second, instructions for the bass, treble, and tenor viol, and also for the treble violin; the third, the art of descant, or of composing music in parts. This work, which is written in a plain and familiar style, succeeded so well that before the year 1684 it had passed into ten editions. Of these, the last is fuller than any of the former, and is also much more correct. In the preface there are many curious and interesting particulars relative to music and musical professors.

Playford appears to have possessed the friendship of most of the eminent musicians of his time, and in consequence was the publisher of a great number of musical works, between the years 1670 and 1685. He was a good judge of music, and was very industrious in his trade, contributing not a little to the improvement of the art of printing music from the letter-press types, by the use of what he in some of his publications calls the new-tied note. In addition to the works already mentioned, Mr. Playford published several others which still retain their popularity. His death took place in 1693.

PLINY THE ELDER, or CAIUS PLINIUS.—This celebrated Roman naturalist was born at Verona in the twenty-third year of the Christian era. He distinguished himself in civil and military life, but his ruling pursuit was the cultivation of literature, to which he devoted himself with such unwearied application and perseverance that he made himself master, not only of all the polite arts, but every branch of science and natural philosophy then known. The hours that others pass in sleep he dedicated to study, as well as those leisure moments of the day which were not appropriated to his civil occupations. His love of letters did not make him neglect public affairs, and he filled the important dignities of augur, and acted as procurator, or manager of the emperor Vespasian's revenue in Spain and Africa, with credit to himself and satisfaction to the virtuous prince whom he served, and from whom he received the most

honourable and distinguished favours. His death, which is so accurately described by the elegant pen of his nephew, the younger Pliny, may be attributed to his pursuits as a naturalist. As he was at Misenum in the Gulf of Naples, where he commanded a fleet which was then stationed there, he was surprised at the sudden appearance of a cloud of dust and ashes. Being ignorant of the cause which produced it, he set sail in a small vessel for Mount Vesuvius, which he at last discovered had produced a dreadful eruption. This was a new and beautiful spectacle for the philosophic Pliny, whose eager curiosity excited him to advance with boldness; and though his vessel was often covered with stones and ashes, that were continually thrown up by the mountain, he landed on the coast. The place was deserted by the inhabitants, but Pliny remained on the spot during the night, to make his observations on the mountain, which, from the surrounding darkness, appeared as one continual blaze. He was soon disturbed by a dreadful earthquake, and in the morning contrary winds prevented his returning to Misenum. The eruptions of the volcano increased, and at last the fire approached the spot where the philosopher was making his observations. He endeavoured to fly before it, but, though he was supported by two of his servants, who went in search of him, he was unable to escape. He soon fell down suffocated by the thick vapours and sulphureous matter which surrounded him. This memorable event happened in the fifty-sixth year of his age, and the seventy-ninth of the Christian era. From the circumstances attending the death of this philosopher, he has been styled the Martyr of Nature.

With respect to the writings of Pliny, his nephew, who was his historiographer, says that his first work was "A Treatise concerning the Art of Using the Javelin on Horseback." He was also the author of "The Life of Pomponius Secundus," and "The History of the Wars in Germany," in which he gave an account of all the battles the Romans had had with the Germans. His nephew says that a dream, which occurred when he served in the army in Germany, first suggested to him the design of this work: it was, that Drusus Nero, who extended his conquests very far into that country, and there lost his life, appeared to him, and conjured him not to suffer his memory to be buried in oblivion. He wrote likewise "A Treatise upon Eloquence," and a critical work concerning dubious Latinity. This last work, which was published in Nero's reign, when the tyranny of the times made it dangerous to engage in studies of a freer kind, is often cited by Priscian. He completed a history which Aufidius Bassus left unfinished, by adding to it thirty books, which contained the history of his own times. Lastly, he left thirty-seven books upon the subject of natural history: a work, says his nephew, of great compass and learning, and almost as full of variety as nature herself. It is indeed a most valuable treasury of ancient knowledge. For its defects, which in the estimation of modern students of natural history must unavoidably be numerous, he thus apologizes, in the dedication to Vespasian: "The path which I have taken has hitherto been, in a great measure, untrodden, and holds forth to the traveller few enticements. None of our own writers have so much as attempted these subjects; and even among the Greeks no one has treated of them in their full extent. The generality of authors in their pursuits attend chiefly to amusement; and

those who have the character of writing with great depth and refinement are involved in impenetrable obscurity. Such is the extent of my undertaking that it comprehends every topic which the Greeks include under the name of "Encyclopædia;" of which, however, some are as yet utterly unknown, and others have been rendered uncertain by excessive subtlety. Other parts of my subject have been so often handled that readers are become cloyed with them. Arduous indeed is the task to give what is old an appearance of novelty; to add weight and authority to what is new; to cast a lustre upon subjects which time has obscured; to render acceptable what is become trite and disgusting; to obtain credit to doubtful relations; and, in a word, to represent every thing according to nature, and with all its natural properties. A design like this, even though incompletely executed, will be allowed to be grand and noble." He adds afterwards, "Many defects and errors have, I doubt not, escaped me; for, besides that I partake of the common infirmities of human nature, I have written this work in the midst of engagements, at broken periods which I have stolen from sleep."

With respect to philosophical opinions, Pliny did not rigidly adhere to any sect, but occasionally borrowed such tenets from each as suited his present inclination or purpose. He reprobates the Epicurean tenet of an infinity of worlds; favours the Pythagorean notion of the harmony of the spheres; speaks of the universe as God, after the manner of the stoics; and sometimes seems to pass over into the field of the sceptics. For the most part, however, he leans towards the doctrine of Epicurus. To the works of this author may be added a vast quantity of manuscripts, which he left to his nephew, and for which he had been offered by Largius Licinius 400,000 sesterces, that is, about 3200*l.* of our money. "You will wonder," says his nephew, "how a man, so engaged as he was, could find time to compose such a number of books; and some of them too upon abstruse subjects. Your surprise will rise still higher when you hear that for some time he engaged in the profession of an advocate, that he died in his fifty-sixth year, that from the time of his quitting the bar to his death he was employed in the highest posts, and in the service of his prince; but he had a quick apprehension, joined to an unwearied application."

**PLINY, CAIUS PLINIUS CÆCILIUS, THE YOUNGER.**—This Roman writer was born A. D. 62, at Comum, and having been adopted by his uncle, Pliny the elder, he made rapid progress in the study of eloquence and philosophy. When Trajan was invested with the imperial purple Pliny was appointed consul, and he acknowledged this honour in his celebrated panegyric. After this he presided over Pontus and Bithynia, in the office of proconsul; and by his humanity he stopped the persecutions which had begun in his province against the Christians. He assured the emperor that the followers of Christ were a meek and inoffensive sect; that they voluntarily bound themselves by the most solemn oaths to relinquish and abstain from every evil pursuit. This letter is still extant among his epistles, and is esteemed one of the most genuine monuments of ecclesiastical antiquity, relating to the times immediately succeeding the apostles, as it was written only forty years after the death of St. Paul. It was preserved by the primitive Christians themselves as a clear and un-

suspicious evidence of the purity of their doctrines, and is frequently appealed to by the early writers of the church against the calumnies of their adversaries. In Syria, where he was the commander of a legion, he enjoyed the society of the philosopher Euphrates, and afterwards made his appearance in Rome as an advocate with success, filled several public offices, and was consul in his thirty-ninth year. By the favour of the emperor Trajan he was appointed augur and governor of Pontus in Bithynia, which office he administered for two years, to the general satisfaction. He was one of the most distinguished, and best, and we may also add, one of the most fortunate men of his age. He had most of the requisites for the enjoyment of life—a cultivated mind, a generous heart, friendship and love. As an author he laboured with ardour. He attempted several departments of literature, both in prose and poetry. Of his writings only a collection of letters, in ten books, and a panegyric on Trajan remain. The letters are addressed to different friends, some of them to the emperor, and are on various subjects. Their elegance and intellectual tone make them attractive and very instructive. In his panegyric on Trajan he is, as some think, extravagant in his praise and in his rhetorical ornaments. It is not indeed to be recommended as a model, yet it is an important work for the history of that noble emperor and his time. The letters and the panegyric were edited together, with notes, by Gesner, Ernesti, and others. A later critical edition of the letters, with notes, was edited by Gierig, and the complete works of Pliny, by the same; afterwards by G. H. Schäfer, and by Titze at Prague in 1820. The panegyric was edited by Gierig, with notes, who also published a work "On the Life, Moral Character, and Literary Reputation of the Younger Pliny." The epistles of Pliny have been translated into English by Lord Orrery and Mr. Melmoth.

**PLOT, ROBERT**, an antiquary and naturalist, who was born in 1640, and received his education at the university of Oxford, where he was appointed professor of chemistry in 1683. He formed the plan of a complete natural history of England, the only parts of which, however, that were properly executed were, his "Natural History of Oxfordshire," and "Natural History of Staffordshire." In addition to those works he collected materials for the counties of Kent and Middlesex, but they remained in manuscript. He however published a treatise on some antiquities in Kent. Dr. Plot was historiographer to James II., and in 1694 was appointed Mowbray herald and archivist of the heralds' office; he was also fellow and secretary to the royal society. His death took place in 1696.

**PLOTINUS**, a distinguished philosopher, who was born at Lycopolis in Egypt, and is said to have studied philosophy at Alexandria, under Ammonius, travelled at the age of thirty-nine into the east, to learn the doctrines of the Magi, and in his fortieth year became a teacher of philosophy in Rome. His writings and instructions excited the most enthusiastic admiration among his disciples. He died A. D. 270, in Campania, his death having been hastened by his austerities. His pupil, Porphyry, wrote his life, and arranged his writings, and Marsilius Ficinus first edited and translated them. Creuzer published his "Dissertation on Beauty" in 1814, and Engelhardt translated his "Enneades" into German, with a commentary.

**PLOWDEN, EDMUND**, an English lawyer, who was born in Shropshire, and studied both at Oxford and Cambridge. Having completed his studies, he became reader in the Middle Temple, and rose to the rank of sergeant-at-law; but being a catholic, he never received farther promotion. His death took place in 1588. His principal work is entitled "Commentaries or Reports:" it contains law cases argued and determined in the reigns of Edward VI., Mary, and Elizabeth.

**PLOWDEN, FRANCIS**, an eminent writer, who was educated at St. Omer's. He afterwards entered as a student at Lincoln's Inn, and became a barrister in the court of chancery. In 1793 he was created a doctor of civil law at Oxford in consequence of some publication in defence of the British constitution. One of his first publications was entitled "An Investigation of the Native Rights of British Subjects;" "A Supplement to the same, written in relation to the Case of the Earl of Newburgh, a descendant of the Earl of Derwentwater;" "Impartial Thoughts upon the Beneficial Consequences of Enrolling all Deeds, Wills, and Codicils, affecting Lands throughout England and Wales, including a draught of a Bill proposed to be brought into Parliament for that purpose," 1789, 1790; "The Case Stated, by Francis Plowden, Esq., Conveyancer, of the Middle Temple, occasioned by the Act of Parliament lately passed for the Relief of the English Roman Catholics."

In 1792 Mr. Plowden published "Jura Anglorum, the Rights of Englishmen; being an Historical and Legal Defence of the present Constitution." In 1794 it was attacked in an octavo pamphlet called "A Letter to Francis Plowden, Esq., Conveyancer, of the Middle Temple, on his Work entitled 'Jura Anglorum,' by a Roman Catholic Clergyman." Dr. Plowden's next publication was, "A Short History of the British Empire during the last Twenty Months; viz. from May 1792, to the Close of the Year 1793." London, 1794.

The next productions of any moment by Mr. Plowden were, "Church and State; being an Enquiry into the Origin, Nature, and Extent of Ecclesiastical and Civil Authority, with Reference to the British Constitution," 1795, and "A Short History of the British Empire during the Year 1794." London, 1795.

In 1803 appeared, in two quarto volumes, his principal work, entitled "An Historical Review of the State of Ireland, from the Invasion of that Country, under Henry II., to its Union with Britain in 1801." Of this, an elaborate critique, by Sir Richard Musgrave, the author of "The History of the Irish Rebellion," appeared in "The British Critic," continued through more than one number; and which was afterwards published in a separate form, with additions, corrections, and an appendix, under the title of "Strictures upon an Historical Review of the State of Ireland, by Francis Plowden, Esq.; or, a Justification of the Conduct of the English Governments in that Country, from the Reign of Henry the Second to the Union of Great Britain and Ireland." At the Lifford assizes, April 4, 1813, Mr. Plowden was prosecuted by Mr. Hart for a libel contained in the history of Ireland. A verdict of 5000*l.* damages was obtained against him, the consequence of which was his retirement to France, where he passed the remainder of his life in pecuniary difficulties. His death took place on the 23rd of January, 1829.

**PLUKENET, LEONARD**, an English botanist,

who was born in 1642. He is believed to have been educated at Cambridge, but the fact is not known with any degree of certainty. He however practised as an apothecary in Westminster for many years, and towards the close of his life was appointed royal professor of botany at Hampton Court. His principal work was his "Phytographia," which was published in four separate parts between the years 1691 and 1696. He was, however, the author of several other botanical works. He died in 1706.

**PLUMPTREE, JAMES**, a popular English writer and divine, whose father was president of Queen's college, Cambridge. Having completed his preparatory studies, he entered the university of Cambridge, where he took his degree of M. A. in 1795; after which he entered holy orders, and obtained the living of Great Gransden in Huntingdonshire. Mr. Plumtree was the author of several popular dramas, in addition to which he published an "Enquiry into the Lawfulness of the Stage," and "The English Drama Purified; a selection of seventeen standard plays, in which the objectionable passages are omitted or altered." He was also the author of several theological works. Mr. Plumtree died in January 1832.

**PLUTARCH**, a learned Greek writer, who was born at Chæronea in Bœotia, A.D. 50. He was early in life initiated in the study of philosophy and mathematics, and while yet very young was appointed by his countrymen as ambassador to the Roman proconsul, in their name, upon important business. This commission he executed with honour to himself and success to his country. He afterwards travelled through the different territories of Egypt and Greece, as an historian and a philosopher; he then retired to Rome, where he opened a school. Here the emperor Trajan honoured him with the office of consul, and afterwards appointed him governor of Illyricum. On the death of his imperial patron he removed from Rome to Chæronea, where he was respected by his fellow-citizens and raised to all the honours that his native town could bestow. In this peaceful retreat he closely applied to study, and wrote the greatest part of his works, particularly his "Lives of the Roman Worthies." He died at Chæronea, at an advanced age, in the 140th year of the Christian era. His most esteemed productions are his "Lives of Illustrious Men," in which he has delineated the different characters with great skill and impartiality and though his diction is neither pure nor elegant, he is considered the most entertaining, instructive, and interesting, of all the writers of ancient history. So highly were "The Lives of Plutarch" estimated at the revival of literature by men of judgment and taste, that a learned Greek being asked what book he would wish preserved among all the profane compositions of antiquity, answered without hesitation, "The Lives of Plutarch." Among the many eulogiums bestowed on Plutarch, this epigram deserves to be noticed, which is supposed to be inscribed on a statue erected by the Romans to his memory:—

"Chæronean Plutarch, to thy deathless praise  
Does martial Rome this grateful statue raise:  
Because both Greece and she thy fame have shar'd,  
Their heroes written, and their lives compar'd.  
But thou thyself could'st never write thy own;  
Their lives have parallels, but thine has none."

Plutarch is said to have written about three hundred philosophical and historical works, of which one hundred and twenty-five are extant, but some of these are falsely ascribed to him. The philosophical works,

which commonly go under the name of "Ethica" or "Moralia," explain the Platonic doctrines, combat the stoic and Epicurean, and treat of various practical subjects in a popular way; they show him to have been of an active turn of mind, and contain happy applications of extensive learning. His historical writings are yet more distinguished, and are valuable as throwing much light on ancient history, particularly his "Lives and Parallels of Illustrious Greeks and Romans," edited by Bryan, 1729, and translated into English by the Langhorne; his "Greek and Roman Researches, Iris and Osiris, or a Treatise on Egyptian Antiquities and Apothegms." The treatise "On the Doctrines of Philosophers," which contains valuable materials for the history of philosophy, is probably not by him. His manner of treating his subject is easy, but often superficial; and this is also the character of his style, which is censured as being too much ornamented by quotations from poets and philosophers.

Plutarch was so voluminous and celebrated a writer that we cannot close his life without giving a specimen of his style as a biographer. The extract is from "The Life of Cato the Censor." He says, "When Fabius Maximus took the city of Tarentum, Cato, who was then very young, served under him. Happening at that time to lodge with a Pythagorean philosopher named Nearchus, he desired to hear some of his doctrines; and learning from him the same maxims which Plato advances,—'That pleasure is the greatest incentive to evil,—that the greatest burden and calamity to the soul is the body, from which she cannot disengage herself, but by such a wise use of reason as shall wean and separate her from all corporeal passions,'—he became still more attached to frugality and temperance. Yet it is said that he learned Greek very late, and was considerably advanced in years when he began to read the Grecian writers, among whom he improved his eloquence, somewhat by Thucydides, but by Demosthenes very greatly. Indeed, his own writings are sufficiently adorned with precepts and examples borrowed from the Greek; and among his maxims and sentences we find many that are literally translated from the same originals. At that time there flourished in Rome a nobleman of great power and eminence, called Valerius Flaccus, whose penetration enabled him to distinguish a rising genius and virtuous disposition, and whose benevolence inclined him to encourage and conduct it in the path of glory. This nobleman had an estate contiguous to Cato's, where he often heard his servants speak of his neighbour's laborious and temperate manner of life. They told him that he used to go early in the morning to the little towns in the neighbourhood, and defend the causes of such as applied to him; that from thence he would return to his own farm, where in a coarse frock, if it was winter, and naked, if it was summer, he would labour with his domestics, afterwards sit down with them, and eat the same kind of bread, and drink of the same wine. They related also many other instances of his condescension and moderation, and mentioned several of his short sayings that were full of wit and good sense. Valerius, charmed with his character, sent him an invitation to dinner. From that time, by frequent conversation, he found in him so much sweetness of temper and ready wit that he considered him as an excellent plant, which wanted only cultivation, and deserved to be removed to a better soil. He therefore persuaded him to go to Rome, and apply

himself to affairs of state. There his pleadings soon procured him friends and admirers; the interest of Valerius, too, greatly assisted his rise to preferment; so that he was first made a tribune of the soldiers, and afterwards quæstor; and having gained great reputation and honour in those employments, he was joined with Valerius himself in the highest dignities, being his colleague both as consul and as censor. Among all the ancient senators he attached himself chiefly to Fabius Maximus, not so much on account of the great power and honour he had acquired as for the sake of his life and manners, which Cato considered as the best model to form himself upon; so that he made no scruple of differing with the great Scipio, who, though at that time but a young man, yet, actuated by a spirit of emulation, was the person who most opposed the power of Fabius; for being sent quæstor with Scipio to the war in Africa, and perceiving that he indulged himself as usual in an unbounded expense, and lavished the public money upon the troops, he took the liberty to remonstrate, observing,—'That the expense itself was not the greatest evil, but the consequence of that expense, since it corrupted the ancient simplicity of the soldiery, who, when they had more money than was necessary for their subsistence, were sure to bestow it upon luxury and riot.' Scipio answered,—'He had no need of a very exact and frugal treasurer, because he intended to spread all his sails in the ocean of war, and because his country expected from him an account of services performed, not of money expended.' Upon this Cato left Sicily and returned to Rome, where, together with Fabius, he loudly complained to the senate of Scipio's 'immense profusion, and of his passing his time like a boy, in wrestling-rings and theatres, as if he had not been sent out to make war, but to exhibit games and shows.' In consequence of this tribunes were sent to examine into the affair, with orders, if the accusation proved true, to bring Scipio back to Rome. Scipio represented to them,—'That success depended entirely upon the greatness of the preparation;' and made them sensible,—'That though he spent his hours of leisure in a cheerful manner with his friends, his liberal way of living had not caused him to neglect any great or important business.' With this defence the commissioners were satisfied, and he set sail for Africa.

"As for Cato, he continued to gain so much influence and authority by his eloquence that he was commonly called the Roman Demosthenes; but he was still more celebrated for his manner of living. His excellence as a speaker awakened a general emulation among the youth to distinguish themselves the same way, and to surpass each other; but few were willing to imitate him in the ancient custom of tilling the field with their own hands, in eating a dinner prepared without fire, and a spare frugal supper; few, like him, could be satisfied with a plain dress and a poor cottage, or think it more honourable not to want the superfluities of life than to possess them; for the commonwealth now no longer retained its primitive purity and integrity, by reason of the vast extent of its dominions; the many different affairs under its management, and the infinite number of people that were subject to its command, had introduced a great variety of customs and modes of living. Justly, therefore, was Cato entitled to admiration, when the other citizens were frightened at labour and enervated by pleasure, and he alone was unconquered by

either, not only while young and ambitious, but when old and grey-haired, after his consulship and triumph; like a brave wrestler, who, after he has come off conqueror, observes the common rules, and continues his exercises to the last. He himself tells us that he never wore a garment that cost more than an hundred drachmas; that even when prætor or consul he drank the same wine with his slaves; that a dinner never cost him from the market above thirty asses; and that he was thus frugal for the sake of his country, that he might be able to endure the harder service in war. He adds, that having got, among some goods he was heir to, a piece of Babylonian tapestry, he sold it immediately; that the walls of his country-houses were neither plastered nor white-washed; that he never gave more for a slave than 1500 drachmas, as not requiring in his servants delicate shapes and fine faces, but strength and ability to labour, that they might be fit to be employed in his stables, about his cattle, or such like business; and these he thought proper to sell again when they grew old, that he might have no useless persons to maintain. In a word, he thought nothing cheap that was superfluous; that what a man has no need of is dear even at a penny; and that it is much better to have fields where the plough goes or cattle feed, than fine gardens and walks that require much watering and sweeping. Some imputed these things to a narrowness of spirit, while others supposed that he betook himself to this contracted manner of living, in order to correct, by his example, the growing luxury of the age. For my part I cannot but charge his using his servants like so many beasts of burden, and turning them off or selling them when grown old, to the account of a mean and ungenerous spirit, which thinks that the sole tie between man and man is interest or necessity. But goodness moves in a larger sphere than justice: the obligations of law and equity reach only to mankind, but kindness and beneficence should be extended to creatures of every species; and these still flow from the breast of a well-natured man as streams that issue from the living fountain. A good man will take care of his horses and dogs, not only while they are young, but when old and past service. Thus the people of Athens, when they had finished the temple called Hecatompodon, set at liberty the beasts of burden that had been chiefly employed in that work, suffering them to pasture at large free from any further service. It is said that one of these afterwards came of its own accord to work, and, putting itself at the head of the labouring cattle, marched before them to the citadel: this pleased the people, and they made a decree that it should be kept at the public charge as long as it lived. The graves of Cimon's mares, with which he thrice conquered at the Olympic games, are still to be seen near his own tomb. Many have shown particular marks of regard in burying the dogs which they had cherished and been fond of; and, among the rest, Xanthippus of old, whose dog swam by the side of his galley to Salamis when the Athenians were forced to abandon their city, was afterwards buried by his master upon a promontory, which to this day is called the Dog's Grave. We certainly ought not to treat living creatures like shoes or household goods, which, when worn out with use, we throw away; and were it only to learn benevolence to human kind, we should be merciful to other creatures. For my own part, I would not sell even

an old ox that had laboured for me, much less would I remove, for the sake of a little money, a man grown old in my service, from his usual place and diet; for to him, poor man! it would be as bad as banishment, since he could be of no more use to the buyer than he was to the seller. But Cato, as if he took a pride in these things, tells us that when consul he left his war-horse in Spain to save the public the charge of his freight. Whether such things as these are instances of greatness or littleness of soul, let the reader judge for himself."

POCAHONTAS.—This celebrated Indian female was the daughter of Powhatan, an Indian warrior in Virginia. She was born about the year 1595, and discovered the warmest friendship for the English, who colonized Virginia when she was about twelve years old, and was eminently useful to the infant settlement. The first remarkable evidence of this attachment was displayed in 1607, when Captain John Smith was taken prisoner by her countrymen, and brought before Powhatan that he might put him to death. As the savage lifted his club to dash out the brains of the prisoner, whose head was laid on a stone at his feet, Pocahontas threw herself on Smith's body and prevailed on her father to spare his life. Captain Smith was suffered to return to Jamestown, whence he sent presents to Powhatan and his benefactress. From this time Pocahontas frequently visited the settlements of the whites, to whom she furnished provisions at times when they were particularly needed. In 1609 Powhatan invited Smith to pay him a visit, promising him a supply of provisions, but designing to entrap and destroy him and his party. Pocahontas, becoming informed of this event, ventured through the forest at midnight to disclose it to Smith. For three or four years she continued to assist the settlers in their distresses, and to save them from the effects of her father's animosity. During this period the infant colony had experienced numerous vicissitudes of good and bad fortune. Smith had been driven by faction to England, and the rapacity of his successors plunged the settlement into an Indian war. An attack was made on one of the forts by the Indians under Powhatan, when the commander and thirty men were slaughtered, only one person, a boy, surviving, who was saved by Pocahontas.

About the year 1612 Pocahontas,—from what cause is not ascertained, but most probably on account of her extraordinary attachment to the whites,—incurring her father's resentment, left her home and visited the territory of Japazaws, chief of Potowmac. Captain Argall coming up the river on a trading expedition, and conceiving that Pocahontas would be a valuable hostage, prevailed on Japazaws, by the tempting offer of a copper kettle, to surrender her to him. Powhatan refused to ransom her on the terms proposed. During her detention Mr. Thomas Rolfe, an Englishman of respectable character, became attached to her and offered her his hand. It was accepted, and the consent of Powhatan being obtained, the marriage was solemnized in presence of the uncle of Pocahontas and her two brothers. This event relieved the colony from the enmity of Powhatan, and preserved peace between them for many years. In the year 1616 Pocahontas embarked with her husband and several Indians, of both sexes, for England, where she was baptized, exchanging her Indian name for that of Rebecca. She became a subject of curiosity to all classes of people. She received in London a visit from her former friend,

Captain Smith, who, for some unknown purpose, she had been taught to believe was dead. When she first beheld him she was overcome with emotion, and, turning from him, hid her face in her hands. During her stay in England she advanced greatly in the knowledge of the English language, and her conversation was much sought after at court. Her residence among civilized men, however, was destined to be short. While about to embark from Gravesend, in company with her husband and an infant son, to revisit her native land, she died at the age of twenty-two years, leaving one son, who was educated by his uncle in London, and afterwards became a wealthy and distinguished character in Virginia. His descendants still exist in that commonwealth.

POCOCK, EDWARD, an oriental critic, who was born in November 1604, and educated at Oxford. His first literary work was the preparing for the press such parts as had not been edited of the Syriac New Testament from a manuscript in the Bodleian library. In 1629 Pocock was appointed chaplain to the English factory at Aleppo, and applied himself there to the cultivation of oriental literature. He was employed by Laud to collect manuscripts and coins for the university of Oxford, and in 1636 was invited to fill the newly founded Arabic professorship at Oxford. He subsequently undertook a second voyage to the east, and remained some time at Constantinople collecting ancient manuscripts. He returned in 1640, and assisted Selden in the publication of part of the annals of Eutychius under the title of "*Origines Alexandrinæ*." In 1648 he was appointed Hebrew professor at Oxford, to which the king, then a prisoner in the Isle of Wight, added the rich canonry of Christ Church, and the grant was confirmed by the parliament. In 1649 he published "*Specimen Historiæ Arabum*," and shortly after he was deprived of his canonry for refusing to subscribe the engagement required by the parliament. In 1655 he published some of the writings of Maimonides under the title of "*Porta Mosis*," and assisted in Walton's Polyglot Bible. In 1658 appeared his edition of the "*Annals of Eutychius*," in Arabic, with a Latin version. The restoration in 1660 enabled him to recover his church preferment, and the same year he printed an Arabic translation of Grotius's work on the truth of Christianity. In 1663 he produced an Arabic and Latin edition of the "*Historia Dynastiæ*" of Abulfargius. He died at Oxford in 1691, leaving "*Commentaries on the Minor Prophets*," and some other works.

POCOCKE, RICHARD, an English divine and oriental traveller, who was born in 1704 at Southampton, and received his education at Oxford. He engaged in a voyage to the Levant in 1737, and, after visiting Egypt, Arabia, Palestine, and other countries, returned home through Italy and Germany in 1742. He published in 1743—1745 "*A Description of the East*," comprising an account of those parts of the world in which he had travelled, and containing much curious information. He was promoted to the see of Ossory in 1756, whence in 1765 he was translated to Elphin and Meath. He died of apoplexy the same year.

POELENBURG, CORNELIUS, a celebrated painter, who was born at Utrecht in 1586, and became a pupil of Bloemaert, and afterwards went to Rome. Here he studied Raphael's works, but he was deficient in design, and therefore confined him-

self principally to natural scenes on a small scale, in which he excelled. Rubens adorned his own cabinet with Poelenburg's productions. Charles I. invited him to England, where he painted a portrait of the king and other works, but soon returned home and died at Utrecht in 1660. His works are rare, and esteemed for delicacy of touch and sweetness of colouring.

POGGIO, BRACCIOLINI.—This celebrated promoter of literature in Italy was born at Terranuova, in the Florentine territory, in 1380. On completing his education he went to Rome, where he obtained the office of writer of apostolical letters, and in 1414 attended John XXII. to the council of Constance. In 1416 he undertook the task of searching the monasteries for ancient manuscripts; in that of St. Gall he discovered a complete copy of Quintilian, with a part of the *Argonautics* of Valerius Flaccus, and in other religious houses several of Cicero's orations, and obtained copies of the works of Silius Italicus, Vegetius, Ammianus Marcellinus, Columella, &c. In 1418, on the invitation of Cardinal Beaufort, he came to England; but soon returned, and he finally attached himself to Cosmo de Medici. In 1440 he published his "*Dialogues on Nobility*," one of the most finished of his works. In 1453 he was chosen chancellor to the Florentine republic. His "*History of Florence*" had not received its last polish at his death in 1459. Poggio was licentious, quarrelsome, and intemperate in controversy; but his sentiments are in general liberal and manly, and he may be deemed the most elegant composer in Latin (the language of all his works) of that period. His writings are numerous, and upon various topics. Many are discussions on moral arguments, a few are philosophical, and several controversial; the remainder are chiefly translations, orations, and letters, the chief fault of which is diffuseness. His "*Historia Florentina*," which comprises the period from 1350 to 1455, is to be found in the collections of Grævius and Muratori.

POLE, REGINALD.—This distinguished ecclesiastic was descended from royal blood, being a younger son of Sir Richard Pole, Lord Montague, knight of the Garter, and cousin-german to Henry VII. by Margaret, his wife, daughter of George, duke of Clarence, younger brother to King Edward IV. He was born at Stoverton Castle, in Staffordshire, in the year 1500; and, about the age of twelve, was sent to Magdalen college, in Oxford. The famous Linacre, and William Latimer, two of the greatest masters of those times in the Greek and Latin languages, were his principal preceptors; and he made a considerable progress in his studies under them.

In 1517 he was made prebendary of Roscomb, in the church of Salisbury, to which the deanery of Exeter and other valuable preferments were added about two years after.

He then went to Italy, and having spent five years abroad he returned to England, and was received with great affection and honour by the court and the nobility. But devotion and study being his sole delight, he retired to the convent of the Carthusians at Sheen, in Surrey, where he had received the first rudiments of education, having obtained a grant from the king of the apartment which the late Dr. Colet had built for his own use. He had passed two years in this retirement when King Henry VIII. began to exhibit his scruples about the lawfulness of his mar-

riage with Queen Catherine. Pole, foreseeing the troubles which this incident must occasion, and that he should not escape being involved in them if he staid in the kingdom, resolved to withdraw; and obtained his majesty's leave to go to Paris in 1529. Here, carrying some learned persons in his train, he passed his time in literary ease, till the king, prosecuting the affair of the divorce, and sending to the most celebrated universities in Europe for their opinion on his case, commanded him to assist his agents in procuring the subscription and seal of the university of Paris to the illegality of the marriage. Pole, being of a contrary opinion, excused himself to the king in his letters, by saying that his studies had lain another way. But Henry was so much displeased that, when his kinsman returned home, not long after, he was advised, by all means, to clear himself of all disloyalty, and appease his majesty's anger: and having averted the storm for the present, by his submission, he retired to his former solitude at Sheen.

About two years after this the measure was secretly resolved upon of deciding the king's cause independently of the pope; and as Pole was universally esteemed for his learning and piety, and was besides of the royal blood, it was observed, that his consent would be of great service as an example to others. Accordingly no means were left untried to win him over, even the archbishopric of York, at this time vacant, was offered him; and, being irresistibly pressed on every side, he yielded, and repaired to the king; but his conscience checking him at the moment he was about to speak, he was not able to utter a word for some time; but being recovered, he spoke his sentiments freely against the divorce, which being quite unexpected, exasperated the king to such a degree that he put his hand to his dagger; but recollecting himself, he only said, "I will consider of your opinion, and you shall have my answer."

Pole, however, being apprehensive that farther danger would inevitably accrue to him if he continued in England, obtained permission once more to go abroad; and his majesty was so far satisfied that he continued his pension for some time. The first place Pole went to was Avignon in France. This town was under the pope's jurisdiction, and here he continued unmolested for the space of a year; but finding the air did not agree with his constitution, he left it, and went to Padua. In this favourite university he fixed his residence for some time, making excursions now and then to Venice.

Pole had now been a considerable time abroad, and Henry had frequently intimated his desire that he would return home; but he at last wrote to the king, that he neither approved of his divorce, nor his separation from the holy see, both of which had now taken place. The king, in return, sent him over a book written in England, by Dr. Sampson, in support of his own supremacy, and required his opinion in answer to it. Upon this Pole wrote his treatise, entitled, "*De Unitate Ecclesiastica*," and sent it over to the king. In this book he condemned the king's actions, depressed the royal and exalted the papal authority, compared the king to Nebuchadnezzar, and concluded with an address to the emperor, conjuring him "to turn his arms rather against the king than the Turk." Henry concealed his resentment, and wrote to him, requiring him to return immediately to England, that he might confer with him on

the subject of his book and his letters, which required further explanation. But this "angel of peace," as he is styled by Phillips, had no inclination, it seems, to die a martyr in the pope's cause; and therefore, taking warning by the fate of More and Fisher, he wisely and peremptorily refused to return; upon which the king withdrew his pensions, and deprived him of his preferments in England; and not long after, an act of attainder passed against him.

The attachment constantly shown by Pole to the papal interest made it expedient that the Roman pontiff should publicly testify his approbation of his conduct by some singular honour. Accordingly he was summoned to Rome as the representative of England, in a general council, to be held for the reformation of abuses in the administration of the affairs of the church. He arrived at Rome in 1536, where he was lodged in the pope's palace, and treated with great respect. His holiness immediately proposed to make him a cardinal, but Pole, who had much higher temporal preferment in view, no less than the crown of England, by marrying the princess Mary, remonstrated against this promotion, and the pope seemed to acquiesce; but the next day he insisted on his obedience, and Pole, who was not yet in holy orders, nor had received the clerical tonsure, submitted to this ceremony, says Beccatelli, who was present, "with as much reluctance as the lamb to the sheering knife." After which he was created cardinal deacon of St. Nereus and Achilleus. His holiness then appointed him nuncio to the courts of France and Flanders, that he might be the better enabled, from the vicinity of his residence, to correspond with the Roman catholics in England, and keep up the declining interests of the papacy in this country.

At Paris he was received by the king very honourably, but did not stay long there, for Henry, being informed of it, sent to demand him of the French monarch, which being notified to him by that prince, he removed to Cambray, and put himself under the protection of the bishop. But this was no place of safety for him, on account of the war between France and the empire, in which Henry was engaged. The nuncio was therefore obliged to quit it with precipitation, for, as a price had been set upon his head, he was exposed to imminent danger if he fell into their hands. He chose Liege for his next residence, in consequence of an invitation from Erardus, the cardinal bishop, who received him with brotherly kindness. He continued at Liege about three months, expecting that the emperor and the king of France would fulfil their engagements with him, by doing their utmost to foment the disturbances raised by the Roman catholics in England; but this project failing, he was recalled to Rome.

Pole, while he was employed in holding a correspondence with Henry's rebellious subjects, and while he was abusing him in the most scurrilous manner in his publications, complained in his letters to the pope, and to the French nuncio, of the ignominious treatment which he had met with from the king of England, who had proclaimed him a traitor and set a price upon his head; and though he owned his treasonable designs against Henry in the same letters, he had the duplicity to write to Lord Cromwell about the same time, to clear himself from the imputation of disloyalty.

At the close of the year 1538 his holiness, ima-

gining that the bulls of excommunication and deposition, which he had published against Henry, would make his subjects better disposed to break out into rebellion, despatched the cardinal a second time in disguise to France and Flanders. But this scheme being counter-worked by Henry, the cardinal met with a cool reception from his imperial majesty; upon which he returned to Avignon, where he acquainted the pope with his ill success. After this he was appointed legate to Viterbo, near Rome, in which station he continued till 1542, when the pope, having called the council of Trent, appointed him, together with Cardinal Paris, and Cardinal John Morone, his three legates; but, as the council could not then assemble, on account of the wars in Germany, Pole returned to Viterbo. Between this place and Rome he passed his time, following his studies in tranquillity till 1545, when the pope issued a second citation for holding the council at the same place, and appointed Pole again, but with two different cardinals, his legates. Pole's colleagues arrived at Trent before him, and his journey was delayed, as Henry had employed his emissaries to seize him on the road. At length he repaired to Trent, escorted through those parts where danger was apprehended by a detachment of the pope's cavalry.

To account for the cardinal's fears, it is necessary to mention, that his mother Margaret, countess of Salisbury, his eldest brother Henry Pole, Lord Montague, the marquis of Exeter, Sir Edward Nevil, and Sir Nicholas Carew, had been condemned and executed in England for high treason, in conspiring to bring the cardinal to the throne.

Soon after Henry's death he wrote a letter to the regency and council, advising them to reconcile the kingdom to the pope, and assured them, that if his advice were not followed, the kingdom would be exposed to imminent dangers, and added, that "the pope was willing, in charity to their souls, to send him over to remedy their evils." He likewise addressed a written justification of himself to Edward VI.

Pope Paul III. dying in 1549, the cardinal was twice elected to succeed him, but refused both the elections—one as being too hasty, and without deliberation; and the other, because it was done in the middle of the night. This conduct has been ascribed by Phillips and others to delicacy; but the true motive was his distant view of the crown of England, to the possession of which no bar arose, in his opinion, from an heretical prince being seated on the throne, provided he could marry the princess Mary. Julius III. being chosen upon his refusal, and the tranquillity of Rome being soon after much disturbed by the wars in France and on the borders of Italy, Pole retired, with the pope's leave, to a monastery of the Benedictines at Maguzano, in the territory of Verona.

In this retirement he continued till the death of Edward VI., but, on the accession of Queen Mary, it was determined by the court of Rome that Pole should be sent legate into England, as the fittest instrument, on all accounts, to effect the reduction of the kingdom to the obedience of the pope. The undertaking, however, required some consideration. The act of attainder which had passed against him under Henry VIII. had been confirmed by Edward, and consequently remained still in force. The legate, therefore, did not think it safe to venture his person

in England till he understood the true state of things there. However, it was not long before he received full satisfaction upon all these points, and accordingly he set out for England, by way of Germany, in the month of October, 1553; but he had not proceeded far in the emperor's dominions, when a message came to him from that prince to put a stop to his farther progress at present. This was soon followed by an express from Queen Mary to the same purpose, who, to keep him in good humour, sent him the two acts that had passed for the justification of her mother's marriage, and for bringing all things back to the state they were in at her father's death, desiring him likewise to send her a list of such persons as should be made bishops.

The cardinal, being satisfied that the true cause of this delay was to prevent his arrival in England before the queen's marriage to Philip should be completed, wrote a letter to her majesty, wherein he said he "knew that this stop to his journey proceeded from the political views of the emperor; that he had spoken to the emperor's confessor about it, and had convinced him of the impropriety of such courses, and set him to work on his master." He also told the queen he "was afraid that carnal pleasures might govern her too much, and that she might thereby fall from her simplicity in Christ, wherein she had hitherto lived." But the queen's marriage with Philip meeting with great opposition in England, it was resolved that the legate should be kept at a distance. With this view another legation was contrived for him, to mediate a peace between the empire and France, in which he was unsuccessful. In the meantime the marriage between Philip and Mary being solemnized, no further opposition was made to the legate's journey, and the lords Paget and Hastings were sent to Brussels to conduct him to England. He arrived at Dover on the 20th of November, 1554, where he was received by the bishop of Ely, Lord Montague, and other persons of distinction. He then proceeded by land to Gravesend, where he was met by the bishop of Durham and the earl of Shrewsbury, who presented him with the repeal of the act of his attainder that had passed the day before. He afterwards went on board a yacht which conveyed him to Whitehall, where he was received with the utmost veneration by their majesties; and after all possible honour and respect paid to him at court, he was conducted to the archbishop's palace at Lambeth, the destined place of his residence, which had been sumptuously fitted up for his reception.

On the 27th he went to the parliament and made a long speech, inviting them to a reconciliation with the apostolic see, from whence, he said, he was sent by the common pastor of Christendom to recover them, who had long strayed from the enclosure of the church. On the 29th the speaker reported to the commons the substance of this speech; and a message coming from the lords for a conference, in order to prepare a supplication to be reconciled to the see of Rome, it was consented to, and the petition, being agreed on, was reported and approved by both houses; so that being presented by them on their knees to the king and queen, these made their intercession with the cardinal, who thereupon delivered a long speech, at the end of which he granted them absolution. This done, they all went to the royal chapel, where "Te Deum" was sung on the occasion. Thus the pope's authority being now restored, the cardinal, two days afterwards, made his public entry into London with all the

solemnities of a legate, and presently set about the business of purging the church of pretended heresy. But though these proceedings gave great satisfaction to the court, the cardinal had the mortification to find that they were detested by the citizens of London; for when he made his public entry, in passing through the city no sort of respect was shown to him, and his blessing the people as he passed was openly ridiculed.

The queen now despatched ambassadors to Rome to make obedience, in the name of the whole kingdom, to the pope, who had already proclaimed a jubilee on that occasion. But these messengers had scarcely set foot on Italian ground when they were informed of the death of Julius III. and the election of Marcellus II., his successor. But this pontiff dying soon after, the queen, upon the first news of it, recommended her kinsman to the papedom; and despatches were accordingly sent to Rome for the purpose; but they came too late, Peter Caraffa, who took the name of Paul IV., being elected before their arrival. The cardinal, however, had now the sole management of ecclesiastical affairs; and from this time it is demonstrated, from the most authentic records, that the religious persecution became more violent and the executions more frequent.

But he did not live long after, being seized with a quartan ague, of which he died early in the morning of the 18th of November, 1558. His death is said to have been hastened by that of his royal mistress and kinswoman, Queen Mary, which happened about sixteen hours before. His body being put into a leaden coffin, laid forty days in great state at Lambeth, after which it was conveyed thence with great funeral pomp to Canterbury, and interred on the north side of Thomas à Becket's chapel in that cathedral. Over his grave there was erected a tomb, on which were inscribed only these three words, as sufficient to his fame, "*Depositum Cardinalis Poli.*"

**POLIGNAC, MELCHIOR DE, CARDINAL**, a French diplomatist, who was born in 1661, and descended from a distinguished family of Languedoc. In 1689 he rendered himself conspicuous by his address in the negotiations with Pope Alexander VIII. relative to the articles adopted by the French clergy in 1682. In 1693 the abbé de Polignac was named ambassador extraordinary to Poland, for the purpose of detaching John Sobieski from the league with Austria and drawing him over to an alliance with France. On the death of Sobieski in 1696, he was employed in endeavouring to effect the election of the prince of Conti to the Polish throne. His intrigues, though seconded by large bribes, were however unsuccessful. On his return to France in 1698 he was banished the court on account of the failure of this mission. In 1710 he was sent to take part in the negotiations at Gertruydenberg, and in 1712 was appointed plenipotentiary to the congress of Utrecht, and was afterwards minister to the court of Rome. As a writer Polignac is known by his didactic poem, in eight books, against the Epicurean system, entitled "*Anti-Lucretius, seu de Deo et Naturâ*," which has been translated into English, French, and German. He died in 1741.

**POLIGNAC, AUGUSTE JULES ARMAND MARIE, PRINCE DE**.—This celebrated French diplomatist was born in 1780. His mother, the favourite of Marie Antoinette, and governess in the royal family, was married in 1767 to the count de Polignac, who was descended from the same illustrious family

as the cardinal. (See Polignac, Melchior de.) In 1780 her husband was created duke, and soon after the duchess became governess to the young dauphin. In 1789, in consequence of some manifestations of popular hatred, she and her husband left France with the count d'Artois, afterwards Charles X., the prince of Condé, &c. She died in 1793 at Vienna. The duke de Polignac died at St. Petersburg in 1817. The subject of this article emigrated from France with his parents, and his elder brother Armand, who was born in 1771, and resided first in Russia and then in England. The two brothers were engaged in the plots of Georges and Pichegru, the elder having landed in France with the former, and the younger with Pichegru in the following January. On the detection of the conspiracy Armand was condemned to death, and Jules to two years' imprisonment. At the time of this trial the two brothers gave a remarkable proof of fraternal affection: Armand pleaded that mercy ought to be extended to his brother, who was young and whom he had led into danger. Jules, on the other hand, entreated the judges to spare the life of his brother and to accept his own instead: "I," said he, "am a single man without fortune or station; my brother is married: do not drive a virtuous woman to despair; and if you will not spare him, at least let me share his fate." Napoleon, yielding to the tears and prayers of Mad. de Polignac, who, encouraged by Josephine and Hortense, threw herself at the feet of the emperor, commuted the sentence of Armand to imprisonment, and he remained in confinement at Ham, in the Temple, and at Vincennes, several years. The brothers still, however, continued to engage in the intrigues against the emperor, and took part in the conspiracy of Mallet. In 1814 they escaped and joined the king, who sent them with full powers to Paris, where they planted the white colours. Jules Polignac was soon after sent by the king on an embassy to Rome, and in May 1815 he followed the court to Ghent, whence he was despatched to Savoy to rally the emigrant royalists. On this latter mission he rendered important services, and after the second restoration was created peer of France. He was one of the peers who at first refused to take the oath of admission, principally on the ground that it was contrary to the interests of religion; but after the delivery of the king's speech, on the opening of the chambers in 1816, professed himself satisfied by the declarations therein contained, and took the oath in the form prescribed. In 1816 he married Miss Campbell, the heiress of a rich Scotch family. He was subsequently appointed ambassador to London, and in August 1829 was recalled to take the place of president of the ministry. From the first, Prince Polignac was regarded with suspicion by the friends of constitutional liberty in France. His known disposition, the character of his associates, the bigotry of the king, and the open menaces of the royalist faction, prevented the possibility of any cordial co-operation between the ministry and the chambers, and finally precipitated Charles X. from his throne. The prince was arrested at Granville in the disguise of a valet, and conveyed to Paris to await his trial. He was defended before the peers by his predecessor in office, Martignac, declared guilty of treason, and sentenced to civil death.

**POLITIANUS, ANGELUS**, an elegant scholar of the fifteenth century, who was born at Monte Pulciano, in the Florentine territories, whence he derived

the appellation by which he is more usually known than by that of Cinis, his family name. The first production which brought him into notice was a Latin poem on the tournament of Giuliano de' Medici. He assumed the ecclesiastical habit, and acquired by his accomplishments the favour of Lorenzo the Magnificent, who made him tutor to his children, and presented him with a canonry in the cathedral of Florence, which he held with the professorship of the Greek and Latin languages. Among the most esteemed of his writings are, "An Account of the Conspiracy of the Pazzi;" a Latin translation of Herodian, and "A Collection of Greek Epigrams," besides some miscellaneous works in prose and verse, and a drama on the story of Orpheus, printed in 1475. This latter piece was set to music, of which science he was so passionately fond that his death is said to have been accelerated by his propensity. An unfortunate attachment to a lady of distinguished rank had brought on a severe illness, which was so much increased by his starting out of bed in a fit of enthusiasm to celebrate her beauties on his lute, that his death was the consequence in 1494.

POLITZ, CHARLES HENRY LOUIS, a distinguished German writer, who was born at Ernsthall in 1772, and educated at Chemnitz. In 1791 he studied at Leipsic, in 1794 obtained the right of lecturing there, and in 1803 was appointed extraordinary professor of philosophy. His numerous works on education, criticism, history, politics, and the German language, are much esteemed in Germany. Among them are his "Weltgeschichte," "Kleine Weltgeschichte," "Die Staatensysteme Europas und Amerikas seit 1783," "Die Staatswissenschaften im Lichte unserer Zeit," "Das Gesamtgebiet der deutschen Sprache," with histories of several German states, &c. His manuals of German prose and of German poetry also deserve notice.

POLLOK, ROBERT, a clever Scottish poet and divine, who was born in Renfrewshire in 1799, and studied at the university of Glasgow during ten sessions. His most celebrated work was entitled "The Course of Time." It was published in May 1827, and in the same month its author was licensed to preach. His health, however, had been so much impaired by his successive exertions in preparing his poem for the press and carrying on the printing, that, after a few trials, he was under the necessity of relinquishing the labours of his profession; and being threatened with complaints which, in the opinion of some eminent physicians, rendered a residence in a milder climate the only probable means of restoring his health, it became indispensably necessary that he should visit the south of France. He left Scotland for that purpose, but had only arrived at Southampton when his disorder took a fatal turn, and he died near that town on the 15th of September, 1827. The following extracts will give the reader some idea of his talents as a poet. The first is a description of Lord Byron's poetry:—

"He touched his harp, and nations heard, entranced;  
As some vast river of unfailing source,  
Rapid, exhaustless, deep, his numbers flowed.  
All passions of all men,  
The wild and tame,—the gentle and severe;  
All thoughts, all maxims sacred and profane,  
All creeds, all seasons, Time—Eternity;  
All that was hated, and all that was dear,  
All that was hoped, all that was fear'd by man,  
He tossed about as tempest withered leaves:  
Then smiling look'd upon the wreck he made."

As some fierce comet of tremendous size,  
To which the stars did reverence as it pass'd;  
So he, through learning, and through fancy took  
His flight sublime; and on the loftiest top  
Of Fame's dread mountain sat: not soiled, and worn,  
As if he from the earth had laboured up;  
But as some bird of heavenly plumage fair  
He looked, which down from higher regions came,  
And perched it there, to see what lay beneath."

His description of Scottish scenery is remarkable for beauty:—

"Nor do I of that isle remember aught  
Of prospect more sublime and beautiful,  
Than Scotia's northern battlement of hills,  
Which first I from my father's house beheld,  
At dawn of life; beloved in memory still,  
And standard still of rural imagery:  
What most resembles them, the fairest seems,  
And stirs the eldest sentiments of bliss;  
And pictured on the tablet of my heart  
Their distant shapes eternally remain,  
And in my dreams their cloudy tops arise."

POLLUX, JULIUS, a celebrated writer, who was born in Egypt in the latter part of the second century. He devoted himself early to letters, and settled at Athens, where he read lectures on ethics and eloquence. He became preceptor to the emperor Commodus, for whose use he drew up a catalogue of Greek synonymes in ten books, under the name of "Onomasticon." He died A. D. 238.

POLNITZ, CHARLES LOUIS, BARON VON, a learned writer, who was born in 1692, and early displayed marks of talent. He travelled through Europe, of which he gave an amusing account in his "Lettres et Mémoires." He was also the author of "L'Etat de Saxe sous Auguste III.," and of the well-known "Saxe Galante;" the "Histoire de la Duchesse d'Hanovre" is attributed to him. After his death, which took place in 1775, appeared his "Mémoires sur les Quatre Derniers Souverains de la Maison de Brandebourg."

POLO, MARCO, a celebrated traveller of the thirteenth century. He was the son of Nicolas Polo, a Venetian merchant, who, accompanied by his brother Matthew, had penetrated to the court of Kublai, the great khan of the Tartars. This prince being highly entertained with their account of Europe, made them his ambassadors to the pope, on which they travelled back to Rome, and, with two missionaries, once more visited Tartary, accompanied by the young Marco, who became a great favourite with the khan. Having acquired the different dialects of Tartary, he was employed on various embassies; and, after a residence of seventeen years, all the three Venetians returned to their own country in 1295 with immense wealth. Marco afterwards served his country at sea against the Genoese, and, being taken prisoner, remained many years in confinement, the tedium of which he beguiled by composing the history of the travels of his father and himself, under the title of "Delle Maraviglie del Mondo da lui vedute," &c., the first edition of which appeared at Venice in 1496. It has been translated into various languages, the best versions of which are one in Latin and another in French, published at the Hague in 1675 in two volumes. Polo relates many incredible things, but the greater part of his narrative has been verified by succeeding travellers, and it is thought that what he wrote from his own knowledge is both curious and true. He not only gave a better account of China than any previously afforded, but likewise furnished an account of Japan, of several islands in the East Indies, of Mada-

gascar, and of the coast of Africa. He ultimately regained his liberty; but of his subsequent history nothing is known.

POLO, GILES, commonly called Gil Polo, a clever Spanish poet, who was born at Valencia in 1517. His inclination for poetry led him to abandon the profession of law, and his first works placed him among the best Spanish poets of his time. His reputation was established by his "*Diana Enamorata*," a pastoral romance, partly in prose and partly in verse, intended as a continuation of the *Diana* of Montemayor. In invention Gil Polo is not inferior to his predecessor, whom he surpasses in purity of style and in the harmony and brilliancy of his verse. He died in 1572. Cervantes excepts the *Diana* of Gil Polo from his list of works condemned to be burnt.

POLYÆNUS, a Greek writer, who flourished in the second century. He appears to have been by birth a Macedonian, and is principally known as the author of a work on military tactics, entitled "*Strategemata*." Isaac Casaubon published an edition of it, which was reprinted at Leyden in 1690, with improvements. There is an English translation of it by Shepherd.

POLYBIUS, a Greek historian, who was born at Megalopolis in Arcadia, about 203 B. C. His father, Lycortas, was one of the leaders of the Achæan league, and the confidential friend of Philopœmen. Educated for arms and political life, he was sent, at the age of twenty-four years, as a member of an embassy to Ptolemy Epiphanes. When the war between Perseus, king of Macedonia, and the Romans broke out, Polybius was sent to the Roman consul Marcius to inform him of the resolution of the Achæans to join him with their forces. He remained some time in the Roman camp, and then returned with a commission from Marcius to oppose the demand made by the commander Appius for more auxiliary troops to be sent to Epirus. About this time the design of the Romans to make all the free states of Greece dependent became evident, and Polybius took part in all the measures for the preservation of their independence. When, therefore, after the subjugation of Perseus, the Romans used less disguise, Polybius found himself among the 1000 hostages whom the Achæans were obliged to deliver up to the Romans. His learning, virtues, and talents, soon gained him the favour of some of the most distinguished senators, especially the two sons of Paulus Æmilius. The hostages were not dismissed until seventeen years had elapsed, when Polybius, who did not wish to see again his degraded country, remained in Rome and entered into the service of Scipio Æmilianus. He accompanied him on his expedition to Africa, and proved a very useful counsellor to him. When the Achæans became involved in a war with the Romans he hastened to the army of the consul Mummius to mitigate the fate of his countrymen. He was a witness of the destruction of Corinth, and of the change of Achaia into a Roman province.

Amid these melancholy occurrences he preserved his patriotism and disinterestedness. He executed, to the satisfaction of both the Romans and Greeks, the difficult commission of introducing the new form of government in the cities of Greece. The people of Achaia erected statues to him, one of which had this inscription:—"To the memory of Polybius, whose counsel, had it been followed, would have saved Achaia, and who consoled it in its adversity."

He attended Scipio to the siege of Numantia, but after the death of his great friend and benefactor, he returned to his native land, where he died in consequence of a fall from a horse, B. C. 121, aged eighty-two years. Polybius is the author of an historical work from the beginning of the second Punic war to the overthrow of the Macedonian empire. It consists of thirty-eight books, besides two introductory books, containing a sketch of the Roman history from the taking of Rome by the Gauls. Although the affairs of Rome are the chief subject, contemporary occurrences in other countries are also related, on which account Polybius gave it the title of a universal history. We have of this great work only the first five books entire, and valuable fragments of the twelve following, together with the politics of Polybius, taken from the history of Constantine Porphyrogenitus, and examples of virtues and vices. The loss of the rest is very much to be regretted, as, in accuracy and fidelity of narration, and in extent of political and military knowledge, Polybius is surpassed by no historian of antiquity. To him is also attributed the introduction of didactic politics into history—that is, of that manner of writing history which, by intermingling views of the causes, occasions, and effects of events, is a useful introduction to politics. On the other hand, his style is destitute of beauty, and can be read only for the matter. Livy has sometimes copied him. Cicero mentions a particular work of his on the Numantian war.

POLYCARP.—The name of a disciple of the apostle John, and one of the earliest bishops of Smyrna, who finally defended the Christian faith in the year 169, under torture, in being put to death during the persecution of the Christians under Marcus Aurelius. The people destined him to the wild beasts, but the judges condemned him to the flames. These, however, according to the legend, played harmlessly around him, in the shape of a swelling sail, and emitting a sweet fragrance. Seeing his body to be proof against the flames, the judges ordered one of the executioners to run him through with a sword. A white pigeon suddenly flew up, and the flames were extinguished by the blood that flowed from the wound. Thus Christianity had changed the heathen eagle which bore the soul of the Roman emperors to their kindred gods into an innocent dove; and a miracle was then performed, which was afterwards repeated at the funeral pile of the Maid of Orleans. The catholic church consecrates the 26th of January to the memory of Polycarp. His epistle to the Philippians is the only one of his pieces which has been preserved.

POLYCLETUS OF SICYON, one of the most celebrated Grecian sculptors of antiquity, who was a scholar of Agelades, and a rival of Phidias, to whom however he was inferior in fire and nobleness of conception. He was an architect as well as Phidias, but excelled chiefly as a statuary. He devoted himself principally to youthful gymnastic figures and figures of females; indeed Polycletus created the ideal of a youthful figure. He executed all the graceful attitudes of the gymnastics of youth. He made the Argive Juno of a colossal form, as if for a counterpart to Phidias's Jupiter, in ivory and gold, unveiled, with a crown of gold on her head, and a large arched eye, holding a sceptre, with a cuckoo in her left hand, and in her right, which was extended, a pomegranate. Polycletus also made small bronze figures, beautiful

vessels, and lamps. There are other artists of the same name.

**POLYCRATES**, a ruler of Samos, who lived during the time of the elder Cyrus and Pythagoras. The Samians had till then been free, but he made himself master of the government by violence, and endeavoured to secure his power by every means, even by an alliance with the Egyptian king Amasis. His extraordinary success in all his undertakings induced Amasis, as Herodotus says, to admonish him to avert calamities by some voluntary sacrifice. Polycrates followed this advice, and cast his most valued jewel, a precious signet ring, into the sea, which was, however, found a few days after in the maw of a fish that had been sent to him as a present on account of its remarkable size. This induced Amasis to renounce his alliance. In fact, to use the language of the ancients, Nemesis at last punished the arrogance of Polycrates in a dreadful manner. When he was on the point of making himself lord of all Ionia and the neighbouring islands, the Persian satrap, Orantes, who considered himself injured by him, treacherously invited him to his palace, and crucified him, B. C. 522. Polycrates seems to have had much taste for learning and the arts, and greatly promoted the refinement of the Samians. Anacreon, his favourite, and the celebrator of his fame, lived at his court.

**POLYGNOTUS OF THASUS**, one of the most distinguished Greek painters, who flourished from 450 to 410 B. C., embellished Athens with his pencil, and was rewarded with the citizenship. Cimon, the demagogue, and rival of Pericles, employed him to decorate the *Pœcile*. He was also the favoured lover of the beautiful Elpinice, sister of Cimon. Micon and Panæus assisted him in painting the *Pœcile*. His two principal pictures there represented the Greeks before Troy; the subject of one of them was the assembly of the chiefs after the rape of Cassandra; of the other, the captive Trojan females, in the midst of whom was Cassandra. In the *Lesche* hall at Delphi, he painted the Conquest of Troy and the Regions of the Dead, which are described by Pausanias. In a portico of the Parthenon there were also several "easel-pieces," relating to the Trojan war. In the temple of Castor and Pollux was a painting representing the abduction and marriage of the daughters of Leucippus, and in the propylæa were several pictures. His works were probably on wood. Polygnotus is represented as being the first who made painting independent of sculpture, and gave life, motion, character, and expression, to the countenance, skilful disposition to the drapery, and proportion to the figures; and he is said to have been the first who painted tetrachrome pictures with four colours. With him began the grand and lofty style in Greek painting.

**POMBAL, SEBASTIAN JOSEPH CARVALHO**, marquis of Pombal, a celebrated Portuguese statesman, who was born in 1699 at the castle of Soura, near Coimbra. His father was a captain of the poorer class of the nobility, but his mother, a Mendoza, and his uncle, a respectable ecclesiastic, opened to the young Carvalho (who, after having studied law at Coimbra, entered the army) the prospect of promotion. Nature had given him all the qualities which indicate a person destined for rule; a tall and strong frame, a vigorous constitution, a daring eye, a fiery temperament, strong passions, a penetrating judgment, and the most captivating address. In every thing which he undertook he led the way.

Having been banished from Lisbon on account of some youthful imprudences, he passed several years at Soura devoted to study. While there he gained the affections of Theresa de Noronha Almada, a rich widow, whose proud relations rejected with disdain his advances. He eloped, however, with the object of his passion, and his courage and resolution saved him from the daggers of assassins. At the same time the contempt with which the family of his wife, the counts of Arcos, treated him, kindled his ambition to rise. He returned to court, where his address acquired him such high favour that in 1739 he was appointed ambassador to England. Here he became acquainted with the relations between England and Portugal, and formed the plan of delivering his country from the fetters of the English commercial system. The new minister, Peter di Motta, his enemy, recalled him in 1745; but the queen, who was his patroness, sent him to Vienna to act as mediator between the pope and the empress Maria Theresa.

Carvalho here gained general esteem, and, his first wife being dead, obtained the hand of the youthful countess of Daun. He was obliged, however, to refute the calumnies which a Portuguese of rank had circulated against him in Vienna, and to prove his claims to nobility. The queen now procured his nomination as ambassador to the Spanish court, but the king and his minister hated him; he was recalled, and even the influence of the queen was insufficient to overcome the aversion of the king, John V. It was in vain that Pombal insinuated himself into the favour of the Jesuits, and, by his entire devotion to the order, imposed upon them to such a degree as to obtain an intimate acquaintance of their organization, of which he afterwards made use when he was minister. The high nobility persecuted him with irreconcilable hatred; but Carvalho concealed his desire of revenge, and passed for the most amiable, modest, and pious courtier in the service of the queen.

John V. died in 1750, and, through the influence of the queen dowager, Carvalho finally obtained from his successor, Joseph I., the long coveted post of secretary of state for foreign affairs. The confessor of the king, Moreira, a Jesuit, was his friend, and Carvalho courted the order with such zeal that he was called the great Jesuit. He soon rendered the feeble and sensual king (particularly after the death of the queen mother in 1754) entirely subject to his influence. Joseph I., from fear of his brother, Don Pedro, to whom Carvalho's enemies attached themselves, fell in with the most daring projects of his minister, and the latter now proceeded to the accomplishment of his four favourite objects;—the expulsion of the Jesuits, the humiliation of the high nobility, the restoration of the prosperity of Portugal, and the absolute command of the state in the name of the monarch. The kingdom at that period was reduced to the lowest condition. The Jesuits and the high nobility monopolized the wealth of the country, which was without an army or a fleet, without commerce or agriculture. The minister acted on the principles of the mercantile system, and although obliged to abandon many of his designs, succeeded in some of them. It required a man of his character to withstand the attacks to which he was exposed from the inquisition, to which he prohibited its *autos da fé*; from the Jesuits, whom he expelled from their missions in Paraguay; from the high nobility, whom he deprived of their princely possessions in the colo-

nies; and from the prelacy, whose powers he abridged. Then came the earthquake of November 1755, which buried 30,000 human beings, and destroyed property to the value of 400,000,000 dollars. Carvalho left the care of his own family and property, and appeared in the midst of the general despair as a saviour, displaying a vigour and resolution which alone ought to have conciliated his enemies. He was to be seen for a whole week after this calamity uninterruptedly employed, in every place where aid was needed, in contriving means of relief, and restoring order; and, under the most disastrous circumstances and greatest difficulties, displayed the most active benevolence and most extraordinary energy. The king looked upon him as a favourite of heaven, and submitted implicitly to his direction.

Carvalho was now created count of Oeyras, and in 1756 first minister. He then removed every one who ventured to obstruct his plans, for it was necessary to proceed with the most unyielding rigour, since the profligate nobility perpetrated assassinations without hesitation, and plundered the people without mercy. But, with the pride of the great, whom he humbled, and the avarice which his commercial regulations exasperated, was now connected the discontent of the country people, excited by his establishment of monopolies, which, however, was done only to counteract the actual monopoly of the British. The discontented vine-dressers committed excesses in Oporto, but Pombal suppressed the riots by the most comprehensive laws against treason, which made the will of the king valid against all constitutions and privileges. He also exposed, to the astonishment of Europe, the conduct of the Jesuits, who endeavoured, in their government in Paraguay, to persuade the public that he was antichrist. In his exposé of this matter there are certainly many exaggerations; and there is no doubt that the fathers ruled these provinces much better than the government of Spain or Portugal would have done. Carvalho finally determined to remove the Jesuits entirely from the person of the king. They were deprived of the place of confessors, and were ordered on the 16th of September, 1757, to retire to their colleges; and several Portuguese grandees who had joined in intrigues against the minister were banished from Lisbon. Pombal now pushed his measures with vigour; as his attempts to encourage agriculture had been unsuccessful, he proceeded to extirpate the vine, and was finally victorious. A conspiracy against the life of the king, who was wounded on the night of the 3rd of September, 1758, by assassins, whose blows he escaped only through the fidelity of his attendant, or the fright of his mules, delivered the minister's mortal enemies into his hands. Three months after the attempt, Pombal, on the night of the celebration of his daughter's marriage, at which the principal nobility were present, arrested the marquis of Tavora and his family, the Jesuit Malagrida, and, the following day, the duke of Aveiro and others. The minister and a member of the supreme judicial tribunal conducted the examination, and, after a hasty trial, a dreadful sentence was passed, and executed before the castle of Belem on the 13th of January, 1759. The duke of Aveiro and the marquis of Tavora were broken on the wheel as the principals of the conspiracy; the sons and the son-in-law, with the servants of the former, were strangled, as accomplices; the wife of the marquis

was beheaded, and a servant of the duke burnt; as were also the dead bodies of the others. The Jesuits were suspected of being the authors of the plot; but the marquis of Tavora, who had thrown out some accusations against them, had retracted them in writing. Still the minister denounced them to the pope as the contrivers of the scheme, and not being able to procure immediately a bull, permitting the secular tribunals to proceed against them, he caused many of them to be executed in prison. Malagrida, who had prophesied the death of the king, was condemned to the flames by the inquisition, and burnt in 1761. Pombal had already banished the whole order from the kingdom as rebels and enemies of the king, by a royal decree of the 3rd of September, 1759; and as they did not comply with the mandates, caused them to be seized by soldiers, and transported, to the number of 1854, to the States of the Church. These proceedings gave rise to a protracted dispute with the pope; in 1760 Pombal transported the papal nuncio beyond the frontiers, and was on the point of dissolving all connexion with Rome when Clement XIII. died, and Clement XIV., his successor, abolished the order in 1773.

Portugal was soon after involved in a short war with Spain; and, at a subsequent period, in a second war, on account of the minister's haughty conduct towards that government. The Portuguese army received an entirely new organization, and the fortifications on the frontiers were put in a better condition. Pombal was no less active in his efforts to improve the country in every relation, and paid particular attention to the schools; he also rendered the censorship less strict, and, by a law of 1773, established the toleration of converts to Christianity, who had before been treated as secret Jews, and denied many civil privileges. Projects of ambition and of vengeance on his enemies, who repeatedly attempted his life, and his plan of placing on the throne the prince of Beira, the grandson of the queen, occupied the rest of his public life. Joseph L., whose daughter was the bitter enemy of Pombal, died in February 1777, and the minister was dismissed. The state prisoners whom he had incarcerated, 9800 in number, were released, and all his regulations were abolished; so that Portugal sunk back into its former state of imbecility. Pombal transferred to the young queen a treasure of 78,000,000 crusados, and a well-organized state. But the hate of his enemies was more powerful than his services. The Portuguese nobility left no means untried to bring him to the scaffold. The queen caused an examination to be made into the trial of the assassins of the king, and Pombal saved himself only by exhibiting the original proofs of the conspiracy, which had not been made public. The hated and persecuted Pombal retained his titles and estates, and, retiring into the village of Pombal, occupied himself in reading and in works of charity. He died there on the 8th of May, 1782, in the eighty-fourth year of his age.

POMFRET, JOHN, an English poet, who was born in Bedfordshire in 1667, and studied at Queen's college, Cambridge, where he entered holy orders. He died in 1703. His "Choice" has been highly popular. His poems were published in 1699.

POMPADOUR, JEANNE ANTOINETTE POISSON, MARCHIONESS DE.—This female was one of the many mistresses of Louis XV., in whose affections she succeeded Madame de Cha-

teaux. She was born in 1720, and was the daughter of a farmer of Ferté-sous-Jouarre, who had made a tolerable fortune in the corn trade. In 1741 she was married to a *sous-fermier* named d'Etioles. She was well educated, and rich in graces and accomplishments. "I know her well," said Voltaire, "I was the confidant of her love. She declared to me that she had always had a secret presentiment that she should be loved by the king, and that, without well knowing why, she had felt a violent inclination in his favour." This notion, which, in her circumstances, was somewhat wild, seems to have been raised by her often seeing the king at the chase in the forest of Senart. Madame d'Etioles made her appearance in a sort of calash, and attracted the notice of the king, who frequently sent her game. She was finally presented to the king, whose favour she soon entirely engrossed. In 1745 she appeared at court under the title of marchioness of Pompadour. Here she enjoyed the highest consideration, but did not at first interfere in political affairs, satisfied with appearing as the patroness of learning and the arts. She collected books, pictures, and curiosities, and encouraged the institution of the military school, of which Paris du Verney was the founder. But when her charms began to fade, and she could only maintain her influence with the king by furnishing him other objects for the gratification of his passions, she turned her attention to state affairs. She filled the most important offices with her favourites, and contributed to produce those evils which afterwards pressed so heavily on France. It is said to have been principally owing to her that France became involved in the war against Frederic II., as the empress Maria Theresa had propitiated her favour by writing to her with her own hand. The burdens and sufferings which this war brought upon France must be laid at her door, since she removed Bernis, who was in favour of peace, and supplied his place by Choiseul, effected the recall of Marshal d'Estrées at the moment of triumph, and promoted incapable generals to the command. She died in 1764, at the age of forty-four years, little regretted by the king, and hated and reviled by the nation.

**POMPEY, CNEUS POMPEIUS**, surnamed the Great, born 107 B. C.—This distinguished Roman was the son of Cneus Pompeius Strabo, an able general, but hated for his severity and avarice. The young Pompey had received from nature a pleasing person and a graceful dignity, and early displayed talents which promised him equal success in the field and the forum. He first served under his father, who commanded an army against Cinna, in the neighbourhood of Rome, during the Marian war. Here he narrowly escaped being assassinated by his comrade Terentius, who had been hired by Cinna to murder father and son. Having received information of the plot, he abandoned his tent in the evening, and secured his father's life by stationing a guard round the prætorium. Soon after a mutiny broke out in the army, and the soldiers had formed the resolution to desert their obnoxious commander; but Pompey, then a youth of nineteen years of age, presented himself among the rioters, and after trying remonstrances and prayers without effect, threw himself before the gate of the camp, and declared that they should go out only over his body. This firmness had the desired effect. By his gracious words and manner he reconciled the soldiers to his father, who soon after perished by lightning. The party of Marius and Cinna

gained the ascendancy, and deluged Rome with blood. Pompey, who had retired to the neighbourhood of Picenum, where his estates lay, raised a body of troops on his own account, on the approach of Sylla, and compelled the neighbouring cities to declare themselves for this general. His popularity enabled him to raise three legions, with which he joined Sylla in Campania. Three leaders of the opposite party had attempted to obstruct his march, but he defeated them successively, and was received by Sylla with the highest marks of esteem, and saluted by him as imperator, although he had not yet attained the senatorial age, being but twenty-three years old.

A series of sanguinary engagements ensued, by which the Marian faction was annihilated in Italy, and Sylla became the absolute master of Rome. To bind Pompey more closely to his interests, Sylla persuaded him to divorce his wife Antistia, and to marry his own step-daughter Æmilia. It was fortunate for Pompey's fame that he was employed, while Sylla was perpetrating his atrocities in the capital, in Sicily against the Marian general Perpenna. He drove Perpenna from the island, and won the affection of the Sicilians by his clemency. The Marian party had meanwhile collected a force in Africa, under Domitius Ahenobarbus, and received aid from the king of Numidia. Sylla obtained a decree of the senate, entrusting the command in that province to Pompey. Making a sudden attack on Domitius, at the head of five legions, he dispersed the greater part of his forces, stormed his camp, killed Domitius, took the Numidian king captive, and gave his dominions to one of his own partisans. This rapid and decisive success, which occupied only fourteen days, excited the jealousy of Sylla, who commanded him to dismiss his forces and return to Rome. But the soldiers, who saw their hopes of plunder disappointed, broke out into a mutiny, and were reduced to obedience only by Pompey's threat to kill himself if they persisted in their designs. On his return Pompey was received by Sylla with every mark of favour. According to Plutarch, it was from Sylla, but, according to Livy, from his flatterers, that Pompey received the surname of Magnus, which he thenceforward con-

tinued to bear. The jealousy of the dictator was, however, revived when the former demanded a triumph. Sylla declared to him that he should oppose this claim with all his power; but Pompey did not hesitate to reply, that the people were more ready to worship the rising than the setting sun, and Sylla yielded. Pompey therefore obtained the honour of a triumph, although he was the first Roman who had been admitted to it without possessing a higher dignity than that of knighthood, and was not yet of the legal age to be received into the senate. Sylla soon after abdicated the dictatorship, and, at the consular election, had the mortification to feel his rival's ascendancy. He revenged himself by passing him over in his will; but Pompey was magnanimous enough to respect the dead, and used his influence to have his body buried at the public expense, with the greatest pomp.

New troubles soon broke out, occasioned principally by the ambitious projects of the consul Lepidus, who aimed at supreme power. Lepidus left Rome, and placed himself at the head of an army, but was defeated by the united forces of the consul Catulus and Pompey. The latter was then commanded to march against M. Junius Brutus, father of the celebrated M. Brutus, who commanded a body of troops in Cisalpine Gaul in the interest of Lepidus. Pompey compelled him to surrender, and put him to death, notwithstanding that he had promised him a safe conduct. A period of quiet now followed, and Catulus endeavoured to oblige Pompey to dismiss his troops. This the latter evaded, under various pretences, until the progress of Sertorius, formerly a general in the service of Marius in Spain, induced the senate to send Pompey, now thirty years of age, to the support of Metellus, who was unequal to cope with so able an adversary. He was invested with proconsular power. The two commanders, who acted independently of each other, though with a mutual good understanding, were both defeated through the superior activity and skill of Sertorius. Pompey lost two battles, and was personally in danger; and, as long as Sertorius was alive, the war was continued with little success. But Sertorius having been murdered by his own officers, and succeeded in the command by Perpenna, Pompey soon brought the struggle to an end. On his return to Italy, the servile war was raging: Crassus had already gained a decisive victory over Spartacus, the leader of the rebels, and nothing was left for Pompey but to complete the destruction of the remnants of the servile forces; yet he assumed the merit of this triumph, and displayed so little moderation in his success that he was suspected of wishing to tread in the steps of Sylla.

He triumphed, however, a second time, and was chosen consul B. C. 70, although he had yet held none of those civil offices through which it was customary to pass to the consulship. His colleague was Crassus, and both of them courted the people—Crassus by his profuse largesses, and Pompey by the restoration of the tribuneship, and other popular institutions. In the course of the year, when the censors were, according to custom, engaged in granting release from service to such knights as had served the time required, Pompey appeared before them in his consular robes, and leading his horse by his bridle. The censor asked him—"Pompey the Great, have you served the time required by law?" "Yes," answered he, "and all under my own command." This

answer was received with a general shout of applause: the censors rose from their seats, and accompanied him amidst the acclamations of the multitude to his house. Two years after the expiration of his consulship, the pirates, encouraged by the Mithridatic war, had become so powerful in the Mediterranean that they carried on a regular warfare along a great extent of coast, and were masters of 1000 galleys and 400 towns. The tribune Gabinius, a man devoted to the interests of Pompey, proposed that an individual (whose name he did not mention) should be invested with extraordinary powers by sea and land for three years, to put an end to the outrages of the pirates. Several friends of the constitution spoke with warmth against this proposition; but it was carried by a large majority, and the power was conferred on Pompey with the title of proconsul. In four months he cleared the sea of the ships of the pirates, got possession of their fortresses and towns, set free a great number of prisoners, and took captive 20,000 pirates, to whom, no less prudently than humanely, he assigned the insular towns of Cilicia and other provinces, which had been abandoned by their inhabitants, and thus deprived them of any opportunity of returning to their former course. Meanwhile the war against Mithridates had been carried on with various fortune, and, although Lucullus had pushed the enemy hard, yet the latter still found new means to continue the contest. The tribune Manilius then proposed that Pompey should be placed over Lucullus in the conduct of the war against Mithridates and Tigranes, and likewise over all the other Roman generals in the Asiatic provinces, and that all the armies in that quarter should be under his control, at the same time that he retained the supreme command by sea. This was a greater accumulation of power than had ever been entrusted to any Roman citizen, and several distinguished men were resolved to oppose a proposition so dangerous to freedom with their whole influence: but Pompey was so high in the popular favour that on the day appointed for the consideration of the proposition only Hortensius and Catulus had the courage to speak against it, while Cicero, who hoped to obtain the consulship through the support of the Pompeian party, advocated it with all his eloquence; and Cæsar, to whom such deviations from the constitution were acceptable, used all his influence in favour of it. Cicero's oration "*Pro Lege Maniliâ*" contains a sketch of Pompey's public life, with the most splendid eulogy that perhaps was ever made on any individual. The law was adopted by all the tribes, and Pompey, with assumed reluctance, yielded to the wishes of his fellow-citizens.

He arrived in Asia B. C. 67, received the command of Lucullus, who was the less able to conceal his chagrin as Pompey industriously abolished all his regulations. The king was driven from his strong holds, defeated with the loss of his camp, and compelled to flee into the country beyond the Caspian. Pompey, who had at the same time detached Tigranes from his alliance with Mithridates, and placed his kingdom at the disposition of the Romans, followed Mithridates to Scythia and waged war for two years with the warlike inhabitants of that region. He then returned to Pontus, completed the conquest of that kingdom, and converted Syria into a Roman province. At the invitation of the two brothers Aristobulus and Hyrcanus, who claimed the throne of Judæa, he appeared in that country to settle the dispute. After a three

months' siege he took Jerusalem by storm, and conferred on Hyrcanus the dignity of high-priest. In the mean time Mithridates, reduced to despair, had poisoned himself, and thus ended the war. After Pompey had settled the affairs of Asia he visited Greece, where he heard the orators and poets, and displayed his respect for philosophy by making a valuable gift to the city of Athens. He then returned to Italy, dismissed his army to quiet the apprehensions of the citizens as soon as he landed at Brundisium, and entered Rome as a private man. The whole city came out to meet him, and received him with acclamations.

His claim of a triumph was admitted without opposition; and never had Rome yet witnessed such a splendid display as on the two days of his triumphal procession. Captive kings and nobles walked before his chariot, and the spoils which were poured into the public treasury amounted to an enormous sum. After the triumph Pompey allowed all the captives to return to their country except Tigranes and Aristobulus. His plan now was, under the appearance of a private individual, to maintain the first place in the state; but he found obstacles on several sides. Lucullus and Crassus were superior to him in wealth; the zealous republicans looked upon him with suspicion; Cæsar was laying the foundations of his future greatness. Pompey was therefore driven to artifices of all sorts, and attached the profligate Clodius to his interest. Cæsar, on his return from Spain, aspired to the consulship, and to effect his purpose he reconciled Pompey and Crassus with each other, and united with them in forming the coalition which is known under the name of the first triumvirate. He was chosen consul; and, by the marriage of his daughter Julia with Pompey, seemed to have secured his union with that general. From this time Pompey countenanced measures which, as a good citizen, he should have opposed as subversive of freedom. He allowed his own eulogist, Cicero, to be driven into banishment by the tribune Clodius; but having afterwards himself quarrelled with Clodius, he had the former recalled. He supported the illegal nomination of Cæsar to a five years' command in Gaul; the fatal consequence of this compliance afterwards appeared; and to maintain their power, Pompey and Crassus were a second time candidates for the consulship, which they obtained, though not without violence. After the expiration of their year, Crassus went to his government in Asia; while Pompey, to whom Spain was assigned, remained at Rome, and exhibited shows to the people. Yet he did not entirely trust to the popular favour, but maintained an army to keep the citizens in awe. The fall of Crassus in Parthia left but two masters to the Roman world; and on the death of Julia in childhood these friends became rivals. Pompey, however, still retained so much good will towards Cæsar that he sent him two legions to supply his losses. As the troubles increased in the capital, it was the wish of some that Pompey should be named dictator; but Cato proposed, as a more regular mode of proceeding, to name him sole consul, which was immediately done. As Cæsar's reputation as a general and his favour with the people continually increased, Pompey endeavoured to strengthen his influence by a union with the principal families. With this view he married Cornelia, widow of the young Crassus and daughter of Metellus Scipio, whom he made his colleague in

the consulship; and he procured a rejection by the senate of Cæsar's request for a continuation of his command in Gaul. The most important offices were filled by his influence with the enemies of Cæsar, and he recalled the two legions which he had lent him. It was now proposed that both should lay down their commands; but Pompey's adherents objected that Cæsar's time had already expired while Pompey's had not. It was soon evident that they were suspicious of each other, and that neither was inclined to return to a private station.

Lucan, who in his sentiments was a Pompeian, says that Pompey could not bear an equal, nor Cæsar a superior. The former had certainly the forms of the law on his side, since the senate had recalled Cæsar and confirmed Pompey in his command. In actual strength the two rivals were very unequal. Pompey had never been equal in ability to Cæsar, and was now but the shadow of a great name. He himself was not conscious of this decline of his influence; and when Cicero, who found him deaf to all proposals of accommodation, asked him how he thought to oppose Cæsar, he replied, "I have only to stamp with my foot and an army will arise out of the ground." Cæsar had already laid siege to Ravenna, and was declared an enemy to his country by the senate, which but too late for the activity of his rival committed to Pompey the defence of the state. Cæsar passed the Rubicon and approached the city, and in sixty days he subdued all Italy. Pompey, besieged in Brundisium, fled to Greece, where he collected a numerous army. Cæsar followed him, first offering terms of accommodation, then battle. Pompey declined both, and encamped before Dyrrachium. Cæsar surrounded him, but he broke through the enemy and escaped, though with a heavy loss. They finally met near Pharsalus, in Macedonia. Pompey had been forced by his officers to engage, and showed himself unworthy of his fame; for when he saw his troops thrown into disorder, he retired to his tent and remained in a state of stupefaction till the approach of the conquerors aroused him to attend to his safety. He fled through Larissa to the sea, and sailed to Lesbos, where he found his faithful Cornelia, with whom and some friends he coasted along the shores of Asia. At Cyprus a council was held in regard to his future course. Pompey wished to go to Parthia; but on the proposition of the Greek Theophanes, he proceeded towards Egypt, where he might expect a favourable reception from the young Ptolemy, whose father had received benefits from his hands. As soon as his approach to Egypt was known, the base ministers of the youthful king determined to possess themselves of his person and put him to death. On his arrival a boat was accordingly sent, with Achilles, the Egyptian general, and some Roman fugitives, inviting him to land. Pompey feared treachery, but it was too late to recede: after tenderly taking leave of his wife and his son he stepped into the boat. A numerous multitude on the shore awaited his approach; but before he had landed the murderers struck him down. Covering his head with his toga, he expired without a groan. His head was separated from his body, and the trunk was left naked on the shore. A faithful freedman and a Roman soldier, who had served under Pompey, collected some wood and burned the sad remains of him who had once been the master of Rome. When Cæsar arrived in Egypt the head of his enemy was shown to him;

but he turned away from the sight with tears, punished his murderers, caused the head to be solemnly interred, and over his grave erected a temple to Nemesis. Pompey was fifty-nine years old at the time of his death; his name is among the most celebrated of antiquity. He was moderate in pleasure, free from extravagant luxury, and, in the highest pitch of his fortune, kind, mild, and humane, when not carried away by party spirit. His genius was various, and his mind was cultivated by philosophy and letters. If he was not a true patriot, his ambition was not to be the destroyer of freedom, but the chief of a free commonwealth; or, as Lucan says of him, "*rector senatus, sed regnantis*." Incapable of sustaining himself at the height which he had reached, he fell rapidly, and lost some of his fame by the manner of his fall. Pompey left two sons, Cneus and Sextus. The former lost his life in the battle of Munda; the latter, after Cæsar's death, made himself formidable to the new triumvirs by sea, and was finally put to death by the command of Antony, in Armenia, whither he had fled.

PONCE DE LEON, JUAN, one of the early Spanish discoverers in America, was sent by Ovando to conquer the island of Porto Rico; and having there amassed great wealth, and received information of an island situated to the north, in which there was a miraculous fountain possessing the power of restoring youth to the aged, he sailed in 1512 in quest of these happy shores. Although he was unable to find the fountain of youth, he discovered the country to which he gave the name of Florida. Ponce returned to Spain and received from Ferdinand permission to colonize the island of Florida, as he called it, but soon after returned to Porto Rico without making any attempts at colonization.

PONIATOWSKI, the name of an illustrious Polish family, who were descended from an Italian stock. Joseph Salinguerra, who was born in 1612, belonging to the old Italian family Torelli, having settled in Poland after the murder of all his house by Ranuzio I., duke of Parma, took the name of Esiolek, and afterwards that of Poniatowski, from an estate Poniatow of his wife, the daughter of Albert Poniatowski and Anna Leczinska. His descendants received the title of prince in 1764, and the family still forms one of the thirty-six Roman ducal and princely families, but has not the same privileges with the thirty-five others.—Stanislaus (Count Poniatowski), who was born in 1678, is known for his connexion with Charles XII., whom, after the battle of Pultawa, he followed into Turkey, and as whose ambassador at Constantinople he had the address to involve the Porte in a war with Russia. He wrote "*Remarques d'un Seigneur Polonais sur l'Histoire de Charles XII. par Voltaire*." His eldest son, Stanislaus II. Augustus, the favourite of Catherine II., was born in 1732, and was elected king of Poland under the influence of Russian bayonets in 1764. He was an elegant and accomplished gentleman, with good intentions, but without the energy and firmness of purpose necessary to sustain a tottering throne and bridle a licentious nobility. The Czartoryski family, with which he was connected, had sent him to Petersburg to promote the election of Prince Adam Czartoryski to the Polish throne, on which, however, the handsome ambassador was himself seated by Catherine's favour; and the Czartoryskis, finding they could not even rule in his name, began to intrigue against him. His attempts

to remove the civil disabilities of the dissidents, and to introduce some modifications into the Polish constitution, raised a powerful party against him. A confederation was accordingly formed, which was put down by Russian troops, and Poland was obliged to submit to a disadvantageous treaty; but new confederations at Bar, Halicz, and Lublin, involved the country in the horrors of a civil war, which broke out in 1768. The catholic confederates declared the throne vacant, and a body of conspirators under Count Pulaski seized the person of the king on the night of the 3rd of November, 1771. Being left alone with a person named Koczinski, the king persuaded him to allow him to write to Warsaw, whence a guard was sent to conduct him home. Austrian and Prussian troops now filled the country, and most of the nobles, therefore, abandoned Stanislaus, and in 1772, in spite of the remonstrances of the king and the senate, the first partition of Poland was made by the three great robbers, Russia, Prussia, and Austria. The king was now become totally dependent on the standing council, which was governed by the Russian ambassador. The Polish nobles at length discerned the true means of securing the independence of Poland.

They obtained from Frederic William II. of Prussia a promise to stand by the republic in case it should be attacked on account of its amendments of the constitution, and Prussia gave her consent to the constitution of the 3rd of May, 1791, which had been accepted by Stanislaus. In this situation Stanislaus conducted himself with so much wisdom and dignity as to recover the esteem and love of the nation. He also seemed determined to brave the resentment of Catherine; but the connexion with Prussia having been broken, and the minority of the diet, which was opposed to the constitution, having procured a reversal of the proceedings through Potocki and Rzewuski from Vienna and Petersburg, the feeble Stanislaus gave way. The Polish army, notwithstanding the valour of Kosciusko, was not suited for a long resistance, and Stanislaus, who had sworn to perish with his people rather than submit, acceded, at the request of Russia, to the confederation of Targowitz. He thus alienated the minds of the nation without disarming Catherine. Prussia and Russia now proceeded to a second partition in 1793 for the purpose, as they declared, of setting limits to Jacobinism in Poland. The king's opposition only served to expose him to personal abuse from the Russian general, Rautenfeld, and the Russian ambassador, Count Sievers. Catherine obliged him to sign the act of partition, which completed the political annihilation of the Polish state, and to abdicate the throne on the 25th of November, 1795, on the anniversary of his coronation. He went to Petersburg, where he received a pension, living as a private individual, and died in 1798.

Joseph, nephew of Stanislaus, born 1763, served with courage against the Russians in 1792, and on the accession of his uncle to the confederation of Targowitz, left the service with most of the best officers. When the Poles attempted, in 1794, to drive the Russians out of the country, he again joined the Polish camp as a volunteer. Kosciusko gave him the command of a division, at the head of which he distinguished himself at the two sieges of Warsaw. After the surrender of the city he went to Vienna, and, rejecting the offers of Catherine and Paul, lived in retirement on his return to Poland, at his estates near Warsaw. The creation of the duchy of Warsaw rekindled the

hopes of the Polish patriots, and Poniatowski accepted the place of minister of war in the new state. In 1809 he commanded the Polish army against a superior Austrian force, which was sent to occupy the duchy, compelled it to retire rather by skilful manœuvres than by force of arms, and penetrated into Galicia. In the war of 1812 against Russia he was again at the head of the Polish forces, and distinguished himself in all the principal affairs of this chequered campaign. After the battle of Leipsic, during which Napoleon created him marshal of France, he was ordered to cover the retreat of the French army. The enemy were already in possession of the suburbs of Leipsic, and had thrown light troops over the Elster, when the prince arrived with a few followers at the river, the bridge over which had been blown up by the French. Poniatowski, already wounded, plunged with his horse into the stream, which swallowed up horse and rider. His body was first found on the 24th, and buried with all the honours of his rank on the 26th. It was afterwards removed to Warsaw, and in 1816 was deposited in the cathedral at Cracow. Thorwaldsen has executed an equestrian statue of Poniatowski for the city of Warsaw.

PONTOPPIDAN, ERIC, a distinguished Danish ecclesiastic, who was born in 1698. He was educated at Copenhagen, and appointed professor of theology in 1738. He was appointed bishop of Bergen in 1747, which office he retained till the time of his death in 1764. He was the author of several works, of which the best known is his "Natural History of Norway."

POPE, ALEXANDER.—There are few poets who stand so high in the annals of English literature as this distinguished scholar. He was born in 1688, and received a good classical education from several members of the catholic priesthood. He made several clever translations from the Greek before he had attained his fourteenth year, and two years later completed his pastorals, which introduced him to the first literati of the day. They were followed by his "Ode for St. Cecilia's Day," and his "Essay on Criticism," a work which displays such extent of comprehension, such nicety of distinction, such acquaintance with mankind, and such knowledge both of ancient and modern learning, as are not often attained by the

most maturest age and longest experience. It was published about two years afterwards, and, being praised by Addison in "The Spectator," was thought so favourably of as to displease the celebrated critic Dennis, "who," he says, "found himself attacked, without any manner of provocation on his side, and attacked in his person, instead of his writings, by one who was wholly a stranger to him, at a time when all the world knew he was persecuted by fortune; and not only saw that this was attempted in a clandestine manner, with the utmost falsehood and calumny, but found that all this was done by a little affected hypocrite, who had nothing in his mouth at the same time but truth, candour, friendship, good-nature, humanity, and magnanimity."

The pamphlet is such as rage might be expected to dictate. He supposes himself to be asked two questions; whether the essay will succeed, and who or what is the author? Its success he admits to be secured by the false opinions then prevalent; the author he concludes to be "young and raw." "First, because he discovers a self-sufficiency beyond his ability, and hath rashly undertaken a task infinitely above his force. Secondly, while this little author struts and affects the dictatorian air, he plainly shows that at the same time he is under the rod; and, while he pretends to give law to others, is a pedantic slave to authority and opinion. Thirdly, he hath, like school-boys, borrowed both from living and dead. Fourthly, he knows not his own mind, and frequently contradicts himself. Fifthly, he is almost perpetually in the wrong." All these positions he attempts to prove by quotations and remarks; but Johnson truly observes that his desire to do mischief is greater than his power. He has, however, justly criticised some passages in these lines:—

"There are whom heaven has bless'd with store of wit,  
Yet want as much again to manage it;  
For wit and judgment ever are at strife—"

It is apparent that wit has two meanings, and that what is wanted, though called wit, is truly judgment.

Of this essay Pope declared that he did not expect the sale to be quick, because "not one gentleman in sixty, even of liberal education, could understand it." The gentlemen, and the education of that time, seem to have been of a lower character than they are of this. He mentioned a thousand copies as a numerous impression. Dennis was not, however, his only censor; the zealous catholics thought the monks treated with too much contempt, and Erasmus too studiously praised; but to these objections he paid but little attention.

Not long after he wrote the "Rape of the Lock," the most airy, the most ingenious, and the most delightful of all his compositions. It was occasioned by a rather too familiar frolic of gallantry, in which Lord Petre cut off a lock of Mrs. Arabella Fermor's hair. This, whether by stealth or violence, was so much resented, that the intimacy of the two families, before very friendly, was interrupted.

At its first appearance it was termed by Addison "merum sal." Pope, however, saw that it was capable of improvement; and, having luckily contrived to borrow his machinery from the Rosicrucians, imparted the scheme with which his head was teeming to Addison, who told him that his work, as it stood, was "a delicious little thing," and gave him no encouragement to retouch it.

Of this poem many years afterwards Dennis pub-

lished some remarks, though with very little force, and with no effect; for the opinion of the public was already settled, and it was no longer at the mercy of criticism. About the same period he published the "Temple of Fame;" on which Dennis afterwards published a criticism, in which the most reasonable objection is, that some of the lines represent motion as exhibited by sculpture.

Of the epistle from "Eloisa to Abelard" Johnson could not ascertain the date. His first inclination to attempt a composition of that kind arose from his perusal of Prior's "Nut-brown Maid." How much he has surpassed Prior's work it is not necessary to mention, when perhaps it may be said with justice that he has excelled every composition of the same kind. The mixture of religious hope and resignation gives an elevation and dignity to disappointed love, which images merely natural cannot bestow. In the year 1713 he published "Windsor Forest," of which part was, as he relates, written at sixteen years of age, about the same time as his pastorals, and the latter part was added afterwards; where the addition begins we are not told. The lines relating to the peace confess their own date. It is dedicated to Lord Lansdowne, who was then in high reputation and influence among the Tories, and it is said that the conclusion of the poem gave great pain to Addison both as a poet and a politician. The pain that Addison might feel it is not likely he would confess, and it is certain that he so well suppressed his discontent that Pope considered himself his favourite; for, having been consulted in the revisal of "Cato," he introduced it by a prologue; and when Dennis published his remarks, undertook, not indeed to vindicate, but to revenge his friend by a "Narrative of the Frenzy of John Dennis." There is reason to believe that Addison gave no encouragement to this disingenuous hostility, for Pope says in a letter to him, "Indeed your opinion, that 'tis entirely to be neglected, would be my own in my own case; but I felt more warmth here than I did when I first saw his book against myself (though indeed in two minutes it made me heartily merry)." He shortly afterwards published in "The Guardian" the ironical comparison between the pastorals of Philips and Pope. The superiority of Pope is so ingeniously dissembled and the feeble lines of Philips so skilfully preferred, that Steele was unwilling to print the paper lest Pope should be offended. Addison immediately saw the writer's design, but concealed his discovery and permitted its publication, which, by making his friend Philips ridiculous, made him for ever an enemy to Pope.

It appears that about this time Pope had a strong inclination to unite the art of painting with that of poetry, and put himself under the tuition of Jervas. He was near-sighted, and therefore not formed by nature for a painter; he tried, however, how far he could advance, and sometimes persuaded his friends to sit. A picture of Betterton, supposed to be drawn by him, was in the possession of Lord Mansfield. He appears to have regarded Betterton with kindness and esteem, and after his death published under his name a version, in modern English, of Chaucer's "Prologues," and one of his "Tales."

The following year produced a bolder attempt, by which profit was sought as well as praise. The poems which he had hitherto written, however they might have raised his name, had made very little addition

to his fortune. The allowance which his father made him, though, proportioned to what he had, it might be considered liberal, could not be large; his religion prevented him from the occupation of any civil employment, and he complained that he wanted even money to buy books. He therefore resolved to try how far the favour of the public extended, by soliciting a subscription to a version of the Iliad, with large notes. To print by subscription was for some time a practice peculiar to the English. The first considerable work for which this expedient was employed, is said to have been Dryden's Virgil, and it had been tried again with great success when the "Tatlers" were collected into volumes. There was reason to believe that Pope's attempt would be successful. He was in the full bloom of reputation, and was personally known to almost all whom dignity of employment or splendour of reputation had made eminent; he conversed indifferently with both parties and never disturbed the public with his political opinions, and it might be naturally expected, as each faction then boasted its literary zeal, that the great men, who on other occasions practised all the violence of opposition, would emulate each other in their encouragement of a poet who delighted all, and by whom none had been offended. With these hopes he offered an English Iliad to subscribers, in six volumes in quarto, for six guineas. His proposal was very favourably received, and the patrons of literature were busy to recommend his undertaking and promote his interest. Lord Oxford, indeed, lamented that such a genius should be wasted upon a work not original, but proposed no means by which he might live without it. Addison recommended caution and moderation, and advised him not to be content with the praise of half the nation when he might be universally favoured. The greatness of the design, the popularity of the author, and the attention of the literary world, naturally raised such expectations of the future sale, that the booksellers made their offers with great eagerness; but the highest bidder was Bernard Lintot, who became proprietor on condition of supplying, at his own expense, all the copies which were to be delivered to subscribers, or presented to friends, and paying 200*l.* for every volume. Of the quartos it was stipulated that none should be printed but for the author, that the subscription might not be depreciated; but Lintot impressed the same pages upon a small folio and paper perhaps a little thinner; and sold exactly at half the price, for half a guinea each volume, books so little inferior to the quartos that, by a fraud of trade, those folios being afterwards shortened by cutting away the top and bottom, were sold as copies printed for the subscribers. Lintot printed 250 on royal paper in folio for two guineas a volume; of the small folio, having printed 1750 copies of the first volume, he reduced the number in the other volumes to 1000. It is unpleasant to relate that the bookseller, after all his hopes and all his liberality, was by a very unjust and illegal action defrauded of his profit. An edition of the English Iliad was printed in Holland in duodecimo, and imported clandestinely for the gratification of those who were impatient to read what they could not yet afford to buy. This fraud could only be counteracted by an edition equally cheap and more commodious, and Lintot was compelled to contract his folio at once into a duodecimo, and lose the advantage of an intermediate gra-

dation. The notes, which in the Dutch copies were placed at the end of each book as they had been in the large volumes, were now subjoined to the text in the same page, and are therefore more easily consulted. Of this edition 2500 were first printed, and 5000 a few weeks afterwards, but indeed great numbers were necessary to produce considerable profit.

The encouragement given to this translation, though report seems to have over-rated it, was such as the world has not often seen. The subscribers were 575; the copies for which subscriptions were given were 654, and only 660 were printed. For those copies Pope had nothing to pay; he therefore received, including the 200*l.* a volume, 5320*l.* 4*s.* without deduction, as the books were supplied by Lintot. By the success of his subscription Pope was relieved from those pecuniary distresses with which, notwithstanding his popularity, he had hitherto struggled. While the translation of Homer was in its progress Mr. Craggs, then secretary of state, offered to procure him a pension, which, at least during his ministry, might be enjoyed with secrecy. This was not accepted by Pope, who told him, however, that if he should be pressed from want of money he would send to him for occasional supplies. Craggs was not long in power, and was never solicited for money by Pope. With the product of this subscription he secured his future life from want by considerable annuities. The estate of the duke of Buckingham was found to have been charged with 500*l.* a year, payable to Pope, which doubtless his translation enabled him to purchase.

To those who have skill to estimate the excellence and difficulty of this great work, it must be very desirable to know how it was performed, and by what gradations it advanced to correctness. Of such an intellectual process the knowledge has very rarely been attainable; but happily there remains the original copy of the Iliad, which, being obtained by Bolingbroke as a curiosity, descended from him to Mallet. But between this manuscript, which is written upon accidental fragments of paper, and the printed edition, there must have been an intermediate copy that was perhaps destroyed as it returned from the press.

From the first copy Dr. Johnson procured a few transcripts, which we subjoin after the copy as it appears in the printed edition. Those words in italics are cancelled in the copy. The beginning of the first book stands thus:—

*"The wrath of Peleus' son, the direful spring  
Of all the Grecian woes, O goddess, sing!  
That wrath which hurl'd to Pluto's gloomy reign  
The souls of mighty chiefs untimely slain.*

*The stern Pelides' rage, O goddess, sing,  
Of all the woes of Greece the fatal spring,  
That strew'd with warriors dead the Phrygian plain,  
And peopled the dark hell with heroes slain.*

Whose limbs unburied on the naked shore,  
Devouring dogs and hungry vultures tore,  
Since great Achilles and Atreides strove;  
Such was the sovereign doom, and such the will of Jove.

*Whose limbs, unburied on the hostile shore,  
Devouring dogs and greedy vultures tore,  
Since first Atreides and Achilles strove:  
Such was the sovereign doom, and such the will of Jove.*

Declare, O Muse, in what ill-fated hour  
Sprung the fierce strife, from what offended power?  
Latona's son a dire contagion spread,  
And heap'd the camp with mountains of the dead;  
The king of men his reverend priest defied,  
And for the king's offence the people died.

*Declare, O goddess, what offended power  
Inflamed their rage, in that ill-omen'd hour;*

*Phæbus himself the dire debate procured,  
To avenge the wrongs his injured priest endured.  
For this the god a dire infection spread,  
And heap'd the camp with millions of the dead:  
The king of men the sacred sire defied,  
And for the king's offence the people died."*

The Iliad was published, volume by volume as the translation proceeded; the four first books appeared in 1715. The expectation of this work was undoubtedly high, and every man who had connected his name with criticism or poetry was desirous of such intelligence as might enable him to talk upon the popular topic. Halifax, who, by having been first a poet and then a patron of poetry, had acquired the right of being a judge, was willing to hear some books while they were yet unpublished. Of this rehearsal Pope afterwards gave the following account:—"The famous Lord Halifax was rather a pretender to taste than really possessed of it. When I had finished the two or three first books of my translation of the Iliad, that lord desired to have the pleasure of hearing them read at his house. Addison, Congreve, and Garth were there at the reading. In four or five places Lord Halifax stopped me very civilly, and with a speech each time much of the same kind, 'I beg your pardon, Mr. Pope, but there is something in that passage that does not quite please me. Be so good as to mark the place, and consider it a little at your leisure. I am sure you can give it a little turn.' I returned from Lord Halifax's with Dr. Garth in his chariot; and, as we were going along, was saying to the doctor, that my lord had laid me under a great deal of difficulty by such loose and general observations; that I had been thinking over the passages almost ever since, and could not guess at what it was that offended his lordship in either of them. Garth laughed heartily at my embarrassment; said I had not been long enough acquainted with Lord Halifax to know his way yet; that I need not puzzle myself about looking those places over and over when I got home. 'All you need do,' says he, 'is to leave them just as they are; call on Lord Halifax two or three months hence, thank him for his kind observations on those passages, and then read them to him as altered. I have known him much longer than you have, and will be answerable for the event.' I followed his advice; waited on Lord Halifax some time after; said I hoped he would find his objections to those passages removed; read them to him exactly as they were at first; and his lordship was extremely pleased with them, and cried out, 'Ay, now they are perfectly right—nothing can be better.'"

It is seldom that the great or the wise suspect that they are despised or cheated. Halifax, thinking this a lucky opportunity of securing immortality, made some advances of favour and some overtures of advantage to Pope, which he seems to have received with sullen coldness. All our knowledge of this transaction is derived from a single letter, dated December 1, 1714, in which Pope says, "I am obliged to you both for the favours you have done me, and those you intend me. I distrust neither your will nor your memory when it is to do good; and if I ever become troublesome or solicitous, it must not be out of expectation, but out of gratitude. Your lordship may cause me to live agreeably in the town, or contentedly in the country, which is really all the difference I set between an easy fortune and a small one. It is indeed a high strain of generosity in you

to think of making me easy all my life, only because I have been so happy as to divert you some few hours; but, if I may have leave to add it is because you think me no enemy to my native country, there will appear a better reason, for I must of consequence be very much, as I sincerely am, yours, &c."

These voluntary offers and this faint acceptance ended without effect. The patron was not accustomed to such frigid gratitude, and the poet fed his own pride with the dignity of independence. They probably were suspicious of each other. Pope would not dedicate till he saw at what rate his praise was valued; he would be "troublesome out of gratitude, not expectation." Halifax thought himself entitled to confidence, and would give nothing unless he knew what he should receive. Their commerce had its beginning in hope of praise on one side, and of money on the other, and ended because Pope was less eager of money than Halifax of praise. It is not likely that Halifax had any personal benevolence to Pope; it is evident that Pope looked on Halifax with scorn. The reputation of this great work failed of gaining him a patron, but it deprived him of a friend. Addison and he were now at the head of poetry and criticism; and both in such a state of elevation that, like the two rivals in the Roman state, one could no longer bear an equal, nor the other a superior. Of the gradual abatement of kindness between friends the beginning is often scarcely discernible by themselves, and the process is continued by petty provocations, and incivilities sometimes peevishly returned, and sometimes contemptuously neglected, which would escape all attention but that of pride, and drop from any memory but that of resentment. Pope doubtless approached Addison when the reputation of their wit brought them together, with the respect due to a man whose abilities were acknowledged, and who, having attained that eminence to which he was himself aspiring, had in his hands the distribution of literary fame. He paid court with sufficient diligence by his prologue to "Cato," by his abuse of Dennis, and with praise yet more direct by his poem on the "Dialogues on Medals," of which the immediate publication was then intended. In all this there was no hypocrisy, for he confessed that he found in Addison something more pleasing than in any other man. It may be supposed that as Pope saw himself favoured by the world, and more frequently compared his own powers with those of others, his confidence increased, and his submission lessened; and that Addison felt no delight from the advances of a young wit, who might soon contend with him for the highest place. Every great man, of whatever kind be his greatness, has among his friends those who officiously or insidiously quicken his attention to offences, heighten his disgust, and stimulate his resentment. Of such adherents Addison doubtless had many, and Pope was now too high to be without them.

From the appearance of the proposals for the *Iliad*, the kindness of Addison seems to have abated. Jervas the painter once pleased himself with imagining that he had re-established their friendship; and wrote to Pope that Addison once suspected him of too close a confederacy with Swift, but was now satisfied with his conduct. To this Pope answered a week after, that his engagements to Swift were such as his services in regard to the

subscription demanded, and that the Tories never put him under the necessity of asking leave to be grateful. "But," says he, "as Mr. Addison must be the judge in what regards himself, and seems to have no very just one in regard to me, so I must own to you I expect nothing but civility from him." In the same letter he mentions Philips, as having been busy to kindle animosity between them; but, in a letter to Addison, he expresses some consciousness of behaviour inattentively deficient in respect.

Of Swift's industry in promoting the subscription for the *Iliad*, there remains the testimony of Kennet, no friend to either him or Pope. "Nov. 2, 1713, Dr. Swift came into the coffee-house, and had a bow from every body but me, who, I confess, could not but despise him. When I came to the antichamber to wait, before prayers, Dr. Swift was the principal man of talk and business, and acted as master of requests. Then he instructed a young nobleman that the best poet in England was Mr. Pope (a papist), who had begun a translation of Homer into English verse, for which he must have them all subscribe; for, says he, the author shall not begin to print till I have a thousand guineas for him."

The first volume of Homer was published in 1715, and a rival version of the first *Iliad*, for rivals the time of their appearance inevitably made them, was immediately printed, with the name of Tickell. It was soon perceived that, among the followers of Addison, Tickell had the preference, and the critics and poets divided into factions. "I," says Pope, "have the town, that is, the mob, on my side; but it is not uncommon for the smaller party to supply by industry what it wants in numbers. I appeal to the people as my rightful judges, and, while they are not inclined to condemn me, shall not fear the high-flyers at Button's." This opposition he immediately imputed to Addison, and complained of it in terms sufficiently resentful to Craggs, their common friend. When Addison's opinion was asked, he declared the versions to be both good, but Tickell's the best that had ever been written; and sometimes said that they were both good, but that Tickell had more of Homer.

Pope was now sufficiently irritated; his reputation and his interest were at hazard. He once intended to print together the four versions of Dryden, Marston, Pope, and Tickell, that they might be readily compared and fairly estimated. This design seems to have been defeated by the refusal of Tonson, who was the proprietor of the other three versions. Pope intended at another time a rigorous criticism of Tickell's translation, and had marked a copy, in all places that appeared defective. But while he was thus meditating defence or revenge, his adversary sunk before him without a blow; the voice of the public were not long divided, and the preference was universally given to Pope's performance. Dr. Johnson says he was convinced, by adding one circumstance to another, that the other translation was the work of Addison himself; but if he knew it in Addison's lifetime, it does not appear that he told it. He left his illustrious antagonist to be punished by what has been considered as the most painful of all reflections, the remembrance of a crime perpetrated in vain.

The other circumstances of their quarrel were thus related by Pope:—"Philips seemed to have been

encouraged to abuse me in coffee-houses and conversations: and Gildon wrote a thing about Wycherley, in which he had abused both me and my relations very grossly. Lord Warwick himself told me one day, that it was in vain for me to endeavour to be well with Mr. Addison; that his jealous temper would never admit of a settled friendship between us: and, to convince me of what he had said, assured me, that Addison had encouraged Gildon to publish those scandals, and had given him ten guineas after they were published. The next day, while I was heated with what I had heard, I wrote a letter to Mr. Addison, to let him know that I was not unacquainted with this behaviour of his; that if I was to speak severely of him, in return for it, it should be not in such a dirty way; that I should rather tell him, himself, fairly of his faults, and allow his good qualities; and that it should be something in the following manner: I then adjoined the first sketch of what has since been called my satire on Addison. Mr. Addison used me very civilly ever after." The verses on Addison, when they were sent to Atterbury, were considered by him as the most excellent of Pope's performances; and the writer was advised, since he knew where his strength lay, not to suffer it to remain unemployed.

Pope removed to Twickenham in 1715, to which his residence afterwards gave so much celebrity, and he settled there with his father and mother. A view of this celebrated villa is given in the subjoined sketch.

Here he planted the vines and the quincunx which he often alludes to; and being under the necessity of making a subterraneous passage to a garden on the other side of the road, he adorned it with fossils, and dignified it with the title of a grotto; a place of silence and retreat, from which he endeavoured to persuade his friends and himself that cares and passions could be excluded.

While the volumes of his Homer were annually published, he collected his former works into one quarto volume, to which he prefixed a preface, written with great elegance, which was afterwards reprinted, with some passages subjoined that he at first omitted; other marginal additions of the same kind he made in the later editions of his poems. Waller remarks, that poets lose half their praise, because the reader knows not what they have blotted. Pope's voracity of fame taught him the art of obtaining the accumulated honour both of what he had published and of what he had suppressed. In this year his father died suddenly, in his seventy-fifth year, having

past twenty-nine years in privacy. He is not known but by the character which his son has given him. If the money with which he retired was all acquired by himself, he had traded very successfully in times when sudden riches were rarely attainable.

The publication of the *Iliad* was completed in 1720. In this disastrous year of national infatuation, when more riches than Peru can boast were expected from the South Sea, when the contagion of avarice tainted every mind, and even poets panted after wealth, Pope was seized with the universal passion, and ventured some of his money. The stock rose in its price; and for a while he thought himself the lord of thousands. But this dream of happiness did not last long; and he seems to have waked soon enough to get clear with the loss of what he once thought himself to have won, and perhaps not wholly of that.

Next year he published some select poems of his friend Dr. Parnell, with a very elegant dedication to the earl of Oxford; who, after all his struggles and dangers, then lived in retirement. He published the same year an edition of "Shakspeare." His name was now of so much authority, that Tonson thought himself entitled, by annexing it, to demand a subscription of six guineas for Shakspeare's plays in six quarto volumes; nor did his expectation much deceive him, for of 750 which he printed he sold a great number at the price proposed. The reputation of that edition indeed sunk afterwards so low that 140 copies were sold at sixteen shillings each. On this undertaking, to which Pope was induced by a reward of 217*l.* 12*s.*, he seems never to have reflected afterwards without vexation; for Theobald, a man of great diligence, with very slender powers, first, in a work called "Shakspeare Restored," and then in a formal edition, detected his deficiencies with all the insolence of victory; and as he was now high enough to be feared and hated, Theobald had from others all the help that could be supplied, by the desire of humbling a haughty rival. From this time Pope became an enemy to editors, collators, commentators, and verbal critics; and hoped to persuade the world that he miscarried in this undertaking only by having a mind too great for such minute employment.

Soon after the appearance of the *Iliad*, resolving not to let the general kindness cool, he published proposals for a translation of the *Odyssey*, in five volumes, for five guineas. He was willing, however, now, to have associates in his labour, being either weary with toiling upon another's thoughts, or having heard, as Ruffhead relates, that Fenton and Broome had already begun the work, and liking better to have them confederates than rivals. In 1723, while he was engaged in this new version, he appeared before the lords at the memorable trial of Bishop Atterbury, with whom he had lived in great familiarity and frequent correspondence. Atterbury had honestly recommended to him the study of the papal controversy in hope of his conversion, to which Pope answered in a manner that cannot much recommend his principles or his judgment. In questions and projects of learning, they agreed better. He was called at the trial to give an account of Atterbury's domestic life and private employment, that it might appear how little time he had left for plots. Pope had but few words to utter, and in those few he made several blunders. His "Letters to Atterbury" express the utmost esteem, tenderness, and

gratitude; "perhaps," says he, "it is not only in this world that I may have cause to remember the bishop of Rochester." At their last interview in the Tower, Atterbury presented him with a Bible.

Of the *Odyssey*, Pope translated only twelve books; the rest were the work of Broome and Fenton; the notes were written wholly by Broome, who was not over-liberally rewarded. The public was carefully kept ignorant of the several shares; and an account was subjoined at the conclusion, which is now known not to be true. His contract with Lintot was the same as for the *Iliad*, except that only 100*l.* were to be paid him for each volume. The number of subscribers were 574, and of copies 819; so that his profit, when he had paid his assistants, was still very considerable. The work was finished in 1725, and from that time he resolved to make no more translations. The sale did not answer Lintot's expectation; and then he pretended to discover something of fraud in Pope, and commenced or threatened a suit in chancery. On the English *Odyssey* a criticism was published by Spence, at that time prelector of poetry at Oxford, a man whose learning was not very great, and whose mind was not very powerful. His criticism, however, was just; what he thought, he thought rightly; and his remarks were recommended by his coolness and candour. In him Pope had the first experience of a critic without malevolence, who thought it as much his duty to display beauties as expose faults; who censured with respect, and praised with alacrity. With this criticism Pope was so little offended that he sought the acquaintance of the writer, who lived with him from that time in great familiarity, attended him in his last hours, and compiled memorials of his conversation. The regard of Pope recommended him to the great and powerful; and he obtained several very valuable preferments in the church.

Not long after Pope was returning home from a visit in a friend's coach, which, in passing a bridge, was overturned into the water; the windows were closed, and being unable to force them open, he was in danger of immediate death, when the postilion snatched him out by breaking the glass. Voltaire, who was then in England, sent him a letter of consolation. He had been entertained by Pope at his table, where he talked with so much grossness that Mrs. Pope was driven from the room.

Pope soon afterwards joined with Swift, who was then in England, to publish three volumes of *Miscellanies*, in which amongst other things he inserted the "Memoirs of a Parish Clerk," in ridicule of Burnet's importance in his own history, and "A Debate upon Black and White Horses," written in all the formalities of a legal process by the assistance, as is said, of Mr. Fortescue, afterwards master of the rolls. Before these *Miscellanies* is a preface signed by Swift and Pope, but apparently written by Pope; in which he makes a ridiculous and romantic complaint of the robberies committed upon authors by the clandestine seizure and sale of their papers. In these *Miscellanies* was first published "The Art of Sinking in Poetry," which, by such a train of consequences as usually passes in literary quarrels, gave Pope occasion to publish a new satirical work. In 1728 he began to put Atterbury's advice in practice; and showed his satirical powers by publishing "The Dunciad," one of his greatest and most elaborate performances, in which he endeavoured to sink into

contempt all the writers by whom he had been attacked, and some others whom he thought unable to defend themselves. At the head of the *Dunces* he placed Theobald, whom he accused of ingratitude; but whose real crime was supposed to be that of having revised "Shakspeare" more happily than himself. This satire had the effect which he intended, by blasting the characters which it touched. Ralph, who, unnecessarily interposing in the quarrel, got a place in a subsequent edition, complained that for a time he was in danger of starving, as the booksellers had no longer any confidence in his capacity.

The history of "The Dunciad" is very minutely related by Pope himself in a dedication which he wrote to Lord Middlesex in the name of Savage. "I will relate," he says, "the war of the Dunces (for so it has been commonly called), which began in the year 1727 and ended in 1730.

"When Dr. Swift and Mr. Pope thought it proper, for reasons specified in the preface to their *Miscellanies*, to publish such little pieces of theirs as had casually got abroad, there was added to them the 'Treatise of the Bathos; or the Art of Sinking in Poetry.' It happened that in one chapter of this piece the several pieces of bad poets were ranged in classes, to which were prefixed almost all the letters of the alphabet (the greatest part of them at random; but such was the number of poets eminent in that art, that some one or other took every letter to himself: all fell into so violent a fury that for half a year or more the common newspapers (in most of which they had some property, as being hired writers) were filled with the most abusive falsehoods and scurrilities they could possibly devise; a liberty no way to be wondered at in those people and in those papers, that for many years during the uncontrolled license of the press, had aspersed almost all the great characters of the age; and this with impunity, their own persons and names being utterly secret and obscure.

"This gave Mr. Pope the thought that he had now some opportunity of doing good, by detecting and dragging into light these common enemies of mankind; since to invalidate this universal slander it sufficed to show what contemptible men were the authors of it. He was not without hopes that by manifesting the dulness of those who had only malice to recommend them, either the booksellers would not find their account in employing them, or the men themselves, when discovered, want courage to proceed in so unlawful an occupation. This it was that gave birth to 'The Dunciad;' and he thought it an happiness that, by the late flood of slander on himself, he had acquired such a peculiar right over their names as was necessary to this design.

"On the 12th of March, 1729, at St. James's, that poem was presented to the king and queen (who had before been pleased to read it), by the right honourable Sir Robert Walpole; and some days after the whole impression was taken and dispersed by several noblemen and persons of the first distinction. It is certainly a true observation, that no people are so impatient of censure as those who are the greatest slanderers, which was wonderfully exemplified on this occasion. On the day the book was first vended a crowd of authors besieged the shop; intreaties, advices, threats of law and battery; nay, cries of 'treason', were all employed to hinder the coming out of 'The Dunciad:' on the other side, the booksellers and

hawkers made as great efforts to procure it. What could a few poor authors do against so great a majority as the public? There was no stopping a torrent with a finger, so out it came.

"Many ludicrous circumstances attended it. The Dunces (for by this name they were called) held weekly clubs to consult of hostilities against the author. One wrote a letter to a great minister, assuring him Mr. Pope was the greatest enemy the government had; and another bought his image in clay to execute him in effigy; with which sad sort of satisfaction the gentlemen were a little comforted.

"Some false editions of the book appeared, having an owl in their frontispiece: the true one, to distinguish it, fixed in its stead an ass laden with authors. Then another surreptitious one being printed with the same ass, the new edition in octavo returned for distinction to the owl again. Hence arose a great contest of booksellers against booksellers, and advertisements against advertisements; some recommending the edition of the owl, and others the edition of the ass; by which names they came to be distinguished, to the great honour also of the gentlemen of 'The Dunciad.'"

Pope appears by this narrative to have contemplated his victory over the Dunces with great exultation; and such was his delight in the tumult which he had raised, that for a while his natural sensibility was suspended, and he read reproaches and invectives without emotion, considering them only as the necessary effects of that pain which he rejoiced in having given.

"The Dunciad," in the complete edition, is addressed to Dr. Swift: of the notes, part were written by Dr. Arbuthnot; and an apologetical letter was prefixed, signed by Cleland, but supposed to have been written by Pope. After this general war upon dulness, he seems to have indulged himself a while in tranquillity; but his subsequent productions prove that he was not idle. He published in 1731 a poem on "Taste," in which he very particularly and severely criticises the house, the furniture, the gardens, and the entertainments, of Timon, a man of great wealth and little taste. By Timon he was privately said to mean the duke of Chandos; a man perhaps too much pleased with pomp and show, but of a kind and beneficent temper, and who had consequently the voice of the public in his favour. A violent outcry was therefore raised against the ingratitude and treachery of Pope, who was said to have been indebted to the patronage of Chandos for a present of a thousand pounds, and who gained the opportunity of insulting him by the kindness of his invitation.

The receipt of the thousand pounds Pope publicly denied; but from the reproach which the attack on a character so amiable brought upon him, he tried all means of escaping. The name of Cleland was again employed in an apology, by which no man was satisfied, and he was at last reduced to shelter his temerity behind dissimulation, and endeavour to make that disbelieved which he never had confidence openly to deny. He wrote an exculpatory letter to the duke, which was answered with great magnanimity, as by a man who accepted his excuse without believing his professions. He said that to have ridiculed his taste or his buildings had been an indifferent action in another man; but that in Pope, after the reciprocal kindness that had been exchanged between them, it had been less easily excused.

The following year deprived him of Gay, a man whom he had known early, and whom he seemed to love with more tenderness than any other of his literary friends. Pope was now forty-four years old; an age at which the mind begins less easily to admit new confidence, and the will to grow less flexible; and when therefore the departure of an old friend is very acutely felt. In the next year he lost his mother, not by an unexpected death, for she had lasted to the age of ninety-three; but she did not die unlamented. The filial piety of Pope was in the highest degree amiable and exemplary; his parents had the happiness of living till he was at the summit of poetical reputation, till he was at ease in his fortune, and without a rival in his fame, and found no diminution of his respect or tenderness. Whatever was his pride, to them he was obedient; and whatever was his irritability, to them he was gentle. Pope now passed much of his time at Hagley, and his favourite summer-house is delineated beneath.

One of the passages of Pope's life which seems to deserve some enquiry, was a publication of letters between him and many of his friends, which, falling into the hands of Curll, a rapacious bookseller, were by him printed and sold. This volume containing some letters from noblemen, Pope incited a prosecution against him in the house of lords for breach of privilege, and attended himself to stimulate the resentment of his friends. Curll appeared at the bar, and knowing himself in no great danger, spoke of Pope with very little reverence. "He has," said Curll, "a knack at versifying; but in prose I think myself a match for him." When the orders of the house were examined, none of them appeared to have been infringed; Curll went away triumphant, and Pope was left to seek some other remedy. Curll's account was, that one evening a man in a clergyman's gown, but with a lawyer's band, brought and offered to sale a number of printed volumes, which he found to be Pope's epistolary correspondence; that he asked no name and was told none, but gave the price demanded, and thought himself authorized to use his purchase to his own advantage.

Before these letters appeared he published his "Essay on Man," which, if his letter to Swift be rightly explained by the commentator, had been eight years under his consideration, and of which he seems to have desired the success with great solicitude. He had now many open, and doubtless many secret enemies. The Dunces were yet smarting with the war: and the superiority which he publicly arrogated dis-

posed the world to wish for his humiliation. All this he knew, and against all this he provided. His own name, and that of his friend, to whom the work is inscribed, were in the first editions carefully suppressed; and the poem, being of a new kind, was ascribed to one or another, as favour determined or conjecture wandered; "it was given," says Warburton, "to every man, except him only who could write it." Those who like only when they like the author, and who are under the dominion of a name, condemned it; and those admired it who are willing to scatter praise at random, which, while it is unappropriated, excites no envy. Those friends of Pope that were trusted with the secret, went about lavishing honours on the newborn poet, and hinting that Pope was never so much in danger from any former rival. To those authors whom he had personally offended, and whose opinion the world considered as decisive, and whom he suspected of envy or malevolence, he sent his essay as a present before publication, that they might defeat their own enmity by praises which they could not afterwards decently retract. With these precautions, in 1733 was published the first part of the "Essay on Man." There had been for some time a report that Pope was busy upon a system of morality; but this design was not discovered in the new poem, which had a form and a title with which its readers were unacquainted.

The subsequent editions of the first epistle exhibited two memorable corrections. At first the poet and his friend

"Exaltate freely o'er this scene of man,  
A mighty maze of walks without a plan."

For which he wrote afterwards,

"A mighty maze, but not without a plan:"

For, if there was no plan it was in vain to describe or to trace the maze.

The other alteration was of these lines:—

"And spite of pride, and in thy reason's spite,  
One truth is clear, whatever is, is right:"

But having afterwards discovered, or been shown, that the "truth" which subsisted "in spite of reason" could not be very "clear," he substituted

"And spite of pride, in erring reason's spite."

The second and third epistles were published, and Pope was more and more suspected of writing them; at last, in 1734, he avowed the fourth, and claimed the honour of a moral poet. In the conclusion it is sufficiently acknowledged that the principal doctrine of the "Essay on Man" was received from Bolingbroke, who is said to have ridiculed Pope among those who enjoyed his confidence, as having adopted and advanced principles of which he did not perceive the consequence, and as blindly propagating opinions contrary to his own.

About this time Warburton began to make his appearance in the first ranks of learning. He was a man of vigorous faculties, a mind fervid and vehement, supplied by incessant and unlimited enquiry with wonderful extent and variety of knowledge, which yet had not oppressed his imagination, nor clouded his perspicacity. To every work he brought a memory full fraught, together with a fancy fertile of original combinations, and at once exerted the powers of the scholar, the reasoner, and the wit. But his knowledge was too multifarious to be always exact, and his pursuits too eager to be always cautious. His abili-

ties gave him an haughty confidence, which he disdained to conceal; and his impatience of opposition disposed him to treat his adversaries with such contemptuous superiority as made his readers commonly his enemies, and excited against the advocate the wishes of some who favoured the cause. He had, in the early part of his life, pleased himself with the notice of inferior wits and corresponded with the enemies of Pope. A letter was produced, when he had perhaps himself forgotten it, in which he tells Concanen, "Dryden, I observe, borrows for want of leisure, and Pope for want of genius; Milton out of pride, and Addison out of modesty." And when Theobald published "Shakspeare" in opposition to Pope, the best notes were supplied by Warburton. But the time was now come when Warburton was to change his opinion, and Pope was to find a defender in him who had contributed so much to the exaltation of his rival. The arrogance of Warburton excited against him every artifice of offence, and therefore it may be supposed that his union with Pope was censured as hypocritical inconstancy; but Warburton, whatever was his motive, undertook, without solicitation, to rescue Pope from the talons of a saucy writer named Crousaz, who had accused him of favouring fatality, or rejecting revelation; and from month to month continued a vindication of the "Essay on Man" in a literary journal of that time, called "The Republick of Letters."

Pope, who probably began to doubt the tendency of his own work, was glad that the positions, of which he perceived himself not to know the full meaning, could by any mode of interpretation be made to mean well. How much he was pleased with his gratuitous defender, the following letter evidently shows:—

"Sir, I have just received from Mr. R. two more of your letters. It is in the greatest hurry imaginable that I write this; but I cannot help thanking you in particular for your third letter, which is so extremely clear, short, and full, that I think Mr. Crousaz ought never to have another answer, and deserved not so good an one. I can only say, you do him too much honour, and me too much right, so odd as the expression seems; for you have made my system as clear as I ought to have done, and could not. It is indeed the same system as mine, but illustrated with a ray of your own, as they say our natural body is the same still when it is glorified. I am sure I like it better than I did before, and so will every man else. I know I meant just what you explain, but I did not explain my own meaning so well as you. You understand me as well as I do myself; but you express me better than I could express myself. Pray accept the sincerest acknowledgments. I cannot but wish these letters were put together in one book, and intend (with your leave) to procure a translation of part at least, or all of them into French; but I shall not proceed a step without your consent and opinion," &c.

From this time Pope lived in the closest intimacy with his commentator, and amply rewarded his kindness and his zeal; for he introduced him to Mr. Murray, by whose interest he became preacher at Lincoln's Inn, and to Mr. Allen, who gave him a bishopric. When he died he left him the property of his works, a legacy which may be reasonably estimated, according to Johnson, at 4,000*l*.

Besides the general system of morality supposed to be contained in the "Essay on Man," it was his intention to write distinct poems upon the different du-

ties or conditions of life; one of which is the epistle to Lord Bathurst on the "Use of Riches," a work on which he declared great labour to have been bestowed. Into this poem some hints are historically thrown, and some known characters are introduced, with others of which it is difficult to say how far they are real or fictitious. This is the only work in which the author has given a hint of his religion by ridiculing the ceremony of burning the pope, and by mentioning with some indignation the inscription on the monument. When this poem was first published, the dialogue having no letters of direction, was perplexed and obscure. Pope seems to have written with no very distinct idea, for he calls that "An Epistle to Bathurst" in which Bathurst is introduced as speaking. He afterwards inscribed to Lord Cobham his "Characters of Men," written with close attention to the operations of the mind and modifications of life. In this poem he has endeavoured to establish and exemplify his favourite theory of the ruling passion, by which he means an original direction of desire to some particular object, an innate affection which gives all action a determinate and invariable tendency, and operates upon the whole system of life, either openly or more secretly, by the intervention of some accidental or subordinate propensity.

To the "Characters of Men" he added soon after, in an epistle supposed to have been addressed to Martha Blount, but which the last edition has taken from her, the "Characters of Women." This poem, which was executed with great diligence, and in the author's opinion with great success, was neglected at its first publication, as the commentator supposes, because the public was informed by an advertisement that it contained no character drawn from the life; an assertion which Pope probably did not expect or wish to have been believed, and which he soon gave his readers sufficient reason to distrust, by telling them, in a note, that the work was imperfect because part of his subject was vice too high to be yet exposed.

He afterwards published (between 1730 and 1740) "Imitations of Different Poems of Horace," generally with his name, and once, as was suspected, without it. What he was upon moral principles ashamed to own, he ought to have suppressed. This mode of imitation, in which the ancients are familiarised, by adapting their sentiments to modern topics, by making Horace say of Shakspeare what he originally said of Ennius, and accommodating his satires on Pantolabus and Nomentanus to the flatterers and prodigals of our own time, was first practised in the reign of Charles the Second by Oldham and Rochester. It is a kind of middle composition between translation and original design, which pleases when the thoughts are unexpectedly applicable, and the parallels lucky. It seems to have been Pope's favourite amusement; for he has carried it further than any former poet. He published likewise a revival of Dr. Donne's "Satires," which was recommended to him by the duke of Shrewsbury and the earl of Oxford. They made no great impression on the public. The epistle to Dr. Arbuthnot, which seems to be derived in its first design from Boileau's "Address à son Esprit," was published in January 1735, about a month before the death of him to whom it is inscribed. It is to be regretted that either honour or pleasure should have been missed by Arbuthnot; a man estimable for his learning, amiable for his life, and venerable

for his piety. In this poem Pope seems to reckon with the public. He vindicates himself from censures, and with dignity, rather than arrogance, enforces his own claims to kindness and respect. Into this poem are interwoven several paragraphs which had been before printed as a fragment, and among them the satirical lines upon Addison, of which the last couplet has been twice corrected. It was at first,

"Who would not smile if such a man there be?  
Who would not laugh if Addison were he?"

Then,

"Who would not grieve if such a man there be?  
Who would not laugh if Addison were he?"

And it stands at last,

"Who but must laugh if such a man there be?  
Who would not weep if Atticus were he?"

He was at this time at open war with Lord Hervey, who had distinguished himself as a steady adherent to the ministry; and being offended with a contemptuous answer to one of his pamphlets, had summoned Pulteney to a duel. Whether he or Pope made the first attack, perhaps cannot now be easily known. He had written an invective against Pope, whom he calls "Hard as thy heart, and as thy birth obscure;" and hints that his father was a hatter. To this Pope wrote a reply in verse and prose. The verses are in this poem; and the prose, though it was never sent, is printed among his letters.

His last satires of a general kind were two dialogues, named, from the year in which they were published, "Seventeen Hundred and Thirty-eight." In these poems many are praised and many are reproached. Pope was then entangled in the opposition; a follower of the prince of Wales, who dined at his house, and the friend of many who obstructed and censured the conduct of the ministers. His political partiality was too plainly shown; he forgot the prudence with which he passed, in his earlier years, uninjured and unoffending, through much more violent conflicts of faction. In the first dialogue, having an opportunity of praising Allen of Bath, he asked his leave to mention him as a man not illustrious by any merit of his ancestors, and called him in his verses "low-born Allen." Men are seldom satisfied with praise introduced or followed by any mention of defect. Allen seems not to have taken any pleasure in this epithet, which was afterwards softened into "humble Allen." In the second dialogue he took some liberty with one of the Foxes, among others, which Fox, in a reply to Lyttleton, took an opportunity of repaying, by reproaching him with the friendship of a lampooner, who scattered his ink without fear or decency, and against whom he hoped the resentment of the legislature would quickly be discharged.

The "Memoirs of Scriblerus," published about this time, extend only to the first book of a work projected in concert by Pope, Swift, and Arbuthnot, who used to meet in the time of Queen Anne, and denominated themselves the Scriblerus Club. Their purpose was to censure the abuses of learning by a fictitious life of an infatuated scholar. They were dispersed; the design was never completed; and Warburton laments its miscarriage as an event very disastrous to polite letters. If the whole may be estimated by this specimen, which seems to be the production of Arbuthnot, with a few touches perhaps by Pope, the want of more will not be much lamented, for the follies which the writer ridicules are so little

practised that they are not known; nor can the satire be understood but by the learned: he raises phantoms of absurdity, and then drives them away.

For this reason this joint production of three great writers has never obtained any notice from mankind; it has been little read, or when read has been forgotten, as no man could be wiser, better, or merrier, by remembering it. The design cannot boast of much originality, for, besides its general resemblance to Don Quixote, there will be found in it particular imitations of "The History of Mr. Ouffe."

Pope did not now sink into idleness; he had planned a work which he considered as subsequent to his "Essay on Man," of which he has given this account to Dr. Swift:—"If ever I write any more epistles in verse," observes he, "one of them shall be addressed to you. I have long concerted it, and begun it; but I would make what bears your name as finished as my last work ought to be, that is to say, more finished than any of the rest. The subject is large, and will divide into four epistles, which naturally follow the 'Essay on Man,' viz., 1. Of the extent and limits of human reason and science. 2. A view of the useful and therefore attainable, and of the unuseful and therefore unattainable arts. 3. Of the nature, ends, application, and use of different capacities. 4. Of the use of learning, of the science of the world and of wit. It will conclude with a satire against the misapplication of all these, exemplified by pictures, characters, and examples."

Pope now began to suffer from an asthma, and finding the powers of life gradually declining, he had no longer courage to undertake a new work; but, from the materials which he had provided, he added, at Warburton's request, another book to "The Dunciad," of which the design is to ridicule such studies as are either hopeless or useless, as either pursue what is unattainable, or what, if it be attained, is of no use.

When this book was printed the laurel had been for some time upon the head of Cibber, a man whom it cannot be supposed that Pope could regard with much kindness or esteem, though in one of the imitations of Horace he has liberally enough praised the "Careless Husband." In "The Dunciad," among other worthless scribblers, he had mentioned Cibber, who in his "Apology" complains of the great poet's unkindness as more injurious, "because," says he, "I never have offended him." It might have been expected that Pope should have been in some degree satisfied by this submissive gentleness, but no such consequence appeared. Though he condescended to commend Cibber once, he mentioned him afterwards contemptuously in one of his satires, and again in his epistle to Arbuthnot, and in the fourth book of "The Dunciad" attacked him with acrimony, to which the provocation is not easily discoverable. Perhaps he imagined that in ridiculing the laureat he satirized those by whom the laurel had been given, and gratified that ambitious petulance with which he affected to insult the great. The severity of this satire left Cibber no longer any patience. He had confidence enough in his own powers to believe that he could disturb the quiet of his adversary, and doubtless did not want instigators, who, without any care about the victory, desired to amuse themselves by looking on at the contest. He therefore published a pamphlet, in which he declares his resolution from that time never to bear another blow

without returning it, and to tire out his adversary by perseverance, if he cannot conquer him by strength. The incessant and unappeasable attacks of Pope he imputes to a very distant cause. After the "Three Hours after Marriage" had been driven off the stage by the offence which the mummy and crocodile gave the audience, while the exploded scene was fresh in memory, it happened that Cibber played Bayes in the rehearsal; and, as it had been usual to enliven the part by the mention of any recent theatrical transactions, he said that he once thought to have introduced his lovers disguised in a mummy and a crocodile. "This," says he, "was received with loud claps, which indicated contempt of the play." Pope, who was behind the scenes, meeting him as he left the stage, attacked him, as he says, with all the virulence of a "wit out of his senses," to which he replied, "that he would take no other notice of what was said by so particular a man than to declare, that as often as he played that part he would repeat the same provocation."

Pope had now been enough acquainted with human life to know, if his passion had not been too powerful for his understanding, that from a contention like his with Cibber the world seeks nothing but diversion, which is given at the expence of the higher character. When Cibber lampooned Pope curiosity was excited; what Pope would say of Cibber nobody enquired, but in hope that Pope's asperity might betray his pain and lessen his dignity.

In May 1744 Pope found his death was approaching; on the sixth of that month he was all day delirious, which he mentioned four days afterwards as a sufficient humiliation of the vanity of man; he afterwards complained of seeing things as through a curtain, and in false colours; and one day, in the presence of Dodsley, asked what arm it was that came out from the wall. He said that his greatest inconvenience was inability to think. Bolingbroke wept over him in this state of helpless decay; and being told by Spence that Pope, at the intermission of his deliriousness, was always saying something kind either of his present or absent friends, and that his humanity seemed to have survived his understanding, answered, "It has so;" and added, "I never in my life knew a man that had so tender a heart for his particular friends, or more general friendship for mankind." At another time he said "I have known Pope these thirty years, and value myself more in his friendship than"—his grief then suppressed his voice.

Pope expressed undoubting confidence of a future state. Being asked by his friend Mr. Hooke, a catholic, whether he would not die like his father and mother, and whether a priest should not be called, he answered, "I do not think it essential, but it will be very right, and I thank you for putting me in mind of it." In the morning after the priest had given him the last sacraments he said, "There is nothing that is meritorious but virtue and friendship, and indeed friendship itself is only a part of virtue." He died in the evening of the 30th of May, 1744, so placidly that the attendants did not perceive the exact time of his departure. He was buried at Twickenham, near his father and mother, where a monument has been erected to him by his commentator, the bishop of Gloucester.

The works of Pope are now to be examined, not so much with attention to slight faults or petty beau-

ties, as to the general character and effect of each performance. It seems natural for a young poet to initiate himself by pastorals, which, not professing to imitate real life, require no experience, and, exhibiting only the simple operation of unmingled passions, admit no subtle reasoning or deep enquiry. Pope's pastorals are not, however, composed but with close thought; they have reference to the times of the day, the seasons of the year, and the periods of human life. To charge these pastorals with want of invention is to require what was never intended. The imitations are so ambitiously frequent that the writer evidently means rather to show his literature than his wit. The design of "Windsor Forest" is evidently derived from "Cooper's Hill," with some attention to Waller's poem on "The Park;" but Pope cannot be denied to excel his masters in variety and elegance, and the art of interchanging description, narrative, and morality. The "Temple of Fame" has, as Steele warmly declared, "a thousand beauties." Every part is splendid; there is great luxuriance of ornaments; the original vision of Chaucer was never denied to be much improved, the allegory is very skilfully continued, the imagery is properly selected, and learnedly displayed; yet, with all this comprehension of excellence, as its scene is laid in remote ages, and its sentiments, if the concluding paragraph be excepted, have little relation to general manners or common life, it never obtained much notice, but is turned silently over, and seldom quoted or mentioned with either praise or blame.

The "Ode for St. Cecilia's Day" was undertaken at the desire of Steele: in this the author is generally confessed to have miscarried, yet he has miscarried only as compared with Dryden; for he has far outgone other competitors. Dryden's plan is better chosen; history will always take stronger hold of the attention than fable: the passions excited by Dryden are the pleasures and pains of real life, the scene of Pope is laid in imaginary existence; Pope is read with calm acquiescence, Dryden with turbulent delight; Pope hangs upon the ear, and Dryden finds the passes of the mind.

One of his greatest though of his earliest works, is the "Essay on Criticism," which, if he had written nothing else, would have placed him among the first critics and the first poets, as it exhibits every mode of excellence that can embellish or dignify didactic composition, selection of matter, novelty of arrangement, justness of precept, splendour of illustration, and propriety of digression.

To the praises which have been accumulated on "The Rape of the Lock," by readers of every class, it is difficult to make any addition. Of that which is universally allowed to be the most attractive of all ludicrous compositions, let it rather be now enquired from what sources the power of pleasing is derived. Dr. Warburton, who excelled in critical perspicacity, has remarked that the preternatural agents are very happily adapted to the purposes of the poem. The heathen deities can no longer gain attention: we should have turned away from a contest between Venus and Diana. The employment of allegorical persons always excites conviction of its own absurdity; they may produce effects, but cannot conduct actions; when the phantom is put in motion, it dissolves: thus discord may raise a mutiny; but discord cannot conduct a march, nor besiege a town. Pope brought in view a new race of beings, with powers and pas-

sions proportionate to their operation. The Sylphs and Gnomes act at the toilet and the tea-table what more terrific and more powerful phantoms perform on the stormy ocean or the field of battle; they give their proper help, and do their proper mischief. Pope is said by an objector, not to have been the inventor of this petty nation; a charge which might with more justice have been brought against the author of the Iliad, who doubtless adopted the religious system of his country; for what is there but the names of his agents which Pope has not invented? Has he not assigned them characters and operations never heard of before? Has he not, at least, given them their first poetical existence? If this is not sufficient to denominate his work original, nothing original ever can be written. In this work are exhibited, in a very high degree, the two most engaging powers of an author. New things are made familiar, and familiar things are made new. A race of aerial people, never heard of before, is presented to us in a manner so clear and easy, that the reader seeks for no further information, but immediately mingles with his new acquaintance, adopts their interests, and attends their pursuits, loves a Sylph, and detests a Gnome.

The chief help of Pope in the Iliad was drawn from the versions of Dryden. Virgil had borrowed much of his imagery from Homer, and part of the debt was now paid by his translator. Pope searched the pages of Dryden for happy combinations of heroic diction; but it will not be denied that he added much to what he found. He cultivated our language with so much diligence and art that he has left in his Homer a treasure of poetical elegances to posterity. His version may be said to have tuned the English tongue; for since its appearance, no writer, however deficient in other powers, has wanted melody. Such a series of lines so elaborately corrected, and so sweetly modulated, took possession of the public ear; the unlettered was enamoured of the poem, and the learned wondered at the translation.

The following letter from Pope to his friend Mr. Bridges forms an interesting illustration of his great work from the Greek:—

"Sir, the favour of your letter, with your remarks, can never be enough acknowledged; and the speed with which you discharged so troublesome a task, doubles the obligation. I must own, you have pleased me very much by the commendations so ill bestowed upon me; but, I assure you, much more by the frankness of your censure, which I ought to take the more kindly of the two, as it is more advantageous to a scribbler to be improved in his judgment than to be soothed in his vanity. The greater part of those deviations from the Greek, which you have observed, I was led into by Chapman and Hobbes; who are, it seems, as much celebrated for their knowledge of the original as they are decryed for the badness of their translations. Chapman pretends to have restored the genuine sense of the author, from the mistakes of all former explainers, in several hundred places; and the Cambridge editors of the large Homer, in Greek and Latin, attributed so much to Hobbes that they confess they have corrected the old Latin interpretation very often by his version. For my part, I generally took the author's meaning to be as you have explained it; yet their authority, joined to the knowledge of my own imperfectness in the language, over-ruled me. However, Sir, you may be confident I think you in the right, because

you happen to be of my opinion: for men, let them say what they will, never approve any other's sense, but as it squares with their own. But you have made me much more proud of, and positive in my judgment, since it is strengthened by yours. I think your criticisms, which regard the expressions, very just, and shall make my profit of them; to give you some proof that I am in earnest, I will alter three verses on your bare objection, though I have Mr. Dryden's example for each of them. And this, I hope, you will account no small piece of obedience from one who values the authority of one true poet above that of twenty critics or commentators. But though I speak thus of commentators, I will continue to read carefully all I can procure, to make up that way for my own want of critical understanding in the original beauties of Homer. Though the greatest of them are certainly those of invention and design, which are not at all confined to the language: for the distinguishing excellences of Homer are (by the consent of the best critics of all nations) first in the manners (which include all the speeches, as being no other than the representations of each person's manners by his words), and then in that rapture and fire which carries you away with him with that wonderful force that no man who has a true poetical spirit is master of himself while he reads him. Homer makes you interested and concerned before you are aware, all at once, whereas Virgil does it by soft degrees. This, I believe, is what a translator of Homer ought principally to imitate; and it is very hard for any translator to come up to it, because the chief reason why all translations fall short of their originals is, that the very constraint they are obliged to renders them heavy and dispirited.

"The great beauty of Homer's language, as I take it, consists in that noble simplicity which runs through all his works; and yet his diction, contrary to what one would imagine consistent with simplicity, is at the same time very copious. I don't know how I have run into this pedantry in a letter, but I find I have said too much, as well as spoken too inconsiderately; what farther thoughts I have upon this subject, I shall be glad to communicate to you (for my own improvement) when we meet; which is a happiness I very earnestly desire, as I do likewise some opportunity of proving how much I think myself obliged to your friendship, and how truly I am, Sir,

"Your most faithful, humble servant,

"A. POPE."

Of the *Odyssey* nothing remains to be observed: the same general praise may be given to both translations, and a particular examination of either would require a large volume. The notes were written by Broome, who endeavoured not unsuccessfully to imitate his master.

Of "*The Dunciad*" the hint is confessedly taken from Dryden's "*Mac Flecknoe*;" but the plan is so enlarged and diversified as justly to claim the praise of an original, and affords perhaps the best specimen that has yet appeared of personal satire ludicrously pompous.

The "*Essay on Man*" was a work of great labour and long consideration, but certainly not the happiest of Pope's performances. The subject is perhaps not very proper for poetry, and the poet was not sufficiently master of his subject; metaphysical morality was to him a new study; he was proud of his acquisitions; and, supposing himself master of great secrets,

was in haste to teach what he had not learned. Thus he tells us in the first epistle, that from the nature of the Supreme Being may be deduced an order of beings such as mankind, because Infinite Excellence can do only what is best. He finds out that these beings must be "somewhere," and that "all the question is whether man be in a wrong place."—"Surely," says Johnson, "if, according to the poet's Leibnitzian reasoning, we may infer that man ought to be, only because he is, we may allow that his place is the right place because he has it. Supreme wisdom is not less infallible in disposing than in creating. But what is meant by *somewhere* and *place*, and *wrong place*, it had been vain to ask Pope, who probably had never asked himself. Having exalted himself into the chair of wisdom, he tells us much that every man knows and much that he does not know himself; that we see but little, and that the order of the universe is beyond our comprehension; an opinion not very uncommon; and that there is a chain of subordinate beings 'from infinite to nothing,' of which himself and his readers are equally ignorant. But he gives us one comfort, which without his help he supposes unattainable, in the position 'that though we are fools, yet God is wise.'" This essay affords a striking instance of the predominance of genius, the dazzling splendour of imagery, and the seductive powers of eloquence. Never was penury of knowledge and vulgarity of sentiment so happily disguised. The reader feels his mind full, though he learns nothing; and when he meets it in its new array, no longer knows the talk of his mother and his nurse. When these wonder-working sounds sink into sense, and the doctrine of the essay, disrobed of its ornaments, is left to the powers of its naked excellence, what shall we discover? That we are, in comparison with our Creator, very weak and ignorant; that we do not uphold the chain of existence, and that we could not make one another with more skill than we are made. We may learn yet more: that the arts of human life were copied from the instinctive operations of other animals; that if the world be made for man, it may be said that man has also his duties to perform.

The "*Imitations of Horace*" seem to have been written as relaxations of his genius. This employment became his favourite by its facility; the plan was ready to his hand, and nothing was required but to accommodate as he could the sentiments of an old author to recent facts or familiar images; but what is easy is seldom excellent; such imitations cannot give pleasure to common readers; the man of learning may be sometimes surprised and delighted by an unexpected parallel; but the comparison requires knowledge of the original, which will likewise often detect strained applications. Between Roman images and English manners there will be an irreconcilable dissimilitude, and the works will be generally uncouth and party-coloured; neither original nor translated, neither ancient nor modern. Pope had, in proportions very nicely adjusted to each other, all the qualities that constitute genius. He had invention, by which new trains of events are formed and new scenes of imagery displayed, as in the "*Rape of the Lock*;" and by which extrinsic and adventitious embellishments and illustrations are connected with a known subject, as in the "*Essay on Criticism*." He had imagination, which strongly impresses on the writer's mind, and enables him to convey to the

reader the various forms of nature, incidents of life and energies of passion, as in his "Eloisa," "Windsor Forest," and the "Ethick Epistles." He had judgment, which selects from life or nature what the present purpose requires, and by separating the essence of things from its concomitants, often makes the representation more powerful than the reality: and he had colours of language always before him ready to decorate his matter with every grace of elegant expression, as when he accommodates his diction to the wonderful multiplicity of Homer's sentiments and descriptions.

It is remarked by Watts, that there is scarcely a happy combination of words, or a phrase poetically elegant in the English language, which Pope has not inserted into his version of Homer. How he obtained possession of so many beauties of speech it were desirable to know. That he gleaned from authors, obscure as well as eminent, what he thought brilliant or useful, and preserved it all in a regular collection, is not unlikely: and Johnson, at a later period, says that new sentiments and new images others may produce, but to attempt any further improvement of versification will be dangerous. Art and diligence have now done their best, and what shall be added will be the effort of tedious toil and needless curiosity.

The controversy that has been lately carried on between various literary men, in which he has been highly eulogized by one party, and declared to be no poet by another, has now subsided; and the literary world appears to have come to the conclusion, that whatever his demerits in a moral point of view, in his own peculiar walk of poetry he stands unequalled.

POPE, SIR THOMAS, an English statesman, who was born at Deddington in Oxfordshire, about 1508. He was educated at Eton, and was called to the bar in 1533. In November 1535 he was made warden of the mint, exchange, and coinage in the Tower of London. In October 1536 he received the honour of knighthood, at the same time with Henry Howard, afterwards the gallant and unfortunate earl of Surrey. In December he was appointed to exercise, jointly with William Smythe, the office of clerk of all the briefs in the star-chamber at Westminster. In 1538 he obtained a new royal licence for exercising the office of clerk of the crown in conjunction with John Lucas, afterwards an eminent crown lawyer in the reign of Edward VI. Some of these appointments, it is probable, he owed to Sir Thomas More, with whom he was acquainted, and some to Lord Audley; but in 1539 he received one of greater importance, being constituted by the king treasurer of the court of augmentations on its first establishment by act of parliament. The business of this court was, to estimate the lands of the dissolved monasteries vested in the crown, receive their revenues, and sell the monastic possessions for the king's service; and it was so called from the increase which the royal revenue thus received. The treasurer's office was a post of considerable profit, and of considerable dignity, as the person holding it ranked with the principal officers of state, and was privileged to retain in his house a chaplain, having a benefice with cure of souls, who should not be compelled to residence. What the emoluments of this office were is not so clear, but they were greater than the allowance of Sir John Williams, treasurer in Edward VIth's reign, who had 320*l.* yearly: and it may be supposed the office gave those advantages in the

purchase of the dissolved possessions which probably formed the foundation of Sir Thomas's vast fortune. He held this office for five years, and during that time was appointed master or treasurer of the jewel-house in the Tower.

During the reign of Henry VIII. Sir Thomas Pope was employed in various services and attendances about court, but in none of more affecting interest than when he was sent by the king to inform his old friend and patron, Sir Thomas More, of the hour appointed for his execution. On the accession of Edward VI., as he was not of the reformed religion, Sir Thomas Pope received no favour or office; but when Queen Mary succeeded, he was again made a privy councillor and cofferer to the household, and was often employed in commissions of considerable importance; nor are we surprised to find his name in a commission for the more effectual suppression of heretics, in concert with Bonner and others; but his conduct when the princess (afterwards queen) Elizabeth was placed under his care in 1555 was far more to his credit. After having been imprisoned in the Tower and at Woodstock, she was permitted by her jealous sister to retire with Sir Thomas Pope to Hatfield House, in Hertfordshire, then a royal palace, where he showed her every mark of respect that was consistent with the nature of his charge, and more than could have been expected from one of his rigid adherence to the reigning politics. He survived the accession of Elizabeth only a year, as he died in January 1559.

POPE, WALTER, an English physician and writer, who was born at Fausley in Northamptonshire, and studied both at Oxford and Cambridge. He subsequently became professor of astronomy at Gresham College, and died in 1714. As an author he is best known by his "Life of Bishop Warde," "The Old Man's Wish," and "Select Novels from the Spanish and Italian."

POPHAM, SIR JOHN, an English lawyer, who was born in Somersetshire in 1531. Having gone through the customary course of study he was called to the bar, and rose rapidly in his profession, but his character was not much esteemed for integrity. He was one of the lawyers detained by the earl of Essex when he determined to defend himself in his own house, and on the trial of that nobleman gave evidence against him. As an author he is best known by his work entitled "Reports and Cases adjudged in the Time of Queen Elizabeth."

PORCIA, daughter of Cato of Utica, and wife of Brutus, celebrated as a model of connubial love and heroic patriotism. She preserved inviolate the secret of the conspiracy against Cæsar, with which she had been entrusted by her husband, and put herself to death when she saw the cause of the republicans lost.

PORDENONE, so called from his birth-place, his true name being Giovanni Antonio Licinio, or Regillo da Pordenone, a celebrated painter of the Venetian school and rival of Titian, who was born in 1584, and executed many works for his native place; some also for Mantua, Vicenza, Genoa, but his greatest works for Venice. For this city he painted the chapel of St. Roch and the hall of the Pregadi in conjunction with Titian, with whom he also painted in St. John's church, whence a constant rivalry existed between them. He died in Ferrara, whither he had been invited by the duke Ercole II. to prepare car-

veral other works with increasing reputation. Among her more popular productions may be enumerated "The Recluse of Norway," in four volumes; "The Village of Mariendorpt," also in four volumes; and "The Fast of St. Magdalen," in three volumes. She also published a volume of ballads and romances, with other poems.

Miss Porter's continued mental exertions proved too much for her bodily constitution, which was naturally rather delicate. For some years her health had been gradually on the decline, her sight especially being greatly impaired. She had just entered with her sister on a plan of relaxation for the summer months, when she suddenly died of typhus fever on the 21st of June, 1831, at Clifton, near Bristol.

Miss Porter's qualifications for the species of literary labour, to which she directed her genius with such honourable success, were of the highest order. To a fertility of invention not often surpassed for its exuberance, she united a close observation of living manners and a quick and accurate discrimination of human character. From the combination of these rare endowments, she acquired the magic power of moulding the creations of her fancy into the forms and incidents of actual life, and of imparting to them, with an intensity immeasurably increased, all the deep and affecting interest which springs from the complicated workings of human passion, and supplies the ample and varied ingredients of human bliss and of human woe. Her delineations of character uniformly display the touches of a master-hand. She sketched with a rapidity and decision, and with a truth and force of colouring which may be aptly compared to the most striking productions of her brother's bold and rapid pencil upon canvass. Her portraits have all the personal individuality and all the force and vividness of real life. There was much of the romantic of gone-by times in Miss Anna Maria Porter's mind, which may be traced in some of the incidents of her tales. But this never blinded her judgment in her estimate of the actual condition of society. Her representations of living manners are always true to nature, and her familiar intercourse with persons moving in the highest circles, enabled her to delineate with a fidelity not often to be found in other writers, the discriminating peculiarities, feelings, usages, and language of the more polished and privileged classes. Her writings are also marked by a high tone of moral feeling—an excellence above all praise, equally pervading the publications of her amiable sister. Her style is characterized by a graceful ease and fluency admirably adapted to her immediate purpose, her narratives are inartificial, smooth, and spirited, her dialogues possess all the flexibility and point of the best conversation, and her didactic lessons are delivered with a simple gravity and force irresistibly impressive and affecting. In private life Miss Porter was distinguished for the purity and elevation of her moral character.

*Anna Maria Porter*

PORTER, SIR ROBERT KER, was born at Durham. His mother was left a widow with five children, and in scanty circumstances. He very early manifested an uncommon genius for drawing; many of his sketches, made when he was only six years of

age, being remarkable for their spirit; and in 1790 he became a student at the royal academy, under the auspices of Mr. West. Not more than two years had elapsed from his commencing his studies at the academy, when he was employed to paint the figures of Moses and Aaron for the communion-table of Shore-ditch church. In 1794 he presented to the Roman catholic chapel at Portsea an altar-piece representing Christ calming the storm; and in 1798 he gave to St. John's college, Cambridge, an altar-piece, the subject of which is St. John preaching in the wilderness. He was only twenty-two when he began his large picture of the storming of Seringapatam. Though it contained nearly 700 figures as large as life, it was finished in ten weeks; nor did it bear any marks of haste, it being, both in composition and colouring, a work of high merit. It was succeeded by two other pictures of the same magnitude—the Siege of Acre, and the Battle of Agincourt. In 1804 he was invited to Russia by the emperor, who made him his historical painter. He consequently visited St. Petersburg, where he was received with distinction and employed to decorate the admiralty hall in the Russian capital. While residing there he gained the affections of the princess Scherbatoff, and was on the point of marrying her when a rupture with England obliged him to leave Russia. He passed into Sweden to join the British forces under Sir John Moore, whom he accompanied to Spain, sharing in the hardships and perils of the campaign, which ended with the battle of Corunna. After having remained for some time in England, he again went to Russia, and received the hand of the princess Scherbatoff. With her he revisited his native country, where in 1813 he obtained the honour of knighthood. From 1817 to 1820 inclusive, he was engaged in travelling through the East; and in the course of his travels explored the countries from the banks of the Black Sea to the Euphrates, and from the Euphrates to the mouth of the Persian Gulf. Among his works are, "Travelling Sketches in Russia and Sweden," "Letters from Portugal and Spain," "Narrative of the Campaign in Russia," and "Travels in Georgia, Persia, and Armenia."

PORTEUS, BEILBY, a learned English prelate, was a native of York, and received the rudiments of his education at Ripon, after which he went to Christ's college, Cambridge. Having entered holy orders he obtained the patronage of the archbishop of Canterbury, who made him his chaplain; and it was owing to the steady friendship of this prelate that he subsequently obtained such rapid preferment in the church. He was raised to the see of Chester in 1776, and eleven years after became bishop of London, over which diocese he continued to preside till his death, which took place in 1808.

PORTLAND.—The Bentinck family is of Dutch extraction, the founder of it in England having been Count Bentinck, created earl of Portland by William III.; his son was created duke by George I. The grandson of the latter, William Henry Cavendish Bentinck, third duke, was born in 1738, and after sitting for some time in the house of commons, was called to the upper house by the death of his father in 1762, from which time he voted with the marquiss of Rockingham, in whose administration he was lord chamberlain. During the American war he acted with the opposition, and in 1782 was appointed lord lieutenant of Ireland, where he remained only three months in consequence of the death of the marquiss

of Rockingham. From the accession of Pitt, the duke acted with the Whig opposition until 1792, when he was elected chancellor of Oxford; and joining with Mr. Burke in his alarm at the French revolution, he supported administration. He was accordingly in 1794 made secretary of state for the home department, which he held until the resignation of Mr. Pitt in 1801, and was then appointed president of the council, which he held until 1805. On the resignation of Lord Grenville in 1807 he was appointed first lord of the treasury, which office he resigned soon after, and died in 1808.

**POSIDONIUS**, a stoic philosopher who was born at Apamea, in Syria, about 103 B.C., and was called also, the Rhodian, because he was the scholar of Panætius of Rhodes, and was himself a teacher at Rhodes after he returned from his travels. He taught the stoic philosophy with great applause, was at the same time a statesman and one of the Prytanes, and went, when fifty years of age, as an ambassador to Rome. The most distinguished Romans were his scholars, and Cicero himself was initiated by him into the stoic philosophy.

**POSTLETHWAYTE, MALACHI**, an English writer who was born in 1707. Little is known of his birth or education, but his writings display considerable knowledge. His principal works are his dictionary of "Trade and Commerce," and his treatise "On the Commercial Interests of Great Britain." This gentleman was a fellow of the antiquarian society, and died in 1767.

**POTEMKIN**.—This extraordinary Russian court favourite was descended from a humble family near Smolensko. He was early in life introduced to the empress Catherine, who squandered immense wealth upon him. When he returned to Petersburg in March 1791, the empress caused splendid festivals to be prepared in honour of him, gave him the Taurian palace, and a dress set with diamonds. Potemkin, however, was seized with the sickness that raged in the camp. Without regarding the advice of the most celebrated physicians of Petersburg who attended him, he continued his excesses. As the air of Jassy was prejudicial to him he set out for Nicolajeff, but on the second day of his journey he became so unwell that he descended from the carriage and expired in the arms of his niece, the countess Branicka, under a tree, on the 16th of October, 1791. His body was carried to Cherson, where the empress appropriated 100,000 roubles for the erection of a monument to him, which was never completed. Afterwards the emperor Paul caused the corpse of his mother's favourite to be taken from its coffin and thrown into the ditch of the fortification.

During his brief career, Potemkin denied himself nothing, and satisfied every passing whim by a prodigal waste of the money of the state and a wanton sacrifice of the lives of others. Though the empress denied him nothing, and the sums of money which she expended on him exceeded all belief, still he was mean enough to appropriate to himself the money entrusted to him for other purposes, and even to forge orders on the treasury in the name of the empress in order to obtain for himself the money which was necessary for supplying the wants of the state. Potemkin also suffered himself to be purchased by foreign powers. While possessed of incredible wealth, and throwing away the largest sums at the gaming table or in the gratification of his whims, he did not

pay the bills of those who furnished his ordinary supplies. Those tradesmen considered themselves ruined who received orders to furnish goods to Potemkin.

Sir Robert Sinclair, who was in Russia during the height of Potemkin's favour, furnishes the following account of his person and habits:—"He is a remarkably tall man, about six feet two, and not displeasing in his appearance, though he has a defect in one of his eyes. He gives one some idea of the famous Mithridates, or of the Maximins and Diocletians of the Roman empire, who partly owed their rise to the bulk and manliness of their appearance. His power in Russia at one time resembled that of a grand vizier in Turkey, not being confined to one particular department, but extending over all. But of late he has found it necessary to agree to a partition. Besbarodko and his party have the entire direction of foreign affairs and the government of old Russia. He has stipulated for himself an unlimited power of drawing on the treasury, the command of all the new acquisitions, together with the interior direction of the palace, the nomination of the empress's personal favourites, &c. He is the only man that the empress stands in awe of, and she both likes and fears him. He has taken every means of security he can devise, ingratiating himself with the guards, placing his relations and friends in high employments, and obtaining an independent command in the Crimea and the neighbouring provinces, with the fleet in the Black Sea, and an army of 90,000 men. He is certainly one of the ablest men in Russia, though better calculated for the intrigues of a court than for conducting a war. He has a great fund of general information, and is very desirous of adding to it. He can apply closely when it is necessary, but loves to enjoy an indolent life of dissipation as much as any man.

"He is very affable to the foreign ministers, and to all strangers of distinction who come to Petersburg. But to the Russians he behaves with inconceivable *hauteur*, and treats them, with a few exceptions, little better than dogs. The family he principally associates with is that of the grand ecuyer, Alexander Nariskin, father of the countess Sulluhub, one of the greatest beauties about court. It was always supposed that he was attached to the English interest, and was convinced that an alliance between England and Russia

would prove of essential advantage to both countries. Sir James Harris and he were on very intimate terms. But he seems to prefer Count Segur, the French, to Mr. Fitzherbert, the English minister, and thence, it is conjectured, is beginning to change his political sentiments in favour of the French. At Berlin they suppose him inclined to Prussia, but erroneously, the emperor having gained him by creating him a prince of the empire, and, it is said, by gratifications of other kinds.

"His great object is the plans against Turkey. As he proposes to command the army himself (which he thinks must be victorious) there is no saying what so daring and ambitious a character may have in view. To be a knight of the order of St. George, the principal one in Russia, which, by the rules of the order, can only be conferred upon those who command an army or a fleet victorious in some great engagement, is certainly one object. Perhaps he imagines, if he were successful as commander-in-chief, that he might gain over the troops he conquered with, and erect a new empire on the destruction of the Turkish. It is imagined that he once intended to be duke of Courland, and the present duke is so much afraid of him that he never trusts himself in Russia, and is as seldom as possible in his own dominions. He would hardly at present condescend to be hospodar of Moldavia, though a plan he formerly had in view.

POTENGER, JOHN, an English writer, who was born in Winchester in July 1647, and admitted on the foundation of the college in 1658, and from thence removed to a scholarship of Corpus Christi college, Oxford, where he took the degree of B. A., and afterwards entered of the Temple, and was regularly called to the bar. The office of comptroller of the pipe, which he held to the day of his death, he purchased in 1676 of Sir John Erle, then chancellor of the exchequer, whose daughter he married. Speaking in his journal of his father, he expresses himself in the following filial words:—"About the thirteenth year of my age, the Christmas before the return of King Charles the Second, I lost a loving father. I was not so young but I was deeply sensible of the misfortune, knowing at what an unseasonable time I was deprived of him, when he should have received a reward for his loyal sufferings. He would often discourse with me, though young, about the unhappy times, and lament the church's and the king's misfortune, which made a great impression on me, and laid the foundation, I hope, of my being a true son of the church of England, and an obedient subject to my lawful prince." His death took place in 1733, in the eighty-seventh year of his age. He was buried near his wife in Blunsden church, Wilts. Mr. Potenger published "A Pastoral Reflection on Death," a poem; and "The Life of Agricola," from Tacitus, and other works.

POTHIER, ROBERT JOSEPH, a celebrated French jurist, who was born in 1699 and died in 1772. His digest of the maxims and principles of the Roman law contained in Justinian's pandects, under the title of "*Pandectæ Justinianæ in Novum Ordinem digestæ*" was more highly esteemed in foreign countries than at home. Of his profound knowledge of the *droit coutumier* we have a proof in his "*Introduction à la Coutume d'Orléans*," and the commentary which accompanies it. His different treatises on various points of legal science are in the highest esteem. The first, which is a sort of foundation for the others, is his "*Traité des Obligations*," which, as is also the case

with the rest, displays a methodical mind, and is distinguished for clearness, profundity, and precision, and for its high tone of morality, which was in accordance with the character of his life. Pothier was appointed professor of French law at the university of Orleans, and appropriated the salary attached to his office for premiums to his most industrious pupils.

POTOCKI.—The name of an ancient Polish family, of which we shall here mention several of the most distinguished members. First, Count Paul Potocki was an illustrious statesman and scholar of the seventeenth century, whose works were published by Zaluski, with the addition of a "*Genealogia Potockiana*." Second, Count Anthony Potocki, grandson of the preceding, was ambassador of Augustus II. to Russia, and, in the reign of Augustus III., marshal of the nobility. His masterly speeches are in part given in Daneykowicz's "*Suada Polona*." Third, Count Stanislaus Felix Potocki, the commander of the Polish artillery, acted an important part in the troubles of 1788. He adhered pertinaciously to the old constitution of the republic, and exerted his influence against the constitution of May 1791. Potocki so far forgot his duty to his country as to form connexions with Russia, and in May 1792 joined with Rzewuski and Branicki in the declaration at Targowicz against the constitution. He then united himself with the Russian army, and was one of the leaders of the diet of Grodno, which abolished the constitution and subscribed the act for the partition of the country. He was thought to aspire to the crown, and received several important appointments from Catherine II. When the Cracow confederation under Kosciusko, Kolontay, Ignatius Potocki, &c., had occasioned the expulsion of the Russians from Warsaw and Wilna, he fled to Russia, and was condemned by the supreme tribunal of the republic as a traitor to his country, and his estates were confiscated. Catherine, however, restored his estates, and made him commander-in-chief. He died in 1803. Count Ignatius Potocki, his cousin, was born in 1751. He was grand marshal of Lithuania, and united with Malachowski, Kolontay, and other patriots in support of the constitution of May 1791. He also procured the declaration of the king in favour of it, and in 1722 went to Berlin for the purpose of inducing the Prussian court to protect the Poles from Russia. When the Russian troops took possession of the country, Potocki fled to Dresden, and was deprived of his estates. In 1794 he returned to Warsaw, to engage in the attempt of Kosciusko, was appointed general, and member of the supreme national council. After the capture of Warsaw he remained in the city, trusting to the capitulation concluded with Suwarroff, but he was arrested in December, and confined as a state prisoner in Russia until he was released by Paul in 1796. In 1806 he again engaged in public affairs, and exerted himself to effect the abolition of slavery, and to promote the progress of education among the people. He died in 1809. Count Stanislaus Kotska Potocki, his brother, was always faithful to the cause of his unfortunate country. He distinguished himself greatly by his information and his eloquence in the various diets which were held between 1788 and 1792. In the latter year he became general of artillery. When the king acceded to the confederation of Targowicz, and by that false step consummated the ruin of Poland, Count Potocki retired into Austria, but he was arrested there and im-

prisoned in a fortress. On being restored to liberty, there being no hope of breaking the chains of his countrymen, he retired to his estate, and devoted himself to the sciences and arts. When, however, the French penetrated in 1807 into Poland, he rallied around him the friends of independence; and on the grand duchy of Warsaw being established he was chosen one of the plenipotentiaries to Napoleon. While the grand duchy existed he held various high offices. When Napoleon meditated the restoration of the ancient kingdom of Poland, Potocki's talent and influence were called into action by him; and the abbé de Pradt pays to the count a warm tribute of praise on this occasion. In 1815 Count Potocki was appointed minister for ecclesiastical affairs and public instruction, and was afterwards chosen president of the senate. He died in 1822.

**POTT, PERCIVAL**, an eminent English surgeon, who was born in 1713, and was educated for the medical profession. At a comparatively early period of life he was appointed principal surgeon at St. Bartholomew's hospital. His first work was "A Treatise on Ruptures." The flattering reception of this publication attached him afterwards to this mode of employing his talents, so that he was seldom long without being engaged in some work. In 1764 he had the honour of being elected a fellow of the royal society; and in the ensuing year he began to give lectures at his house, which was then in Watling Street; but finding it necessary, from the increase of his business, to choose a more central situation, he removed in 1769 to Lincoln's Inn Fields, and in 1777 to Hanover Square. He was universally consulted and employed by persons of the first rank, and received honorary tributes to his merit from the royal college of surgeons at Edinburgh and in Ireland. In 1787 he resigned the office of surgeon to St. Bartholomew's hospital, "after having served it," as he expressed himself, "man and boy for half a century;" and in December 1788 he died at the age of seventy-five. In addition to the works already mentioned, he published several other useful medical works. A complete edition was published by Sir J. Earle.

**POTTER, JOHN**, primate of all England, was born in 1674, and was the son of a linen-draper of Wakefield in Yorkshire, in the grammar-school of which town he received the rudiments of a classical education. He then became a member of University college, Oxford, where, in his twentieth year, he published "*Variantes Lectiones et Notæ ad Plutarchi Librum de audiendis Poetis, et ad Basilii Magni Orationem ad Juvenes quomodo cum Fructu legere possint Græcorum Libros.*" The next year he became fellow of Lincoln college, and in 1697 printed an edition of Lycophron. Soon after appeared his "*Archæologia Græca, or, The Antiquities of Greece,*" which has gone through many editions, and is almost indispensable to the classical student. In 1706 he became chaplain to Queen Anne, on which occasion he took his degree of doctor in divinity. In 1715, being then regius professor of divinity, he was raised to the see of Oxford, and in 1727 was appointed archbishop of Canterbury. He died in 1747. His works, besides those enumerated, are, "A Discourse on Church Government," and an edition of Clemens Alexandrinus. His theological works were printed together.

**POTTER, DR. CHRISTOPHER**, a learned English divine, who was born in Westmoreland about 1591. He was admitted a member of Queen's college,

Oxford, in 1606, where he took both the degrees in arts and divinity. He was first made fellow, and in 1626 succeeded his uncle in the provostship of his college. Though a zealous puritanical preacher, he became at length an adherent to Laud. In 1628 he preached a sermon at Ely House upon the consecration of his uncle, who, "though a thorough-paced Calvinist," says Wood, was made bishop of Carlisle by the endeavours of Laud. In 1633 he published "An Answer to a late Popish Pamphlet, entitled, 'Charity Mistaken,'" which he wrote by the special order of Charles I., whose chaplain he was. In 1635 he was promoted to the deanery of Worcester; and in 1640 became vice-chancellor of Oxford, in the execution of which office he met with some trouble from the members of the long parliament. Upon the breaking out of the civil wars he sent all his plate to the king, and declared that he would rather, like Diogenes, drink out of the hollow of his hand than that his majesty should want; and he afterwards suffered much for the royal cause. He was nominated to the deanery of Durham in 1645, but was prevented from being installed by his death, which took place at his college in March following. Dr. Gerard Langbaine, who succeeded him in the provostship of Queen's college, married his widow.

**POTTER, ROBERT**.—This learned classical scholar was born in 1721, and graduated at Cambridge in 1741. He was an admirable classical scholar, distinguished by his excellent translations of the works of Æschylus, Euripides, and Sophocles, which are equally remarkable for the spirit and fidelity with which they are executed.

**POTTER, PAUL**, a celebrated painter of animals, who was born at Enkhuisen in 1625, was the son of Peter Potter, a painter, from whom he received his first instruction, but to whom he himself was greatly superior. As early as his fifteenth year he had executed a work, which was universally admired; and after he settled at the Hague he was unable to satisfy the demand for his works. His department was the painting of animals and landscapes, but he was more particularly successful in the former; the latter were designed merely to afford an opportunity for exhibiting animals in different attitudes and circumstances. His colouring is uncommonly brilliant, and the separate parts are most delicately executed, yet without any appearance of stiffness or mannerism. His works were generally of a small size; but there was one in the Louvre which originally belonged to the prince of Orange, representing a man and cattle as large as life. His walks were always occupied in study; whatever struck his fancy he immediately sketched. He died in 1654 at Amsterdam, where he had been residing two years. His engravings are not less esteemed than his paintings, and his cabinet pieces command a very high price. His celebrated Cow, which was taken from the Cassel gallery to Paris, was bought by Alexander, emperor of Russia, for about 1000*l*.

**POUSSIN, NICHOLAS**, an eminent French artist, who was born at Audely in 1594. He was the descendant of a poor but noble family, and perceiving early in life the necessity for exertion, he chose the profession of an artist as the one best calculated to advance him in the world. He soon rose to eminence, and for many years received a pension from both Louis the Thirteenth and Fourteenth, which he enjoyed till his death, which took place in 1642.

**POWEL, JOHN JOSEPH**, an English barrister, who rendered himself celebrated by his professional writings. Among his numerous works we may enumerate his "Law of Mortgages," his "Essay on the Learning respecting the Creation and Execution of Powers, and also respecting the Nature and Effects of Leasing Powers," and his "Essay on the Law of Contracts and Agreements." His death took place in June 1801.

**POWELL, WILLIAM SAMUEL**, an English divine, who was born at Colchester in 1717, and admitted to St. John's college, Cambridge, in 1734. Having taken the degree of bachelor of arts in 1738 he was elected fellow of it in March 1740. In 1741 he was taken into the family of Lord Townshend as private tutor to his second son Charles Townshend, afterwards chancellor of the exchequer, and was ordained at the end of the year, when he received the rectory of Colkirk in Norfolk on Lord Townshend's presentation. He returned to college the year after, and began to read lectures as an assistant to the principal tutor, but became himself principal tutor in 1744. He took the degree of bachelor of divinity in 1749, and of doctor in 1756. In 1765 he was elected master of his college, obtained the archdeaconry of Colchester the year after, and in 1768 was instituted to the rectory of Freshwater in the Isle of Wight. He died in 1775. The preceding account is taken from an advertisement prefixed to a volume of "Discourses on Various Subjects," published by his friend Dr. Thomas Balguy; "which discourses," says the editor, "are not published for the credit of the writer, but for the benefit of his readers, especially that class of readers for whom they were chiefly intended, the younger students in divinity. The author's reputation," he adds, "stands on a much wider bottom—a whole life uniformly devoted to the interests of sound philosophy and true religion." Two small mathematical tracts by Dr. Powell are mentioned in the "Anecdotes of Bowyer," where we are also told that "his will was remarkably precise, neat, and elegant, which were the characteristics of all his performances. He left twenty friends, most if not all of the college, 100*l.* a-piece."

**POWNALL, THOMAS**, a scholar who was born at Lincoln in 1722, and became secretary to the commissioners for trade and plantations in 1745, and had a situation in the commissariat of the army in Germany. In 1753 he went to America, and in 1757 was appointed governor of Massachusetts Bay, and subsequently of South Carolina. He remained there till 1761, when, returning to England, he was nominated director-general of the office of control, with the rank of colonel. He died at Bath in April 1805. Governor Pownall was a fellow of the society of antiquaries, and a contributor to the *Archæologia*. He was also the author of "Descriptions of Antiquities of the Provincia Romana of Gaul," "Descriptions of Roman Antiquities dug up at Bath," "Observations on the Currents in the Atlantic Ocean," and "Intellectual Physics," besides many political tracts, as the "Administration of the Colonies, &c."

**POYNET, JOHN**, an English prelate, who was born in Kent in 1516, and became successively bishop of Rochester and Winchester. He drew up the catechism called King Edward's, and which was printed in Latin and English in 1553. On the accession of Mary he withdrew to Strasburgh, and died in exile in 1556.

Besides the catechism already mentioned, Bishop Poynet was the author of "A Tragedie or Dialoge of the Unjust Usurped Primacie of the Bishop of Rome, Translated from Bernard Ochinus;" "A Notable Sermon concerning the Ryght Use of the Lorde's Supper," preached before the king at Westminster, &c.

**POZZO DI BORGO, COUNT**, one of the ministers of the emperor of Russia, who was born in 1769, in the village of Alala in Corsica. His family was noble, but poor. In 1790 he was appointed to office under the protection of General Paoli, and in the year following was elected deputy to the national assembly, to whom in 1792 he addressed a very elaborate speech, in the name of the diplomatic committee, to determine them to declare war against the Germanic body. After the 10th of August, however, he was compelled to withdraw from Paris by menaces of denunciation from Arena, a fellow-deputy, who had found his name under suspicious circumstances in the papers of Louis XVI. Having retired to Corsica he renewed his political relations with Paoli. He was named president of the council of state, and attorney-general of the department. Four months later a decree of the convention commanded him to appear at the bar, to explain his conduct and that of General Paoli. He refused to obey, and in conjunction with Paoli invited the English to take possession of the island. He was named president of the council under the new government, and afterwards secretary of state. In this situation it was not long before he found himself opposed to numerous enemies, and withdrew to England. He afterwards attached himself to the service of the emperor Alexander, and arrived at the highest diplomatic honours. In the latter campaigns he held the rank of major-general. In 1813 he was despatched on a mission to the prince-royal of Sweden, whom he accompanied to the battle of Leipzig. He afterwards accompanied the emperor Alexander in the campaign in France at the commencement of 1814. After the restoration of Louis XVIII. he was appointed Russian minister-plenipotentiary to the new French government. He quitted Paris at the commencement of the revolution of March 1815, but resumed his functions at the French court on the return of the king.

**PRADON, JEAN NICOLAS**, a dramatic poet, who was born at Rouen, and died at Paris in 1698. His tragedies were received on their first appearance with great applause, and gained him the friendship of distinguished persons, among whom were St. Evremont and Madame de Sévigné. Pradon even ventured to appear as a rival of Racine, having attempted a tragedy on the same subject on which the latter had already written. His "Phèdre et Hippolyte" was brought out in 1677, and for some time was actually preferred to that of Racine, but it has been long forgotten. His "Regulus" and "Tamerlane" are more known. Boileau made Pradon, who was indeed a very moderate poet, and extremely ignorant and arrogant, the subject of his satire. His dramatic works were published in 1744.

**PRAXITELES**, one of the greatest sculptors of ancient Greece. He carried the art to such perfection that a Greek epigram on his Niobe says, "The gods changed me to stone, but Praxiteles restored me to life." Praxiteles and his contemporary Scopas united grandeur with grace; and with them begins the period of the beautiful style in statuary. The

former also worked in bronze, but, according to Pliny, he was most successful in marble. Pliny gives a list of his principal works, which were statues of the gods. The finest is said to have been the Cnidian Venus, whom he was the first to represent undressed. According to tradition, the celebrated courtesans, Cratina and Phryne, served as models for it. This Venus is represented with a smiling countenance, and in the attitude of having left the bath or risen from the sea. This statue was frequently copied. In Bottiger's opinion, the Venus de' Medici resembles the Cnidian Venus only in the position of the left hand; but the Capitoline Venus is considered as a copy of it. The group of Niobe now in existence, which is also attributed to Scopas, seems to have been the production of different times. His two statues of Cupid were also celebrated, one of them, which was placed in the temple of Cupid at Thespia, and a statue of a satyr, which was called *periboetos* or the far famed, were considered by Praxiteles, according to Pausanias, as his finest works. An excellent copy of the latter, discovered in a villa of the emperor Antonius, is in the *Museo Pio Clementino*. Among his works were also statues of Diana, Ceres, Bacchus, &c., in marble and in bronze, which served as models to succeeding artists.

PREBLE, EDWARD, a celebrated commodore of the American navy, who was born on the 15th of August, 1761, in that part of Falmouth in Casco Bay which is now called Portland. From early childhood he discovered a strong disposition for perils and adventures, and a firm, resolute, and persevering temper. About the year 1779 he became midshipman in the state ship Protector, twenty-six guns, Captain John Foster Williams, which, in her first cruise, captured the Admiral Duff, an English vessel of thirty-six guns, but, in her second, fell in with a British sloop and frigate, and was taken. The principal officers were carried to England; but Preble, by the interest of a friend of his father, obtained his release at New York, and returned to his friends. He next entered as first lieutenant on board the sloop of war Winthrop, Captain Little, and, while in that capacity, boarded an English armed brig of superior force, lying in Penobscot harbour, under circumstances which gave the action great *éclat*. He remained in the Winthrop until the peace of 1783, and between that period and the commencement of the French war in 1798, occupied himself mostly as ship-master in various voyages. In the latter year he was named one of the five lieutenants that were first appointed by the government of the United States when making preparations to resist the insults and injuries of the rulers of France. In the autumn and winter of 1798 he made two cruises as commandant of the brig Pickering. The following year he received a captain's commission, and the command of the frigate Essex, of thirty-six guns. In January 1800 he made a voyage in her to Batavia, whither he was sent with Captain James Sever in the Congress, to convoy the homeward-bound vessels from India and the East. The day after leaving port a snow storm came on, and they parted from the three vessels under convoy out. On the 12th, in a heavy gale, he lost sight of the Congress, which was unfortunately dismasted, and obliged to put back. The Essex pursued the voyage alone, and after waiting a suitable time at the Cape of Good Hope for the Congress, proceeded to Batavia. Before and after arriving at Ba-

tavia, Captain Preble made two cruises of a fortnight each in the Bay of Sunda. In June he took under convoy home fourteen sail of American merchantmen, valued at several millions of dollars, and protected them until they were out of danger. Near the end of the year he arrived at New York, in a very delicate state of health; and he continued so feeble as to be prevented from assuming the command of the Adams for the Mediterranean, to which he was appointed.

In 1803 he was sufficiently recovered to enter again upon duty, and in May of that year was directed to take command of the frigate Constitution, then lying at Boston, and get her ready for sea. In June he received orders to take charge of the squadron destined to act in the Mediterranean as soon as it should be prepared. In August he set sail, and reached the Mediterranean the ensuing month. In that station, by a happy union of prudence and energy, he first prevented a war between the emperor of Morocco and the United States, and next brought the bashaw of Tripoli to terms, by a series of skilful and daring bombardments. Having been joined by another squadron, under the command of Commodore Barron, his senior officer, he obtained leave to return home. On his departure he received an address from the officers who had served under him, containing the strongest expressions of attachment and respect. Congress voted the thanks of the nation to him, and an emblematical medal, which were presented by the president with emphatic declarations of esteem. After his return he was much consulted and employed by the government in the management of the naval concerns. In the latter part of the year 1806 the health of Commodore Preble began to decline. He was attacked with the same complaint—a debility of the digestive organs—under which he was near sinking a few years before. For many months he struggled with the disorder, indulging a hope of recovery till within ten days of his death. Finding that he received no relief from medical skill, he determined upon trying the effects of a voyage, and embarked in a packet, but soon returned in the certitude that his end was near. He breathed his last August 25, 1807, in the forty-seventh year of his age. The appearance of Commodore Preble was commanding; his features were strongly marked, and his carriage firm and erect. In the exercise of authority he was peremptory and rigid; but though he made himself feared, and sometimes failed in restraining the impetuosity of his temper, he always retained a strong interest in the affections of his officers and men. In private life he was kind and affectionate; a fond relation and a kind neighbour. His public spirit was great. He was patient of labour, and in business was remarkable for exactness and despatch.

PRESTER JOHN.—In the middle ages it was reported by travellers that there was a Christian prince who reigned in the interior of Asia under this name, and the same story was also known to the crusaders. Albert of Aix, and Otho of Freisingen, speak of him in the twelfth century; Rubruquis, in the thirteenth century, attributes the name of Prester John to a Nestorian prince, Ungkhan, who had reigned in Caracorum, over two Mongul tribes, and perished in a war against Gengis Khan, about half a century before the time of his journey. Other travellers of the thirteenth century also mention this personage, and Giovanni di Montecorvino, bishop of Cambalu, is said to have converted in 1305 a prince of his house

to Christianity. Who this Prester John was, it is not easy to decide; the supposition that he was the Dalia Lama, or one of the chief priests of the Lamaites, does not agree with the position assigned to his residence by travellers, nor does any of the etymological explanations, which have been proposed, seem satisfactory. The most ludicrous mistake on this subject was that made by the Portuguese in the fifteenth century, who picked up a story of a Christian prince in the interior of Africa, whose name was Ogan, and who was in fact the king of Abyssinia. In consequence of the resemblance of the names Ogan and Ungkhan, they transferred the throne of Prester John from Asia to Africa, and gave the name to the Abyssinian prince.

PRESTON, THOMAS, an English dramatic writer, who flourished in the earlier part of the reign of Elizabeth. He was educated at Cambridge, where he succeeded to a fellowship. He was afterwards created a doctor of civil law, and appointed master of Trinity Hall, over which he presided fourteen years. He wrote one dramatic piece, entitled "A Lamentable Tragedy, full of Pleasant Mirth, containing the Life of Cambises, King of Persia, &c.," a sad tissue of fustian which escaped not the satire of Shakspeare, who in Henry IV. makes Falstaff talk of speaking in Cambyases' vein. Preston died in 1598.

PRESTON, JOHN, a learned English divine, who was born at Keyford in Northamptonshire in 1587, and became fellow of Queen's college, Cambridge, where he became celebrated for his skill as a disputant. He particularly distinguished himself in an academic discussion held by King James when he visited Cambridge. The account of this dispute is so interesting that we give the details in the words of his biographer:—"His (Mr. Preston's) first and great care was to bring his argument unto a head without affronts or interruptions from the answerer, and so made all his major propositions plausible and firm, that his adversary might neither be willing nor able to enter there, and the minor still was backed by other syllogisms, and so the argument went on unto the issue; which fell out well for master Preston; for in disputations of consequence the answerers are many times so fearful of the event that they slur and trouble the opponents all they can, and deny things evident, which had been the case in all the former acts; there was such wrangling about their syllogisms, that sullied and clouded the debates extremely, and put the king's acumen into straits; but when master Preston still cleared his way, and nothing was denied but what was ready to be proved, the king was greatly satisfied, and gave good heed, which he might well do, because the question was tempered and fitted unto his content; namely, whether dogs could make syllogisms?"

"The opponent urged that they could; an enthymeme (said he) is a lawful and real syllogism, but dogs can make them; he instanced in an hound who had the major proposition in his mind, namely, 'the hare is gone either this or that way;' smells out the minor with his nose, namely, 'she is not gone that way,' and follows the conclusion, 'Ergo, this way with open mouth.' The instance suited the auditory, and was applauded; and put the answerer to his distinctions, that dogs might have sagacity but not sapience, in things especially of prey, and that did concern their belly, might be *nasutus* but not *logici*; had much in their mouths, little in their minds, unless it

had relation to their mouths; that their lips were larger than their understandings; which the opponent, still endeavouring to wipe off with another syllogism, and put the dogs upon a fresh scent, the moderator, Dr. Reade, began to be afraid, and to think how troublesome a pack of hounds, well followed and applauded, at last might prove, and so came to the answerer's aid, and told the opponent that his dogs, he did believe, were very weary, and desired him to take them off, and start some other argument; and when the opponent would not yield, but hallooed still and put them on, he interposed his authority, and silenced him. The king in his conceit was all the while upon Newmarket heath, and liked the sport, and therefore stands up, and tells the moderator plainly he was not satisfied in all that had been answered, but did believe an hound had more in him than was imagined. I had myself (said he) a dog, that straggling far from all his fellows, had light upon a very fresh scent, but considering he was all alone, and had none to second and assist him in it, observes the place, and goes away unto his fellows, and by such yelling arguments as they best understand, prevailed with a party of them to go along with him, and bringing them unto the place, pursued it into an open view. Now the king desired to know how this could be contrived and carried on without the use and exercise of understanding, or what the moderator could have done in that case better; and desired him that either he would think better of his dogs, or not so highly of himself.

"The opponent also desired leave to pursue the king's game, which he had started, unto an issue; but the answerer protested that his majesty's dogs were always to be excepted, who hunted not by common law, but by prerogative. And the moderator, fearing the king might let loose another of his hounds and make more work, applies himself with all submissive devotion to the king, acknowledged his dogs were able to out-do him, and besought his majesty for to believe they had the better: that he would consider how his illustrious influence had already ripened and concocted all their arguments and understandings; that whereas in the morning the reverend and grave divines could not make syllogisms, the lawyers could not, nor the physicians; now every dog could, especially his majesty's."

From the skill which he displayed on this occasion, he was rewarded by Lord Brook with a pension of 50*l.* per annum. He was subsequently made master of Emanuel college, and died in 1628. He was the author of several theological works, the most celebrated of which is "A Treatise on the Covenant."

PREVILLE, PIERRE LOUIS DUBOIS DE, a distinguished French actor who was born at Paris in 1721, and was designed for the church, but ran away, and after serving as a journeyman-mason, joined a company of players, and performed at Strasburg, Dijon, Rouen, and finally became manager of a company at Lyons. In 1753 he made his *debut* at Paris at the *théâtre Français*. Armand favoured his first appearance at the theatre of Fontainebleau, which decided his reputation. He played five different parts in the "Mercure Galant." Louis XV., who had a good taste, was so struck with his performance that he ordered him to be received among his own players. Preville's acting was excellent, and he shone not only in humorous parts, but in pathetic scenes. He left

the theatre in 1786, but afterwards made his appearance again to relieve some of his companions, who had been reduced to distress by the revolution. He died blind at Beauvais in 1799.

PREVOST D'EXILES, ANTOINE FRANÇOIS, a French writer who was born in 1697, studied with the Jesuits, and entered the order, which, however, he soon quitted for the military service. Dissatisfied with the slowness of promotion, he again joined the Jesuits, but after a short time, once more returned to the career of arms, and served with reputation. Disappointed love next caused him to assume the habit of the Benedictines of St. Maur, and he retired to St. Germain des Prés, where he found consolation in study. His restless temper soon led him to separate himself from the Benedictines, and in 1729 he went to Holland, and was thrown upon his own resources for subsistence. Here he published his "*Mémoires d'un Homme de Qualité*," and shortly after came to England. In 1734 he returned to France, and was appointed almoner and secretary to the prince of Conti. The chancellor d'Aguesseau also selected him to superintend the "*Histoire Générale des Voyages*." As he was one day walking in the forest of Chantilly, he was attacked by a stroke of apoplexy. Having been found in a state of insensibility by some peasants, the public officer proceeded to open the body of the supposed deceased, when he opened his eyes; but the wound was mortal. This event occurred in 1763. Besides the works already mentioned are, his "*Histoire de M. Cleveland*," "*Histoire du Chevalier des Grieux, et de Manon Lescaut*," with several other romances, and numerous translations from the English of Richardson, Hume, &c.

PRICE, JAMES, an English physician and writer, who was a native of Surrey. He professed to have the possession of the secret of converting the baser metals into gold, and actually presented some metal to the royal society and the king which he said had undergone that operation. In addition to his alchemical labours he published a work entitled "*An Account of Experiments on Mercury, Silver, and Gold, made at Guildford in May 1782, in the Laboratory of James Price, M. D. F. R. S.*," to which is prefixed an Abridgement of Boyle's Account of a Degradation of Gold." These pretended productions of precious metals were stated to be produced by a composition which the author kept a profound secret. Being compelled by the royal society to repeat his experiments before some scientific men of the period, on pain of exclusion, he entirely failed. He however begged a short time for delay, promising to repeat his experiments on a future occasion; dreading, however, the exposures which awaited him he took poison and died on the day previous to the trial. This gentleman possessed a handsome fortune, and was only led into these absurd experiments by an unhappy love of notoriety.

PRICE, JOHN, an able English critic, who was born in the metropolis in 1600, and educated at Christ Church, Oxford. He subsequently became a convert to the catholic faith, and spent the principal part of his life on the continent. His death took place at Rome in 1676. His most celebrated works are his "*Commentaries on the New Testament*," and his "*Notes on Apuleius*."

PRICE, RICHARD, a dissenting minister, who was distinguished both as a mathematician and statistical writer. He was born at Llangunnor, in Gla-

morganshire, in 1723, and was educated at Talgarth, in his native county, whence he removed to a presbyterian academy in London, and became pastor of a nonconformist congregation, of Arian or Socinian principles, at Hackney, where he continued as long as he lived. He commenced his literary career in 1758 by his "*Review of the Principal Difficulties in Morals*," which was followed by "*Four Dissertations on the Importance of Christianity, the Nature of Historical Evidence, and Miracles*," &c. In 1769 he received the diploma of D. D. from the university of Glasgow. In 1771 appeared his "*Observations on Reversionary Payments and Annuities*," which established his character as a mathematical calculator. He next published "*An Appeal to the Public on the Subject of the National Debt*," and, during the contest with the North American colonies, advocated their cause in "*Observations on Civil Liberty*," "*Additional Observations*," and a Supplement." These tracts provoked the animadversions of a number of writers on the opposite side of the question, and exposed him to some obloquy; but they also procured him a vote of thanks from the corporation of London, presented in a gold box. He engaged in an epistolary correspondence with his friend Dr. Joseph Priestley on the subjects of materialism and necessity, the subject of which was laid before the public in an octavo volume in 1778. When Pitt became prime-minister, he consulted Dr. Price in his schemes for the reduction of the national debt; and the establishment of the sinking fund was the result of his recommendation. At the commencement of the French revolution, in a sermon "*On the Love of Country*," he warmly expressed his delight at the emancipation of the French people. This discourse produced "*Burke's Reflections*," in which Dr. Price was severely treated. He died on the 19th of April, 1791. Besides many papers in the Transactions of the royal society, of which he was a fellow, he published "*Sermons on the Christian doctrine*," as received by the different denominations of Christians," and several single sermons and political pamphlets.

*Rich: Price*

PRIDDEN, JOHN, an English divine, who was born in Fleet Street, London, in 1758, and received the rudiments of his education at St. Paul's school, from which he was removed to Queen's college, Oxford. Both at St. Paul's and at Oxford he was distinguished by regularity of conduct and diligent application to his studies; and the periods of vacation were constantly passed in pedestrian excursions, so numerous, that not a single cathedral in the kingdom, or any town particularly worthy notice, was unexplored; and having a taste for antiquities and a ready pencil, his sketch-books were filled with accurate drawings of what appeared to him best worth preserving. In 1781 he took the degree of B. A.; and, having been ordained shortly afterwards, commenced his clerical duties in 1782, as afternoon lecturer of Tavistock chapel, which in the November of that year he relinquished, on being elected to a minor-canonry in the cathedral church of St. Paul.

In July 1783 he was presented by the dean and chapter of St. Paul's to the vicarage of Heybridge juxta Maldon in Essex. In the same year he undertook the curacy of St. Bride's, Fleet Street, for a short time as assistant to Mr. Applebee, then far advanced in years; after whose death Mr. Pridden was for about twenty years the diligent curate of one of the largest parishes in London, the vicar being all the time non-resident. In 1785 he was elected a fellow of the society of antiquaries; and the first fruits of his proficiency in topographical research appeared in a letter to Mr. Nichols, dated March 1787, accompanied by several correct drawings, which, under the title of "An Appendix to the History of Reculver and Herne," was printed in the "Bibliotheca Topographica Britannica."

Mr. Pridden distinguished himself in 1786 as one of the most active promoters of the subscription for a statue to the immortal John Howard. The modesty of the great philanthropist during his lifetime refused this honourable distinction. Part of the subscriptions were applied to the relief of the prisoners confined in gaols, and with the rest a medal was intended to have been struck. But Mr. Howard's death intervening, all objections to the original intention vanished; and Mr. Pridden was the first who suggested the propriety of endeavouring to obtain permission to erect the statue in St. Paul's. This application was instantly consented to by the dean and chapter, at the same time intimating, "that no fee should be required for its admission, and that no monument should be erected without the design being first approved of by the royal academy." In 1788 he was elected by the governors of St. Bartholomew's hospital to the vicarage of Little Wakering in Essex. In 1789 he was appointed domestic chaplain to Earl Powlett; and having taken his degree of M. A. at St. John's college, Cambridge, was collated, *de novo*, to his vicarage of Heybridge. In 1795 he was appointed one of the chaplains in ordinary of his majesty's chapels royal; and in the same year was presented by Bishop Horsley to a minor-canonry in the collegiate church of St. Peter, Westminster.

In 1797 he resigned both his Essex livings on being presented by the dean and chapter of St. Paul's to the vicarage of Caddington in Bedfordshire, where he resided a considerable portion of the year. He in 1812 entirely rebuilt the vicarage-house, in which he was his own architect and surveyor.

A favourite idea of his, after taking up his residence at Caddington, was the more effectual drainage of the fens in the several counties of Northampton, Suffolk, Lincoln, Cambridge, Huntingdon, and the Isle of Ely, commonly called the great level of the fens, which is under the direction of a highly-respectable corporation, called governors of the Bedford level. To this subject he paid great attention, and suggested several useful hints, which in various conferences he communicated to the proper officers of the corporation.

He was a zealous supporter of the royal humane society, having for thirty-three years been one of the gratuitous chaplains and managers of that institution; and frequently advocated the cause of that excellent public charity in the pulpit. He was also for some time the honorary secretary of the sea-bathing infirmary at Margate, of which, in conjunction with Dr. Lettsom and Mr. Nichols, he was one of the

original founders; the freehold on which the infirmary was built having been purchased in their names. He also furnished the design from which the building was erected. During several successive years he attended the anniversary of the governors of the infirmary; and at intervals inspected the churches in the isle of Thanet, all of which are ancient and most of them very curious; he also made drawings of all these religious edifices. The registers were examined; the remarkable epitaphs copied, and the numerous brass plates rolled off, with a view to an improved edition of Lewis's "History of the Isle of Thanet."

In 1812 he was presented by the dean and chapter of St. Paul's to the united rectories of St. George, Botolph Lane, and St. Botolph, Billingsgate.

In the progress of "The History of Leicestershire," a period of more than twenty years, Mr. Pridden frequently accompanied Mr. Nichols in his visits to the several churches in that county, and made drawings of all that he visited, many of which he contributed to the numerous embellishments of that county history. Mr. Pridden died much regretted in April 1825, and was buried by the side of his first wife in Islington church-yard.

PRIDEAUX, HUMPHREY, a learned English divine, who was born in 1648, and educated at Oxford, and while at the university published the ancient inscriptions from the Arundel marbles, under the title of "Marmora Oxoniensia." Lord Chancellor Finch, earl of Nottingham, gave him a prebend in Norwich cathedral, and Lord North bestowed on him the rectory of Bladen, which, on taking the degree of D. D., he exchanged for the benefit of Soham, in Norfolk. He was subsequently promoted to the archdeaconry of Suffolk, and in 1702 made dean of Norwich. His death took place on the 1st of November, 1724. Besides his great work entitled "The Old and New Testament connected in the History of the Jews and Neighbouring Nations," of which there are many editions, he was the author of "The Life of Mohammed," &c.

PRIDEAUX, JOHN, a learned English prelate, who was born at Harford in Devonshire in 1578. His parents were persons in very humble life, and gave their son but a very limited education. To rectify this deficiency he travelled to Oxford on foot, and obtained a humble post in the kitchen of Exeter Hall, from which he rose solely by his own merit and industry to the rank of vice chancellor. The civil wars, however, deprived him of his bishopric of Worcester, to which he had been preferred in 1641, and he died in comparative indigence in 1650. He was the author of several works, the principal of which was entitled "Fasciculus Controversiarum."

PRIESTLEY, JOSEPH, an English writer, philosopher, and divine, who was born in March 1733 at Fieldhead, near Leeds. His father was a respectable clothier of the Calvinistic persuasion, in which he was himself educated under the protection of his aunt, who, after he had acquired a considerable share of scholastic knowledge, placed him at a dissenting academy at Daventry. Dr. Priestley, at a later period of life so graphically describes his feelings and habits while in this establishment and during a considerable portion of his after life, that we give the description in his own words. He says,—Three years, viz., from September 1752 to 1755, I spent at Daventry with that peculiar satisfaction with which

young persons of generous minds usually go through a course of liberal studies, in the society of others engaged in the same pursuits, and free from the cares and anxieties which seldom fail to lay hold on them when they come out into the world. In my time the academy was in a state peculiarly favourable to the serious pursuit of truth, as the students were about equally divided upon every question of much importance, such as liberty and necessity, the sleep of the soul, and all the articles of theological orthodoxy and heresy; in consequence of which all these topics were the subject of continual discussion. Our tutors also were of different opinions, Dr. Ashworth taking the orthodox side of every question, and Mr. Clark, the sub-tutor, that of heresy, though always with the greatest modesty. Both of our tutors being young, at least as tutors, and some of the senior students excelling more than they could pretend to do in several branches of study, they indulged us in the greatest freedoms, so that our lectures had often the air of friendly conversations on the subjects to which they related. We were permitted to ask whatever questions, and to make whatever remarks we pleased, and we did it with the greatest, but without any offensive, freedom. The general plan of our studies was exceedingly favourable to free inquiry, as we were referred to authors on both sides of every question, and were even required to give an account of them. It was also expected that we should abridge the most important of them for our future use. The public library contained all the books to which we were referred. It was a reference to Dr. Hartley's "Observations on Man," in the course of our lectures, that first brought me acquainted with that performance, which immediately engaged my closest attention, and produced the greatest, and in my opinion the most favourable effect on my general turn of thinking through life. It established me in the belief of the doctrine of necessity, which I first learned from Collins; it greatly improved that disposition to piety which I brought to the academy, and freed it from the rigour with which it had been tinged. Indeed I do not know whether the consideration of Dr. Hartley's theory contributes more to enlighten the mind or improve the heart; it affects both in so super-eminent a degree.

All the while I was at the academy I never lost sight of the great object of my studies, which was the duties of a Christian minister, and there it was that I laid the general plan which I have executed since. Particularly I there composed the first copy of my "Institutes of Natural and Revealed Religion," Mr. Clark, to whom I communicated my scheme, carefully perusing every section of it, and talking over the subject of it with me. But I was much discouraged even then with the impediment in my speech, which I inherited from my family, and which still attends me. Sometimes I absolutely stammered, and my anxiety about it was the cause of much distress to me. However, like St. Paul's "thorn in the flesh," I hope it has not been without its use. Without some such check as this I might have been dissipated in company, or might have been seduced by the love of popular applause as a preacher; whereas my conversation and my delivery in the pulpit having nothing in them that was generally striking, I hope I have been more attentive to qualifications of a superior kind. It is not, I believe, usual for young persons in dissenting academies to

think much of their future situations in life. Indeed we are happily precluded from that by the impossibility of succeeding in any application for particular places. We often, indeed, amused ourselves with the idea of our dispersion in all parts of the kingdom after living so happily together; and used to propose plans of meeting at certain times, and smile at the different appearance we should probably make after being ten or twenty years settled in the world. But nothing of this kind was ever seriously resolved upon by us. For my own part I can truly say I had very little ambition, except to distinguish myself by my application to the studies proper to my profession; and I cheerfully listened to the first proposal that my tutor made to me, in consequence of an application made to him to provide a minister for the people of Needham Market, in Suffolk, though it was very remote from my friends in Yorkshire, and a very inconsiderable place.

Mr. Priestley goes on to say, When I went to preach at Needham as a candidate I found a small congregation, about an hundred people, under a Mr. Meadows, who was superannuated. They had been without a minister the preceding year on account of the smallness of the salary; but there being some respectable and agreeable families among them, I flattered myself that I should be useful and happy in the place, and therefore accepted the unanimous invitation to be assistant to Mr. Meadows, with a view to succeed him when he died. He was a man of some fortune. This congregation had been used to receive assistance from both the presbyterian and independent funds; but upon my telling them that I did not choose to have any thing to do with the independents, and asking them whether they were able to make up the salary they promised me, which was 40*l.* per annum, without any aid from the latter fund, they assured me they could. I soon, however, found that they deceived themselves; for the most that I ever received from them was in the proportion of about 30*l.* per annum, when the expense of my board exceeded 20*l.*

Notwithstanding this every thing else for the first half year appeared very promising, and I was happy in the success of my schemes for promoting the interest of religion in the place. I catechised the children, though there were not many, using Dr. Watts's catechism; and I opened my lectures on the theory of religion from the Institutes, which I had composed at the academy, admitting all persons to attend them, without distinction of sex or age, but in this I soon found that I had acted imprudently. A minister in that neighbourhood had been obliged to leave his place on account of Arianism; and though nothing had been said to me on the subject, and from the people so readily consenting to give up the independent fund, I thought they could not have much bigotry among them, I found that when I came to treat of the unity of God merely as an article of religion, several of my audience were attentive to nothing but the soundness of my faith in the doctrine of the Trinity. Also, though I had made it a rule to myself to introduce nothing that could lead to controversy into the pulpit, yet making no secret of my real opinions in conversation, it was soon found that I was an Arian. From the time of this discovery my hearers fell off apace, especially as the old minister took a decided part against me. The principal families, however, still continued with me;

but notwithstanding this my salary fell far short of 30*l.* per annum; and if it had not been for Dr. Benson and Dr. Kippis, especially the former, procuring me now and then an extraordinary 5*l.* from different charities, I do not believe that I could have subsisted. I shall always remember their kindness to me at a time when I stood in so much need of it.

But what contributed greatly to my distress was the impediment in my speech, which had increased so much as to make preaching very painful, and took from me all chance of recommending myself to any better place. In this state, hearing of the proposal of one Mr. Angier to cure all defects of speech, I prevailed upon my aunt to enable me to pay his price, which was twenty guineas, and this was the first occasion of my visiting London. Accordingly I attended him about a month, taking an oath not to reveal his method, and I received some temporary benefit, but soon relapsed again, and spoke worse than ever.

At Needham I felt the effect of a low despised situation, together with that arising from the want of popular talents. There were several vacancies in congregations in that neighbourhood, where my sentiments would have been no objection to me, but I was never thought of. Even my next neighbour, whose sentiments were as free as my own, and known to be so, declined making exchanges with me, which, when I left that part of the country, he acknowledged was not owing to any dislike his people had to me as heretical, but for other reasons the more genteel part of his hearers always absenting themselves when they heard I was to preach for him. But visiting that country some years afterwards, when I had raised myself to some degree of notice in the world, and being invited to preach in that very pulpit, the same people crowded to hear me, though my elocution was not much improved, and they professed to admire one of the same discourses they had formerly despised. Notwithstanding these unfavourable circumstances I was far from being unhappy at Needham. I was boarded in a family from which I received much satisfaction; I firmly believed that a wise Providence was disposing every thing for the best, and I applied with great assiduity to my studies, which were classical, mathematical, and theological. These required but few books. As to experimental philosophy I had always cultivated an acquaintance with it, but I had not the means of prosecuting it.

When I was at Needham I drew up a treatise on the doctrine of divine influence, having collected a number of texts for that purpose, and arranged them under proper heads, as I had done those relating to the doctrine of atonement. But I published nothing relating to it until I made use of some of the observations in my sermon on that subject, delivered at an ordination, and published many years afterwards.

While I was in this retired situation I had, in consequence of much pains and thought, become persuaded of the falsity of the doctrine of atonement, of the inspiration of the authors of the books of Scripture as writers, and of all idea of supernatural influence, except for the purpose of miracles. But I was still an Arian, having never turned my attention to the Socinian doctrine, and contenting myself with seeing the absurdity of the Trinitarian system. Another task that I imposed on myself, and in part executed at Needham, was an accurate comparison of the Hebrew text of the hagiographa, and the pro-

phets with the version of the Septuagint, noting all the variations, &c. This I had about half finished before I left that place; and I never resumed it except to do that occasionally for particular passages, which I then began, though with many disadvantages, with a design to go through the whole. I had no polyglot Bible, and could have little help from the labours of others.

Like most other young men of a liberal education, I had conceived a great aversion to the business of a schoolmaster, and had often said that I would have recourse to any thing else for a maintenance in preference to it. But having no other resource, I was at length compelled by necessity to make some attempt that way, and for this purpose I printed and distributed proposals, but without any effect. Not that I was thought to be disqualified for this employment, but because I was not orthodox. I had proposed to teach the classics, mathematics, &c., for half-a-guinea per quarter, and to board the pupils in the house with myself for twelve guineas per annum. Finding this scheme not to answer, I proposed to give lectures to grown persons in such branches of science as I could conveniently procure the means of doing, and I began with reading about twelve lectures on the use of the globes at half-a-guinea. I had one course of ten hearers, which did something more than pay for my globes; and I should have proceeded in this way, adding to my apparatus as I should have been able to afford it, if I had not left that place, which was in the following manner. My situation being well known to my friends, Mr. Gill, a distant relation by my mother, who had taken much notice of me before I went to the academy, and had often lent me books, procured me an invitation to preach as a candidate at Sheffield on the resignation of Mr. Wadsworth. Accordingly I did preach as a candidate, but though my opinions were no objection to me there, I was not approved. But Mr. Haynes, the other minister, perceiving that I had no chance at Sheffield, told me that he could recommend me to a congregation at Nantwich in Cheshire, where he himself had been settled; and as it was at a great distance from Needham, he would endeavour to procure me an invitation to preach there for a year certain. This he did, and I gladly accepting of it, removed from Needham, going thence to London by sea to save expense. This was in 1758, after having been at Needham just three years.

At Nantwich I found a good-natured friendly people, with whom I lived three years very happily; and in this situation I heard nothing of those controversies which had been the topics of almost every conversation in Suffolk, and the consequence was that I gave little attention to them myself. Indeed it was hardly in my power to do it on account of my engagement with a school, which I was soon able to establish, and to which I gave almost all my attention; and in this employment, contrary to my expectations, I found the greatest satisfaction, notwithstanding the confinement and labour attending it. My school generally consisted of about thirty boys, and I had a separate room for about half-a-dozen young ladies. Thus I was employed from seven in the morning until four in the afternoon, without any interval except one hour for dinner: and I never gave a holiday on any consideration, the red letter days, as they are called, excepted. Immediately after this employment in my own schoolrooms, I went to teach in

the family of Mr. Tomkinson, an eminent attorney, and a man of large fortune, whose recommendation was of the greatest service to me; and here I continued until seven in the evening. I had therefore but little leisure for reading, or for improving myself in any way, except what necessarily arose from my employment. Being engaged in the business of a schoolmaster, I made it my study to regulate it in the best manner, and I think I may say with truth, that in no school was more business done, or with more satisfaction, either to the master or the scholars, than in this of mine. Many of my scholars are probably living, and I am confident that they will say that this is no vain boast.

At Needham I was barely able, with the greatest economy, to keep out of debt (though this I always made a point of doing at all events), but at Nantwich my school soon enabled me to purchase a few books, and some philosophical instruments, as a small air-pump, an electrical machine, &c. These I taught my scholars in the highest class to keep in order and make use of; and by entertaining their parents and friends with experiments, in which the scholars were generally the operators, and sometimes the lecturers too, I considerably extended the reputation of my school; though I had no other object originally than gratifying my own taste. I had no leisure, however, to make any original experiments until many years after this time. As there were few children in the congregation (which did not consist of more than sixty persons, and a great proportion of them travelling Scotchmen) there was no scope for exertion with respect to my duty as a minister. I therefore contented myself with giving the people what assistance I could at their own houses, where there were young persons; and I added very few sermons to those which I had composed at Needham, where I never failed to make at least one every week.

My engagements in teaching allowed me but little time for composing any thing while I was at Nantwich. There, however, I recomposed my "Observations on the Character and Reasoning of the Apostle Paul," as mentioned before. For the use of my school, I then wrote an English Grammar on a new plan, leaving out all such technical terms as were borrowed from other languages, and had no corresponding modifications in ours, as the future tense, &c.; and to this I afterwards subjoined "Observations for the Use of Proficients in the Language," from the notes which I collected at Warrington, where, being tutor in the languages and belles lettres, I gave particular attention to the English language, and intended to have composed a large treatise on the structure and present state of it. But dropping the scheme in another situation, I lately gave such parts of my collection as I had made no use of, to Mr. Herbert Croft, of Oxford, on his communicating to me his design of compiling a dictionary and grammar of our language. The academy at Warrington was instituted when I was at Needham, and Mr. Clark, knowing the attention that I had given to the learned languages when I was at Daven-try, had then joined with Dr. Benson and Dr. Taylor in recommending me as tutor in the languages. But Mr. (afterwards Dr.) Aikin, whose qualifications were superior to mine, was justly preferred to me. However, on the death of Dr. Taylor and the advancement of Mr. Aikin to be tutor in divinity, I was invited to succeed him. This I accepted, though my

school promised to be more gainful to me. But my employment at Warrington would be more liberal and less painful. It was also a means of extending my connexions. But, as I told the persons who brought me the invitation, viz. Mr. Seddon and Mr. Holland, of Bolton, I should have preferred the office of teaching the mathematics and natural philosophy, for which I had at that time a great predilection.

The early engagements of Mr. Priestley in his favourite character of a minister, the discouragements he encountered, and his incessant labours as a schoolmaster, for a scanty maintenance, have been all ingenuously related by himself. He will now appear to occupy a station which prepared for his talents a more extended exercise. Hence also he shared the society, and at length secured the intimate friendship, of men who have largely contributed to the moral and intellectual "glory of their times; leaders of the people by their counsels; wise and eloquent in their instructions; merciful men, whose righteousness hath not been forgotten." The memoir thus proceeds:—My removal to Warrington was in September 1761, after a residence of just three years at Nantwich. In this new situation I continued six years, and in the second year I married a daughter of Mr. Isaac Wilkinson, an ironmaster, near Wrexham, in Wales, with whose family I had become acquainted in consequence of having the youngest son, William, at my school at Nantwich. This proved a very suitable and happy connexion, my wife being a woman of an excellent understanding, much improved by reading, of great fortitude and strength of mind, and of a temper in the highest degree affectionate and generous; feeling strongly for others, and little for herself. Also, greatly excelling in every thing relating to household affairs, she entirely relieved me of all concern of that kind, which allowed me to give all my time to the prosecution of my studies, and the other duties of my station. And though, in consequence of her father becoming impoverished, and wholly dependent on his children in the latter part of life, I had little fortune with her, I unexpectedly found a great resource in her two brothers, who had become wealthy, especially the elder of them. At Warrington I had a daughter, Sarah, who was afterwards married to Mr. William Finch, of Heath Forge, near Dudley.

Though at the time of my removal to Warrington I had no particular fondness for the studies relating to my profession then, I applied to them with great assiduity; and besides composing courses of "Lectures on the Theory of Language," and on "Oratory and Criticism," on which my predecessor had lectured, I introduced lectures on "History and General Policy," on the "Laws and Constitution of England," and on the "History of England." This I did in consequence of observing that, though most of our pupils were young men designed for situations in civil and active life, every article in the plan of their education was adapted to the learned professions. In order to recommend such studies as I introduced, I composed an "Essay on a Course of Liberal Education for Civil and Active Life," with syllabuses of my three new courses of lectures; and Dr. Brown having just then published a plan of education, in which he recommended it to be undertaken by the state, I added some remarks on his treatise, showing how inimical it was to liberty and the natural rights of parents. This leading me to consider the

subject of civil and political liberty, I published my thoughts on it, in an "Essay on Government," which in a second edition I much enlarged, including in it what I wrote in answer to Dr. Balguy, "On Church Authority," as well as my animadversions on Dr. Brown. My "Lectures on the Theory of Language and Universal Grammar," were printed for the use of the students, but they were not published. Those on "Oratory and Criticism," I published when I was with Lord Shelburne; and those on "History and General Policy" are now printed, and about to be published. Finding no public exercises at Warrington, I introduced them there, so that, afterwards, every Saturday the tutors, all the students, and often strangers, were assembled to hear English and Latin compositions, and sometimes to hear the delivery of speeches, and the exhibition of scenes in plays. It was my province to teach elocution, and also logic and Hebrew. The first of these I retained; but after a year or two I exchanged the two last articles with Dr. Aikin for the civil law, and one year I gave a course of lectures in anatomy.

With a view to lead the students to a facility in writing English, I encouraged them to write in verse. This I did not with any design to make them poets, but to give them a greater facility in writing prose, and this method I would recommend to all tutors. I was myself far from having any pretension to the character of a poet, but in the early part of my life I was a great versifier; and this I believe, as well as my custom of writing after preachers, mentioned before, contributed to the ease with which I always wrote prose. Mrs. Barbauld has told me that it was the perusal of some verses of mine that first induced her to write any thing in verse, so that this country is in some measure indebted to me for one of the best poets it can boast of. Several of her first poems were written when she was in my house, on occasions that occurred while she was there. It was while I was at Warrington that I published my "Chart of Biography," though I had begun to construct it at Nantwich. Lord Willoughby, of Parham, who lived in Lancashire, being pleased with the idea of it, I, with his consent, inscribed it to him; but he died before the publication of it: the "Chart of History," corresponding to it, I drew up some time after at Leeds. I was in this situation, when going to London and being introduced to Dr. Price, Mr. Canton, Dr. Watson (the physician), and Dr. Franklin, I was led to attend to the subject of experimental philosophy more than I had done before; and having composed all the lectures I had occasion to deliver, and finding myself at liberty for any undertaking, I mentioned to Dr. Franklin an idea that had occurred to me of writing the history of discoveries in electricity, which had been his favourite study. This I told him might be an useful work, and that I would willingly undertake it, provided I could be furnished with the books necessary for the purpose. This he readily undertook, and my other friends assisting him in it, I set about the work without having the least idea of doing any thing more than writing a distinct and methodical account of all that had been done by others. Having, however, a pretty good machine, I was led, in the course of my writing the history, to endeavour to ascertain several facts which were disputed; and this led me by degrees into a large field of original experiments, in which I spared no expense that I could possibly furnish. These experiments employed a

great proportion of my leisure time; and yet before the complete expiration of the year in which I gave the plan of my work to Dr. Franklin, I sent him a copy of it in print. In the same year five hours of every day were employed in lectures, public or private, and one two months' vacation I spent chiefly at Bristol, on a visit to my father-in-law. This I do not mention as a subject of boasting, for many persons have done more in the same time, but as an answer to those who have objected to some of my later writings as hasty performances; for none of my publications were better received than this "History of Electricity," which was the most hasty of them all. However, whether my publications have taken up more or less time, I am confident that more would not have contributed to their perfection in any essential particular; and about any thing farther I have never been very solicitous. My object was not to acquire the character of a fine writer, but an useful one. I can also truly say, that gain was never the chief object of any of my publications. Several of them were written with the prospect of certain loss. During the course of my electrical experiments in this year, I kept up a constant correspondence with Dr. Franklin and the rest of my philosophical friends in London; and my letters circulated among them all, as also every part of my history as it was transcribed. This correspondence would have made a considerable volume, and it took up much time; but it was of great use with respect to the accuracy of my experiments and the perfection of my work. After the publication of my "Chart of Biography," Dr. Percival, of Manchester, then a student at Edinburgh, procured me the title of doctor of laws from that university; and not long after my new experiments in electricity were the means of introducing me into the royal society, with the recommendation of Dr. Franklin, Dr. Watson, Mr. Canton, and Dr. Price.

Dr. Priestley thus writes respecting his introduction to the royal society in a letter of March 8, 1766:—

"I ask pardon if I was guilty of any impropriety in desiring the recommendation of Lord Charles Cavendish. I thought that if his friends, Mr. Canton and Dr. Franklin, could not satisfy him from my letters, (which you are pleased to suppose would recommend me to the society,) that I was a person properly qualified to be a member, mere personal acquaintance had been of no moment at all. My recommendation to the university of Edinburgh was signed by Lord Willoughby. He also wrote to Dr. Robertson in my favour. A copy of this Dr. Robertson gave my friend Dr. Percival, who has sent it to Dr. Watson, as it may possibly be of some weight in this affair.

"I shall write out a full account of the new experiments I have mentioned to Dr. Franklin and Mr. Canton after a week or two, in which I shall have made other experiments which have a connexion with them. In the mean time my friends here think it will be best to mention them to some of the principal members, and to read the full account of them to the society about the time of election; but I beg of you, dear Sir, and Mr. Canton, not to have me proposed at all (if it be not done) unless you be morally certain it will be carried. I thankfully accept the offer of your name and Mr. Canton's, and desire you would act in concert with Dr. Watson."

Though all the tutors in my time lived in the most perfect harmony; though we all exerted ourselves to the utmost, and there was no complaint of want of

discipline, the academy did not flourish. There had been an unhappy difference between Dr. Taylor and the trustees, in consequence of which all his friends, who were numerous, were our enemies; and too many of the subscribers, being probably weary of the subscription, were willing to lay hold of any pretence for dropping it and of justifying their conduct afterwards. It is possible that in time we might have overcome the prejudices we laboured under, but there being no prospect of things being any better, and my wife having very bad health, on her account chiefly I wished for a removal, though nothing could be more agreeable to me at the time than the whole of my employment, and all the laborious part of it was over. The terms also on which we took boarders, viz. 15*l.* per annum, and my salary being only 100*l.* per annum, with a house, it was not possible, even living with the greatest frugality, to make any provision for a family. I was there six years, most laboriously employed, for nothing more than a bare subsistence. I therefore listened to an invitation to take the charge of the congregation of Mill Hill chapel, at Leeds, where I was pretty well known, and thither I removed in September 1767.

Though while I was at Warrington it was no part of my duty to preach, I had from choice continued the practice; and wishing to keep up the character of a dissenting minister, I chose to be ordained while I was there; and though I was far from having conquered my tendency to stammer, and probably never shall be able to do it effectually, I had, by taking much pains, improved my pronunciation some time before I left Nantwich, where for the first two years this impediment had increased so much that I once informed the people that I must give up the business of preaching and confine myself to my school.

At Leeds I continued six years very happy with a liberal, friendly, and harmonious congregation, to whom my services (of which I was not sparing) were very acceptable. Here I had no unreasonable prejudices to contend with, so that I had full scope for every kind of exertion; and I can truly say that I always considered the office of a Christian minister as the most honourable of any upon earth, and in the studies proper to it I always took the greatest pleasure.

On reading Mr. Mann's "Dissertation on the Times of the Birth and Death of Christ," I was convinced that he was right in his opinion of our Saviour's ministry having continued little more than one year, and on this plan I drew out "A Harmony of the Gospels," the outline of which I first published in the "Theological Repository," and afterwards separately and at large, both in Greek and English, with notes, and an occasional paraphrase. In the same work I published my "Essay on the Doctrine of Atonement," improved from the tract published by Dr. Lardner, and also my animadversions on the reasoning of the apostle Paul.

The plan of this Repository occurred to me on seeing some notes that Mr. Turner, of Wakefield, had drawn up on several passages of Scripture, which I was concerned to think should be lost. He very much approved of my proposal of an occasional publication, for the purpose of preserving such original observations as could otherwise probably never see the light. Of this work I published three volumes while I was at Leeds, and he never failed to give me an article for every number of which they were composed. Giving particular attention to the duties of

my office, I wrote several tracts for the use of my congregation, as two Catechisms, "An Address to Masters of Families on the subject of Family Prayer," "A Discourse on the Lord's Supper, and on Church Discipline," and "Institutes of Natural and Revealed Religion." Here I formed three classes of catechumens, and took great pleasure in instructing them in the principles of religion. In this respect I hope my example has been of use in other congregations. The first of my controversial treatises was written here in reply to some angry remarks on my discourse on the Lord's Supper, by Mr. Venn, a clergyman in the neighbourhood. I also wrote remarks on Dr. Balguy's sermon on church authority, on some paragraphs in Judge Blackstone's "Commentaries on the Laws of England," relating to the dissenters. To the two former no reply was made; but to the last the judge replied in a small pamphlet, on which I addressed a letter to him in the "St. James's Chronicle."

This controversy led me to print another pamphlet, entitled "A View of the Principles and Conduct of the Protestant Dissenters, with respect to the Civil and Ecclesiastical Constitution of England." With the encouragement of Dr. Price and Dr. Kippis, I also wrote "An Address to Protestant Dissenters, as such, by a Dissenter," but without my name. Several of these pamphlets having been animadverted upon by an anonymous acquaintance, who thought I had laid too much stress on the principles of the dissenters, I wrote a defence of my conduct in letters addressed to him. The methodists being very numerous in Leeds, and many of the lower sort of my own hearers listening to them, I wrote "An Appeal to the Serious and Candid Professors of Christianity," "An Illustration of Certain Passages of Scripture," and republished "The Trial of Elwall," all in the cheapest manner possible. Those small tracts had a great effect in establishing my hearers in liberal principles of religion, and in a short time had a far more extensive influence than I could have imagined. By this time (1787) more than thirty thousand copies of the Appeal have been dispersed. Besides these theoretical and controversial pieces, I wrote, while I was at Leeds, my "Essay on the First Principles of Government," mentioned before, my English Grammar enlarged, "Familiar Introduction to the Study of Electricity," "A Treatise on Perspective," and my "Chart of History," and also some anonymous pieces in favour of civil liberty during the persecution of Mr. Wilks, the principal of which was "An Address to Dissenters on the subject of the difference with America," which I wrote at the request of Dr. Franklin and Dr. Fothergil.

But nothing of a nature foreign to the duties of my profession engaged my attention while I was at Leeds so much as the prosecution of my experiments relating to electricity, and especially the doctrine of air. The last I was led into in consequence of inhabiting a house adjoining to a public brewery, where I at first amused myself with making experiments on the fixed air which I found ready made in the process of fermentation. When I removed from that house I was under the necessity of making the fixed air for myself; and one experiment led to another, as I have distinctly and faithfully noted in my various publications on the subject, I by degrees contrived a convenient apparatus for the purpose, but of the cheapest kind.

When I began these experiments I knew very little of chemistry, and had in a manner no idea on the subject before I attended a course of chemical lectures delivered in the academy at Warrington, by Dr. Turner of Liverpool. But I have often thought that upon the whole this circumstance was no disadvantage to me, as in this situation I was led to devise an apparatus and processes of my own, adapted to my peculiar views. Whereas, if I had been previously accustomed to the usual chemical processes, I should not have so easily thought of any other; and without new modes of operation I should hardly have discovered any thing materially new. My first publication on the subject of air was in 1772. It was a small pamphlet on the method of impregnating water with fixed air; which, being immediately translated into French, excited a great degree of attention to the subject, and this was much increased by the publication of my first paper of experiments in a large article of "The Philosophical Transactions" the year following, for which I received the gold medal of the society. My method of impregnating water with fixed air was considered at a meeting of the college of physicians, before whom I made the experiments, and by them it was recommended to the lords of the admiralty (by whom they had been summoned for the purpose) as likely to be of use in the sea scurvy.

Having succeeded so well in the history of electricity, I was induced to undertake the history of all the branches of experimental philosophy; and at Leeds I gave out proposals for that purpose, and published "The History of Discoveries relating to Vision, Light, and Colours." This work also, I believe, I executed to general satisfaction, and being an undertaking of great expense I was under the necessity of publishing it by subscription. The sale, however, was not such as to encourage me to proceed with a work of so much labour and expense; so that after purchasing a great number of books to enable me to finish my undertaking, I was obliged to abandon it, and to apply wholly to original experiments.

In writing "The History of Discoveries relating to Vision," I was much assisted by Mr. Mitchell, the discoverer of the method of making artificial magnets. Living at Thornhill, not very far from Leeds, I frequently visited him, and was very happy in his society, as I also was in that of Mr. Smeaton, who lived still nearer to me. He made me a present of his excellent air-pump, which I constantly use to this day. Having strongly recommended his construction of this instrument it is now generally used, whereas, before that hardly any had been made during the twenty years which had elapsed after the account that he had given of it in "The Philosophical Transactions."

I was also instrumental in reviving the use of large electrical machines and batteries in electricity, the generality of electrical machines being little more than play-things at the time that I began my experiments. The first very large electrical machine was made by Mr. Nairne, in consequence of a request made to me by the grand duke of Tuscany to get him the best machine that we could make in England. This, and another that he made for Mr. Vaughan, were constructed on a plan of my own. But afterwards Mr. Nairne made large machines on a more simple and improved construction; and in consideration of the service which I had rendered him he made me a present of a pretty large machine

of the same kind. The review of my "History of Electricity," by Mr. Bewley, who was acquainted with Mr. Mitchell, was the means of opening a correspondence between us, which was the source of much satisfaction to me as long as he lived. I instantly communicated to him an account of every new experiment that I made, and in return was favoured with his remarks upon them. All that he published of his own were articles in the appendices to my volumes on air, all of which are ingenious and valuable. Always publishing in this manner he used to call himself my satellite. There was a vein of pleasant wit and humour in all his correspondence, which added greatly to the value of it. His letters to me would have made several volumes, and mine to him still more. When he found himself dangerously ill he made a point of paying me a visit before he died; and he made a journey from Norfolk to Birmingham, accompanied by Mrs. Bewley, for that purpose; and after spending about a week with me he went to his friend, Dr. Burney, and at his house he died.

While I was at Leeds a proposal was made to me to accompany Captain Cook in his second voyage to the South Seas. As the terms were very advantageous, I consented to it, and the heads of my congregation had agreed to keep an assistant to supply my place during my absence. But Mr. Banks informed me that I was objected to by some clergymen in the board of longitude, who had the direction of this business, on account of my religious principles, and presently after I heard that Dr. Forster, a person far better qualified for the purpose, had got the appointment. As I had barely acquiesced in the proposal this was no disappointment to me, and I was much better employed at home, even with respect to my philosophical pursuits. My knowledge of natural history was not sufficient for the undertaking; but at that time I should by application have been able to supply my deficiency, though now I am sensible I could not do it.

I had two sons born to me at Leeds, Joseph and William, and though I was very happy there, I was tempted to leave it, after continuing there six years, to go into the family of the earl of Shelburne, now the marquis of Lansdowne, he stipulating to give me 250*l.* per annum, a house to live in, and a certainty for life in case of his death, or of my separation from him; whereas at Leeds my salary was only one hundred guineas per annum and a house, which was not quite sufficient for the subsistence of my family, without a possibility of making a provision for them after my death.

I had been recommended to Lord Shelburne by Dr. Price as a person qualified to be a literary companion to him. In this situation, my family being at Calne in Wiltshire, near to his lordship's seat at Bowood, I continued seven years, spending the summer with my family, and a great part of the winter in his lordship's house in London. My office was nominally that of librarian, but I had little employment as such, besides arranging his books, taking a catalogue of them and of his manuscripts, which were numerous, and making an index to his collection of private papers. In fact I was with him as a friend, and the second year made with him the tour of Flanders, Holland, and Germany, as far as Strasburgh, and after spending a month at Paris, returned to England. This was in the year 1774. This little

excursion made me more sensible than I should otherwise have been of the benefit of foreign travel, even without the advantage of much conversation with foreigners. The very sight of new countries, new buildings, new customs, &c., and the very hearing of an unintelligible new language, gives new ideas, and tends to enlarge the mind. To me this little time was extremely pleasing, especially as I saw every thing to the greatest advantage, and without any anxiety or trouble, and had an opportunity of seeing and conversing with every person of eminence wherever we came; the political characters by his lordship's connexion, and the literary ones by my own. I was soon, however, tired of Paris, and chose to spend my evenings at the hotel, in company with a few literary friends. Fortunately for me Mr. Magellan, being at Paris at the same time, spent most of the evenings with me; and, as I chose to return before his lordship, he accompanied me to London, and made the journey very pleasing to me, he being used to the country, the language, and the manners of it, which I was not. He had seen much of the world, and his conversation during our journey was particularly interesting to me. Indeed in London, both before and after this time, I always found him very friendly, especially in every thing that related to my philosophical pursuits.

Notwithstanding the attention that I gave to philosophy in this situation, I did not discontinue my other studies, especially in theology and metaphysics. Here I wrote my "Miscellaneous Observations relating to Education," and published my "Lectures on Oratory and Criticism," which I dedicated to Lord Fitzmaurice, Lord Shelburne's eldest son. Here also I published the third and last part of my "Institutes of Natural and Revealed Religion;" and having in the preface attacked the principles of Dr. Reid, Dr. Beattie, and Dr. Oswald, with respect to their doctrine of common sense, which they made to supersede all rational inquiry into the subject of religion, I was led to consider their system in a separate work, which, though written in a manner I do not entirely approve, has I hope, upon the whole, been of service to the cause of free inquiry and truth. In the preface I had expressed my belief of the doctrine of philosophical necessity, but without any design to pursue the subject, and also my great admiration of Dr. Hartley's theory of the human mind, as indeed I had taken many opportunities of doing before. This led me to publish that part of his "Observations on Man," which related to the doctrine of association of ideas, detached from the doctrine of vibrations, prefixing three dissertations explanatory of his general system.

Reflecting on the time that I spent with Lord Shelburne, being as a guest in the family, I can truly say that I was not at all fascinated with that mode of life. Instead of looking back upon it with regret, one of the greatest subjects of my present thankfulness is the change of that situation for the one in which I am now placed; and yet I was far from being unhappy there, much less so than those who are born to such a state, and pass all their lives in it. These are generally unhappy from the want of necessary employment; on which account chiefly there appears to be much more happiness in the middle classes of life, who are above the fear of want, and yet have a sufficient motive for a constant exertion of their faculties, and who have always some other

object besides amusement. I used to make no scruple of maintaining that there is not only most virtue and most happiness, but even most true politeness, in the middle classes of life. For in proportion as men pass more of their time in the society of their equals, they get a better established habit of governing their tempers; they attend more to the feelings of others, and are more disposed to accommodate themselves to them. On the other hand, the passions of persons in higher life, having been less controlled, are more apt to be inflamed; the idea of their rank and superiority to others seldom quits them; and though they are in the habit of concealing their feelings, and disguising their passions, it is not always so well done but that persons of ordinary discernment may perceive what they inwardly suffer. On this account they are really entitled to compassion, it being the almost unavoidable consequence of their education and mode of life. But when the mind is not hurt in such a situation, when a person born to affluence can lose sight of himself, and truly feel and act for others, the character is so godlike as shows that this inequality of condition is not without its use. Like the general discipline of life, it is for the present lost on the great mass, but on a few it produces what no other state of things could do.

The greatest part of the time that I spent with Lord Shelburne I passed with much satisfaction, his lordship always behaving to me with uniform politeness, and his guests with respect; but about two years before I left him I perceived evident marks of dissatisfaction, though I never understood the cause of it, and until that time he had been even lavish on all occasions in expressing his satisfaction in my society to our common friends. When I left him I asked him whether he had any fault to find with my conduct, and he said none. At length, however, he intimated to Dr. Price that he wished to give me an establishment in Ireland, where he had large property. This gave me an opportunity of acquainting him that if he chose to dissolve the connexion, it should be on the terms expressed in the writings which we mutually signed when it was formed, in consequence of which I should be entitled to an annuity of 150*l.*, and then I would provide for myself, and to this he readily acceded. He told Dr. Price that he wished our separation to be amicable, and I assured him that nothing should be wanting on my part to make it truly so.

Notwithstanding my allowance from Lord Shelburne was larger than that which I had at Leeds, yet my family growing up, and my expenses, on the and other accounts, increasing more than in proportion, I was barely able to support my removal. But my situation being intimated to Mrs. Rayner, besides smaller sums with which she occasionally assisted me, she gave me an hundred guineas to defray the expense of my removal, and deposited with Mrs. Lindsey, which she soon after gave up to me, 400 guineas, and to this day has never failed giving me, every year, marks of her friendship. Hers is indeed, I seriously think, one of the first Christian characters that I was ever acquainted with, having a cultivated, comprehensive mind, equal to any subject of theology or metaphysics, intrepid in the cause of truth, and most rationally pious.

My winter's residence in London was the means of improving my acquaintance with Dr. Franklin. I

was seldom many days without seeing him, and being members of the same club, we constantly returned together. The difference with America breaking out at this time, our conversation was chiefly of a political nature, and I can bear witness that he was so far from promoting it, as was generally supposed, that he took every method in his power to prevent a rupture between the two countries. He urged so much the doctrine of forbearance that for some time he was unpopular with the Americans on that account, as too much a friend to Great Britain. His advice to them was to bear every thing for the present, as they were sure in time to out-grow all their grievances, as it could not be in the power of the mother country to oppress them long. He dreaded the war, and often said that if the difference should come to an open rupture, it would be a war of ten years, and he should not live to see the end of it. In reality the war lasted nearly eight years, but he did live to see the happy termination of it. That the issue would be favourable to America he never doubted. The English, he used to say, may take all our great towns, but that will not give them possession of the country. The last day that he spent in England, having given out that he should leave London the day before, we passed together without any other company; and much of the time was employed in reading American newspapers, especially accounts of the reception which the Boston port bill met with in America, and as he read the addresses to the inhabitants of Boston, from the places in the neighbourhood, the tears trickled down his cheeks. It is much to be lamented that a man of Dr. Franklin's general good character and great influence should have been an unbeliever in Christianity, and also have done so much as he did to make others unbelievers. To me, however, he acknowledged that he had not given so much attention as he ought to have done to the evidences of Christianity, and desired me to recommend to him a few treatises on the subject, such as I thought most deserving of his notice, but not of great length, promising to read them, and give me his sentiments on them. Accordingly I recommended to him Hartley's evidences of Christianity in his "Observations on Man," and what I had then written on the subject in my "Institutes of Natural and Revealed Religion;" but the American war breaking out soon after, I do not believe that he ever found himself sufficiently at leisure for the discussion. I have kept up a correspondence with him occasionally ever since; and three of his letters to me were, with his consent, published in his miscellaneous works, in quarto. The first of them, written immediately on his landing in America, is very striking.

About three years before the dissolution of my connexion with Lord Shelburne, Dr. Fothergill, with whom I had always lived on terms of much intimacy, having observed, as he said, that many of my experiments had not been carried to their proper extent on account of the expence that would have attended them, proposed to me a subscription from himself and some of his friends, to supply me with whatever sums I should want for that purpose, and named 100*l.* per annum. This large subscription I declined, lest the discovery of it (by the use that I should of course make of it) should give umbrage to Lord Shelburne; but I consented to accept of 40*l.* per annum, which from that time he regularly

paid me from the contributions of himself, Sir Theodore Jansen, Mr. Constable, and Sir George Savile. On my leaving Lord Shelburne, which was attended with the loss of one half of my income, Dr. Fothergill proposed an enlargement of my allowance for my experiments, and likewise for my maintenance, without being under the necessity of giving my time to pupils, which I must otherwise have done. And, considering the generosity with which this voluntary offer was made by persons who could well afford it, and who thought me qualified to serve the interests of science, I thought it right to accept of it; and I preferred it to any pension from the court, offers of which were more than once made by persons who thought they could have procured one for me.

About this period Dr. Priestley made his very important discovery respecting the formation of noxious vapours in stagnant water, which has formed the basis for all our modern sanatory provisions in great towns. His experiments are models for those of future investigators. He describes his labours in the following letter to Sir John Pringle:—

"Dear Sir,—Having pursued my experiments on different kinds of air considerably farther in several respects than I had done when I presented the last account of them to the royal society, and being encouraged by the favourable notice which the society has been pleased to take of them, I shall continue my communications on this subject; but without waiting for the result of a variety of processes, which I have now going on, or of other experiments which I propose to make, I shall, from time to time, communicate such detached articles as I shall have given the most attention to, and with respect to which I shall have been the most successful in my inquiries.

"Since the publication of my papers, I have read two treatises, written by Dr. Alexander of Edinburgh, and am exceedingly pleased with the spirit of philosophical inquiry which they discover. They appear to me to contain many new, curious, and valuable observations; but one of the conclusions which he draws from his experiments I am satisfied, from my own observations, is ill-founded, and, from the nature of it, must be dangerous; I mean his maintaining that there is nothing to be apprehended from the neighbourhood of putrid marshes. I was particularly surprised to meet with such an opinion as this in a book inscribed to yourself, who have so clearly explained the great mischief of such a situation, in your excellent treatise on the diseases of the army. On this account I have thought it not improper to address to you the following observations and experiments, which I think clearly demonstrate the fallacy of Dr. Alexander's reasoning, indisputably establishes your doctrine, and indeed justifies the apprehensions of all mankind in this case. I think it probable enough that putrid matter, as Dr. Alexander has endeavoured to prove, will preserve other substances from putrefaction; because, being already saturated with the putrid effluvia, they cannot readily take any more; but Dr. Alexander was not aware that air that is loaded with putrid effluvia is exceedingly noxious when taken into the lungs. I have lately, however, had an opportunity of fully ascertaining how very noxious such air is.

"Happening to use at Calne a much larger trough of water for the purpose of my experiments than I had done at Leeds, and not having fresh water so near at hand as I had there, I neglected to change it

till it turned black, and became offensive, but by no means to such a degree as to deter me from making use of it. In this state of the water I observed bubbles of air to rise from it, and especially in one place, to which some shelves that I had in it directed them, and having set an inverted glass vessel to catch them, in a few days I collected a considerable quantity of this air, which issued spontaneously from the putrid water, and putting nitrous air to it, I found that no change of colour or diminution ensued, so that it must have been in the highest degree noxious. I repeated the same experiment several times afterwards, and always with the same result. After this I had the curiosity to try how wholesome air would be affected by agitation in this water; when to my real surprise I found that, after one minute only, a candle would not burn in it; and after three or four minutes, it was in the same state with the air which had issued spontaneously from the same water. I also found that common air, confined in a glass vessel, in contact only with this water, and without any agitation, would not admit a candle to burn in it after two days.

"These facts certainly demonstrate that air, which either arises from stagnant and putrid water, or which has been for some time in contact with it, must be very unfit for respiration; and yet Dr. Alexander's opinion is rendered so plausible by his experiments, that it is very possible that many persons may be rendered secure and thoughtless of danger in a situation in which they must necessarily breathe it. On this account I have thought it right to make this communication as early as I conveniently could; and as Dr. Alexander appears to be an ingenious and benevolent man, I doubt not but he will thank me for it.

"That air issuing from water, or rather from the soft earth or mud, at the bottom of pits containing water, is not always unwholesome, I have also had an opportunity of ascertaining. Taking a walk about two years ago in the neighbourhood of Wakefield, in Yorkshire, I observed bubbles of air to arise, in remarkably great plenty, from a small pool of water which, upon inquiry, I was informed, had been the place where some persons had been boring the ground in order to find coal. These bubbles of air having excited my curiosity, I presently returned with a bason and other vessels proper for my purpose, and having stirred the mud with a long stick, I soon got about a pint of this air; and, examining it, found it to be good common air; at least, a candle burned in it very well. I had not then discovered the method of ascertaining the goodness of common air by a mixture of nitrous air. Previous to the trial, I had suspected that this air would have been found to be inflammable.

"I shall conclude this letter with observing, that I have found a remarkable difference in different kinds of water with respect to their effect on common air agitated in them, and which I am not yet able to account for. If I agitate common air in the water of a deep well near my house in Calne, which is hard, but clear and sweet, a candle will not burn in it after three minutes. The same is the case with the rain water which I get from the roof of my house. But in distilled water, or the water of a spring well near the house, I must agitate the air about twenty minutes before it will be so much injured. It may be worth while to make farther experiments with respect

to this property of water. In consequence of using the rain water and the well water above-mentioned, I was very near concluding, contrary to what I have asserted in my printed papers, that common air suffers a decomposition by rarefaction; for when I had collected a considerable quantity of air which had been rarefied about 400 times by an excellent pump made for me by Mr. Smeaton, I always found that, when I filled my receivers with the water above-mentioned, though I did it so gradually as to occasion as little agitation as possible, a candle would not burn in the air that remained in them. But when I used distilled water, or fresh spring water, I undeceived myself."

One more letter illustrative of Dr. Priestley's critical style in epistolary composition, places him in a very striking point of view:—

"Dear Mrs. Barbauld,—As my wife informs me that you wish to know what I think of your late publication, I shall very freely tell you, though as you are well acquainted with my writings on similar subjects, you must be sensible that my sentiments and those which you now express are very different. But you know my natural freedom, and that it is not only consistent with, but arises from, my sincere friendship; and therefore I know you will excuse it. My notions on the subjects of your essay were always what are called old-fashioned; and I used to flatter myself that yours were nearly the same with mine: but I, whose religious sentiments have undergone what you call a total revolution, cannot be offended at another person on account of any change of a like nature. Sometimes people's sentiments and views of things of this nature change, in consequence of coming more into the world; but I do not find that this is the case with myself. I now see pretty much of what is called high life. If there be any such thing in this country, I may say that I live in it: but still my ideas with respect to devotion, "sects, and establishments," are just what they were before: and, I am sorry to say it, in almost every respect the very reverse of those in your essay. And really, Mrs. Barbauld, all my more serious and judicious acquaintance, who are among your best friends, are, without exception, of the same opinion, and declared themselves to be so without having had any communication with one another upon the subject. To discuss all the articles of your essay would be too much for a letter; but I shall just hint at what I think to be the most exceptionable in it.

"I cannot help considering the very title of your essay, viz., 'On the Devotional Taste,' to be a debasing of the subject. Agreeably to this you say, that devotion is 'an affair of sentiment and feeling, and has its source in that relish for the sublime, the vast, and the beautiful, by which we taste the charms of poetry, and other compositions that address our finer feelings.' You also say, that 'those who want this taste want a sense, a part of their nature.' Now if this be the case, all endeavours to acquire it must be in vain. But then, being a thing so vague and so rare as taste in works of genius, it may be thought that the want of it is not much to be regretted; for though, like other refined tastes, it might add to the elegant enjoyments of life, we may do very well without it. This may not be a strictly logical inference from your maxim, but it is an inference that will naturally be drawn from it, and is not far from being just. On the other hand, to consider devotion not

as an affair of taste, but, as it certainly is, an elevated passion or affection, adapted to a proper object, is not liable to any just objection. Whereas your placing it on the same footing with the taste 'for the fine arts,' has led you to treat of it in such a manner that it appears to some of my most judicious acquaintance that the tendency of your essay is in reality the very reverse of the professed object of it; for that, instead of promoting the true 'spirit of devotion,' it will contribute to damp it.

"Many serious persons are more especially offended, and I think justly, at your comparing devotion to the passion of love, thinking it to be a profanation of the subject; as when you compare the conduct of a devout person with that of one 'who loved with ardour and delicacy,' with respect to his mentioning 'the name of his mistress amongst mixed companies,' and especially when you say 'you can hardly address the greatest of all beings in a strain of more profound adoration than the lover uses to the object of his attachment.' Now if there be any persons who apply the language of 'profound adoration' to a human being, I consider it as a most abominable practice, as nothing less than direct impiety, and that the crime is the same in the person who hears such language, as in the person who uses it. As there is an infinite difference in the object of our attachment in these two cases, certainly both our feelings, and the expression of our feelings, ought to be very different, so as hardly to bear the most remote comparison. A much more proper comparison in this case would be that mixture of love and reverence that a child bears towards his parent.

"Your notion, that 'philosophy is unfavourable to piety,' I think altogether ill-founded, if by philosophy you mean true philosophy, founded on the most just and exalted conceptions of the Divine Being and his providence that we can attain to. For surely the more raised are our conceptions of God, the deeper will be our sense of humility and reverence, the more entire will be our confidence in his care and goodness, and the more unreserved our resignation to his will; and these are the sentiments that are the basis, I may say the essence, of true devotion. The firm belief of a providence, with respect to which nothing is either too great or too small, that every degree of happiness, and every measure of affliction, are appointed by the same wise and kind over-ruling power, cannot impress the mind in a manner unfavourable to the most lively feelings of gratitude, confidence, and joy. To have the mind habitually impressed with these sentiments, is to set God always before us, and to live as 'seeing him who is invisible.' It is this that raises the mind above the world, and keeps it fixed, 'stayed on God,' in all the varieties of prosperity and adversity, and enables us to 'rejoice evermore.' It is this that gives us a solid satisfaction in doing and bearing the will of God, as such, here below, and that fills the mind with 'joy unspeakable and full of glory,' in the prospect of death and a future life. Such language as this is equally that of the Scriptures, and that of the strictest philosophy, of which you say, that it 'must ever be cold and dry.' If you mean a spurious and false philosophy you should have specified it. At present, it will naturally be concluded, from what you say on the subject, that you have adopted the maxim ascribed to the papists, viz. that 'ignorance is the mother of devotion;' and what you say of establishments

in general, will be thought to favour that construction of your meaning. Indeed, I am much surprised that you should give so evident a preference to establishments, above every thing that comes under the denomination of a sect, and especially that you should say, that 'an establishment will preserve devotion from ever sinking into contempt.' I am persuaded you would not have used this language if you had seen what I lately saw upon the continent, where every thing relating to devotion is more absurd and contemptible than can well be expressed; and what you see of an establishment here is, in fact, no more than a sect, and has nothing of the venerable appearance of its mother church.

"It appears to me that the devotion of the church of Rome, and even, in a great measure, that of the church of England, as partaking of the same spirit, is so far from answering the most useful purposes of devotion, viz. that of being a security for the practice of virtue, that it is too often the substitute for the most substantial part of virtue, and in general has little or no connexion with the duties of social life. The feelings that are inspired by solemn processions, pictures, images, music, &c., are very improperly called devotion. What you say of establishments in general, that 'they affect the mind by splendid buildings, music, the mysterious pomp of ancient ceremonies, the sacredness of peculiar orders, habits, and titles,' &c., only applies to some establishments, and does not belong to them as such. There is nothing of this pomp in the Scotch establishment, which is as meagre in these respects as almost any sect, except that of the Quakers; and on the other hand, the Moravians, who never were any thing but a sect, make more use of music, pomp, and ceremony, than the church of England. You call establishments 'the womb and the grave' of sects; but though this is very prettily said, it is by no means true in fact. You expressly consider Christianity as a sect, and so did the apostle Paul himself. Mahometanism is also a sect, and the whole of the reformed religion is a sect; but none of these sects have yet sunk into the establishments from which they sprung. It depends entirely upon other circumstances than its being a sect, whether any separate mode of religion keeps its ground, and continues along with the establishment, whether it sinks into it, or whether it overturns the establishment; and there are instances in history of all these events.

"You say 'there is nothing more prejudicial to the feelings of a devout heart than a habit of disputing on religious subjects.' Now I am clearly of opinion that the contrary is universally true, and that it may be evinced both from the nature of the thing and from fact. No person can have practical religion much at heart, who has not a value for religious truth (which, indeed, is the necessary foundation of all religious practice); and if he really values it, he will, if occasion requires, contend for it, and with more or less earnestness, in proportion to its apprehended importance. Did not our Saviour dispute much, St Paul more, the primitive Christians without ceasing, the first reformers and the Puritans the same? If you only look into their writings you will find them to be, in general, half controversial and half practical, or devotional; as may be exemplified by the writings of Luther, Calvin, Owen, Howe, Baxter, &c. And who were more distinguished for their piety than Socinus and Biddle, whose writings are entirely con-

troversial? If I look among my own acquaintance I see all the reason in the world to conclude that those who are indifferent to religious truth have the least regard to religion under any description of it, and that they have the least of a devotional spirit. My own evidence, if that might be allowed to have any weight (and few persons now living have had more to do with religious controversy than myself), would decide clearly against you. It is, I am confident, the same fervour of mind, partly perhaps natural, and partly improved by education, that produces, I hope, in some measure, both those effects which you deem to be absolutely incompatible.

"Lastly, I would observe that common opinion, which, in this case, may be allowed to have some foundation, is entirely contrary to this maxim of yours. For the orthodox dissenters are always supposed to be the most pious and devout of us all, and yet it is notorious that they are the most disputatious of all dissenters. I therefore think that the direct reverse of your maxim is universally and necessarily true.

"I am exceedingly concerned to have occasion to say any thing to Mrs. Barbauld, whom I always have esteemed, and always shall esteem so much, that may give her pain; but I shall be greatly deceived if you do not think it well meant, and, believing it well meant, if you be displeased with me. To balance my opinion you have secured the applause of the high clergy (as I know in several instances), of the decent part of the polite world in general, and of those dissenters in particular who wish to have their defection from us made easier to them than it would otherwise have been. On this account I cannot help wishing that you had, at least, qualified what you have said on these subjects, with some intimation of the stress, which I am sure you cannot but lay, on religious truth and the rights of conscience; for, because you have said nothing about them when a tolerably fair opportunity presented, many will conclude, though unjustly, that you have little regard for them. I cannot say but that it gives me, as well as many others, much concern, that with respect to the important subjects of your essay, a person of your acknowledged genius, and a dissenter, should have given so much countenance to a turn of thinking which is very seducing, and, I think, very alarming and dangerous. It is the way to which the world and the temper of the times leads, and this so strongly, that all we can write, say, or do, is ineffectual to counteract it, except with a very few persons, in comparison, but whose judgments are, in my opinion, more solid, and whose minds are of a firmer, or, as you, perhaps, would say, of a harsher texture, more rigid, obstinate, and uncomplying. But though you and I, Mrs. Barbauld, take different roads, I shall always think that you act from the best principles, and write with the best intentions. Our difference of opinion and conduct, therefore, is merely a subject of regret, without the least shade of blame. If, upon reflection, you should think there may be something of weight in any of these remarks, I could wish that, for the sake of many serious persons who esteem and love you, and who are exceedingly hurt by your late publication, you would, in a second edition, qualify some of the expressions, as far as regard to your real persuasion will admit.

"I am, dear Mrs. Barbauld, yours very sincerely."

Having thus traced Dr. Priestley through the most interesting portion of his life by the aid of the un-

adorned biographical sketch written by himself, and published by that amiable philanthropist, Mr. Rutt, we must now proceed, briefly, to follow him through the remainder of his chequered course. Dr. Priestley's "Familiar Letter to the Inhabitants of Birmingham" was written in support of the claims of the dissenters for a repeal of the test act. The era of the French revolution added to the too frequent animosity of theological dispute, so that on the celebration of the anniversary of the capture of the Bastille a mob assembled at Birmingham; and, although Dr. Priestley was not present, proceeded to his house, which, with his library, manuscripts, and apparatus, fell a prey to the flames. The outrage was countenanced by too many exercising both lay and clerical influence, and the legal compensation which he obtained fell considerably short of his real losses. On quitting Birmingham he was chosen to succeed his friend, Dr. Price, at Hackney, where he remained some time in the cultivation of his scientific pursuits, until, finally, he was goaded by party enmity to seek an asylum in the United States of America, which he reached in 1794, and took up his residence at Northumberland, in Pennsylvania. In America he dedicated his whole time to his accustomed pursuits, until a severe illness laid the foundation of a debility in his digestive organs; and a gradual decay followed, which terminated his existence, February 6th, 1804, in his seventy-first year.

Dr. Priestley was an ardent controversialist, chiefly in consequence of extreme simplicity and openness of character, but no man felt less animosity towards his opponents than he did; and many who entertained the strongest antipathy to his opinions were converted into friends by his gentleness and urbanity in personal intercourse. As a man of science he stands high in the walk of invention and discovery; and to no one has pneumatic chemistry been so much indebted. As a metaphysician his elucidation of Hartley's theory of association, his works upon philosophical necessity, and upon materialism, will always ensure attention. As a theologian Dr. Priestley, who followed his convictions wherever they led him, passed through all the changes from Calvinism to a Unitarian system, in some measure his own; but, to the last, remained a zealous opposer of absolute infidelity. Of his theological and controversial productions those most generally esteemed are his "Institutes of Natural and Revealed Religion," and "Letters to a Philosophical Unbeliever." He also wrote many works of practical divinity.

PRINCE, JOHN, an English writer and divine, who was born in 1643 at Axminster, in Devonshire, and studied at Brasenose college, Oxford, where he took his degree of B. A. in 1664. After entering holy orders he received several church preferments: the last of them was Berry-Pomeroy. He died there in 1723. His principal work is entitled "Dammion Orientales Illustres; or, The Worthies of Devon."

PRINGLE, SIR JOHN, an eminent physician and natural philosopher, who was born on the 10th of April, 1707, in the county of Roxburgh, Scotland. He was educated at the university of St. Andrew's, from which he was removed to Edinburgh for the purpose of studying medical science. He remained in the Scottish metropolis only one year, as he was desirous of going to Leyden for further improvement, as that city then enjoyed the reputation of being the best medical school in Europe. While there

he became the pupil of the celebrated Boerhaave, and took his degree of M. D. in July 1730. On his return home he settled as a physician at Edinburgh; shortly after which he was appointed joint professor of pneumatics and moral philosophy with Mr. Scott, during that gentleman's life, and sole professor after his decease; and in consequence of this appointment Dr. Pringle was admitted, on the same day, a member of the university. In discharging the duties of this new employment, his text-book was "*Puffendorff de Officio Hominis et Civis*," agreeably to the method he pursued through life, of making fact and experiment the basis of science. Dr. Pringle continued in the practice of medicine at Edinburgh, and in performing the obligations of his professorship till 1742, when he was appointed physician to the earl of Stair, who then commanded the British army. By the interest of this nobleman Dr. Pringle was constituted physician to the military hospital in Flanders. The attention which Dr. Pringle paid to his duty as an army physician is apparent from his "*Treatise on the Diseases of the Army*." One thing, however, deserves particularly to be mentioned, as it is highly probable that it was owing to his suggestion that a considerable improvement was made in the hospital. It had hitherto been usual, for the security of the sick, when the enemy was near, to remove them a great way from the camp; the consequence of which was, that many were lost before they came under the care of the physicians. The earl of Stair proposed to the duke de Noailles, when the army was encamped at Aschaffenburg in 1743, that the hospitals on both sides should be considered as sanctuaries for the sick, and mutually protected. The French general, who was distinguished for his humanity, readily agreed to the proposal, and took the first opportunity of showing a proper regard to his engagement. Soon after this Dr. Pringle met with no small affliction in the retirement of his great friend, the earl of Stair, from the army. He offered to resign with his noble patron, but was not permitted. But though Dr. Pringle was thus deprived of the immediate protection of his patron, his conduct in the duties of his station procured him effectual support. He attended the army in Flanders through the campaign of 1744, and so powerfully recommended himself to the duke of Cumberland, that in the spring following he had a commission from his royal highness, appointing him physician-general to his majesty's forces in the Low Countries; and on the next day he received a second commission from the duke, by which he was constituted physician to the royal hospitals in the same countries: on which he resigned his professorship in consequence of these promotions. In 1745 he was with the army in Flanders, but was recalled from that country in the latter end of the year to attend the forces which were to be sent against the rebels in Scotland. At this time he was chosen fellow of the royal society. Dr. Pringle at the beginning of 1746, in his official capacity, accompanied the duke of Cumberland in his expedition against the rebels, and remained with the forces after the battle of Culloden, till their return to England in the middle of August. In 1747 and 1748 he again attended the army abroad; and in the autumn of 1748 he embarked with the forces for England, upon the conclusion of the treaty of Aix-la-Chapelle. From that time he principally resided in London. In April 1749 Dr. Pringle was appointed physician in ordinary to

his royal highness the duke of Cumberland; and in 1750 he published "*Observations on the Gaol or Hospital Fever*." In the same year Dr. Pringle communicated to the royal society his celebrated "*Experiments upon Septic and Antiseptic Substances, with Remarks relating to their Use in the Theory of Medicine*." These experiments, which comprehended several papers, were read at different meetings of the society. Only the three first numbers were printed in "*The Philosophical Transactions*," as Dr. Pringle had subjoined the whole appendix to his "*Observations on the Diseases of the Army*." In February 1753 he presented to the royal society "*An Account of Several Persons seized with the Gaol Fever by working in Newgate; and of the manner by which the Infection was communicated to one entire family*." Dr. Pringle's next communication was, "*A Remarkable Case of Fragility, Flexibility, and Dissolution of the Bones*." It would be extraneous to enumerate the various papers which, both before and after he became president of the royal society, were transmitted through his hands. Besides his communications in "*The Philosophical Transactions*," he wrote in the "*Edinburgh Medical Essays*," volume the fifth, "*An Account of the Success of the Vitrum Ceratum Antimonii*." About 1750 Dr. Pringle published the first edition of his "*Observations on the Diseases of the Army*." It was reprinted in the year following with some additions. To the third edition, which was much improved from the further experience the author had gained by attending the camps for three seasons in England, an appendix was annexed, in answer to some remarks that Professor De Haen, of Vienna, and M. Gaber, of Turin, had made on the work. A similar attention was paid to the improvement of the treatise in every subsequent edition. Scarcely any medical writer has mentioned it without some tribute of applause. Ludwig, in the second volume of his "*Commentarii de Rebus in Scientia Naturali et Medicina gestis*," speaks of it highly; and gives an account of it, which comprehends sixteen pages, as did also the celebrated Baron Haller in his "*Bibliotheca Anatomica*." It is allowed to be a classical book in the physical line, and has placed the writer of it in a rank with the celebrated Sydenham. The reputation that Dr. Pringle gained by his "*Observations on the Diseases of the Army*," was very great: the utility of it, however, was of still greater importance than its reputation. From the time that he was appointed a physician to the army, it seems to have been his grand object to lessen, as far as lay in his power, the calamities of war; nor was he without considerable success in his benevolent design. By the instructions received from this book the late General Melville, who united with his military abilities the spirit of philosophy and humanity, was enabled, when governor of the Neutral Islands, to be singularly useful. By taking care to have his men always lodged in large, open, and airy apartments, and by never letting his forces remain long enough in swampy places to be injured by the noxious air of such places, the general was the happy instrument of saving the lives of several hundred soldiers. In 1753 Dr. Pringle was chosen one of the council of the royal society. Though he had not for some years been called abroad, he still held his place of physician to the army; and in the war that began in 1755, attended the camps in England during three seasons. This enabled him, from further experience,

to correct some of his former observations, and to give additional perfection to the third edition of his great work. In 1758 he entirely quitted the service of the army; and being now determined to reside entirely in London, he was admitted a licentiate of the college of physicians in the same year. After the accession of George III. to the throne, Dr. Pringle was appointed physician to the queen's household; and this honour was succeeded by his being constituted, in 1763, physician extraordinary to her majesty. In April in the same year he had been chosen a member of the academy of sciences at Haarlem; and in June following he was elected a fellow of the royal college of physicians, London. In the succeeding November he was returned, on the ballot, a second time, one of the council of the royal society, and in 1764, on the decease of Dr. Wollaston, he was made physician in ordinary to the queen. In 1766 he was elected a foreign member, in physical science, of the royal society of sciences at Gottingen; and on the 5th of June in that year his majesty raised him to the dignity of a baronet of Great Britain. In July 1768 Sir John Pringle was appointed physician in ordinary to her royal highness the princess dowager of Wales, to which office a salary was annexed of 100*l.* a-year. In 1770 he was chosen a third time into the council of the royal society, and on the 30th of November, 1772, he was chosen president of that learned body. Ill health induced him to resign that office in 1778, and three years after he left London to settle at Edinburgh, where he died on the 18th of January, 1782.

PRINTZ, WOLFGANG CASPAR, a musical composer who was born in the Upper Palatinate of Hungary in 1664. His father was a magistrate and a receiver of the public revenues there, till on account of his religion he quitted his station and removed to Vohenstraus, a small town in the territory of Furstenburg. Young Printz very early in life displayed a strong taste for music, and was instructed in the principles of composition, and the practice of the harpsichord, violin, and other instruments; after which he was admitted a student in the university at Altdorff, where he continued three years; and from thence he was taken into the service of Count Promnitz, at Dresden, as director of his music and court-organist. With this nobleman he travelled through Silesia, Moravia, and Austria. On the decease of the count, Printz was invited to the office of chanter in the church of a town named Triebel, where he married; but after a year's continuance in that employment, being called to the same office in the church at Sarau, in Upper Saxony, he entered upon it in the year 1665.

Some years afterwards he was appointed to the direction of the choir in the same church; and, as it is supposed, continued in that station until the time of his death, which took place in the year 1717.

His works are numerous. Among them there is a history of vocal and instrumental music, which was published at Dresden in the year 1690, with the title of "*Historische Beschreibung der edelen Sing und Klingkunst.*" This is written in chronological order, and the author begins it with an account of the invention of the harp by Jubal. He has delineated the Hebrew instruments chiefly from the authority of Joannes Schutterus, the author of "*Collectanea Philologica.*" The Grecian and Hebrew music are treated at some length, and the history is continued through

all the later writers to his own time, concluding with an account of himself and his studies.

PRIOR, MATTHEW.—This talented English poet was born in London in 1664, and was brought up by his uncle, who kept a tavern at Charing Cross. He was sent to Westminster school by his relatives, and while there displayed so strong a love for classical literature as to attract the attention of the earl of Dorset, who sent him to St. John's college, Cambridge, where he was ultimately chosen fellow. At college he contracted an intimacy with Charles Montagu, afterwards earl of Halifax, in concert with whom, in 1688, he composed "*The Country Mouse and City Mouse,*" a parody on Dryden's "*Hind and Panther.*" In 1690 he was introduced at court by the earl of Dorset, at whose recommendation he was appointed secretary to the English plenipotentiaries at the Hague. With this post he also held the title of gentleman of the king's bed-chamber; and he presented an ode to King William in 1695 on the death of Queen Mary, and soon after displayed his humorous vein in a parody of Boileau's ode on the taking of Namur, when it was recaptured by William. In 1697 he was nominated secretary to the commissioners for the treaty of Ryswick, and on his return from that employment was made secretary to the lord-lieutenant of Ireland. He was afterwards secretary to the earls of Portland and Jersey, successively ambassadors to France. At length he was made under-secretary of state, and while holding that office was sent to France to assist in the partition treaty. In 1701 he succeeded Locke as a commissioner at the board of trade, but soon after deserted the Whigs and joined the Tories, for which no satisfactory reasons have been assigned.

At the beginning of the reign of Anne he published a volume of poems, and took some share in "*The Examiner.*" When the Tories again obtained the ascendancy, he was employed in secretly negotiating at Paris the terms of the treaty of Utrecht. He remained in France with the appointment of ambassador, and after the departure of the duke of Shrewsbury in 1713, publicly assumed that character. On the accession of George I. he was recalled, and examined before the privy council in respect to his share in negotiating the treaty of Utrecht, and treated with great rigour for some time, although ultimately discharged without trial. Being without any provision for his declining years except his fellowship, he again applied himself to poetry; and having finished his "*Solomon,*" he published his poems by subscription. The publication, being liberally encouraged by party zeal, produced a considerable sum, which was doubled by the earl of Oxford, at whose seat the author died, after a lingering illness, in 1721, in the fifty-eighth year of his age, and was buried in Westminster Abbey, under a monument, for which "*last piece of human vanity*" as he styles it in his will, he left the sum of 500*l.* Prior seems to have made his way by wit and social qualities, rather than by moral or political endowments of a superior order. As a poet, his reputation has much declined, the humour in which he principally excels being overlooked on account of the character of his serious performances, which although, as in his "*Solomon,*" and "*Henry and Emma,*" splendid and correct in diction, harmonious in versification, and copious in poetical imagery, fail in moving either the feelings or the fancy. The great art of Prior consists in telling

a story with a degree of poetical ease and vivacity, which, perhaps, setting aside La Fontaine, has never been excelled. His "Alma," a piece of philosophical pleasantry, exhibits a felicitous vein of humour, and for his lighter pieces he is now chiefly read. A history of his own times, compiled from his MSS., contains little from his pen, and is of small value. His poems were published in 1733, in three volumes, 8vo., and are also in all the collections.

**PROCOPIUS**, of Cæsarea, a Greek historian, who was a native of Cæsarea. He filled the offices of imperial counsellor of Anastasius, also of Justin and Justinian, and secretary to Belisarius, whom he attended in his expeditions, of which he wrote the history; and a senator and prefect of Constantinople, where he is supposed to have died about 560. His works are, a history of his own times in eight books, the first two relating to the Persian war, the two following to the wars with the Vandals, and the remaining four to the Gothic war; and a "History of the Edifices Built or Repaired by Justinian." A kind of scandalous chronicle of the court of Justinian, including a most degrading account of the personal history of the emperor, the empress Theodora, and many other individuals, and entitled "Anecdota," has been attributed to him by some writers.

**PROCRUSTES**, a celebrated robber of Attica, who had two bedsteads, one short and the other long. The monster placed his short guests in the long bed, and then, under pretence of fitting the bed to the occupant, stretched the latter till he died. If his guest was tall, Procrustes placed him in the short bed, and reduced him to the proper dimensions by cutting and clipping. He was finally served as he had served others.

**PRONY, GASPARD CLAIR FRANCOIS MARIE RICHE DE**, a French geometrician and mechanical philosopher, who was a member of the academy of sciences and of the legion of honour, and for some time professor in the polytechnic school, and first engineer of roads and bridges. He was the author of many valuable works. Among them are the "Nouvelle Architecture Hydraulique," "Recherches Physico-Mathématiques sur la Théorie des Eaux courantes," "Leçons de Mécanique," &c.

**PROPERTIUS, SEXTUS AURELIUS**, a Latin elegiac poet, who was born at Mevania, in Umbria. He was the son of a Roman knight who had been banished by Augustus on account of his attachment to Antony. He did not possess the natural ease and grace of Ovid and Tibullus, but is distinguished for his art and ingenuity and the brilliancy of his style. He is particularly happy in his descriptions of heroic scenes. We have four books of his elegies, the last of the fourth book is the most highly esteemed, and is often called the "queen of elegies;" yet it is not wholly free from the usual fault of the author, a straining after originality of expression. Love is the subject of many of his elegies, but not a noble spiritual love, which, indeed, we must not look for in any Roman poet of that age, although all were not so entirely abandoned as Propertius to licentious descriptions. There are also in the fourth book several poems, which although written in the elegiac measure, yet from their subjects belong to the class of didactic and narrative poems. He makes a display of his learning when he handles subjects of mythology, and therefore affects our feelings less. In general he imitates the Grecian elegiac poets, particularly Cal-

limachus the Alexandrian. We know nothing more of his life than that after the end of the civil war he found a patron at Rome in Mæcenas, through whom he obtained the favour of the emperor. He appears to have been the bosom friend of Ovid, to have lived mostly in Rome in the enjoyments of love and poetry, and to have died there in the prime of life about 12 B. C. The elegies of Propertius are usually published with the poems of Tibullus and Catullus.

**PROTA, IGNASIO**, a celebrated musician, who was born at Naples in 1699, and distinguished both as a teacher and composer. Prota first studied in the conservatory Dei Poveri di Gesu Cristo, and afterwards in that of La Pieta, under Alessandro Scarlatti; but from the rank of a pupil he soon rose to that of a master, and was named director of the latter of these establishments. Prota is amongst the last of those whose time was chiefly absorbed by instruction. We know of none of his compositions; but as his reputation is somewhat extended, it is probable that it is due both to his labours as a composer and a professor. His style is asserted to have been full of truth and expression.

**PROTOGENES**, a Greek painter contemporary with Apelles, according to some born in Rhodes, according to others in Caria. Several masterpieces of his are mentioned, particularly a picture of Jalyus, who is said to have been the founder of the city of Rhodes. In this picture a hound was represented panting, and with froth on his mouth. Pliny relates that for a long time the painter was unable to satisfy himself in the execution of the froth, but that at last, in a fit of anger, he threw the sponge, with which he used to wipe off the colours, on the painting, and thus accidentally produced a natural representation of it. This picture saved the city of Rhodes when it was besieged by Demetrius. In the time of Cicero it was still in that city, but Cassius carried it to Rome, and placed it in the temple of Peace, in which it was burnt during the reign of Commodus.

**PRYNNE, WILLIAM**, a learned lawyer and antiquary, who was born at Swanswick, in Somersetshire, in 1600, and was placed at Oriel college, Oxford, where he was graduated bachelor of arts in 1620. He then removed to Lincoln's Inn to study the law, and received several offices in that inn. His attendance upon the lectures of Dr. Preston, a distinguished puritan, strongly attached him to that sect, and he began to write as early as 1627, attacking the drinking of healths, love-locks, popery, and Arminianism, which he deemed the enormities of the age. In 1632 he published his work against theatrical exhibitions, entitled "Histrio-Mastix," which, although licensed by Archbishop Abbot's chaplain, yet, in consequence of some reflections upon female actors, that were construed to be levelled at the queen, who had acted in a pastoral before the publication of the work, brought a persecution upon the author in the star-chamber, which condemned him to a fine of 5000*l.*, to be expelled the university of Oxford and Lincoln's Inn, to be degraded from his profession of the law, to stand twice in the pillory, losing an ear each time, and to remain a prisoner for life. Prynne continued writing against prelacy in prison, until, for a virulent piece entitled "News from Ipswich," he was again sentenced by the star-chamber to a fine of 5000*l.*, to lose the remainder of his ears in the pillory, and to be branded in each

cheek with the letters S. L., seditious libeller. This sentence was also executed, and he was removed for imprisonment to Caernarvon castle, and afterwards to the island of Jersey. His spirit was not, however, to be subdued, and he continued to write until the meeting of parliament in 1640, when, being chosen representative for Newport in Cornwall, the house of commons issued an order for his release. He entered London with other sufferers in triumphant procession, and petitioned the commons for damages against his prosecutors. On the impeachment of Laud he was employed as chief manager of the prosecution, and when the parliament became victorious, was appointed one of the visitors to the university of Oxford, where he laboured strenuously to advance the cause of presbyterianism. He warmly opposed the independents when they acquired ascendancy, and used all his influence to produce an accommodation with the king, being one of the members who were excluded and imprisoned on that account. With the other excluded members he resumed his seat in 1659, and displayed so much zeal for the restoration that General Monk was obliged to check his impetuosity. He sat in the healing parliament as member for Bath, and on the restoration was appointed to the office of chief keeper of the records in the Tower. He occupied his later years in writings connected with his office in the Tower, and finished his life at his chambers in Lincoln's Inn in 1669. Prynne was a man of extensive learning and indefatigable industry, but wanted genius and judgment.

**PSALMANAZAR, GEORGE.**—This was the assumed name of a man of letters, who is chiefly known as a literary impostor. He was born of catholic parents in the south of France in 1679, and his mother, on being abandoned by her husband, sent her son to a school kept by Franciscan friars, and he was afterwards placed in a college of Jesuits. He then studied among the Dominicans, and, having finished his education, acted as a private tutor. Leaving his situation he engaged in several adventures; and at length, having stolen from a church where it had been dedicated, the habit of a pilgrim, he roved about in that character, subsisting on charity. He afterwards became a common vagrant, and then servant to the keeper of a tavern, whose house he left clandestinely, and renewing his wandering mode of life, he conceived the project of professing himself to be a Japanese convert to Christianity who had found his way to Europe. As he did not find this scheme very profitable he adopted the character of a heathen native of the island of Formosa, and in order to support his pretensions he contrived a new language, which he called the Formosan. At this time he became acquainted with a clergyman named Innes, who, conceiving he could turn the imposture to good account, persuaded the pretended Formosan to suffer himself to be converted to the church of England; and the clergyman and his new disciple went to London, where the latter was presented to Bishop Compton and others, and the former was rewarded for his zeal with church preferment. Psalmanazar had the effrontery to translate the "Church Catechism" into his newly-invented Formosan language, and he published "A History of Formosa." This work appeared in 1704, and passed through several editions. In the meantime he was sent to study at Oxford; and a controversy was carried on between his patrons and Dr. Halley, Dr. Mead, and

some other less credulous persons, who refused to admit his pretensions. The imposture at length became clearly manifest; and the culprit, deserted by those whom he had deceived, was obliged to rely on the exercise of his literary abilities for his support. He settled in London, where he resided many years, and was employed by the booksellers, particularly in the former part of the "Universal History," published in 1747. Towards the close of his life he drew up an autobiographical memoir, in which he expresses much contrition for the deceptions which he had allowed himself to practise. His death took place in 1763.

**PTOLEMY, CLAUDIUS.**—This celebrated geographer was born in Egypt, and commenced a series of observations about 120 A. D., which he ended only with his life, the exact duration of which is not known. Science is greatly indebted to this distinguished Egyptian, who has preserved and transmitted to us the observations and principal discoveries of the ancients, and at the same time augmented and enriched them with his own. He corrected Hipparchus's catalogue of the fixed stars, and formed tables by which the motions of the sun, moon, and planets might be calculated and regulated. He was indeed the first who collected the scattered and detached observations of the ancients, and digested them into a system. Ptolemy's "Geography" is also a very important work, and indeed the one by which he is best known. The Greek text was first published by itself at Basil in 1533, and afterwards, with a Latin version and notes, by Gerard Mercator at Amsterdam in 1605, which last edition was reprinted at the same place in 1618, folio, with geographical tables by Bertius.

There are other works of Ptolemy, though less considerable than these two, still extant; but the only one we need notice is entitled "Elementorum Harmonicorum Libri Tres," published in Greek and Latin, with a commentary by Porphyry the philosopher, by Dr. Wallis at Oxford in 1692, and afterwards reprinted there, and inserted in Wallis's works in 1699. Of this work Dr. Burney says, that "Ptolemy ranks as high amongst the great writers of antiquity for his 'Harmonics, or Theory of Sound,' as for his 'Almagestum' and 'Geography.'"

**PTOLEMY.**—The name of a long line of distinguished Egyptian monarchs. One of the most celebrated, and indeed the founder of the family, was a son of Philip of Macedonia and Arsinoe. He was educated in the court of the king of Macedonia, and became one of the friends and associates of Alexander, and when that monarch invaded Asia, the son of Arsinoe attended him as one of his generals. During the expedition he acted with great valour, and killed one of the Indian monarchs in single combat, and it was to his prudence and courage that Alexander was indebted for the reduction of the rock Aornus. After the conqueror's death, in the general division of the Macedonian empire Ptolemy obtained as his share the government of Egypt, with Lybia, and part of the neighbouring territories of Arabia. In this appointment the governor soon gained the esteem of the people by acts of kindness, benevolence, and clemency, and though he did not assume the title of independent monarch till nineteen years after, yet he was so firmly established that the attempts of Perdiccas to drive him away from his possession proved abortive; and Ptolemy, after the murder of

his rival by Grecian soldiers, might have added the kingdom of Macedonia to his Egyptian territories. He made himself master of Cœlosyria, Phœnicia, and the neighbouring coast of Syria, and when he had reduced Jerusalem he carried above 100,000 prisoners to Egypt to people the extensive city of Alexandria, which became the capital of his dominions.

After he had rendered these prisoners the most attached and faithful of his subjects by his liberality and the grant of privileges, Ptolemy assumed the title of king of Egypt, and soon after reduced Cyprus under his power. He made war with success against Demetrius and Antigonus, who disputed his right to the provinces of Syria; and from the assistance he gave to the people of Rhodes against their common enemies he received the name of Soter. While he extended his dominions Ptolemy was not negligent of the advantages of his people. The bay of Alexandria being dangerous of access, he built a tower to conduct the sailors in the obscurity of the night, and that his subjects might be acquainted with literature he laid the foundation of a library, which under the succeeding reigns became the most celebrated in the world. He also established in the capital of his dominions a society called Musœum, of which the members, maintained at the public expence, were employed in philosophical researches, and in the advancement of science and the liberal arts. Ptolemy died in the eighty-fourth year of his age, after a reign of thirty-nine years. He was succeeded by his son Ptolemy Philadelphus, who had been his partner on the throne the last ten years of his reign. Ptolemy Soter has been commended for his abilities, not only as a sovereign, but as a writer, and among the many valuable compositions which have been lost we are to lament an history of Alexander the Great, by the king of Egypt.

The son of Ptolemy the First succeeded his father on the Egyptian throne, and was called Philadelphus because he killed two of his brothers. He showed himself worthy in every respect to succeed his father, and conscious of the advantages which arise from an alliance with powerful nations, he sent ambassadors to Italy to solicit the friendship of the Romans, whose name and military reputation had become universally known. His ambassadors were received with marks

of great distinction, and immediately after four Roman senators came to Alexandria, where they gained the admiration of the monarch, and of his subjects, by refusing the crowns of gold and rich presents which were offered to them. But while Ptolemy strengthened himself by alliances with foreign powers, the internal peace of his kingdom was disturbed by the revolt of Magas his brother, king of Cyrene. The sedition, however, was stopped, though kindled by Antiochus, king of Syria, and the death of the rebellious prince re-established peace for some time in the family of Philadelphus. Antiochus, the Syrian king, married Berenice, the daughter of Ptolemy, and the father, though old and infirm, conducted his daughter to her husband's kingdom, and assisted at the nuptials. Philadelphus died in the sixty-fourth year of his age, 246 years before the Christian era. He left two sons and a daughter by Arsinoe, the daughter of Lysimachus. During the whole of his reign Philadelphus was employed in promoting industry, and in encouraging the liberal arts and useful knowledge among his subjects. He gave every possible encouragement to commerce, and by keeping two powerful fleets, one in the Mediterranean, and the other in the Red Sea, he made Egypt the mart of the world. With justice, therefore, he has been called the richest of all the princes and monarchs of his age, and indeed the remark is not false when it is observed, that at his death he left in his treasury 750,000 Egyptian talents, a sum equivalent to 200,000,000 sterling. His palace was the asylum of learned men, and by increasing the library which his father had founded, he showed his taste for learning and his wish to encourage genius. This celebrated library at his death contained 200,000 volumes of the best and choicest books, and it was afterwards increased to 700,000 volumes. Part of it was burnt by the flames of Cæsar's fleet when he set it on fire to save himself; a circumstance, however, not mentioned by the general, and the whole was again magnificently repaired by Cleopatra, who added to the Egyptian library that of the kings of Pergamus. It is said that the Old Testament was translated into Greek during his reign.

The third Ptolemy succeeded his father Philadelphus on the Egyptian throne. He early engaged in a war against Antiochus Theus for his unkindness to Berenice, the Egyptian king's sister, whom he had married with the consent of Philadelphus. With the most rapid success he conquered Syria and Cilicia, and advanced as far as the Tigris, but a sedition at home stopped his progress, and he returned to Egypt loaded with the spoils of conquered nations. Among the immense riches which he brought he had a great number of statues of the Egyptian gods, which Cambyses had carried away into Persia when he conquered Egypt. The last years of Ptolemy's reign were passed in peace, if we except the refusal of the Jews to pay the tribute of silver talents which their ancestors had always paid to the Egyptian monarchs. He also interested himself in the affairs of Greece, and assisted Cleomenes, the Spartan king, against the leaders of the Achæan league; but he had the mortification to see his ally defeated, and even a fugitive in Egypt. He died 221 years before Christ, after a reign of twenty-five years, and, like his two illustrious predecessors, he was the patron of learning, and gained great popularity among his subjects by clemency, moderation, and humanity.

Ptolemy the Fourth succeeded his father on the throne of Egypt, and received the surname of Philopater, because, according to some historians, he destroyed his father by poison. He began his reign with acts of the greatest cruelty, and he successively sacrificed to his avarice his own mother, his wife, his sister, and his brother. He received the name of Tiphon from his extravagance and debauchery, and that of Gallus because he appeared in the streets of Alexandria like one of the bacchanals, and with all the gestures of the priests of Cybele. In the midst of his pleasures Philopater was called to war against Antiochus king of Syria, and at the head of a powerful army he soon invaded his enemy's territories, and might have added the kingdom of Syria to Egypt, if he had made a prudent use of the victories which attended his arms. In the latter part of his reign the Romans, whom a dangerous war with Carthage had weakened, but at the same time roused to superior activity, renewed, for political reasons, the treaty of alliance which had been made with the Egyptian monarchs. Philopater at last, weakened and enervated by intemperance, died in the thirty-seventh year of his age, after a reign of seventeen years.

Ptolemy the Fifth succeeded his father Philopater as king of Egypt, though only in the fourth year of his age. During the years of his minority he was under the protection of Sosibius and of Aristomenes, by whose prudent administration Antiochus was dispossessed of the provinces of Cœlosyria and Palestine, which he had conquered by war. The Romans also renewed their alliance with him after their victories over Annibal, and the conclusion of the second Punic war. This flattering embassy induced Aristomenes to offer the care of the patronage of the young monarch to the Romans, but the regent was confirmed in his honourable office, and by making a treaty of alliance with the people of Achaia he convinced the Egyptians that he was qualified to wield the sceptre and to govern the nation. When Ptolemy had reached his fourteenth year, according to the laws and customs of Egypt, the years of his minority had expired. He received the surname of Epiphanes, or Illustrious, and was crowned at Alexandria with the greatest solemnity, and Aristomenes resigned into his hands an empire which he had governed with honour to himself, and with credit to his sovereign. Young Ptolemy was no sooner delivered from the shackles of a superior than he betrayed the same vices which had characterised his father, the counsels of Aristomenes were despised, and the minister, who for ten years had governed the kingdom with equity and moderation, was sacrificed to the caprice of the sovereign. His cruelties raised seditions among his subjects, but these were twice quelled by the prudence and the moderation of Polycrates, the most faithful of his corrupt ministers. In the midst of his extravagance Epiphanes did not forget his alliance with the Romans; above all others he showed himself eager to cultivate friendship with a nation from whom he could derive so many advantages, and during their war against Antiochus he offered to assist them with money against a monarch whose daughter Cleopatra he had married, but whom he disliked on account of the seditions he raised in the very heart of Egypt. After a reign of twenty-four years Ptolemy was poisoned by his ministers, whom he had threatened to rob of their possessions to carry on a war against Seleucus king of Syria.

Ptolemy the Sixth, succeeded his father Epiphanes on the Egyptian throne, and received the surname of Philometor. He was in the sixth year of his age when he ascended the throne, and during his minority the kingdom was governed by his mother, and at her death by an eunuch who was one of his favourites. He made war against Antiochus Epiphanes, king of Syria, to recover the provinces of Palestine and Cœlosyria, which were part of the Egyptian dominions, and after several successes he fell into the hands of his enemy, who detained him in confinement. During the captivity of Philometor, the Egyptians raised to the throne his younger brother Ptolemy Evergetes, or Physcon, also son of Epiphanes; but he was no sooner established in his power than Antiochus turned his arms against Egypt, conquered the usurper and restored Philometor to all his rights and privileges as king of Egypt. This apparently generous conduct of Antiochus was comprehended by Philometor, when he saw that Pelusium, the key of Egypt, had remained in the hands of his Syrian ally; he therefore recalled his brother Physcon, and made him partner on the throne, and concerted with him how to repel their common enemy. Antiochus entered Egypt with a large army, but the Romans checked his progress and obliged him to retire. No sooner were they delivered from the impending war than Philometor and Physcon, whom the fear of danger had united, began with mutual jealousy to oppose each other's views. Physcon was at last banished by the superior power of his brother, and as he could find no support in Egypt he immediately repaired to Rome. To excite more effectually the compassion of the Romans, and to gain their assistance, he appeared in the humblest dress, and took his residence in the most obscure corner of the city. He received an audience from the senate, and the Romans settled the dispute between the two royal brothers by making them independent of one another, and giving the government of Libya and Cyrene to Physcon, and confirming Philometor in the possession of Egypt and the island of Cyprus. These terms of accommodation were gladly accepted, but Physcon claimed the dominion of Cyprus, and in this he was supported by the Romans, who wished to aggrandize themselves by the diminution of the Egyptian power. Philometor refused to deliver up the island of Cyprus, and to call away his brother's attention he fomented the seeds of rebellion in Cyrene. But the death of Philometor left Physcon master of Egypt and all the dependent provinces.

Ptolemy the Seventh, surnamed Physcon, ascended the throne of Egypt after the death of his brother Philometor, and as he had reigned for some time conjointly with him, his succession was approved, though the wife and the son of the deceased monarch laid claim to the crown. Cleopatra was supported in her claims by the Jews, and it was at last agreed that Physcon should marry the queen, and that her son should succeed to the throne at his death. The nuptials were accordingly celebrated, but on that very day the tyrant murdered Cleopatra's son in her arms. He ordered himself to be called Evergetes, but the Alexandrians refused to confirm the title, and stigmatized him with the appellation of Kakergetes, or evil-doer. A series of cruelties rendered him so odious that the Alexandrians abandoned their habitations. Physcon endeavoured to re-people the city which his cruelty had laid desolate; but the fear of

sharing the fate of its former inhabitants prevailed more than the promise of riches, rights, and immunities. The king at last disgusted with Cleopatra, repudiated her, and married her daughter by Philometer. He still continued to exercise the greatest cruelty upon his subjects, and at last all Egypt revolted. Without friends or support in Egypt, he fled to Cyprus, and Cleopatra, the divorced queen, ascended the throne. In his banishment Physcon dreaded lest the Alexandrians should also place the crown on the head of his son, who was then governor of Cyrene; and under these apprehensions he sent for the young prince to Cyprus, and murdered him as soon as he reached the shore. To make the barbarity more complete, he sent the limbs of the young prince to Cleopatra, and they were received as the queen was going to celebrate her birth-day. Soon after this he invaded Egypt with an army, and obtained a victory over the forces of Cleopatra, who, being left without friends or assistance, fled to her eldest daughter Cleopatra, who had married Demetrius, king of Syria. This decisive blow restored Physcon to his throne, where he continued to reign for some time, hated by his subjects and feared by his enemies. He died at Alexandria in the sixty-seventh year of his age, after a reign of twenty-nine years.

Ptolemy the Eighth, surnamed Lathyrus, succeeded his father Physcon as king of Egypt. He had no sooner ascended the throne than his mother Cleopatra, who reigned conjointly with him, expelled him to Cyprus and placed the crown on the head of his brother Ptolemy Alexander, her favourite son. Lathyrus, banished from Egypt, became king of Cyprus, and soon after he appeared at the head of a large army to make war against Alexander Jannæus, king of Judea, through whose assistance he had been expelled by Cleopatra. The Jewish monarch was conquered, and 50,000 of his men were left on the field of battle. Lathyrus, after he had exercised the greatest cruelty upon the Jews, and made vain attempts to recover the kingdom of Egypt, retired to Cyprus till the death of his brother Alexander restored him to his native dominions. Some of the cities of Egypt refused to acknowledge him as their sovereign, and Thebes, for its obstinacy, was closely besieged for three successive years, and from a powerful and populous city it was reduced to ruins. In the latter part of his reign Lathyrus was called upon to assist the Romans with a navy for the conquest of Athens, but Lucullus, who had been sent to obtain the wanted supply, though received with kingly honours, was dismissed with evasive and unsatisfactory answers, and the monarch refused to part with troops which he deemed necessary to preserve the peace of his kingdom. Lathyrus died after a reign of thirty-six years. He was succeeded by his only daughter Cleopatra, whom Alexander, the son of Ptolemy Alexander, by means of the dictator Sylla, soon after married and murdered.

PUFFENDORF, SAMUEL, a learned German professor, who was born in Misnia in 1631, and studied at the universities of Jena and Leipsic, after which he became tutor in the family of the Swedish ambassador. In this situation, which continued for eight months, he employed himself in studying the works of Grotius and Hobbes on law and government. The result of his labours appeared at the Hague in 1660, in a work entitled "*Elementa Jurisprudentiæ Universalis*." The learned elector of the palatinate, Charles Louis, to whom it was dedicated,

was so much pleased with this work that he founded for the author in 1661 a professorship of the law of nature and nations, the first in Germany. Here he taught till 1670, when the king of Sweden, Charles XI., offered him the professorship of natural law in the new university at Lund. He there wrote his work on natural law entitled "*De Jure Naturæ et Gentium*, Lund, 1672," which superseded the former, and is characterized by perspicuity, method, and sound reasoning; soon after appeared the smaller compendium, or rather abstract of the above work, "*De Officio Hominis et Civis*," which passed through innumerable editions, and has been translated into several languages. Puffendorf, in these works, deviated still further than Grotius from the scholastic method of philosophizing, and consequently excited violent opposition.

However opinions may differ respecting these works of Puffendorf, it is not to be denied that he formed an epoch in the history of natural law. He had a more distinct conception than Grotius of a science which, independently of positive law or theology, should determine the rules of right solely by the laws of reason. His law of nature was a philosophical morality, settling the mutual relations of justice between men, and which still remained dependent on the Christian morality. With Grotius he laid the foundation of law in the social instinct, which is nearly allied to the Christian precept of love of our neighbour, and with Hobbes he derived law from the state of fallen nature. Puffendorf also made an epoch in the German public law. While professor in Heidelberg he wrote, at the suggestion of the elector, under the name of Severinus a Monzambano, the celebrated book "*De Statu Reipublicæ Germanicæ*," which he sent to his brother, then Swedish ambassador in Paris, to be printed. It represents Germany as a republican body, whose clumsily joined parts formed an anomalous whole. This book was violently attacked, and Puffendorf, who defended it with energy, did not think it advisable to avow himself as the author. He afterwards went to Stockholm, where he was appointed secretary of state, royal counsellor, and historiographer. There he wrote in Latin "*The History of Sweden, from the Campaign of Gustavus Adolphus in Germany, to the Abdication of Queen Christina*," and the "*History of Charles Gustavus*," and in German his "*Einleitung zur Geschichte der vornehmsten Reiche und Staaten*," subsequently continued by Oehlenschläger, and translated by Martinière into French. These works so much increased his reputation, that in 1686 he received from Frederic William, elector of Brandenburg, an invitation to Berlin as counsellor, historiographer, and judge of the supreme court of judicature, with the charge to write the life of that prince, which he finished under the reign of his son Frederic III. In 1690 he was made privy counsellor of the elector of Brandenburg, and in 1694 was created baron by Charles XI., king of Sweden. He died at Berlin in 1695.

PUGATSCHEFF, JEMELIAN.—This notorious individual was the son of a Cossack, and was born at Simoweisk, a village on the Don, in 1726. War and robbery were the employments of his youth, and he became the leader of a predatory band. He afterwards entered the Prussian service during the seven years' war, then joined the Austrians, served against the Turks, and was present at the siege of Bender in

1770. Returning to his native country he attempted to sow the seeds of rebellion among his countrymen, but was soon arrested and confined at Kasan. Having made his escape he was joined by some restless spirits, and was encouraged, by his personal resemblance to the lately deceased emperor Peter III., to attempt to pass himself off for that emperor. His adherents pretended that the corpse which had been exposed as Peter's was in fact that of a soldier resembling him, that the emperor had escaped in disguise, and had at last appeared in the midst of his faithful Cossacks, by whose support he expected to be restored to the throne. The insurrection began in the middle of August 1773, when a manifesto was issued in the name of the pseudo-Peter. The number of his followers, which was at first only nine, had increased in September to 300. He was every where joined by his countrymen and the peasantry, to whom he promised deliverance from their oppressions. His force was increased by 500 deserters from the garrison of Jaizkai and many Roskólnicks, and he took several fortresses, practising the most shocking cruelties. His army now amounted to 16,000 men, and was gaining strength by the concurrence of Bashkirs, Watiaks, Tartars, &c. He captured Kasan, the old capital of the empire, and passed the Volga. He was at length defeated, at the moment that Moscow was threatened, betrayed by his followers to Suwarroff, and on the 10th of June, 1775, was executed, together with the other rebel leaders, at Moscow—the only instance of capital punishment in the reign of Catherine. Thus ended this rebellion, which cost more than 100,000 lives.

PUGET, PIERRE, a celebrated French sculptor, architect, and painter, who was born at Marseilles in 1622, and was at an early age placed with a ship-builder, but soon after went to Italy, and displayed such marks of talents as to attract the notice of Cortona, who instructed him in painting. He returned to Marseilles in 1643; and there are several pictures from his pencil at Aix, Toulouse, and Marseilles, which are much admired. His design is correct, and his figures graceful, but his colouring is cold. In 1655, being obliged by his health to abandon painting, he thenceforward devoted himself to sculpture and architecture, in which he received no instruction. His success in these departments of art was complete. He lived some time at Genoa, where he executed numerous works in statuary and architecture, and in 1669 was recalled to France by Colbert, as director of the ornaments of ships of war, in which capacity he was employed in carving figures, bas-reliefs, &c. But he soon returned to labours more worthy of his genius, and produced a great number of works in marble, which have gained for him the appellation of the Michael Angelo of France. Puget died at Marseilles in 1694.

PUGIN, AUGUSTUS, a celebrated architectural draughtsman who was born in France, but spent the principal part of his life in England. Having completed his education he obtained employment of Mr. Nash, whose assistant he continued for many years. He was afterwards much employed by Mr. Ackermann of the Strand, particularly for "The Microcosm of London," and other books containing architectural views. His own elaborate works on the architecture of the middle ages were directed to elucidating the characteristics of the ancient styles, and the improvement of the public taste in modern imi-

tations; they present a careful delineation in detail from the finest ancient examples, and afford a profitable lesson to the artist, as well as to gentlemen who study the subject merely as an amusement. On the 2nd of February, 1802, Mons. Pugin married the daughter of William Welby, Esq., of Islington; and his first publication after was "A Series of Views in Islington and Pentonville, from original drawings, made in 1813, by Augustus Pugin; with descriptions by Mr. Brayley." In 1821 he began to issue in numbers his "Specimens of Gothic Architecture, selected from various ancient edifices in England, consisting of plans, elevations, sections, and parts at large; calculated to exemplify the various styles and the practical construction of this class of admired architecture." The descriptions were chiefly by Mr. Wilson of Lincoln, from which county a large proportion of the subjects was derived. The first volume was completed in sixty quarto plates, the second in 1823, with fifty-four plates.

In 1824 he undertook, in conjunction with John Britton, Esq., "Architectural Illustrations of the Public Buildings of London," which work was completed in two volumes. Mr. Britton also superintended the publication of the "Specimens of Architectural Antiquities of Normandy," measured and drawn by Mr. Pugin, and engraved by John and Henry Le Keux, and in 1829 he furnished the drawings for "Paris and its Environs Displayed," by Ventouillac. Mr. Pugin was under an engagement to make drawings of the fine old church and other monuments of antiquity at Sleaford and in its vicinity, as well as of the market-place and recently erected edifices in that town, with the view of publishing them by subscription; but his death, which took place on the 19th of December, 1832, prevented its completion at that period.

PULAWSKI, COUNT JOSEPH, a distinguished Pole, who, after attempting in vain to restore the independence of his own country, entered the American service. Pulawski had followed the profession of the law, and in 1768 was at the head of the patriots who formed the confederation of Bar. Eight noblemen only constituted the first assembly of that confederation, and of these three were the sons and one the nephew of Pulawski. In 1771, at the head of a few accomplices, he seized the person of the king; but the latter having procured his liberation, Pulawski was condemned to death, and obliged to save himself by flight. He soon after went to America, and offered his services to the United States against the mother country. Being appointed brigadier-general in the American service, he served both in the northern and southern army. On the 9th of October, 1779, he was mortally wounded in the attack on Savannah, and died two days afterwards.

PULCI, LUIGI, an Italian poet, who was born at Florence in 1431, and was the youngest of three brothers distinguished for their talents and learning. Of the circumstances of his life we know nothing but that he lived in terms of intimacy with Lorenzo de Medici and Politian. His epic poem, "Il Morgante Maggiore," in which he relates the adventures and exploits of Rinaldo and the giant Morgante, is said to have been written at the suggestion of Lorenzo's mother, and to have been read as an entertainment at table.

PULTENEY, WILLIAM, earl of Bath, a distinguished English statesman, who was the political

antagonist of Sir Robert Walpole. He was born in 1682, and became a student of Christ Church, Oxford, and after having travelled abroad, returned home to devote himself to politics. Being chosen a member of the house of commons, he joined the party of the Whigs in the latter years of the reign of Anne. Under George I. he was made secretary at war, but a dispute with Sir Robert Walpole caused his removal to the ranks of the opposition, when he joined Lord Bolingbroke in conducting an anti-ministerial journal, called "The Craftsman." In 1731 a duel with Lord Hervey gave offence to the king, who removed Mr. Pulteney from the office of privy counsellor, which he had hitherto held, and also from the commission of the peace. These and other marks of the displeasure of the court only served to increase the popularity of Pulteney, who at length succeeded in procuring the resignation of his rival, Walpole, in 1741. The party with which he had acted then came into power, and he was raised to the peerage by the title of earl of Bath. From that period, however, his popularity and influence entirely ceased. He died on the 8th of June, 1764.

**PUNTO, JOHANN WENZEL.**—This celebrated performer on the horn, whose name was properly Stich, was born at Tetschen in Bohemia, in 1755. His instructor on the horn was Hampel, of Dresden, under whose care he was placed by the Count Von Thun, of whom Punto was by birth a serf. From Dresden he returned to the count's service at Prague, but was so ill-used by his master as shortly after to decide on privately quitting that kingdom; which step he put in execution after encountering many difficulties. After passing the frontier he changed his name to Punto. He then travelled to various courts of Germany, where his powers on his instrument occasioned general astonishment and admiration. He died at Prague in 1803.

**PURCELL, HENRY.**—This celebrated composer was born in 1658. His father and uncle were both musicians and gentlemen of the chapel royal at the restoration. From whom Henry Purcell received his first instructions in music cannot be ascertained; but his father dying in 1664, when he was only six years old, it is probable that he was qualified for a chorister by Captain Cook, who was master of the children from the restoration till his death in 1672. As Purcell was appointed organist of Westminster Abbey at eighteen years of age, he must have learned the elements of his art at an early period of his life. He certainly was taught to sing at the king's chapel, and received lessons from Pelham Humphrey, Cook's successor, till his voice broke; an accident which usually happens to youth at sixteen or seventeen years of age.

Purcell is said to have profited so much from his first lessons and early application as to have composed, while a singing-boy in the chapel, many of his anthems, which have been constantly sung in our cathedrals ever since. Eighteen was a very early age for the appointment of organist of Westminster Abbey, one of the first cathedrals in the kingdom for choral compositions and performance. It was not likely he would stop here; the world is more partial to promising youth than to accomplished age. At twenty-four, in 1682, he was promoted to one of the three places of organist to the chapel royal on the death of Edward Low, the successor of Dr. Christopher Gibbons in the same station. After this he

produced so many admirable compositions for the church and chapel of which he was organist, and where he was certain of having them performed better than elsewhere, that his fame soon extended to the remotest parts of the kingdom. He was very early in life engaged to compose for the stage and chamber; in both which undertakings he was so decidedly superior to all his predecessors that his compositions seem to speak a new and more intelligible language. His songs contain whatever the ear could then wish, or heart feel. In fact, no other vocal music was listened to with pleasure for nearly thirty years after Purcell's death, when they gave way only to the favourite opera songs of Handel. The unlimited powers of this musician's genius embraced every species of composition that was then known with equal felicity. In writing for the church, whether he adhered to the elaborate and learned style of his great predecessors, Tallis, Bird, and Gibbons, in which no instrument is employed but the organ, and the several parts moving in fugue, imitation, or plain counterpoint; or, on the contrary, giving way to feeling and imagination, adopted the new and more expressive style, of which he was himself one of the principal inventors, accompanying the voice parts with instruments, to enrich the harmony, and enforce the melody and meaning of the words, he manifested equal abilities and resources. In compositions for the theatre, though the colouring and effects of an orchestra were then but little known, yet, as he employed them more than his predecessors, and gave to the voice a melody more interesting and impassioned than during that century had been heard in this country, or even, perhaps, in Italy. And in the several species of chamber music which he attempted, whether sonatas for instruments, or odes, cantatas, songs, ballads, and catches for the voice, he far surpassed whatever had been produced before.

To enter into a critical examination of Purcell's numerous compositions would exceed the limits of this work. We cannot, however, avoid a few remarks on his "Te Deum" and "Jubilate." It has been erroneously imagined that these were originally composed for the feast of the sons of the clergy; and Dr. Tudway says positively that the "Te Deum" and "Jubilate" of Mr. Henry Purcell were intended for the opening of the new church of St. Paul, and though he did not live to see it finished, they were afterwards performed three several times, when Queen Anne went thither in state. The following title to a printed copy in the library of Christ Church, Oxford, incontestibly confutes both these opinions, "Te Deum and Jubilate, for Voices and Instruments, made for St. Cecilia's Day, 1694, by Henry Purcell." The custom, since Purcell's time, of opening this magnificent and venerable hymn with an overture or symphony, which Handel and Graun have done so powerfully, renders the beginning of our countryman's composition somewhat abrupt, and inferior in dignity to the subject. There is, however, a stock of genius, boldness, and effect in the four last bars of the first line, where the discords are struck by the trumpets, and resolved by the violins, which marks the great musician. There is likewise a grandeur in the movement, and richness in the harmony of the chorus "All, all the earth doth worship Thee;" and the distribution of the parts in ascending after each other by the harmonic intervals of the perfect chord, has a beautiful effect.

The opening of the "Jubilate" is well calculated to display a fine performer, and, therefore, the military cast which is given to the whole air may be proper; it does not, however, appear to us to be exactly appropriate. Yet Purcell and his contemporaries in England were of a different opinion, as it prevails too generally in all their works.

His admirable compositions were constantly performed at St. Paul's on the feast of the sons of the clergy, from the decease of the author in 1695, till the year 1713, when Handel's "Te Deum" for the peace of Utrecht was produced by command of Queen Anne. From which period, till 1743, when Handel's second "Te Deum" for the battle of Dettingen was composed, they seem to have been alternately performed. Since that time Purcell's "Te Deum" and "Jubilate" have been but seldom executed, even at the triennial meetings of the three choirs of Hereford, Worcester, and Gloucester. Handel's superior knowledge and use of instruments, and more polished melody, added to the novelty of his productions, took such entire possession of the national favour, that Purcell's "Te Deum" is now only performed occasionally as an antique curiosity.

Of his detached and incidental songs, dialogues, and scenes, which were performed at our national theatre, those whose merits are prominent will be mentioned in speaking of the "Orpheus Britannicus," or posthumous collection of his miscellaneous compositions. But before we enter on an examination of this work, it is necessary to acquaint the reader that the chief part of his instrumental music for the playhouse is included in a publication that appeared two years after his decease, under the title of "A Collection of Ayres, composed for the Theatre, and on other Occasions, by the late Mr. Henry Purcell."

The following is Dr. Burney's critique on the music in the "Orpheus Britannicus:—" 'Ye twice ten hundred Deities' opens with, perhaps, the best piece of recitative in our language. The words are admirably expressed throughout this song by modulation as well as melody; and there is a propriety in the changes of movement, which does as much honour to Purcell's judgment as the whole composition to his genius. If ever it should be said of a composer that he had *devancé son siècle*, Purcell is entitled to that praise. The music in 'King Arthur' is well known, and frequently performed; in this there are movements, particularly in the duet, 'Two daughters of this aged stream,' and 'Fairest Isle all isles excelling,' which the lapse of a century has not injured. These do not, perhaps, contain a single passage which the best of modern composers would reject. 'From rosy bowers,' is said to have 'been set in his last sickness,' at which time he seems to have realized the poetical fable of the 'Swan,' and to have sung more sweetly as he approached his dissolution. The variety of movement, the artful, yet pathetic modulation, and, above all, the exquisite expression of the words, render it the most affecting composition extant, to every Englishman who regards music, not merely as an agreeable arrangement and combination of sounds, but as the vehicle of sentiment, and the voice of passion. To those who understand the full power of our language, and feel the force, spirit, and shade of meaning which every word bears according to its place in a sentence, may we not venture to repeat, that this unrivalled com-

position will have charms and effects, which, perhaps, Purcell's music only can produce." This distinguished composer died in 1695.

PURCHAS, SAMUEL, an English divine, who was born in 1577, at Thaxted in Essex, and educated at St. John's College, Cambridge. His principal work was entitled "Purchas his Pilgrimages, or Relations of the World;" which, with Hakluyt's Voyages, led the way to other collections of the same kind, and have been much valued and esteemed. The first volume was published in 1614, but the fourth edition of it, in 1626, contains numerous important additions. The four last volumes appeared in 1625. He also wrote "Microcosmos, or the History of Man," "The King's Tower and Triumphal Arch of London." Mr. Purchas was rector of St. Martin's in Ludgate, and chaplain to Abbot, archbishop of Canterbury. He died at London in 1625, and his works now fetch a high price.

PURVER, ANTHONY, a self-educated mechanic, who by dint of industry acquired a good knowledge of the Greek and Latin languages. He died in 1777, after having completed and published a new translation of the Old and New Testaments into English.

PUTNAM, ISRAEL, a distinguished American soldier in the French and English wars, and subsequently in that of the revolution. He was born of English parents at Salem, in the then province of Massachusetts, on the 7th of January, 1718, and being intended for a farmer he received only a common education. He had a strong mind, vigorous constitution, great bodily strength, enterprise, and activity; excelled in athletic exercises, and while a stripling, was ambitious of performing the full labour of manhood. He married very young, and removed in 1739 to Pomfret, in Connecticut, where he had purchased a tract of land. During his residence there his flocks and those of his neighbours being terribly thinned by a monstrous wolf, Putnam, with a few associates, traced the ferocious animal to a deep cavern in a rock. Into this he crept alone, with a torch in one hand and a musket in the other, and at the utmost personal risk destroyed the creature. When the war of 1755 broke out between France and England, he was appointed, at the age of thirty-seven, commander of a company, enlisted the necessary number of recruits

from the young men in his vicinity, and joined the army then commencing the campaign near Crown Point. His services as a partisan officer were unremitting and great, and caused him to be promoted, in 1757, to the rank of major, by the legislature of Connecticut. In 1758 he fell into an Indian ambuscade, and was taken prisoner, when returning to Fort Edward from an expedition to watch the enemy's movements near Ticonderoga. The Indians were about to burn him to death, having already tied him to a tree and set fire to a circle of combustibles around him, when he was rescued by the interposition of their leader, Molang, a famous French partisan officer. He was then carried to Ticonderoga, where he underwent an examination before the marquis de Montcalm, who ordered him to Montreal. There he found several fellow prisoners, among whom was Colonel Peter Schuyler, who he immediately visited and found almost destitute of clothing, and dreadfully wounded and bruised. The colonel supplied him with money, and having clothed himself in a decent garb, he was immediately treated with the respect due to his rank. An exchange of prisoners procured Putnam his liberty. He resumed his military duties, and having previously been appointed a lieutenant-colonel, rendered especial service at the siege of Montreal by the British in 1760.

In 1762, after war had been declared between England and Spain, he accompanied the expedition under Lord Albemarle, against the Havana. In 1764, having been appointed colonel, he marched at the head of a regiment, with General Bradstreet, against the savages of the western frontier. On his return from this expedition, which resulted in a treaty between the contending parties, he betook himself once more to a country life, filled several offices in his native town, and represented it in the general assembly. In 1770 he went with General Lyman and some others, to explore a grant of land on the Mississippi. General Lyman formed an establishment and died there; but Putnam returned after having made some improvements on his tract. When hostilities commenced between England and the colonies, in April 1775, Putnam received the intelligence as he was ploughing in the middle of a field; he left his plough there, unyoked his team, and, without changing his clothes, set off for the scene of action. Finding the British shut up and closely invested with a sufficient force in Boston, he returned to Connecticut, levied a regiment under colonial authority, and marched to Cambridge. His colony now appointed him a major-general on the provincial staff, and congress soon after confirmed to him the same rank on the continental. About this time the British offered him the rank of a major-general in his majesty's army, with a pecuniary remuneration for his treason; but the temptation could not influence him. In the several preparatory operations for the battle of Bunker's Hill, he took an active part. After the commencement of the retreat at the battle of Bunker's Hill, Putnam arrived on the field with a reinforcement, and performed every thing to be expected from a brave and experienced officer: the enemy pursued the retreating Americans to Winter Hill, but Putnam halted there and drove them back under cover of their ships. On the evacuation of Boston on the 17th of March, 1776, the greater part of the forces were despatched to New York, and Putnam was some time after sent thither to take upon him the command.

After the disastrous action on Long Island, and General Washington's masterly retreat from thence, Putnam was nominated to the command of the right grand division of the army. He served some time in the vicinity of New York, and was sent to the western side of the Hudson, and shortly after to superintend the fortifications of Philadelphia. After the battles of Trenton and Princeton, he was posted at Princeton, where he continued till the ensuing spring with a very inferior force, guarding a considerable extent of frontier, curtailing and harassing the enemy without sustaining the least disaster. During his stay at Princeton, by attacking the foraging parties of the enemy and assemblages of the disaffected who invested his vicinity, he captured nearly 1,000 prisoners. In the spring of 1777 he was appointed to the command of a separate army in the highlands of New York. There was no regular enemy in this neighbourhood, but the country round was filled with royalists and a species of banditti called Cow-boys, who committed shocking depredations. Many of the latter clandestinely traversed the country with messages from one British army to another, and even on recruiting expeditions for the royal service. A lieutenant in the new British levies was detected in the American camp, and reclaimed by Governor Tryon, his commander, with threats of vengeance in case of his punishment. He received this laconic answer from General Putnam:—"Sir, Nathan Palmer, a lieutenant in your king's service, was taken in my camp as a spy; he was tried as a spy; he was condemned as a spy; and you may rest assured, sir, he shall be hanged as a spy.—P. S. Afternoon. He is hanged."

After the capture of Fort Montgomery, Putnam selected West Point as the best calculated site for a fortress to protect the river. The reputation it afterwards attained evinced the judiciousness of this selection. After the battle of Monmouth, Putnam was posted for the winter at Reading, in Connecticut, that he might protect the country adjoining to the Sound, and the garrison at West Point. While he was on a visit to one of his out-posts, Governor Tryon advanced upon him with 1500 men. Putnam had with him but 150 men and two field-pieces, with which he kept the enemy at bay some time. At length, seeing the enemy preparing to charge, he ordered his men to retire to a swamp, while he plunged down a precipice so steep as to have artificial steps, nearly one hundred in number, for the use of foot passengers. The enemy's dragoons stopped short, afraid to venture, although within a sword's length of him. While they went round the brow of the hill to gain the valley, he raised a force sufficiently strong to pursue Tryon on his retreat. In the campaign of 1779 he commanded the Maryland line stationed near West Point. In the autumn of this year the American army retired into winter quarters, at Morristown, and Putnam accompanied his family into Connecticut for a few weeks. At the commencement of his journey from thence to Morristown, while on the road between Pomfret and Hartford, he was seized with an extraordinary numbness of his right hand and foot, which crept gradually upon him until his right side became in a considerable degree paralyzed. This severe affliction produced a transient depression of his mind, but he conquered his dejection and resumed his naturally cheerful temper. He was still able to walk and ride moderately, and the faculties of his mind

were unimpaired. In this situation he lived to see his country enjoying that independence of which he had been so able a champion, and died at Brookline, in Connecticut, on the 29th of May, 1790, aged seventy-two years.

**PUTTER, JOHN STEPHEN**, a German scholar who was born at Iserlohn, in 1725, and made such rapid progress in his studies that he was ready to enter the university in his thirteenth year. After studying at Marburg, Halle, and Jena, he became professor extraordinary of law at Göttingen in 1747, and soon became distinguished as a lecturer. In 1757 he was named Professor Juris Publici. Although employed in various public capacities, he still continued to reside in Göttingen till the time of his death in 1807. His works have lost much of their importance by the dissolution of the German empire, but his "*Historische Entwicklung der Verfassung der Deutschen Staaten*" is still valuable.

**PYE, HENRY JAMES**, a clever English poet who was born in 1745. He was educated at Oxford, and after writing a variety of miscellaneous poems, was in 1790 appointed poet-laureat. Mr. Pye died in 1813.

**PYLE, THOMAS**, an English ecclesiastic, who was born in 1674. He was educated at Cambridge, and ultimately presented to a prebendal stall by Bishop Hoadly. He was the author of several valuable Scripture paraphrases, on which he was engaged till his death in 1755.

**PYM, JOHN**, a parliamentarian in the reign of Charles I., was descended of a good family in Somersetshire, where he was born in 1584. He was educated at Pembroke college, Oxford, whence he removed to one of the inns of court, and was called to the bar and placed as a clerk in the office of the exchequer. He was early elected member of parliament for Tavistock in the reign of James I., and in 1626 was one of the managers of the impeachment of the duke of Buckingham. He was also a great opposer of Arminianism, being attached to Calvinistic principles. In 1639, with several other commoners and lords, he held a close correspondence with the commissioners sent to London by the Scottish covenanters; and in the parliament of 1640 was one of the most active and leading members. On the meeting of the long parliament he made an able speech on grievances, and impeached the earl of Strafford, at whose trial he was one of the managers of the house of commons. It was the zeal and earnestness of Pym which led Charles into the imprudent measure of going to the parliament in person to seize him and four other members. Some time before his death he drew up a defence of his conduct, which leaves it doubtful what part he would have taken had he lived until hostilities commenced. In November 1643 he was appointed lieutenant of the ordnance, and died on the 8th of December, 1643.

**PYRRHO**, a Grecian philosopher, who was the founder of the Pyrrhonian or ancient sceptical school. He flourished about 340 B. C., and was probably born about the 101st Olympiad. In his youth he studied the art of painting, but was early led to apply himself to philosophy by the writings of Democritus. He accompanied his master, Anaxarchus, to India, in the train of Alexander the Great. During this journey he became acquainted with the doctrines of the Brahmins, Gymnosophists, Magi, and other eastern philosophers. His doubts concerning positive know-

ledge were strengthened as he proceeded in his studies, until at length he came to hold all knowledge useless, and considered virtue alone as valuable. In all his disputes his answer to his opponents was, "What you say may or may not be true, I cannot decide;" and he taught in his school that truth could not be attained, but we must be content to suspend our judgment on all subjects. He spent a great part of his life in solitude, and by abstaining from all decided opinions concerning moral and physical phenomena, he endeavoured to attain a state of tranquillity not to be affected by fear, joy, and sorrow. He bore corporal pains with great fortitude, and no danger could disturb his equanimity. In disputation he was distinguished for acuteness of argument and clearness of language. His countrymen made him high priest, and exempted all philosophers from the payment of taxes. Pyrrho died in the ninetieth year of his age. The Athenians erected a statue in honour of him, and his countrymen raised a monument to his memory. His scepticism is easily accounted for; he early became acquainted with the system of Democritus, who held that, except the immediate elements of bodies, or atoms, nothing was real, and that all perception was subjective. He was confirmed in these views by the doctrines of Socrates, to whom in his character he bore a great resemblance. Cicero mentions him expressly among the disciples of Socrates, and his scepticism is allied to the irony of that philosopher. Led by his temperament and his manner of life to esteem an interrupted tranquillity the great object of all philosophy, believing that nothing tended so much to destroy this quiet as the interminable disputes of the schools of the Dogmatists, and that uncertainty was increased by their contentions; he determined to seek, in some other way, the peace which he despaired of finding in dogmatical philosophy. This made him a sceptic. Pyrrho left no writings. His friend and scholar, Timon, first wrote on the subjects of scepticism, but his writings are lost. It is only from the works of his later followers, particularly Sextus Empiricus, that we learn the principles of his school, or rather their mode of thinking, by which they strove rather to overthrow other philosophical structures than to build up one of their own.

**PYRRHUS II.**, a celebrated king of Epirus, who was one of the greatest generals of his age. He ascended the throne of his father when but twelve years old; being driven from it five years afterwards by Neoptolemus, he soon regained it, and increased his power by the conquest of Macedonia. Being called by the Tarentines to aid them against the Romans, he twice defeated the latter by means of his elephants, to which the Romans were unaccustomed; but his confession, "Such another victory and I must go home alone," proved the cost of his triumph. In the mean time the disturbances in Syracuse tempted him into Sicily. But he returned to Italy without having accomplished his vain scheme of conquest, and being here defeated by the Romans, who had now become acquainted with this mode of fighting, he was obliged to return to Greece without having succeeded in his designs. A tile at the siege of Argos ended his restless life, 272 B. C. From this king the Romans learned most of their art of war, which afterwards made them so formidable to their enemies.

**PYTHAGORAS**, a celebrated Grecian philosopher, who was the founder of the Italian school. Accord-

ing to the most received opinion, he was a native of Samos. His father, Mnesarchus, was a merchant, probably of Tyre or some other Phœnician city, who traded to Samos, where he received the rights of citizenship, and settled with his family. The year of Pythagoras's birth is uncertain, but is believed to have taken place about 584 or 586 B. C. He received his first instruction from Creophilus in his native city. He then went to the island of Scyros, and was a scholar of Pherecydes till the death of the latter; others make him also a scholar of Thales. Jamblichus says that Pythagoras, during his journey to Egypt, spent some time in Phœnicia in intercourse with the successors of Moschus and other priests of the country, by whom he was initiated into their mysteries, and that he travelled through various parts of Syria, in order to become acquainted with the most important religious usages and doctrines. But this account is blended with many fabulous circumstances. Pythagoras is said to have been recommended by Polycrates, king of Samos, to the Egyptian king Amasis. In Egypt he was probably initiated into the mysteries of the priests, and became acquainted with the whole range of Egyptian learning. From Egypt he is said to have journeyed to the East, and visited the Persian and Chaldean Magi, as well as the Indian Gymnosophists. After his return he opened a school at Samos, in which he taught his doctrines in a symbolic form in imitation of the Egyptians. Tradition, moreover, relates that he went to Delos, and received from the priestess moral maxims, which he communicated to his disciples under the name of divine precepts. He also visited Crete, where the priests of Cybele took him to the caverns of Ida, in which Jupiter had been cradled. Here he met Epimenides, who boasted of having intercourse with gods and the gift of prophecy, and whom he initiated into the sacred mysteries of the Greeks. From Crete he is said to have gone to Sparta and Elis, and from thence to Phlius, where, being asked by King Leon what was his profession, he replied that he was a philosopher, or friend of wisdom, declaring that the name of sage belonged solely to the Divinity.

With augmented knowledge he returned home, where he now founded a philosophical school with great success. His doctrines seemed divine oracles, and the sacred obscurity in which he had the art of veiling them attracted a great number of disciples. He resolved, nevertheless, to leave Samos, either to avoid the public offices conferred upon him, or the tyranny of Polycrates, and went to Magna Græcia. He landed at Crotona, whose inhabitants were notorious for the looseness of their manners. From all traditions it may be concluded that he laid claim to supernatural powers, and his extraordinary qualities collected around him persons of all classes. The good effects of his influence were soon visible. Sobriety and temperance succeeded to the prevailing luxury and licentiousness; 600 of the inhabitants of Crotona are said to have submitted to the strictest precepts of his doctrine, and united their property in one common stock, for the benefit of the whole community or society which Pythagoras founded. The object of the society was to aid each other in promoting intellectual cultivation. From all quarters Pythagoras found numerous pupils, who paid him almost divine honours. But as he taught the nobles who joined him, his society became suspected by

the popular party. At the head of his enemies in Crotona was Cylon, a rich and respectable citizen, whose enmity he had excited by refusing to receive him among his scholars. In revenge, Cylon once attacked the house of Milo where a number of Pythagoreans were assembled, surrounded it with his partisans, and set it on fire. Forty persons perished and but few escaped. Pythagoras was not in the house, he had fled to the Locrians, and, when these refused to admit him, to Metapontum. Finding enemies here also who meditated his ruin, he sought an asylum in the temple of the Muses, where, according to tradition, he perished from want of sustenance, eighty years of age, about 506 B. C.

His scholars are said to have paid him divine honours after his death. He is said to have asserted that his soul had already lived in several bodies. In public he appeared in the oriental costume, in a long white robe, with a flowing beard, and, as some say, with a crown of gold on his head; and his exterior was grave, commanding, and dignified. He abstained, it is related, from all animal food, and limited himself to vegetables. These circumstances contributed to give him the appearance of an extraordinary being. To show his respect for marriage he took a wife at Crotona, by whom, among several children, he had two sons, Telanges and Mnesarchus, who were his scholars and successors. That Pythagoras left any works, is improbable on the testimony of the ancients. The golden sentences extant under his name, which may be considered as a short abridgment of his popular doctrines, appear to have been composed by later hands. Like those of the Egyptian priests, his doctrines were of two kinds, public and secret. His public instruction consisted of practical discourses, in which he recommended virtue and dissuaded from vice, with a particular reference to the various relations of mankind, such as those of husbands and wives, parents and children, citizens and magistrates, &c. His hearers at these lectures must not be confounded with the members of his society, whom he subjected to a separate discipline, and, not till after long instruction and severe examination, admitted to all the mysteries of his secret doctrines. These scholars were required to practise the greatest purity and simplicity of manners. He imposed upon them a silence of two to five years, according to circumstances. For a time the disciples were only hearers; the well-known "He said so" was sufficient authority without any proof. He alone who had passed through the appointed series of severe trials was allowed to hear the word of the master in his immediate presence. Whoever was terrified by the difficulties might withdraw without opposition, and his contributions to the common stock were repaid, a tomb was erected to him as if he were dead, and he was no more thought of. To the members of the secret society, the doctrines were not delivered as to others, under the mask of images and symbols, but unveiled.

These secrets probably related to religious and political subjects. It was requisite, however, to take an oath of secrecy, and the pupils could then interrogate and make objections. They were called, by way of distinction, Pythagoreans. As soon as his disciples had made sufficient progress in geometry, they were introduced to the study of nature, to the investigation of fundamental principles, and to the knowledge of God. Others, according to their inclinations and

capacities, were instructed in morals, economics, or politics, and afterwards employed either in managing the affairs of the society, or sent abroad to inculcate and bring into practice the principles of philosophy and government in the other Grecian cities. According to the accounts of later writers, the mode of living at the Pythagorean school at Crotona was the following:—"The Pythagoreans, with their wives and children, lived together in a public building in perfect harmony, as if one family. Each morning it was decided how the day should be spent, and every evening a review was made of all that had been done. They rose before the sun in order to worship it; verses from Homer and other poets were then recited, or music was introduced, to arouse the mental powers, and fit them for the duties of the day. Several hours were then spent in serious study. A pause followed for recreation, in which a solitary walk was usually taken to indulge in contemplation; a conversation then took place. Before dinner various gymnastic exercises were performed. The common meal consisted principally of bread, honey, and water. The remainder of the day was devoted to public and domestic affairs, conversation, bathing, and religious performances."

After the destruction of the association, and the flight of his scholars from Lower Italy, Lysis and Archippus deemed it necessary to collect the doctrines of their master in a systematic treatise, and preserve them from oblivion; but the greatest secrecy was nevertheless recommended. Thus Plato purchased from Philolaus a writing on the philosophy of Pythagoras, and received from Archytas his commentaries on the verses and tenets of his master. The accounts that we possess of the doctrines of Pythagoras are very scanty, and, with the exception of what we learn from Aristotle, and from some fragments of the Pythagoreans, very uncertain. Neither can we accurately discriminate between his doctrines and those of his scholars. Later writers represent him as making it the object of all philosophy to exalt the mind to the contemplation of immutable truth, to the knowledge of divine and spiritual objects. This can only be affected by degrees, on account of familiarity with sensual things. The first step to wisdom is the study of mathematics, the foundation of which appeared to him to be the doctrine of numbers. Numbers are, in his view, the first and most essential of things. They are, as it were, the model, according to which the world is formed in all parts. The odd numbers are limited and perfect; the even, unlimited and imperfect. The *monad*, or unity, is the source of all numbers. The *dyad* is, according to the later Pythagorean doctrines, imperfect and passive, and the cause of increase and division. The *triad*, compounded of the *monad* and *dyad*, partakes of the nature of both. The *tetras*, or number four, is in the highest degree perfect. The *decad*, which contains the sum of the four prime numbers, and is therefore called *tetractys*, comprehends all musical and arithmetical proportions, and denotes the system of the world.

The real meaning of the Pythagorean doctrine of numbers is not well understood; numbers were probably, in this system, the symbolical or allegorical representations of the first principles or forms of nature. As Pythagoras could not express abstract ideas in simple language, he seems to have made use of numbers, as geometers do of a diagram, to assist the

comprehension of his scholars. He perceived some analogies between numbers and the attributes of the divine understanding, and made the former the symbols of the latter. As the numbers proceed from the *monad*, or unity, undergo various combinations, and in their progress assume new properties, so he regarded the pure and simple essence of the Deity as the common source of all the forms of nature, which, according to their various modifications, possess different properties. Pythagoras is also said to have invented the multiplication table, thence called the Pythagorean Table. Next to numbers, music belongs to the preparatory exercises of the Pythagorean school, by which the mind was elevated above the dominion of passion, and fitted for contemplation. Pythagoras considered music not only as an art to be judged of by the ear, but as a science to be reduced to mathematical maxims and relations, and allied to astronomy. Tradition makes him the inventor of a musical instrument called the *octochordum Pythagoræ*, which, after his death, was engraved in brass, and preserved in the temple of Juno at Samos. The invention of the harmonic canon, or monochord—an instrument of a single string—which served for the measurement of musical intervals, has also been ascribed to him by ancient and modern writers. He believed that the heavenly spheres, in which the planets move, dividing the ether in their course, produced tones, and that the tones must be different according to their size, velocity, and distance. That these relations were in concord, that these tones produced the most perfect harmony or music of the spheres, he necessarily believed, in consequence of his notions of the supreme perfection of the universe. The real meaning of this doctrine was, that he regarded the world as an harmonically arranged whole, in which the relations of numbers were realized. His followers, on account of this doctrine, said of their master, that he was the only mortal whom the gods had permitted to hear the harmony of the spheres.

Geometry, which he had learned in Egypt, he reduced, more than any of his predecessors and contemporaries, to the form of a regular science. According to his notion, the geometrical point was simple, the line double, the area threefold, and solids quadruple; and in this way also he applied the doctrine of numbers. Of the geometrical theorems which are ascribed to him, the following are the most important:—The three angles of a triangle are together equal to two right angles; and in a right-angled triangle, the square of the hypotenuse is equal to the sum of the squares of the two sides. This last is still called the Pythagorean theorem (also *magister matheseos*), although it is doubtful whether Pythagoras invented it. In astronomy he taught the following:—The word heaven denotes either the spheres of the fixed stars, or the whole space between the fixed stars and the moon, or the whole world, including both the heavenly spheres and the earth. Agreeably to the arithmetical hypothesis, there are ten heavenly spheres, of which nine are visible to us, viz., the sphere of the fixed stars, the seven spheres of the seven planets (including the sun and moon), and the sphere of the earth. The tenth earth, called by him *Antichthon* (anti-earth), is invisible, but necessary to the perfection of the harmony of nature, since the *decad* is the perfection of the numerical harmony. By this anti-earth he explains the eclipses of the moon. In the middle of the universe is the

central fire, which is the principle of warmth and life. The earth is one of the planets, moving around the sphere of fire. The atmosphere of the earth is a gross, immovable mass, but the ether is pure, clear, always in motion, and the region of all divine and immortal natures. The distances of the various heavenly spheres from the earth correspond to the proportions of the musical scale. His moon and stars are gods, or inhabited by gods.

Pythagoras rendered important services to the mathematical sciences, and first established a mathematical philosophy. His disciples, Philolaus, Archytas, Ecphantus, Ocellus, and Timæus, carried it farther. Philolaus in particular, whose fragments are the most valuable relics of the Pythagorean school, distinguished himself by his astronomical system; and with mathematics were also connected the natural sciences. With respect to philosophy, Pythagoras taught that true knowledge embraced those subjects which are in their nature immutable, eternal, and indestructible, and of which alone it can be properly predicated that they exist. He who devotes himself to this study is a philosopher. The object of philosophy is, by contemplation, to render the human mind similar to the divine, and make it fit to enter the assembly of the gods. For this purpose it is necessary to invoke, in prayer, the assistance of the Divinity and good demons. Contemplative wisdom cannot be fully attained without entire abstraction from common things, without entire tranquillity, and freedom of mind. Hence the necessity of founding a society separate from the world for contemplation and study. The theoretical philosophy of Pythagoras, which treats of nature and its origin, was enveloped in the most profound obscurity, and we know nothing of it but what may be conjectured from single intimations of the ancients. In the opinion of Pythagoras, God is the universal spirit, diffused in all directions from the centre, the source of all animal life, the actual and inward cause of all motion, in substance similar to light, the first principle of the universe, incapable of suffering, invisible, indestructible, and to be comprehended by the mind alone. To the Divinity there were subordinate, according to the notions of the Pythagoreans, three kinds of intelligences, gods, demons, and heroes, emanations of the supreme God, varying in dignity and perfection, in proportion as they were more or less removed from their source. The heroes he believed to be clothed with a body of subtle matter. Besides these three kinds, there was a fourth—the human mind; likewise, an emanation of the Divinity. As God is one, and the origin of all variety, he was represented as a monad, and the subordinate spirits as numbers derived from and contained in unity. Thus the numbers of Pythagoras resembled the ideas of Plato, excepting that they are contained in the things themselves. The regions of the air the Pythagoreans thought filled with spirits, demons, and heroes, who were the cause of health or sickness to man and animals, and, by means of dreams and other kinds of divinations, imparted the knowledge of future events. The soul, according to him, was likewise a number, and by numbers it first has perception, as Philolaus says, of the world; it is an emanation of the central fire, and, consequently, always in motion, and indestructible.

Of man, the Pythagoreans believed, at least the later, that, since he consisted of an elementary nature, of a divine or rational principle, he was a microcosm;

that his soul was a self-moving principle, and consisted of two parts, the rational, which was a portion of the universal soul, an emanation of the central fire, and had its seat in the brain, and the irrational, which comprised the passions and lived in the heart; that in both man had something in common with the brutes, who, on account of their bodily structure and the want of language, are incapable of acting reasonably; that the sensitive soul perishes, but that the rational mind is immortal, because it has its origin in an immortal source; that the latter, when freed from the fetters of the body, assumes an ethereal vehicle, and passes to the habitations of the dead, where it remains till it returns to the world, to dwell in some other human or animal body, and that at last, when sufficiently purified, it returns to the source from which it proceeded. This doctrine of the transmigration of souls (metempsychosis), which was originally Egyptian, and connected with the idea of the reward and punishment of human actions, was the chief cause why the Pythagoreans killed no animals. His morality Pythagoras taught in symbolic maxims and ascetic precepts, in connexion with his contemplative views. "The powers of the mind are reason and passion; where the latter is obedient to the former, virtue reigns. The mind possesses unity, harmony, and a resemblance to God. Right consists in retribution." The following maxims are also ascribed to him:—"Youth should be habituated to obedience, for it will then find it easy to obey the authority of reason. It should be trained in the best course of life; habit will soon make it the most pleasant." "Silence is better than unmeaning words." "The wise man should be prepared for every thing that does not lie within his controul." "Do what you consider right; whatever the people think of you, despise its censure and its praise." "It is cowardly to quit the post assigned us by God before he permits us." "Strength of mind rests on sobriety, for this keeps the reason unclouded by passion." "No one is to be deemed free who has not perfect self-command." "Intoxication is a temporary madness." "The desire for the superfluous is folly, for it has no bounds," &c. The Pythagoreans recommended, especially, the virtue of friendship. In it Pythagoras requires the absence of all dissension, perfect confidence, aid under all circumstances, and a mutual endeavour to make each other perfect. "To true friends every thing is common. True friendship is imperishable. In performing the usages of religion he required piety of soul. The gods are to be worshipped by symbols corresponding to their nature, by simple purifications and offerings, and with purity of heart. An oath should never be violated. The dead must not be burned. Next to the gods and demons, the highest respect belongs to parents and lawgivers. The laws and customs of our country are to be sacredly observed."

QUADRATUS.—The name of an early Christian writer who lived during the reigns of the emperors Trajan and Adrian. His celebrated work, entitled "An Apology for the Christian Religion," was written with much ability; a fragment of it, however, only now remains. The time of his death is not known with any degree of certainty.

QUANTZ, JOHN JOACHIM, a celebrated flute-player, who is best known as a teacher of the flute to Frederic the Great. He was born in Hanover in 1697. His father was a smith. After holding several appointments he was invited, in 1741, by the king

of Prussia, to Berlin, and remained with that monarch until his death in 1773. He did much to improve his instrument, and is said to have composed 299 concertos and 200 solos for his royal pupil, of which few came before the public. Frederic was very fond of him, and caused a monument to be erected to him after his death.

QUARLES, FRANCIS, an English poet, who was born in 1592 near Romford in Essex, and received his education at Cambridge, and entered at Lincoln's Inn. He was under-secretary to Archbishop Usher in Ireland, from which country he was driven, with the loss of his property, by the rebellion of 1641, and was appointed chronologer to the city of London. At the commencement of the civil wars he wrote a work entitled "The Loyal Convert," which gave offence to the parliament; and, when he afterwards joined the king at Oxford, his property was sequestered, and his books and MSS. plundered. He was so much affected by his losses that grief is supposed to have hastened his death in 1644. Of the works of Quarles, in prose and verse, the most celebrated is his "Embleins," a set of designs in prints, illustrated by verses. A great part of them are borrowed from the "Emblems" of Hermannus Hugo, but the verses are his own, and, in the midst of much false taste and conceit, contain frequent bursts of fancy and strokes of pathos.

QUATREMERRE-DE-QUINCY, ANTOINE CHRYSOSTOME, a distinguished French *savant*, who was distinguished for his literary taste and talents before the commencement of the revolution. He embraced the cause of moderate reform, and in 1791 was chosen deputy for Paris to the legislative assembly, where he was the advocate of the constitutional monarchy. His firmness and moderation could not fail to displease the violent; and he was among the deputies who, on the 8th of August, were insulted on coming out of the assembly. After the dissolution of the legislative assembly, Quatremere was thirteen months in prison, and, after the proscriptions of 1793, his horror of the terrorists was such that he became one of the leaders of the insurrection of the 5th of October, 1795. The party of the Jacobins having triumphed, he was condemned to death for contumacy, in not appearing to a charge of having excited a revolt against the convention. He escaped; and a jury having, in July 1796, declared that no revolt had existed on that occasion, he came forward, took his trial, and pronounced a discourse on his acquittal, which was distinguished for its boldness and strength. The department of the Seine named him, in 1797, deputy to the council of five hundred; but his opposition to the revolutionists of that day involved him in the sentence of banishment of the 5th of September, 1797. He again escaped, and was recalled in December 1799 by the consuls. In 1800, having been named member of the general council of the department of the Seine, he was appointed secretary to that body, and was afterwards called to the national institute, in the class of history and ancient literature. In 1814 he was made officer of the legion of honour, censor royal, and intendant of arts and public monuments. In 1815 he was named member of the council of public instruction. He was appointed editor of the "Journal des Savants," for the department of the fine arts, in 1816, and knight of St. Michael in 1817. His funeral discourses on many of his departed fellow academi-

cians were distinguished for their rich and powerful eloquence.

QUESNAY, FRANCIS, a French physician who was principally celebrated as a writer on political economy. He was born in 1694, and died at Paris in 1774. His father was a farmer, and he acquired the rudiments of his profession under a country surgeon; after which, on going to the metropolis, he became secretary to a society established for the improvement of surgery. At length he took the degree of M. D., and obtained the situation of physician to Madame de Pompadour, the mistress of Louis XV., and through her interest became physician to the king. Amid the intrigues of a licentious court, he observed a simplicity of manners and apparent disinterestedness, which formed a strong contrast with the characters of those around him. Towards the latter part of his life he became the founder of the political sect of the economists. He was the author of various surgical and medical works, several articles in the "Encyclopédie," and tracts on politics, including "A Treatise on Physiocracy, or the Government Most Advantageous to the Human Race."

QUEVEDO-VILLEGAS, DON FRANCISCO DE, a Spanish poet, who was born at Madrid in 1580, and studied at Alcala de Henares. Besides the ancient languages, his course of studies comprised theology, medicine, and philosophy, as he was unwilling to devote himself to any professional pursuit. He combined extensive learning with much wit and great originality. In consequence of a duel, in which his adversary fell, he fled to Italy, where his services gained him the confidence and friendship of the duke of Ossuna. After having visited Germany and France, Quevedo returned to Spain; and on account of his connexions with the duke, then in disgrace, he was arrested and confined to his estate, La Torre de Juan, for three years. To restore his health, impaired by his confinement, he travelled through Spain, and afterwards lived in retirement on his estate, where he probably wrote his poems, published under the title of "The Bachelor of La Torre." Philip IV. conferred on him the place of secretary, and in 1634 Quevedo married the sister of the archbishop of Narazán. But at the age of sixty-eight years he was imprisoned for a libel on the duke of Olivarez, which was imputed to him without any proofs. He was released after two years' confinement, but his health had suffered much from his imprisonment. Being banished from court, he retired to his estate, which had been repeatedly plundered while he was in prison, and died at Villa Nueva de los Infantes in 1645. His works are various in their character. His humorous productions are distinguished for playfulness, wit, and invention. His prose works are mostly effusions of humour and satire. His "Visions" have been translated into most European languages; his "Vida del Gran Tacano" is a comic romance of the sort called by the Spaniards a "picaresco." He also translated the "Enchiridion" of Epictetus into Spanish. His works were published at Brussels, in three volumes quarto, in 1660 and in 1670, and have since been repeatedly reprinted.

QUICK, JOHN, an eminent nonconformist divine, who was born at Plymouth in 1636, and studied at Exeter college, Oxford. After taking his degree of B. A. he returned to his native county, and was ordained according to the forms then in use. He first officiated at Ermington, in Devonshire, whence he

was invited to be minister of Kingsbridge and Churchstow, in the same county; but afterwards removed to Brixton, whence he was ejected in 1662. He had some valuable preferments offered to him if he would conform, but his opinions were fixed; for, besides having been educated in the principles of the non-conformists, he had this additional difficulty, that he was one of those whom the law required to be re-ordained before admission into the church, their previous ordination being accounted invalid. He continued for some time after his ejection to preach to his people, but was repeatedly prosecuted and imprisoned. He accepted an offer made in 1679 to be pastor of the English church at Middleburgh, in Zealand. Here, however, were some dissensions which rendered his situation uncomfortable, and induced him to return to England in 1681, where he preached privately during the remainder of King Charles II.'s reign, and afterwards taking advantage of King James's indulgence, formed a congregation in Bartholomew Close. He died in April 1706, in the seventieth year of his age. Besides three funeral sermons, he published two tracts, the one, "The Young Man's Claim to the Sacrament of the Lord's Supper," the other, "An Answer to that Case of Conscience, Whether it be Lawful for a Man to Marry his deceased Wife's Sister?" But his most valuable work is his "Synodicon in Gallia Reformata; or the Acts, Decisions, Decrees, and Laws of the famous National Councils of the Reformed Churches in France, &c." This work is composed of very interesting and authentic memorials, collected probably while he was in Zealand. It comprises a history of the rise and progress of the reformation in France, down to the revocation of the edict of Nantes in 1685.

QUICK, JOHN, a highly gifted English actor, who was born in 1748 in London, where his father was an opulent brewer. He early in life displayed a strong predilection for the stage. After playing in several parts of the country, he was engaged by Foote at the Haymarket, where he did not remain long, but procured an engagement at Covent Garden. Quick may be considered as the last of the Garrick school, and deservedly enjoyed for thirty-six years the favour of the public. In 1798 he retired from the stage; but he subsequently played a few nights at the Lyceum, after the destruction of Covent Garden by fire. His death took place at Islington, on the 4th of April, 1831. Mr. Davenport, the son-in-law of this gentleman, is well known in the literary world by the extent and variety of his publications.

QUIN, JAMES, an eminent English actor, who was born in London in 1693, but was educated in Dublin. His father had married a supposed widow, whose husband, after a long absence, returned and claimed her; on which account Quin, who was the offspring of the connexion, was deemed illegitimate, and upon his father's death in 1710, was left without a fortune. This interruption of his prospects prevented him from being adequately educated for a profession, and he had recourse to the Dublin stage in 1715, and in a year after secured an engagement at Drury Lane theatre. In 1717 he quitted Drury Lane for the theatre in Lincoln's Inn Fields, where he remained seventeen years, and gradually acquired celebrity in characters of grave, dignified, and sententious tragedy, as in *Cato*, *Zanga*, and *Coriolanus*, and in those of strong sarcastic comic humour, as *Falstaff*, *Volpone*, and *Sir John Brute*. In 1732 he

removed with the same company to Covent Garden, but in 1735 was induced to join that of Fleetwood at Drury Lane, on such terms as no actor had previously received; and he retained the pre-eminence until the appearance of Garrick in 1741. In 1747 he was engaged at Covent Garden with Garrick; but the new actor obtained so great a share of attention as to have gradually induced Quin to retire. His last performance was *Falstaff*, in which character he is supposed never to have been exceeded. He survived his retreat several years, which he spent chiefly at Bath, where his fund of anecdote and pointed sense made him much sought after. Quin, who was convivial, and too fond of the bottle, was often coarse and quarrelsome on these occasions, which led to two or three hostile encounters, one of which proved fatal to his antagonist. He was otherwise manly, sensible, and generous; and his deliverance of Thomson, although then unknown to him, from an arrest by a present of 100*l.*, is much to his honour. He died at Bath in 1766, aged seventy-three. Garrick, once his rival and afterwards his friend, wrote the epitaph for his monument in Bath cathedral.

QUINAULT, PHILIPPE, a distinguished French opera writer, who was born in 1635. He was the son of a baker, and had no advantages of education. Excepting some instruction in regard to versification by Tristan L'Hermite, he owed every thing to his own industry and talent. Even before the twentieth year of his age he brought out some plays, and for several years continued to write with success for the stage. His success, however, only rendered him a mark for the satire of Boileau, who attacked him with so much bitterness as to have injured his own fame. Quinault then abandoned tragedy, which he felt not to be his province; and connecting himself with Lully, laboured for the opera. In this lyric department of poetry he displayed such talents as to be placed above all his competitors, and to be ranked by the best judges among the most distinguished men of the age of Louis XIV. There is nothing in the French language more delicate, tender, and ingenious, than the turn of his songs and love dialogues. Boileau, and the other censurers of Quinault, attributed the success of his pieces solely to the merit of Lully's music; which, however, is now forgotten, while Quinault's verse is always read with pleasure. His "*Armide*," which appeared in 1686, and his "*Atys*," are masterpieces in their kind. Quinault, who was not without experience in affairs of business, married the widow of a rich merchant, whose estate he had settled, and purchased the post of auditor in the chamber of accounts. He was soon after received into the French academy, and in the name of that body congratulated the king on his return from the campaigns of 1675 and 1677. The flattery which he employed in his prologues obtained him a pension. A melancholy, produced probably by the decline of his health, disturbed the happiness of his last years. He was filled with regret for having devoted his talents to theatrical productions, and determined to apply what remained of his powers to the honour of God and the king. He began a poem upon the extirpation of protestantism in France, which, however, would only have diminished his reputation. He died in 1688. In society Quinault was polite, amiable, and kind; and, besides his theatrical pieces, he was the author of several occasional poems.

QUINCY, JOHN, an eminent physician who was

also distinguished as a medical writer. He practised his profession and delivered lectures in London for many years with great success, and died in the metropolis in 1723. His principal works are, "The Dispensatory of the Royal College of Physicians, translated with Notes and Remarks," and his "Lexicon Physico-Medicum, or a New Physical Dictionary."

QUINCY, JOSIAH, an eminent American patriot, who was born in Boston in 1744. He acquired the rudiments of a classical education at Braintree, and in 1759 entered Harvard college, where he became conspicuous for industry, zeal, and talent. In 1763 he graduated, and three years afterwards he received the degree of master of arts. Immediately after he entered the office of Oxenbridge Thatcher, a distinguished lawyer of Boston, who was subsequently associated with James Otis against the famous writs of assistance. He had not been long admitted to the bar before he obtained an extensive practice and high professional rank. He made himself equally conspicuous by the ardour with which he wrote and spoke against the encroachments of the mother country. In October 1769 he married the eldest daughter of William Phillips, Esq., and in the following year he was called upon to perform a duty which it required all his strength of mind to discharge. On the 5th of March in that year occurred, what is called the "Boston massacre." A party of British soldiers, under the command of Captain Preston, having fired upon and killed a number of persons in a mob, by whom they had been attacked with stones and other missiles, Captain Preston and the accused soldiers selected John Adams and Mr. Quincy for their defenders, notwithstanding the intense hostility which those gentlemen had always evinced towards the proceedings of England. It was a trying moment for both of those patriots. The soldiery had acted in self-defence, and were entitled to the best means of obtaining justice; but the public feeling was so bitter against them, that the advocates they had chosen saw inevitable odium in undertaking their cause. They nevertheless did what duty demanded, and the soldiers were acquitted with the exception of two, who received a slight punishment. For a time the well-earned popularity of their defenders remained under a cloud, but only to shine afterwards with greater brightness. Until 1772 Mr. Quincy continued actively engaged in his profession, at the same time constantly disseminating his patriotic sentiments by writing; but in that year his naturally delicate constitution became so much exhausted by unremitted occupation, that he was obliged to abandon all business. His complaint assumed a pulmonary character, and in February 1773 it was decided that his only hope of life depended upon an immediate change to a more southern climate. Accordingly, on the 8th of that month, he embarked for Charleston, South Carolina. He returned to Boston by land in the ensuing May, so much improved in health as to be able to resume his professional and political labours.

In May 1774 he published his chief political work, entitled "Observations on the Act of Parliament, commonly called the Boston Port Bill, with Thoughts on Civil Society and Standing Armies," which is affixed to the interesting memoir of him written in 1825 by his son Josiah Quincy, then president of Harvard college. Soon after this work was advertised as being in the press, he received a communication signed "Your well-wisher," in which he

was warned of the imminent danger the writer considered him in, "of the loss of life and confiscation of his estate," and at the same time was conjured to abandon his "treasonable and rebellious" course, and devote his "rare talents" to reconciling the people with the English government, instead of "keeping up their frenzy." To this he published a reply in the "Massachusetts Gazette," in which is this passage:—"The danger and the wrongs of my country are to me equally apparent. In all my public exertions I feel a sense of right and duty, that not only satisfies my conscience, but inspires my zeal. While I have this sentiment, I shall persevere till my understanding is convinced of its error—a conviction that will not be wrought by the arm of power, or the hand of an assassin." In September 1774 Mr. Quincy sailed for England, at the urgent solicitation of his political friends, who supposed that he might be of great service to his country in London. He landed at Falmouth, and proceeded thence to the metropolis. In London he became intimately acquainted with the principal Whigs, and was unremitting in his labours to promote his country's interests in every way that was in his power. He maintained a constant correspondence with many of the patriotic leaders in America, which, together with his interesting journal, is contained in the volume of his son, to which we have referred. After remaining in London until March 1775 he embarked for America, because his intimate friends in that city thought that his return there would be of great advantage to the cause for which he was toiling, though his health had been for some time in such a state that his physician had strongly advised his remaining in England, and trying the Bristol air and water, and he himself was convinced that his recovery depended upon following the advice. He never reached his native shores. He grew worse and worse during the voyage, and on the 20th of April, when in sight of land, breathed his last, at the early age of thirty-one years, a martyr to his love of country.

QUINTILIANUS, or QUINCTILIANUS, MARCUS FABIVS, an eminent writer, who flourished in the first century of the Christian era, and at an early age left Calaguris, now Calahorra, in Spain, the place of his birth, for Rome, where he first distinguished himself as an advocate, and afterwards as a rhetorician and writer. Some of the most eminent Romans were his pupils, and the emperor Domitian bestowed on him the consular dignity. During the reign of that emperor Quintilian wrote his excellent work, "De Institutione Oratoria," which contains a system of rhetoric; it exhibits him as a practised master, a man of taste and talents, and a worthy imitator of Cicero. The tenth book, which contains his opinions of Greek and Roman writers, is particularly interesting and important for the history of literature, and is characterized no less by acuteness than cogency of reasoning. There are also a considerable number of rhetorical speeches or declamations attributed to him, but they are not considered genuine. A treatise, "De Oratoribus sive de Causis Corruptæ Eloquentiæ," is often published with his works, but is also ascribed to Tacitus and to other writers.

QUINTUS CALABER, or SMYRNÆUS, a Greek poet, the time and place of whose birth are uncertain. His surnames are derived from the discovery of his poem in Calabria, and his mention of Smyrna as the place of his residence. He probably flourished in the

fourth century, A. D. His "Supplement to Homer," is a continuation of the Iliad, in which Homer is indeed imitated, but by no means equalled in grace and simplicity. One of the best critical editions of this work is by Tychsen, with remarks by Heyne.

QUIROGA, ANTONIO, a celebrated leader of the Spanish troops, who, in January 1820, declared themselves in favour of the constitution of the cortes of 1812. He was born in Galicia in 1784, of a very respectable family. After having served in the navy, he entered the army in 1808 and distinguished himself under Morillo in the war of Spanish independence. In 1814 he was made lieutenant-colonel, and a few years after, colonel in the forces designed for America. Perceiving the discontent of the troops, Quiroga, in 1819, placed himself at the head of the conspiracy got up under the influence of the general, Count Del Abisbal; the latter, however, having divulged the fact of the conspiracy, Quiroga and several other officers were thrown into prison, from which they were released by the insurrection of the troops under Riego in January 1820. Quiroga was now promoted to a major-generalcy, and chosen by the province of Galicia member of the extraordinary cortes of 1820. In this body he was distinguished no less for his moderation and prudence than for his zeal, opposing with equal firmness and eloquence the encroachments of power and popular licentiousness. In 1821 he was appointed commander-in-chief of the second military province, Galicia, and the cortes voted him an estate as a mark of the national gratitude; but he declined to accept it as he considered the burdens of the nation already too great. In March 1822 a duel took place between him and the deputy, Morena Guerra, in consequence of the latter having insulted him in several letters. It was arranged that only one pistol should be loaded, and that lots should be drawn for it. Chance put it into the hands of Quiroga, and he immediately fired it into the air. In the campaign of 1823 he commanded the fourth division under Morillo, and when the latter entered into a kind of convention of neutrality with the enemy, Quiroga separated from him, and attempted to defend Corunna against the French; but his means were insufficient, and after further ineffectual attempts in defence of the constitution, he retired to England. In 1830 he was one of the patriots who endeavoured to organize a new insurrection in Spain by an invasion from the Pyrenees, but the attempt was without success.

RABANUS, MAURUS MAGNENTIUS, a learned German prelate, who was born in 785 at Mayence, received his first instruction at Fulda, and afterwards became the disciple of Alcuin at Tours. In 822 he was made abbot of Fulda. In 839 the monks expelled him, alleging that in consequence of his devoting so much time to his studies the affairs of the monastery were neglected. They afterwards wished him to resume the government, but he declined and remained in retirement until 847, when he was made bishop of Mayence. One of his first acts was to summon a council, in which he procured the condemnation of Godeschalc, for maintaining the doctrine of St. Augustine respecting predestination and grace. Rabanus died in 856. He was a man of great learning, which he displayed in several treatises and commentaries which were published in 1627 at Cologne, in three volumes folio.

RABAUT DE ST. ETIENNE, JOHN PAUL,

a French protestant clergyman and advocate, who was born in 1741 at Nismes, for which city he was chosen a deputy to the constituent assembly in 1789. He had previously obtained some reputation by his writings, and possessing eloquence and address he appeared with advantage as a public speaker. He distinguished himself at first as one of the warmest advocates for innovation; but on being elected a member of the national convention, his ardour in some degree subsided. He had the courage to speak against the right of the convention to sit in judgment on Louis XVI.; but his sentiments and his connexions with the Girondists proved his destruction. He was arrested June 2, 1793, but made his escape, and was declared an outlaw on the 28th of July. He returned to Paris and found an asylum in the house of his brother. Being discovered by accident, he was guillotined, December 5, 1793. He published several historical and political works, among which are "*Lettres sur l'Histoire Primitive de la Grèce*," and "*Précis de l'Histoire de la Révolution de France*."

RABELAIS, FRANCOIS, a clever French writer and satirist, who was born in Touraine about 1483, and spent many of his early years in the convent of the Franciscans at Fontenay le Compté. He subsequently entered the order of the Benedictines, but soon after went to Montpellier as a secular priest, and afterwards studied medicine, received the degree of doctor, and taught and practised the medical profession. Remorse or fear induced him to procure from Paul III. absolution for the violation of his monastic vows, and he spent some time as canon in the abbey of Saint Maur des Fossés, where he was placed by the interest of his patron, the cardinal du Bellay, and where he is supposed to have written a considerable part of his "*Pantagruel*." He was afterwards transferred to Meudon as parish priest. He died at Paris in 1553. Voltaire censures the "*Gargantua*" and "*Pantagruel*," in which the taste of the age for the wonderful and the ignorance of the monks are severely satirized; but the buffoonery which it contains must be attributed to the spirit of the age and not to the taste of Rabelais, who is, however, much below Servantes in humour. He was one of the first to give flexibility and finish to the yet rude and harsh language of his country. Boileau calls him "*la raison en masque*," and Rousseau, "*le gentil maître François*." Rabelais was a conscientious teacher of his people, and it was his pleasure to instruct the children of his parish in sacred music. His house was the resort of the learned, his purse was always open to the needy, and his medical skill was employed in the service of his parish. His work cannot now be easily understood without glossaries and commentaries, the best of which is in the edition of Le Duchat, with engravings by Picart.

RABENER, GOTTLIEB WILLIAM, a German satirist, who was born in 1714, near Leipsic, and was comptroller of the taxes for the circle of Leipsic until his death in 1771. His works were re-published several times, but the latest edition appeared at Leipsic in 1771. His life, by Weisse, appeared in 1772. He never allowed himself to indulge in personalities, but chastised folly in general. His satire would be considered rather tame in this country, where the party contentions incident to a free government give rise to violent abuse and biting ridicule unheard of in arbitrary governments. His works have been translated into French and Dutch. A report of his death be-

came current long before his actual decease; so that he had the pleasure of learning what people said about him.

**RACINE, JOHN.**—This distinguished dramatist who shares with Corneille the honours of French tragedy, was born at La Ferte Milon in 1639, and received his education at Port Royal, where he made great progress in scholastic knowledge. He afterwards removed to the college at Harcourt, where he went through a course of philosophy. He was first known as an author by a poem composed on the marriage of Louis XIV., called the "Nymph of the Seine," for which he received a pension. The success of this little piece induced him to devote his talents to the service of the theatre, and he successively produced "Andromache," "Berenice," "Iphigenia," and "Phedra," which were received with great applause, notwithstanding the opposition which envy and cabal are ever ready to raise against superior genius, and although Corneille was then in his highest reputation.

After the publication of "Phedra," Racine formed the resolution of quitting the theatre for ever, although he was only thirty-eight years of age, and his talents in full vigour. From his infancy he had entertained a deep sense of religion, and though these pious sentiments had been smothered by his connexions with the theatre, it now triumphed over all other considerations. Not only did he resolve to write no more plays, but likewise to perform a rigorous penance for those he had already written, and had actually formed the design of becoming a Carthusian friar. But his religious director counteracted this intention, and advised him to marry, and he complied with this advice. Although Racine had made it a point of religion to renounce poetry, he could not resist the entreaty of Madame de Maintenon to compose a tragedy for her young ladies at the convent of St. Cyr, and to take the subject from the Bible. Racine composed "Esther," which was received with universal applause; this was followed two years after by "Athalie," which did not then meet with the success it deserved, and which it has since received from the impartial judgment of posterity.

Disappointed with the unfavourable reception of this piece, Racine became more disgusted than ever with poetry, which he now totally renounced. He passed the latter years of his life in composing a "History of the House of Port Royal," where he was educated. Racine possessed great sensibility and delicacy of mind, which contributed to shorten his life. For though he had been much at court, his simplicity of character had not learned the art of disguising his sentiments. Having drawn up a memorial upon the miseries of the people, and the means of relieving them, he lent it to Madame de Maintenon to read. It came to the knowledge of the king, who commended the zeal of Racine, but disapproved his interfering with political affairs, and said, with an angry tone, "Because he knows how to write good verses, does he think he knows every thing? And would he be a minister of state because he is a great poet." These words so sensibly affected Racine, that it brought on a fever, of which he died on the 22nd of April, 1699.

The king, who appreciated his talents, often sent to him during his illness, and finding after his death that his fame was greater than his riches, settled a handsome pension upon his family. Tenderness and delicacy, united to an elegant and correct style, con-

stitute the merit of his immortal tragedies. Corneille might surpass him in heroic sentiments and the epic character of his personages, but the great art of moving the passions, and interesting the heart, was the peculiar talent of Racine. We subjoin his autograph.

Racine (

**RADCLIFFE, ANNE.**—This eminent English authoress was born in London on the 9th of July, 1704, and having received a good education was married at Bath, where her parents then resided, to Mr. Radcliffe, who subsequently became proprietor and editor of "The English Chronicle." The following description of her person and habits is from the pen of a contemporary:—

"This admirable writer, whom I remember from about the time of her twentieth year, was, in her youth, of a figure exquisitely proportioned, while she resembled her father, and his brother and sister, in being low of stature. Her complexion was beautiful, as was her whole countenance, especially her eyes, eyebrows, and mouth. Of the faculties of her mind let her works speak. Her tastes were such as might be expected from those works. To contemplate the glories of creation, but more particularly the grander features of their display, was one of her chief delights; to listen to fine music was another. She had also a gratification in listening to any good verbal sounds, and would desire to hear passages repeated from the Latin and Greek classics, requiring, at intervals, the most literal translations that could be given, with all that was possible of their idiom, howmuchsoever the version might be embarrassed by that aim at exactness. Though her fancy was prompt, and she was, as will readily be supposed, qualified in many respects for conversation, she had not the confidence and presence of mind, without which a person conscious of being observed can scarcely be at ease, except in long-tried society. Yet she had not been without some good examples of what must have been ready conversation in more extensive circles. Besides that a great part of her youth had been passed in the residences of her superior relatives, she had the advantage of being much loved, when a child, by the late Mr. Bentley, to whom, on the establishment of the fabric known by the name of Wedgwood and Bentley's, was appropriated the superintendence of all that related to form and design. Mr. Wedgwood was the intelligent man of commerce and the able chemist; Mr. Bentley the man of more general literature and of taste in the arts. One of her mother's sisters was married to Mr. Bentley, and, during the life of her aunt, who was accomplished 'according to the moderation,'—may I say, the wise moderation?—of that day, the little niece was a favourite guest at Chelsea, and afterwards at Turnham Green, where Mr. and Mrs. Bentley resided. At their house she saw several persons of distinction for literature, and others, who, without having been so distinguished, were beneficial objects of attention for their minds and their manners. Of the former class the late Mrs. Montague, and once, I think, Mrs. Piozzi; of the latter, Mrs. Ord. The gentleman called Athenian Stuart was also a visitor there."

Thus connected, in a manner which must have in-

duced her to cherish her literary powers, Mrs. Radcliffe first came before the public as a novelist in 1789, only two years after her marriage, and when she was twenty-four years old. A romance, entitled "*The Castles of Athlin and Dunbayoe*," which she then produced, gave but moderate intimation of the authoress's peculiar powers. The scene is laid in Scotland during the dark ages, but without any attempt to trace either the peculiar manners or scenery of the country; and although, in reading the work with that express purpose, we can now trace some germs of that taste and talent for the wild, romantic, and mysterious, which the authoress afterwards employed with such effect, we cannot consider the work, on the whole, as by any means worthy of her pen. It is always, however, of consequence to the history of human genius to preserve its earlier efforts, that we may trace, if possible, how the oak at length germinates from the unmarked acorn. Mrs. Radcliffe's genius was more advantageously displayed in the "*Sicilian Romance*," which appeared in 1790. This work displays the exuberance and fertility of imagination which was the authoress's principal characteristic. Adventures heaped on adventures in quick and brilliant succession, with all the hair-breadth charms of escape or capture, hurry the reader along with them, and the imagery and scenery by which the action is relieved are like those of a splendid oriental tale. Still this work had marked traces of the defects natural to an unpractised authoress. The scenes were inartificially connected, and the characters hastily sketched, without any attempt at individual distinctions, being cast in the usual mould of ardent lovers, tyrannical parents, with domestic ruffians, guards, and others, who had wept or stormed through the chapters of romance without much alteration in their family habits or features for a quarter of a century before Mrs. Radcliffe's time. Nevertheless, the "*Sicilian Romance*" attracted much notice among the novel readers of the day, as far excelling the ordinary meagreness of stale and uninteresting incident with which they were at that time regaled from the Leadenhall press. Indeed the praise may be claimed for Mrs. Radcliffe of having been the first to introduce into her prose fictions a tone of fanciful description and impressive narrative, which had hitherto been exclusively applied to poetry.

"*The Romance of the Forest*," which appeared in 1791, placed the authoress at once in that rank of pre-eminence in her own particular style of composition in which her works have ever since maintained her. Her fancy in this new effort was more regulated, and subjected to the fetters of a regular story. The persons, too, although perhaps there is nothing very original in the conception, were depicted with skill far superior to that which the authoress had hitherto displayed, and the work attracted the public attention in proportion. That of *La Motte*, indeed, is sketched with particular talent, and most part of the interest of the piece depends upon the vacillations of a character who, though upon the whole we may rather term him weak and vicious than villainous, is, nevertheless, at every moment on the point of becoming an agent in atrocities which his heart disapproves of. He is the exact picture of "the needy man who has known better days," and who spited at the world from which he had been expelled with contempt, and condemned by circumstances to seek an asylum in a desolate castle full of mysteries and horrors, avenges himself

by playing the gloomy despot within his own family, and tyrannizing over those who were subjected to him only by their strong sense of duty. A more powerful agent appears in the scene—obtains the mastery over this dark but irresolute spirit, and, by alternate exertion of seduction and terror, compels him to be his agent in schemes against the virtue and even the life of an orphan, whom he was bound in gratitude, as well as in honour and hospitality, to cherish and protect. The heroine, too, wearing the usual costume of innocence, purity, and simplicity, as proper to heroines as white gowns are to the sex in general, has some pleasing touches of originality. Her grateful affection for the *La Motte* family—her reliance on their truth and honour when the wife had become unkind, and the father treacherous towards her, is an interesting and individual trait in her character.

Passing some minor works we come to "*The Mysteries of Udolpho*." The very name was fascinating, and the public, who rushed upon it with all the eagerness of curiosity, rose from it with unsated appetite. When a family was numerous the volumes flew, and were sometimes torn from hand to hand, and the complaints of those whose studies were thus interrupted were a general tribute to the genius of the authoress. One might still be found of a different and higher description in the dwelling of the lonely invalid, or neglected votary of celibacy, who was bewitched away from a sense of solitude, of indisposition, of the neglect of the world, or of secret sorrow, by the potent charm of this mighty enchantress. Perhaps the perusal of such works may, without injustice, be compared with the use of opiates, baneful when habitually and constantly resorted to, but of most blessed power in those moments of pain and of languor, when the whole head is sore, and the whole heart is sick.

In general "*The Mysteries of Udolpho*" was, at its first appearance, considered as a step beyond Mrs. Radcliffe's former work, high as that had justly advanced her. Yet there were persons of no mean judgment to whom the simplicity of "*The Romance of the Forest*" seemed preferable to the more highly coloured and broader style of "*The Mysteries of Udolpho*;" and it must remain matter of opinion, whether their preference be better founded than in the partialities of a first love, which, in literature as in life, are often unduly predominant. With the majority of the public, the superior magnificence of landscape, and dignity of conception of character, secured the palm for the more recent work.

"*The Italian*" appeared in 1790, and obtained a share of public favour equal to any of its predecessors. Here, too, the authoress had with much judgment taken such a difference, that while employing her own peculiar talent and painting in the style of which she may be considered the inventress, she cannot be charged with repeating or copying herself. She selected the new and powerful machinery afforded her by the Popish religion, when established in its paramount superiority, and thereby had at her disposal monks, spies, dungeons, the mute obedience of the bigot, the dark and denominating spirit of the crafty priest,—all the thunders of the Vatican, and all the terrors of the inquisition. This fortunate adoption placed in the hands of the authoress a powerful set of agents, who were at once supplied with means and motives for bringing forward scenes of horror; and thus a tinge of probability was thrown

over even those parts of the story which are most inconsistent with the ordinary train of human events. Most writers of romance have been desirous to introduce their narrative to the reader in some manner which might at once excite interest, and prepare his mind for the species of excitation which it was the authoress's object to produce. In "The Italian" this has been achieved by Mrs. Radcliffe with an uncommon degree of felicity, nor is there any part of the romance itself which is more striking than its impressive commencement.

The plan of the last-mentioned work, "The Italian," is as follows:—A youth of high birth and noble fortune becomes enamoured of a damsel of low fortunes, unknown race, and all that portion of beauty and talents which belongs to a heroine of romance. This union is opposed by his family, and chiefly by the pride of his mother, who calls to her aid the real hero of the tale, her confessor Father Schedoni, a strongly drawn character as ever stalked through the regions of romance, equally detestable for the crimes he has formerly perpetrated, and those which he is willing to commit; formidable from his talents and energy; at once a hypocrite and a profligate, unfeeling, unrelenting, and implacable. With the aid of this agent, Vivaldi, the lover, is thrown into the dungeons of the inquisition, while Ellena, his bride, is carried by the pitiless monk to an obscure den, where, finding the services of an associate likely to foil his expectation, he resolves to murder her with his own hand. Hitherto the story, or, at least the situation, is not altogether dissimilar from "The Mysteries of Udolpho;" but the fine scene, where the monk, in the act of raising his arm to murder his sleeping victim, discovers her to be his own child, is of a new, grand, and powerful character; and the horrors of the wretch, who, on the brink of murder, has but just escaped from committing a crime of yet more exaggerated horror, constitute the strongest painting which has been under Mrs. Radcliffe's pencil, and are well fitted to be actually embodied on canvass by some great master. In the prisons of the inquisition the terrific Schedoni is met, counterplotted, and at length convicted, by the agency of a being as wicked as himself, who had once enjoyed his confidence. Several of these pauses of breathless suspense are thrown in during the detail of these intrigues, by which Mrs. Radcliffe knew so well how to give interest to the work.

The following extract will serve to display Mrs. Radcliffe's powers of description:—"These excursions sometimes led to Puzzuoli, Baia, or the woody cliffs of Pausilippo; and as, on their return, they glided along the moonlight bay, the melodies of Italian strains seemed to give enchantment to the scenery of its shore. At this cool hour the voices of the vine-dressers were frequently heard in trio, as they reposed after the labour of the day on some pleasant promontory, under the shade of poplars; or the brisk music of the dance from fishermen on the margin of the waves below. The boatmen rested on their oars, while their company listened to voices modulated by sensibility to finer eloquence than it is in the power of art to display; and at others, while they observed the airy natural grace which distinguishes the dance of the fishermen and peasant girls of Naples. Frequently as they glided round a promontory, whose shaggy masses impended far over the sea, such magic scenes of beauty unfolded,

adorned by these dancing groups on the bay beyond, as no pencil could do justice to. The deep clear waters reflected every image of the landscape; the cliffs, branching into wild forms, crowned with groves, whose rough foliage often spread down their steep in picturesque luxuriance; the ruined villa on some bold point peeping through the trees; peasants' cabins hanging on the precipices, and the dancing figures on the strand—all touched with the silvery tint and soft shadows of moonlight."

One specimen of Mrs. Radcliffe's poetical productions is all that our space admits of. It is an "Address to Melancholy," and breathes a spirit of the tenderest and best regulated feeling:—

"Spirit of love and sorrow—hail!  
Thy solemn voice from far I hear,  
Mingling with evening's dying gale:  
Hail, with this sadly-pleasing tear!

"O! at this still, this lonely hour,  
Thine own sweet hour of closing day,  
Awake thy lute, whose charmed power  
Shall call up Fancy to obey;

"To paint the wild romantic dream,  
That meets the poet's musing eye,  
As on the bank of shadowy stream  
He breathes to her the fervid sigh.

"O lonely spirit! let thy song  
Lead me thro' all thy sacred haunt;  
The minster moonlight aiales along,  
Where spectres raise the midnight chant!

"I hear their dirges faintly swell!  
Then, sink at once in silence drear,  
While, from the pillar'd cloister's cell,  
Dimly their gliding forms appear!

"Lead where the pine-woods wave on high,  
Whose pathless sod is darkly seen,  
As the cold moon, with trembling eye,  
Darts her long beams the leaves between.

"Lead to the mountain's dusky head,  
Where, far below, in shades profound,  
Wide forests, plains, and hamlets spread,  
And sad the chimes of vesper sound.

"Or guide me where the dashing oar,  
Just breaks the stillness of the vale,  
As slow it tracks the winding shore,  
To meet the ocean's distant sail:

"To pebbly banks, that Neptune laves,  
With measured surges, loud and deep,  
Where the dark cliff bends o'er the waves,  
And wild the winds of autumn sweep.

"There pause at midnight's spect'ring hour,  
And list the long resounding gale;  
And catch the fleeting moonlight's power,  
O'er foaming seas and distant sail."

Mrs. Radcliffe suffered much in the latter years of her life from the attacks of asthma, of which she died in London in 1823.

RADCLIFFE, DR. JOHN, a celebrated medical practitioner, who was born in Yorkshire in 1650, and received the early part of his education in the town of Wakefield. He was subsequently sent to Oxford to continue his studies, and in 1672 took his degree of 'M. A., after which he directed his attention to the study of medicine. He commenced practice in 1679.

Radcliffe appeared to have many enemies in the university, and, among others, Dr. Marshall, the rector of Lincoln college, who could not forgive him for some satirical remarks he had made on him; he therefore showed his enmity to him, by opposing Radcliffe's application for a "faculty-place" in the college; which would have been a dispensation from entering into holy orders, which the statutes required, if he kept his fellowship; and he therefore was obliged to quit his fellowship in the year 1677. How-

ever, after his resignation, he was desirous of keeping his old chambers, and residing in them as a commoner; but meeting with some ill-will on that account also from Dr. Marshall, he thought fit to quit Lincoln college, and to reside elsewhere in the university.

In 1686 the princess Anne of Denmark appointed Dr. Radcliffe her principal physician, and in 1688, when matters were hastening on towards the introduction of the catholic religion, and all the court influence was employed to gain new converts, one of the court chaplains and a Dominican were commanded by King James II. to use their endeavours to bring Dr. Radcliffe over to their communion. They accordingly waited on him, and pressed him to embrace the catholic religion. Radcliffe heard what they had to say for some time, and then told them, "that he held himself obliged to his majesty for his charitable dispositions to him in sending them to him on so good an account as the saving his soul, which he would endeavour to show his acknowledgments of by his duty and loyalty; but, if the king would be graciously pleased to let him jog on in the way he had been bred up in during this life, he would run the risk of incurring the penalties they threatened him with in that which was to come." Some other attempts were made to induce him to change his religion; but these proving equally unsuccessful, his catholic friends gave up the point. In 1689 he paid his first tribute of gratitude to University college, into which he was first admitted, by making them a present of a window of painted glass, which he had put up over the altar of the chapel at his own expence.

At the revolution, Dr. Bidloo, the celebrated Dutch anatomist, came over with King William as his chief physician; and it was supposed that this would have caused Dr. Radcliffe to lose much of his practice among the great. But this was not the case, for his patients increased considerably. In 1691 William duke of Gloucester being taken violently ill with fainting fits, Dr. Radcliffe, who was then at Epsom, being sent for, came up to town, and attended his highness, whom he so perfectly restored that Queen Mary ordered her chamberlain on that account to make Mr. Radcliffe a present of 1000 guineas. In 1692 Dr. Radcliffe met with a very considerable loss. He had formed an acquaintance with Betterton, the eminent tragedian, who by the solicitation of a friend had deposited 2000*l.*, or, as others say, 8000*l.*, as a venture in an interloper that was about to set sail for the East Indies; and having a prospect of a very good return, he communicated the affair to Dr. Radcliffe, who, agreeably to his proposal, very readily invested 5000*l.* The ship was successful in the outward-bound passage; but having, to avoid the French privateers in her return home, first put into Ireland, and then finding no convoy ready, set out for England without one, she was taken by the Marquis de Nesmond, with all her rich cargo, which amounted to more than 120,000*l.*

In 1694 Queen Mary was seized with the small pox, which the court physicians not being able to raise, Dr. Radcliffe was sent for by the council. Upon perusing the recipes he told them, without seeing her majesty, that "she was a dead woman; for it was impossible to do any good in her case, where remedies had been given that were so contrary to the nature of the distemper; yet he would endeavour to do all that lay in him to give her some ease." Accordingly

the pustules began to fill by a cordial julap he prescribed for her majesty, which gave some faint hopes of her recovery; but these soon vanished, for Queen Mary died on the 28th of December, 1694.

Some time after Dr. Radcliffe, who had always stood high in the opinion of the princess of Denmark, afterwards Queen Anne, lost her favour by the uncourtliness of his behaviour. Her highness, being indisposed, had given orders that he should be sent for; in answer to which, he made a promise of coming to St. James's soon after; but as he did not make his appearance there, that message was backed by another, importing that she was extremely ill. At which Radcliffe swore "that her highness's distemper was nothing but the vapours, and that she was in as good a state of health as any woman breathing, could she but give into the belief of it." But on his going to wait on the princess not long after, he found that his freedom with her highness had been highly resented; for, offering to go into the presence, he was stopt by an officer in the antichamber, and told "that the princess had no further occasion for the services of a physician who would not obey her orders, and that she had selected Dr. Gibbons to succeed him in the care of her health." But though Dr. Radcliffe lost the favour of the princess Anne he still continued to retain that of King William.

In 1697, after King William's return from Loo, where he had ratified the treaty of peace made at Ryswick, his majesty found himself very much indisposed at his palace at Kensington, and after his physicians in ordinary had given their opinions, sent for Dr. Radcliffe's advice. When he was admitted, the king was reading Sir Roger L'Estrange's new version of "*Æsop's Fables*;" and told him that he had once more sent for him to try the effects of his skill, though he had been told by his body-physicians, who were not sensible of his inward decay, that he might yet live many years, and would very speedily recover. Upon which the doctor, having put some interrogatories to him, Dr. Radcliffe asked leave of his majesty to turn to a fable in the book before him, which would let him know how he had been treated by his physicians. Accordingly he read it to the king as follows: "'Pray Sir, how do you find yourself?' says the doctor to his patient. 'Why truly,' says the patient, 'I have had a most violent sweat.' 'O! the best sign in the world,' quoth the doctor. And then in a little while he is at it again: 'Pray how do you find your body?' 'Alas!' says the other, 'I have just now a terrible fit of horror and shaking upon me.' 'Why this is all as it should be,' says the physician; 'it shows a mighty strength of nature;' and then he comes over him with the same question again. 'Why I am swelled,' says the other, 'as if I had a dropsy.' 'Best of all,' quoth the doctor, and goes his way. Soon after this comes one of the sick man's friends to him, with the same question, how he found himself; 'Why, truly, so well (said he) that I am even ready to die, of I do not know how many good signs and tokens.'"— "May it please your majesty, (said Radcliffe) your's and the sick man's case in the fable is the very same; you are buoyed up with hopes that your malady will soon be driven away, by persons that are not apprized of means to do it, and know not the true cause of your ailment. But I must be plain with you, and tell you, that in all probability, if your majesty will adhere to my prescriptions, it may be in my power to lengthen out your life for three or four years, but

beyond that time nothing in physic can protract it; for the juices of your stomach are all vitiated, your whole mass of blood is corrupted, and your nutriment, for the most part, turns to water. However, if your majesty will forbear making long visits to the earl of Bradford's (where it is said the king was apt to drink freely), I'll try what can be done to make you live easily; though I cannot venture to say I can make you live longer than I have told you."

In 1699, while King William was abroad, the duke of Gloucester was taken ill on his birth-day at Windsor, where he had over-heated himself with dancing. Whatever was really his highness's distemper, the physicians who attended him are said to have judged it to be the small pox, and to have prescribed accordingly, but without success. The whole court was alarmed, and the princess of Denmark, notwithstanding her resentment to Dr. Radcliffe, was prevailed upon to send for him. Upon the first sight of the royal youth, Radcliffe gave it as his opinion, that there was no possibility of recovering him; and it is even said, that he mentioned the very hour on which he would die next day, and that he died at that time accordingly.

Upon the accession of Queen Anne to the throne, the earl of Godolphin endeavoured to get Dr. Radcliffe appointed principal physician to the queen; but her majesty could not be prevailed upon to consent to that arrangement. However, in all cases of emergency, he was continually consulted, and was paid large sums for his private prescriptions for the queen. In 1703 the marquis of Blandford, only son of the duke of Marlborough, was taken ill of the small pox at Cambridge. Radcliffe was desired to go to the university to attend him; but as he had the marchioness of Worcester, and several other persons then under his care, he declined going to Cambridge, but sent down prescriptions for the young marquis and directions how he should be treated. It was his practice to give his patients who were ill of that disease, as much air as could be well allowed them, and to set open their windows in the summer season; and also to set down strong broths and rich cordials in his regimen, that the pustules might be forced out, and filled the sooner, contrary to the methods then practised by the physicians of the day. The medical men acted in direct opposition to the wishes of Dr. Radcliffe, and the young marquis in consequence lost his life.

In 1704 a general collection being made for propagating the gospel in foreign countries, Dr. Radcliffe, unknown to any of the society, settled 50*l.* per annum, payable for ever to them under a concealed name. In the same year he also made a present of 500*l.* to the deprived bishop of Norwich, to be distributed among the poor non-juring clergy; but he desired this also to be kept secret; and it was not known till after the bishop's death whence the benefaction came, but it was then discovered by Radcliffe's letter upon the subject being found among the prelate's papers. A few days before the death of Prince George of Denmark, husband to Queen Anne, application was made to Dr. Radcliffe to attend him. The prince had for some years before been troubled with an asthma and a dropsy; for the cure of which, he was persuaded by her majesty and his own physicians to go to Bath. Accordingly he went there, accompanied by the queen, the year before he died; and as he thought himself much better after, the

queen and the court expressed their admiration of the healing virtues of the waters of Bath. But Radcliffe then said, "that the ensuing year would let them all know their mistakes in following such preposterous and unadvised counsels; since the very nature of a dropsy might have led those, whose duty it was to have prescribed proper medicines for the cure of it, into other precautions for the safety of so illustrious a patient, than the choice of means that must unavoidably feed it." And indeed the prince soon relapsed, and died in October 1708.

In 1713 Dr. Radcliffe was elected member of parliament for the town of Buckingham; and when the malt tax bill was introduced, the doctor made the following short speech in the house of commons in favour of the bill:—

"Mr. Speaker,—

"I am sensible that, though I am an old man, I am but a young member, and therefore should decline speaking till my betters have delivered their sentiments; but young and old are obliged to show their duty to their country, which I look upon with the eyes of a son to his parent. Cræsus's son, that was tongue-tied, spoke when his father was in danger; and I, who otherwise should have no relish for speech-making, do the same upon much the same motive. The North British member that spoke last says, their nation has had hardships enough put upon them in other matters, relating to the union, not to have an addition made to them in this article of the malt tax. But by that worthy gentleman's leave, I must beg the favour to say, that all the hardships, if any, lay on the side of England. For, as I take it, to give on the one part, and to receive on the other, are two different cases: therefore, it is but fitting they should refund the equivalent we, who are such great gainers by it, made them a present of, or acquiesce in this duty upon malt, which will not come to the twentieth part of it. Since it is very reasonable that we who have given them money to come and incorporate with us, ought to have it returned us again, if they refuse to be upon equal terms with us. This is my sense of the matter; therefore I am for reading the bill a second time." The doctor also made a speech in favour of the bill to prevent the growth of schism.

On the 1st of August, 1714, Queen Anne died; and a report was soon after propagated, that not only the privy council, but the queen herself, had given orders for Dr. Radcliffe to be present at a consultation with the other physicians, and that he excused himself from coming under pretence of an indisposition. The rumour caused a considerable part of the nation to be much incensed against Dr. Radcliffe; but the truth is said to be, that his name was never mentioned, either by the queen or any one lord of the council; and that he was only sent to by Lady Masham, two hours before her majesty's death, without their knowledge. Radcliffe was then down at his seat at Casehalton, or Carshalton, much afflicted with the gout, which had seized his head and stomach. However, he sent word by the messenger, "that his duty to her majesty would oblige him to attend her, had he proper orders for so doing; but he judged, as matters at that juncture stood between him and the queen, that his presence would be of more disservice to her majesty than use; and that since her majesty's case was desperate, and her distemper incurable, he could not at all think it proper to give her any disturbance in her last moments,

which were so very near at hand; but rather an act of duty and compassion, to let her majesty die as easily as was possible."

Many persons, however, continued to be much exasperated against him for his supposed neglect of the late queen; so one of his friends, with whom he had always voted on the Tory side, made a motion in the house of commons, that Dr. Radcliffe might be summoned to attend in his place, in order to be censured for not waiting upon the queen in her last moments. This is referred to in the following letter which the doctor wrote to another of his friends:—

"Casehalton, August 1714.

"Dear Sir,—I could not have thought so old an acquaintance, and so good a friend as Sir John always professed himself, would have made such a motion against me. God knows my will to do her majesty any service has ever got the start of my ability; and I have nothing that gives me greater anxiety and trouble than the death of that great and glorious princess. I must do that justice to the physicians that attended her in her illness, from a sight of the method that was taken for her preservation, transmitted me by Dr. Mead, as to declare nothing was omitted for her preservation; but the people about her (the plagues of Egypt fall on them!) put it out of the power of physic to be of any benefit to her. I know the nature of attending crowned heads in their last moments too well to be fond of waiting upon them, without being sent for by a proper authority. You have heard of pardons being signed for physicians before a sovereign's demise. However, as ill as I was, I would have went to the queen in a horse-litter had either her majesty, or those in commission next to her, commanded me so to do. You may tell Sir John as much, and assure him from me that his zeal for her majesty will not excuse his ill usage of a friend, who has drank many a hundred bottles with him, and cannot even after this breach of a good understanding that ever was preserved between us, but have a very good esteem for him. I must also desire you to thank Tom Chapman for his speech in my behalf; since I hear it is the first he ever made, which is taken the more kindly; and to acquaint him that I shall be glad to see him at Casehalton, since I fear (for so the gout tells me) that we shall never sit any more in the house of commons together.

"I am, dear Sir,

"Your's, with the greatest friendship

"and observance,

"JOHN RADCLIFFE."

There is reason to believe that the doctor's chagrin at his having incurred so much odium as rendered it unsafe for him to go abroad, and his confinement at home on that account, contributed towards shortening his life. Indeed he asserts this himself in a letter he wrote to the earl of Denbigh, which is dated the 15th of October, 1714. "Your lordship," says he, "is too well acquainted with my temper to imagine that I could bear the reproaches of my friends, and threats of my enemies, without laying them deeply at heart; especially since there are no grounds for the one nor foundation for the other; and you will give me credit when I say these considerations alone have shortened my days. I dare persuade myself that the reports which have been raised of me, relating to my non-attendance on the queen in her last moments, are received by you, as by others of my constant and assured friends, with an air of contempt and disbelief;

and could wish they made as little impression on me. But I find them to be insupportable, and have experienced, that though there are repellent medicines for diseases of the body, those of the mind are too strong and impetuous for the feeble resistance of the most powerful artist." In this letter Radcliffe also regrets that he had indulged himself in such liberties with his bottle companions, and advises Lord Denbigh, who was one of them, to adopt a more regular course of life. "Your lordship knows how far an air of jollity has obtained amongst you and your acquaintance, and how many of them in a few years have died martyrs to excess. Let me conjure you, therefore, for the good of your soul, the preservation of your health, and the benefit of the public, to deny yourself the destructive liberties you have hitherto taken; and which I must confess, with a heart full of sorrow, I have been too great a partaker of in your company."

Dr. Radcliffe died on the 1st of November, 1714, and his body lay in state at the house where he died till the 27th of that month. It was then removed to the house of an undertaker in the Strand, from which it was conveyed to Oxford, where it was interred on Friday the 3rd of December following, on the south-east side of the organ-gallery in St. Mary's church, in that university to which he had left by his will the greatest part of his estate. All the colleges and halls in the university were directed to toll a bell on the day on which the doctor was buried; as had also been done two days before, when an oration was made in honour of his memory by the university-orator. His funeral was attended by the vice-chancellor, the regius professor of physic, and all of that faculty; by the noblemen of the university, the doctors and bachelors of divinity and law, and the masters of arts.

The following is a brief summary of the character of Dr. Radcliffe from the pen of an able writer:—

"Dr. Radcliffe was the most celebrated physician of his time, and was generally considered as superior to all others as a successful practitioner. His greatest excellence seems to have been an happy sagacity in finding out the causes of diseases, which the better enabled him to apply the proper remedies. As he was apt to speak contemptuously of other physicians and of their modes of practice, so the gentlemen of the faculty in his own time, as well as since, have spoken very slightly of him in their turn. It is probable that people in general entertained too high an opinion of him, to the prejudice of other physicians of real merit; but, on the other hand, there seems reason to believe, that those of the same profession have not done justice to the medical abilities of Radcliffe. Sir Hans Sloane had an high opinion of Radcliffe's merit; and in order to express more emphatically his contempt of such persons as spent the best part of their time in niceties of language and verbal criticisms, he observes in the introduction to the second volume of his 'Natural History of Jamaica,' that one of this turn would needs persuade him that Dr. Radcliffe could not cure a disease, because he had seen a recipe of his wherein the word *Pilula* was spelt with *ll*. Radcliffe was not a hard student, but he certainly had a liberal education, and was unquestionably a man of wit and strong natural understanding; and the uncommon extensiveness of his practice must have greatly contributed towards increasing his skill and abilities as a physician."

By his will Dr. Radcliffe left the principal part of his estate to the university of Oxford, to which he

was a very munificent benefactor. He left "all his estates in Yorkshire in trust to pay 600*l.* per annum to two persons, to be chosen out of the university of Oxford, when they are master of arts, and entered into the practice of medicine. They are to receive this sum for their maintenance for the space of ten years and no longer; the half of which time, at least, they are to travel in parts beyond sea for their better improvement. And the yearly overplus of his Yorkshire estates he left to University college in Oxford, for buying perpetual advowsons for the members of that college. He also left 5,000*l.* for building the front of University college down to Logic Lane, answerable to the front that was already built; and for building the master's lodgings therein and chambers for his two travelling fellows. He likewise left 40,000*l.* for building a library in Oxford, and purchasing the lands on which it was to be built: and gave 150*l.* per annum for ever, as a salary for the library keeper; 100*l.* per annum, for ever, for purchasing books for the said library, and 100*l.* per annum for keeping it in repair."

The Radcliffean library was finished in the year 1747; Gibbs was the architect by whom it was erected. It stands in the centre of a magnificent square, formed by St. Mary's church, the public schools, and Brazenose and All Soule's colleges. It is a sumptuous pile of building, standing upon arcades, which, circularly disposed, inclose a spacious dome, in the centre of which is the library itself, and into which there is an ascent by a flight of spiral steps. As Dr. Radcliffe's estates produced more than was sufficient for the particular purposes for which he bequeathed them, his trustees erected and completely furnished the public infirmary at the north side of the city of Oxford, and which is denominated "The Radcliffe Infirmary, for the relief of the Sick and Lame Poor, from whatever county recommended."

RÆBURN, SIR HENRY, a distinguished Scottish portrait painter, who was born on the 4th of March, 1756, and received his education from his brother, William Ræburn. The circumstances of young Ræburn rendering it urgent that he should as early as possible be enabled to provide for his own support, he was accordingly, at the age of fifteen, apprenticed to an eminent goldsmith in Edinburgh. It was soon after this that he began to paint miniatures. In what manner this taste first showed itself is not exactly known; but it certainly was altogether spontaneous, without lesson or example, and without even having ever seen a picture. His miniatures were executed, however, in such a manner as drew immediate attention among his acquaintances. His master then took him to see Martin's pictures, the view of which altogether astonished and delighted him, and made an impression which was never effaced. He continued to paint miniatures; they were much admired, and were soon in general demand. His time was fully occupied, and he generally painted two in the week. In the course of his apprenticeship young Ræburn began to paint in oil, and on a large scale, and he soon after adopted that style in preference to miniature painting. At the expiration of his apprenticeship Mr. Ræburn became professionally a portrait-painter. At the age of twenty-two he married a daughter of Peter Edgar, Esq., of Bridgelands, with whom he received some fortune. Ambitious still farther to improve his art, he repaired to London, where he introduced himself

and his works to the notice of Sir Joshua Reynolds. That great man instantly saw all that the young Scotman was capable of, gave him the kindest reception, and earnestly advised him to enlarge his ideas by a visit to Italy. He even offered, had it been necessary, to supply him with money. Mr. Ræburn accordingly set out for Rome, well furnished with introductions from Sir Joshua to the most eminent artists and men of science in that capital. He spent two years in Italy, assiduously employed in studying those great works of art with which that country abounds. His powers now fully matured, Mr. Ræburn returned in 1787 to his native country, and immediately established himself at Edinburgh. Having taken apartments in George Street, he came at once into full employment as a portrait-painter.

In 1795, finding his apartments not sufficiently spacious for the operations to be there carried on, he built a large house in York Place, the upper part of which was lighted from the roof, and fitted up as a gallery for exhibition, while the lower was divided into convenient painting rooms. Mr. Ræburn had always his domestic residence at St. Bernard's, near Stockbridge, in a house beautifully situated on the waters of Leith.

Sir Henry Ræburn painted portraits of many of the most celebrated individuals by whom Scotland has for the last half century been graced. Among the works executed during the latter part of his life, were the portraits of Sir Walter Scott, of Dugald Stewart, the late Professor Playfair, Lord Frederick Campbell, Mac Donnell of Glengarry, &c.

We give the following estimate of the general merits of Sir Henry Ræburn's pictures from the pen of an eminent artist:—

"Of Sir Henry Ræburn's pictures, it may be said, that few, perhaps none of them, exhibit that attention to finishing which invites close and minute inspection. At an early period of his career he began to paint for effect; and he seems to have judged that labour unnecessary which was not to tell in the general result of his works, as viewed at a certain distance from the spectator. In the works of Vandyke this minuteness of finish, and delicate expression of all the smaller parts, has been happily combined with a mastery and power over the general effect, which, while it takes nothing away from their vigour as seen on the walls of the gallery, renders them interesting and delightful as subjects of near inspection and careful analysis. To those who are curious to know how far this latter quality may be sacrificed without prejudice to the former, the pictures of Sir Henry will afford a school of very interesting instruction; nor is that discernment and dexterity to be ranked of ordinary attainment, which can at once see, and at once express, all that is effective and essential, so as to exhibit, at the distance from which it is intended to be seen, the full result of the highest and most careful finishing. All who are conversant with the practice of art, must have observed how often the spirit which gave life and vigour to a first sketch has gradually evaporated as the picture advanced to its more finished state. To preserve this spirit, combined with the evanescent delicacies and blendings which nature on minute inspection exhibits, constitutes a perfection in art to which few have attained. And if the works of Sir Henry fail to exhibit this rare combination in that degree, to this distinction they will always have a just claim, that they possess a freedom, a vigour and spirit of effect, conveying an

impression of grace, and life, and reality, which we look for in vain amidst thousands of pictures, both ancient and modern, of more elaborate execution, and pains-taking finish."

When George the Fourth visited Scotland he conferred on Mr. Raeburn the dignity of knighthood, and, it is said, that so far was this from having been the result of any application, that Mr. Raeburn had not the remotest idea of it till the evening before, when he received a letter from Mr. Peel, announcing the royal intention, and requesting him to meet his majesty next day at Hopetoun House. The ceremony was performed in the great saloon, amid a numerous assemblage of company, and with the sword of Sir Alexander Hope.

Sir Henry received afterwards the appointment of portrait-painter to his majesty for Scotland; a nomination, however, which was not announced to him till the very day when he was seized with his last illness. The king, when conferring the dignity of knighthood, had expressed a wish to have a portrait of himself painted by this great artist; but Sir Henry's numerous engagements prevented him from visiting the metropolis for that purpose.

Although Sir Henry had now reached the decline of life, yet his vigorous constitution, fortified by habitual temperance, gave a reasonable hope of his living to an advanced period of life. He appeared to enjoy the most perfect health, and was just returned from an excursion into Fifeshire with Sir Walter Scott, the Chief Baron Shepherd, and a small party of friends, united under the auspices of Lord Chief Commissioner Adam, who have for some years past interposed a parenthesis into the chapter of public business, for the purpose of visiting objects of historical curiosity and interest. None of the party on this occasion seemed more to enjoy the party or its objects than Sir Henry Raeburn. He showed on all occasions his usual vigour, both of body and of intellect, and visited with enthusiasm the ancient ruins of St. Andrew's of Pittenweem.

When he returned to Edinburgh, Sir Walter Scott sate to him, in order that Sir Henry might finish two portraits; one, already mentioned, for the artist himself, and one for Lord Montague. These were the last pictures which the pencil of this great master ever touched—a subject of affectionate regret to the person represented, who had been long a friend of Sir Henry Raeburn. Within a day or two afterwards this amiable and excellent man was suddenly affected with a general decay and debility, not accompanied by any visible complaint. This state of illness, after continuing for about a week to baffle all the efforts of medical skill, terminated fatally on the 8th of July, 1823, when he had reached the age of sixty-seven.

**RAFFLES, SIR STAMFORD.**—This learned naturalist and enterprising traveller ranks higher from his personal character and the extent of his knowledge than any other of his contemporaries in the same walk of life. He was born at sea on the 5th of July, 1781, and was the only surviving son of Benjamin Raffles, one of the oldest captains in the West Indian trade out of the port of London. His paternal grandfather held a situation in the prerogative office, Doctors' Commons; but little beyond this is known of his family. In his childhood and in early youth he is said to have displayed a thoughtfulness and a closeness of application above his years. The

chief part of the education he received was at an academy at Hammersmith, from whence, at the early age of fourteen, he was removed to the situation of an extra clerk in the East India house. Many years after this he thus writes to his cousin, the Rev. Dr. Raffles:—"The deficiency of my early education has never been fully supplied, and I have never ceased to deplore the necessity which withdrew me so early from school. I had hardly been two years at a boarding-school when I was withdrawn, and forced to enter on the busy scenes of public life, then a mere boy. My leisure hours, however, still continued to be devoted to favourite studies, and with the little aid my allowances afforded, I contrived to make myself master of the French language and to prosecute inquiries into some of the branches of literature and science; this was, however, in stolen moments, either before the office hours in the morning or after them in the evening. I look back to those days of difficulty and application with some degree of pleasure. I feel that I did all that I could, and I have nothing to reproach myself with.

"This statement will account for my deficiencies in education: all I ever presumed to consider myself was—a lover and admirer of all that I could reach in literature and science. The varied, important, and incessant duties of my public life have always deprived me of that calm and retirement which I have desired, and to which alone I look as the ultimate end of my ambition on earth. To qualify myself for the enjoyment of such a state I omit no opportunity. The high stations which I have held have enabled me to foster and encourage the pursuits of others, and if I have any merit it has rather been as the patron of science than in any other capacity."

Chained down to the desk at the above-mentioned early age, and doomed as it then appeared to obscurity and drudgery—without friends to aid him and without the hope of promotion—the natural bias of his mind and the talents which he must have been conscious of possessing had but little scope. His attention to the dull routine of copying was, however, most patient and unremitting; he worked early and late, and by his extra labour earned a small addition to his salary. His parents were in difficulties and all his little gains were carried home for their relief. "His affection to his mother," says Lady Raffles, "was always one of the strongest feelings of his heart. At this time, with that self-denying devotion to the happiness of others, which was his distinguishing quality through life, he deprived himself of every indulgence that he might devote to her his hard-earned pittance; and in after days of comparative affluence he delighted in surrounding her with every comfort." His youth appears to have been strongly characterized by innocence and simplicity. Lady Raffles observes, that—

"As a school-boy his garden was his delight: to this was added a love of animals, which was perhaps unequalled. It has been observed that it is one of the characteristic properties of a great mind, that it can contract as well as dilate itself, and the mind which cannot do both is not great in its full extent: this observation was forcibly realised in him; he spent hours in fondling and domesticating those objects of his care and attention. He entered with the most child-like simplicity into occupations and pleasures which many would consider beneath their notice. A mountain scene would bring tears into his

eyes; a flower would call forth a burst of favourite poetry; it was perhaps peculiar to himself to be able to remark on his last return to England, that he had never seen a horse-race, never fired a gun."

Mr. Raffles possessed through life an extraordinary facility of acquiring languages, and the "further East" afforded him abundant scope for the exercise of this talent. His studies at home were desultory, but he was always acquiring something which he had the happy faculty of retaining in his memory. His abilities were taken notice of in the office and mentioned to those who had the power to reward them; and, on a vacancy occurring, he was put upon the establishment over the heads of several others. In 1805 the court of directors determined to form an establishment on Penang, or Prince of Wales's Island. India was the field for which the ambition of Raffles most panted, and Mr. Ramsay, the secretary, aware of his peculiar fitness for that sphere, recommended him to the notice of the late Sir Hugh Inglis, who gave him the appointment of assistant secretary to the new government, and ever afterwards watched his progress with an almost paternal interest.

In September 1805 Mr. Raffles arrived at Penang. The progress he had made in the Malay language on the passage, gave him an immediate and decided advantage over the rest of the establishment. By intense application he speedily acquired a general knowledge of the history, government, and local interests of the neighbouring states and islands. "He conversed freely with the natives who were constantly visiting Penang, many of whom were found to be sensible intelligent men, and greatly pleased to find a person holding Mr. Raffles's situation, able and anxious to converse with them in their own language." On the elevation in 1806 of Mr. Pearson to the council he was appointed secretary, and about the same time registrar to the new court of judicature. But the fatigue and responsibility of organizing a new government, in a climate which in a very short period proved fatal to two governors, the whole of the council and many of the new settlers, brought on an alarming illness, which made it advisable he should proceed to Malacca for the recovery of his health. Here he had an opportunity of observing and mingling with the varied population congregated from all parts of the Archipelago, and from the more distant countries of Asia—from Java, Amboyna, Celebes, the Moluccas, Borneo, Papua, China, Cochin-China, &c.; and the knowledge he obtained from these strangers of the nature and extent of their several resources, of their trade, their customs, manners, and feelings, became of infinite service to him in the high and responsible situations he was shortly destined to fill.

Happy for Malacca that this visit was made! Orders had been issued for demolishing the fortifications, and destroying the public buildings, with the view of deterring Europeans from establishing themselves there, and of transferring the trade and population to Penang. This Dutch kind of policy accorded so ill with Raffles's feeling, that he made a strong remonstrance against so cruel a proceeding. He represented that the population far exceeded 20,000 souls—Dutch, Portuguese, and their half-caste Chinese, Arabs, Javanese, &c., of whom more than three-fourths were born in Malacca, where their families had been settled for centuries. Here they felt they were at home; their peculiarities were attended

to, their rank respected, and their wants supplied. Many were proprietors of the soil, or attached to those who were so; their gardens produced pepper, vegetable, and all kinds of fruit in abundance; and from these and the fisheries they derived comfort and independence. That they were strongly bound to the soil was proved by their not accepting the offers made of a free passage to Penang, in one single instance. On these representations the orders were countermanded, and the government thus escaped a heavy and needless load of obloquy and indignation. Shortly after his arrival at Penang, Mr. Raffles made an acquaintance with that extraordinary young man, the late Dr. Leyden, on whose return to Calcutta, where he was established in the household of Lord Minto, a correspondence ensued on Malayan language and literature, and other subjects connected with the eastern Archipelago. The letters of Raffles were shown to the governor-general, who was so much pleased with the talent and intelligence they displayed that he commissioned Leyden to say to his friend, that he should be gratified in receiving directly from himself any communications respecting the eastern parts of the Indian seas. This led to a regular correspondence, and so satisfied was his lordship of the superior knowledge possessed by Raffles, that he hinted at placing him in the government of the Moluccas, which in the year 1810 had fallen into our hands. This suggestion determined Mr. Raffles to proceed to Calcutta, where he was received with great kindness and marked attention by Lord Minto, who from this moment appears to have reposed in him the most unreserved confidence. About this time the annexation of Holland to France had placed at the disposal of Bonaparte all the valuable and extensive possessions of the Dutch in the eastern seas, of which Java was the great central point, and from which operations were likely to be most successfully directed against the political ascendancy and the commercial interests of England. "I at once," says Raffles, in a letter to his cousin, "drew his lordship's attention to Java, by observing that there were other islands worthy of his consideration besides the Moluccas—Java, for instance. On the mention of Java, his lordship cast a look of such scrutiny, anticipation, and kindness, upon me, as I shall never forget. 'Yes,' said he, 'Java is an interesting island; I shall be happy to receive any information you can give me concerning it.' This was quite enough, the information had already been collected, and the result was, his lordship's determination to undertake without delay, and on his own responsibility, the reduction of Java and its dependencies." Mr. Raffles was despatched forthwith to Malacca in the capacity of agent to the governor-general. Here he was instructed to prepare the necessary arrangements; to open communications with the several native chieftains of the Archipelago, with the view of obtaining information as to their feelings with regard to the Dutch; and to facilitate the extension of the British influence in the eastern seas. On the 9th of May, Lord Minto arrived at Malacca, when Mr. Raffles put into his hands a minute of all the information he had collected, and which is certainly one of the most wonderful specimens of what assiduity, energy, and talent, are capable of accomplishing. It occupies nearly sixty pages of the memoir, is full of information respecting every part of the Archipelago, and takes a most statesmanlike view

of the whole subject. A difficulty had been started as to the choice of a passage for the expedition among the islands and through the narrow straits. The alternative of two routes presented itself; the direct route along the south-west coast of Borneo, which was represented as very difficult and uncertain, if not altogether impracticable; the other round the north and east coasts of Borneo and through the straits of Macassar, which, though considered practicable, was stated to be imminently dangerous as well as tedious. But Raffles had solved the problem; he had sent a vessel to examine the supposed difficulties, and to perform the passage; he, therefore, stated boldly that "he did not hesitate to stake his reputation on the success which would attend the expedition, if the route he pointed out should be followed." The naval authorities were all opposed to the attempt of a new passage with so many transports; but Lord Minto, in full confidence in the judgment of Raffles, embarked with him in his majesty's ship *Modeste*, commanded by his own son; and in less than six weeks after quitting Malacca, the fleet, consisting of upwards of ninety sail, was in sight of Batavia without accident to a single vessel. Lord Minto observes—"If I had yielded to the predicted difficulties of the passage, the expedition must have been abandoned for the present year." The result of this expedition is well known. On the reduction of this grand island, or as Lord Minto announces it to the authorities at home, "an empire which for two centuries had contributed greatly to the power, prosperity, and grandeur, of one of the principal and most respected states in Europe." Its government, though partly pledged to another, Lord Minto declared "he could not conscientiously withhold from him who had won it;" and therefore, "as an acknowledgment of the services he had rendered, and in consideration of his peculiar fitness for the office," his lordship performed a noble act of justice, equally honourable to the giver and receiver, by immediately appointing Mr. Raffles to the situation under the title of "lieutenant-governor of Java and its dependencies." Lady Raffles here observes,—

"An event occurred at this time to interrupt the satisfaction, and humble the heart that might have been too much elated at the success which had crowned the expedition. Dr. Leyden was seized with a fever a few days after he had reached those shores, on which he hoped to slake his ardent thirst for knowledge, and expired in the arms of his friend. This loss was deeply mourned by Mr. Raffles, who had anticipated the happiness of having as an inmate of his family, one with whom he could take counsel both in public and private; whose judgment would aid, whose affection would cheer, and whose society would brighten the care and troubles of the responsible situation he was about to undertake." We are now to contemplate the young extra clerk of the India house in his capacity of governor over some five or six millions of people. His first care was to ascertain the quantity and quality of the materials he had to work upon. For this purpose he sent English residents to the native courts to institute statistical enquiries in every district; to cause a survey to be made of the whole island; to obtain detailed information of the lands attached to each village, and the tenure by which they were held; to discontinue many expensive and useless establishments; to reform the departments of revenue, commerce, and

judicature; and, in short, to collect such a body of materials as might enable him to carry into effect that thorough change of a vicious system which he considered indispensable, no less for the interests and honour of the British government than for the happiness and prosperity of the island itself. It is highly creditable to the skill and judgment of Mr. Raffles, that in totally subverting the establishments by means of the very persons who had fattened on the abuses which beset them all, he seems to have incurred no personal animosities. So judiciously, indeed, was the change introduced, that not a single individual, high or low, felt aggrieved by it; the native population, chiefs, subordinates, and people, with one accord hailed the new order of things as a boon conferred upon them by British philanthropy, and entered on the enjoyment of its advantages with confidence and increased industry. "His mild, conciliatory, and unassuming manners, obtained for him the respect and confidence of the Dutch; whilst the natives, who had been led to form the highest possible opinion of his character, looked with anxious hope for that amelioration in their condition which they afterwards experienced, and which will make his memory adored on the island of Java for ages to come." It should be observed, that the British government succeeded to Java at a moment of the greatest public distress, when the Dutch had been unable to pay even their lowest establishments, when the funds of the public charities had been appropriated to the necessities of the state, and the finances of the colony were in a condition of bankruptcy. A depreciated paper currency inundated the whole island. The revenues were paid in this paper that could not be re-issued. There was, therefore, no option left but to withdraw this paper from circulation, and the only means of doing so was by the sale of the public lands, which Lord Minto approved of as an able expedient in a case of great emergency, though the directors of the East India company thought fit to disapprove it. The change of system was, however, universally felt as a blessing by the people of Java.

"If I look forward," observes Mr. Raffles, "to its effects as it may contribute to the happiness of the people, the improvement of the country, and the consequent increase of the public revenue, the result is incalculable. Let the present wretched state of the Dutch metropolis of the east be contrasted with the flourishing state of the British establishments wherever they have been formed, and it will speak a volume in favour of the change. Desolation and ruin would seem to have tracked the steps of the Dutch power wherever it has extended; individual prosperity and national riches have accumulated under the English. The principles of their governments are radically different, and with such experience before us can it be a question on which side we shall rely? The mass of the population, snatched as they are at a favourable moment from the destructive grasp of Mahomedan despotism and indefinite exaction, and established in the possession of property, to be secured by impartial justice and administered to them in a simple and a prompt mode, adapted to their peculiar sentiments and institutions, afford a wide scope to the philosopher as well as to the statesman. A new people, still advancing in civilization even under the former restraints, with what accelerated progress will they not proceed when their natural energies have fair play?"

The measures which Mr. Raffles carried into effect were, extensive revenue and judicial arrangements; reforms of the courts of justice, and the establishment of a magistracy; the institution of trial by jury, and of laws for the abolition of slavery; the prosecution of the statistical surveys by a committee; the establishment of a benevolent society, and of schools for the natives;—the revival of the Batavian society, and the holding out of great encouragement for researches and making collections of natural history. But that which raised the condition of the great agricultural population was, the abolition of forced deliveries of produce and conferring the privilege of bringing it to a free and open market. By these judicious measures, the revenue, "which at no time under the Dutch exceeded four millions of rupees, was not less, in the year he left it, than thirty millions." Mr. Raffles appears, from the first moment, to have been anxious to abolish that dreadful scourge, slavery, throughout the Dutch possessions, and he had the satisfaction to find that the leading inhabitants expressed their concurrence in his views; but the Bengal authorities refused their sanction under the plea of its not being known whether the government was permanently to be administered by the king or by the company. When it was proposed that all the slaves on the island should be registered, a native chief, the Penambahan of Samunap, proudly declared, "I will not register my slaves; hitherto they have been kept such because it was the custom, and the Dutch liked to be attended by slaves when we visited the palace; but as that is not the case with the English, they shall cease to be slaves. For long have I felt shame, and my blood has run cold when I reflected on what I once saw at Batavia and Samarang, where human beings were exposed for public sale, placed on a table and examined like sheep and oxen." When Raffles mentioned this noble trait to Mr. Wilberforce, on his first return to England, he was commissioned to carry out a seal, to be presented to this chief, as an acknowledgment of his liberal act; and the latter, in return, requested Mr. Wilberforce's acceptance of a handsome crees. The blessings which Mr. Raffles had conferred on the inhabitants of Java were not attained without difficulties, and the occasional occurrence of events of a disagreeable nature. The public tranquillity was speedily disturbed by some of the native powers of Java, particularly the sultan of Djojocarta, who vainly imagined he could succeed in driving the Europeans from the island; but Raffles was aware of the confederacy he was endeavouring to establish, and, by a force under Colonel Gillespie, crushed the whole of the malcontents in detail. The proceedings of the sultan of Palembang, a dependency situated in the island of Sumatra, next required his prompt attention. A commission being sent to this sultan to have the right of British dominion acknowledged, he not only disdainfully refused to hear of such a claim, but formed the diabolical plan of murdering the commissioners, and all the Dutch inhabitants of the place. Such atrocities determined Mr. Raffles to take immediate and decisive measures, and for this purpose Colonel Gillespie was sent with a commanding force; but bad weather and the currents of the river retarded his progress. As he proceeded, intelligence was brought that the sultan had fled,—that confusion, plunder, and murder prevailed, not only within the interior of the fort and palace, but in many parts of the city; and that

a massacre by the sultan's adherents was meditated the very next night on the wealthy Chinese and other inhabitants, whose property was to become the prize of the assassins. Gillespie, on hearing this, proceeded with the Arab chief who had brought the intelligence, in his canoe, accompanied only by Capt. Meares and a Spanish gentleman; in it and another small canoe were distributed seven grenadiers of the 59th regiment, and they were followed by two men of war's boats.

The canoes, in one of which the colonel was, had gained much on the other two boats, and were now completely out of sight, when the report of a signal-gun fired by the enemy not a little alarmed them and increased the anxiety for the rest of the party; the more so as every thing around tended to excite suspicion of some treacherous design being in agitation. A dreadful yell and shrieking in all directions was next heard, and lights and conflagrations were seen throughout the whole extent of this large tract of population, which stretched along both banks of the river for upwards of seven miles. By the redoubled exertions of the crews the boats in the rear were soon brought up to the support of the little band, and thus happily formed in time an important junction.

To paint the horrors of the scene that presented itself in their true colours or to attempt an expression of the sensations it was calculated to excite, would be a difficult task, and the undaunted act which gained the possession of the fort, the palace, and its batteries may be credited when the name of the leader is recollected. Undismayed, in the face of numerous bodies of armed men, Colonel Gillespie boldly stepped on shore at eight o'clock at night, and with those who had accompanied him in the canoe and the seven grenadiers, he marched with a firm step through a multitude of Arabs and treacherous Malays, whose missile weapons, steeped in poison, glimmered by the light of torches.

Huge battlements with immense gates leading from one area to another presented the frightful spectacle of human blood still reeking and flowing on the pavement. The massive gates closed upon the rear, and the blood-stained court-yards through which the party were conducted appeared as if they were the passage to a slaughter-house.

A Malay, who had pressed through the crowd, approached the colonel and was walking by his side, when a large double-edged knife was secretly put into his hands by one of his countrymen. It was a dark stormy night, and a ray of lightning at the very instant when the man was pushing the knife up his long loose sleeve to conceal it, discovered the weapon. The colonel's eye caught the object, and instantly turning round, he had the fellow seized, totally regardless of the crowd: thus fortunately frustrating by his firmness the murderous design. The weapon was found as described, but the man contrived to steal away in the crowd and escaped.

The palace exhibited a melancholy picture of devastation and cruelty. Murder had been succeeded by rapine, and while the palace was completely ransacked, the pavements and floors were clotted with blood. In every direction spectacles of woe caught the sight and were rendered peculiarly awful by the glare of the surrounding conflagration, accompanied by vivid flashes of lightning and loud peals of thunder.

The flames which continued to spread destruction, notwithstanding the rain that poured down in torrents, had reached the outer buildings of the palace and threatened the part where the colonel with his party had taken up their temporary abode. The cracking of bamboos resembling the discharge of musketry; the tumbling in of burning roofs with a tremendous crash; the near approach of the fire in the midst of an immense hostile multitude and assassins; altogether gave to their situation a most appalling prospect.

The little band consisting only of seventeen British grenadiers, with the officers, naval and military, already mentioned, and a few seamen belonging to the gig and barge, had to secure possession of the fort and to provide for their safety, in the determined resolution of selling their lives dearly should any attack be made before the arrival of reinforcements. Having carefully reconnoitred by the light of torches the interior of the palace court, and ordered all the entrances except one to be shut and barricaded, Colonel Gillespie stationed the grenadiers at the principal entrance, and the strictest guard was kept up. Soon after midnight they had the satisfaction of hailing the welcome arrival of Major Trench with about sixty men of the 89th regiment, and the remaining part of the ordered advance under Lieutenant-Colonel McLeod joined the little garrison early the next morning. Thus an act of daring enterprise, conceived with judgment and executed with intrepidity, gained possession of the fort and batteries defended by 242 pieces of cannon, without the loss of a man. This formidable position could not have been carried under any other circumstances of attack but by the sacrifice of many lives, and by hazarding altogether the safety of the little armament.

Alluding to the previous massacre, Colonel Gillespie observes in his report to the lieutenant-governor, that "the unwary and confiding Dutchmen, unsuspecting of evil intentions, were speedily surrounded, without the hope of escape; the guns were all seized by parties on the ramparts, and the unfortunate garrison were dragged to a scene of cold-blooded cruelty, which can never be contemplated but with sentiments of horror and abhorrence.

"There was one European woman among the unhappy victims thus sacrificed by the sultan. She was embarked on the boats; and after suffering every violence her abandoned murderers were capable of offering her, she was inhumanly butchered and thrown into the river with the rest of the garrison. The remaining women were sent as slaves up the country, and the relation of distress, starvation, and misery, they encountered in their bondage, is calculated to excite such sentiments of horror and indignation against the whole race, that at times I can with difficulty hold intercourse with people allied to such monsters of barbarity. There was no punishment too severe, no persecution too considerable, no degradation too humiliating for these unhappy women."

On deposing the monster who had fled, the brother was placed on the throne, to the great joy and satisfaction of the people. Yet, incredible as it may seem, the Dutch had no sooner resumed possession of Batavia, than they rejected our treaty made with the new sultan, commenced machinations against him, seized and sent him a prisoner to Batavia, recalled the old villain who had so inhumanly butchered their own countrymen, and replaced him on the throne, in

consideration of the payment of 400,000 dollars! On this point Mr. Raffles says,—

"The instructions to Lord Minto, which authorized the conquest, directed that after dismantling the fortifications the country should be given up in independence to the native chiefs. Holland at that time did not exist as a nation, and the prospect of transferring Java to France was not to be contemplated. The humane and benevolent mind of Lord Minto revolted at the idea of suddenly transferring back to the natives a colony which had been in possession of the European authority for two centuries. If such a policy were to be pursued, he conceived that it ought to be gradual; and while he took upon himself the responsibility of suspending, pending the reference to Europe, the rigid enforcement of the orders he had received, he did not hesitate to say that he had done so, and publicly to assure the natives that they would, in the meantime, be allowed every degree of rational liberty and independence consistent with the safety of the provisional government he had established. On this principle was my government regulated; and you may judge with what surprise we received a copy of the convention for the unconditional transfer of the country to the Dutch, as the first and only communication from Europe. The Dutch no sooner obtained possession than it became an object with them to lower the character of the British provisional administration, to displace those in whom we had confidence, and to obliterate, as far as possible, all recollection of our rule. Of this I do not complain; if our ministers, in the zenith of their magnanimity, chose to sacrifice the interests of 5,000,000 of people, and to cast them aside without notice or remembrance, it was not, perhaps, to be expected from the Dutch that they should be very nice. Gratitude is not among the list of national virtues; it is, perhaps, inconsistent with them: at least it is at variance with national pride and vanity. I am willing to leave the Dutch to the full enjoyment of all the improvements they are inclined to make in Java and the Moluccas; to give them the full advantage of all they can fairly claim, and to put up patiently with all the ingratitude, rivalry, and even hostility, that is naturally to be expected; but I wish them to be confined to their proper ground. I wish them to leave us in possession of the advantages of that trade which we enjoyed in the year 1803, previous to the last war. Not satisfied, however, with the possession of those places which at that date were occupied by the European power, we find them grasping at the sovereignty of the whole of the Archipelago, taking a mean advantage of our generosity and forbearance; and, profiting by the reduction of our naval establishment, they have sent out to Batavia a force, both military and naval, of an alarming extent. The European troops in Java alone exceed 10,000 men, besides what are at the Moluccas and other out-stations. A large colonial army is raised; while a navy, consisting at present of one ninety-gun ship, one seventy-four, three frigates, eight corvettes, and innumerable smaller vessels, manned with upwards of 1700 Europeans, strikes terror through all the adjacent countries."

The instructions to Lord Minto, which, previously to the capture, he communicated in confidence to Mr. Dr. Raffles, were, "the expulsion or reduction of the Dutch power, the destruction of their fortifications, the distribution of their arms and stores to the natives, and the evacuation of the island by our own

troops." But his lordship adds, in a spirit of philanthropy which is honourable to his memory, "I conclude, however, that the destructive and calamitous consequences of this plan to so ancient and populous an European colony, the property and lives of which must have fallen a sacrifice to the vindictive sway of the Malay chiefs, if transferred suddenly and defenceless to their dominion, have not been fully contemplated; and I have already stated my reasons for considering a modification of their orders as indispensable."

Unjustifiable it certainly would have been to pursue this line of conduct on the conquest of the island, and leave the European settlers to the mercy of a race whom they had injured and exasperated; but we cannot but consider that, instead of surrendering six millions of people to the Dutch after giving them liberty and freedom of trade, and improved their morals and condition, we should have better served the interests of humanity at the conclusion of the war by removing the Dutch population altogether, or such as might choose it, destroying all the fortifications, and leaving the island to be governed by the native princes, than by surrendering it to a power who had not the sense to follow up the system that had been proved to work so well. And what has been the result?—their line-of-battle ships, frigates, and corvettes, with their ten thousand men, have long since disappeared, and many thousands more, both Europeans and natives, have been swept from the face of the earth.

Lord Minto had foreseen that the island of Java was likely to be given up, and, anxious to secure to Mr. Raffles an honourable retreat, appointed him provisionally to the residency of Fort Marlborough, in Bencoolen, if Java should pass into other hands, notwithstanding the orders he had received to place a civil servant of the Bengal establishment in that office. When the time appointed for surrendering the island to the Dutch arrived, Mr. Fendall was appointed to make the transfer. Mr. Raffles, before he took leave, made a strong appeal in behalf of those for whose welfare he had so anxiously laboured. When it became generally known that he was to proceed to England, the European and native inhabitants united in expressing their deep regret at his departure, and in acknowledging, in the warmest terms, their gratitude for the benefits which he had conferred upon them during his administration. A magnificent service of plate was given to him, and "on the morning of his embarkation the Roads of Batavia were filled with boats crowded with people of various nations, all anxious to pay the last tribute of respect within their power to one for whom they entertained the most lively affection. On reaching the vessel he found the decks filled with offerings of every description—fruits, flowers, poultry, whatever they thought would promote his comfort on the voyage. It is impossible to describe the scene which took place when the order was given to weigh the anchor; the people felt that they had lost the greatest friend whom Java ever possessed; and perhaps they anticipated, as too near, their re-delivery to the Dutch power, and the consequently too probable revival of the scenes of misgovernment from which, under the administration of Mr. Raffles, they had been relieved for five years, and ought to have been relieved for ever."

On his arrival in England Mr. Raffles soon discovered that much ignorance prevailed, where it ought not, as to the value of Java and the Dutch posses-

sions, which determined him to write the history of that splendid island, a work full of information, which he completed, with his usual rapidity, in a few months. In the early part of 1817 he married Sophia, daughter of T. W. Hull, Esq., of the county of Down; and about the same time he was presented to the prince regent, and received the honour of knighthood. During the fifteen months he remained in England, Sir Stamford Raffles, by his superior intelligence, made a host of friends, and was a welcome guest in the very best society; among others, he became acquainted with Princess Charlotte and Prince Leopold, who honoured him with proofs of sincere regard; and on his taking leave on returning to India, the princess bestowed on him a ring as a mark of her esteem. It deserves to be mentioned, as an instance of that active benevolence for which his character was distinguished, that, before his departure for his new government of Fort Marlborough, Sir Stamford resolved to proceed to Holland to demand an audience of the king of the Netherlands, to lay before him some representations in behalf of the native inhabitants of Java, and some of the Dutch whom he conceived to have claims on his attention. The king, whose personal character all who know any thing of it must venerate, received him with marked civility, and invited him to dine with him; but he found, that though the leading ministers seemed to mean well, "they had too great a liking for immediate profit for any liberal system to thrive under them." The king himself promised that the new system should be continued, but kings are not always permitted to make good their promises.

In October 1817 Sir Stamford with his family embarked for Sumatra, the court of directors having conferred on him the title of lieutenant-governor of Bencoolen. On his arrival at Bencoolen, he thus writes to his friend, Mr. Marsden:—

"This is, without exception, the most wretched place I ever beheld. I cannot convey to you an adequate idea of the state of ruin and dilapidation which surrounds me. What with natural impediments, bad government, and the awful visitations of Providence which we have recently experienced, in repeated earthquakes, we have scarcely a dwelling in which to lay our heads, or wherewithal to satisfy the cravings of nature. The roads are impassable; the highways in the town overrun with rank grass; the government-house a den of ravenous dogs and polecats. The natives say that Bencoolen is now a *tana mati* (dead land). In truth, I could never have conceived any thing half so bad. We will try and make it better; and if I am well supported from home, the west coast may yet be turned to account. You must, however, be prepared for the abolition of slavery; the emancipation of the country people from the forced cultivation of pepper; the discontinuance of the gaming and cock-fighting farms; and a thousand other practices equally disgraceful and repugnant to the British character and government. A complete and thorough reform is indispensable, and reductions must be made throughout." To this miserable establishment he found from two to three hundred slaves attached, the children of African negroes originally purchased by the East India Company; and he was assured they were much happier than free men. He soon discovered, however, that they were a most dissolute and depraved set of beings. The following extract is from his letter to the court of directors—

"It has been but too common an opinion, and, I regret to say, the authorities which sanction it are most respectable, that the Malayan character is too despicable to be entrusted with personal freedom, and that the degree of restraint exercised over them on this coast is not only wholesome, but necessary. That indolence and vice prevail among the Malays on this coast, and to a considerable extent, I am not prepared to deny; but I apprehend they are rather to be attributed to the effects of the system hitherto prescribed, than to any original defect of character.

"My own experience of twelve years, in different parts of the Archipelago, enables me to assert that there is no radical defect in the character of the common people, however bad their Mahometan government may be. They are alive to the same incentives, have the same feelings, and, if once allowed, would as rapidly advance in civilization as their fellow-men; once relieved from the oppression and disabilities under which they labour, and placed under an honourable protection, there would be no want of energy or enterprise; the temptations to vice by which they are surrounded once removed, they would be amiable and trustworthy. Of some of the oppressions and disabilities under which they labour I have already spoken; of the temptations to vice by which they are surrounded I need only observe, that the principal local revenues of government, both at Bencoolen and at the different residences, are in the gaming and cock-fighting farms. Of the first I shall not at present speak, as it is connected with the revenues of Bengal; but of the latter, which are entirely local, it is incumbent on me, as chief magistrate, to point out that the continuance of the farms is destructive of every principle of good government, of social order, and the morals of the people.

"The forced services, and forced deliveries at inadequate rates, must be abolished. The labourer must be allowed to cultivate pepper or not, at pleasure, and such radical changes made throughout, as will enable the people to distinguish the political influence of the British government from the commercial speculations of the company and their agents. I am aware that the task is difficult, if not invidious; but under the confidence placed in me, and having at heart the honour and character of the nation, and of the East India Company, I shall not hesitate to undertake it.

"My first public act must be the emancipation of the unfortunate Caffre slaves: when I have done this, and abolished the gaming and cock-fighting farms, I may, with some conscience, call upon the chiefs to assist me in the general work of reform, amelioration, and improvement."

Too zealous to carry into effect the reform he contemplated, without waiting orders from home, which would occasion the loss of a year, and conscious that no improvement could take place until he had cleared away the rubbish at Fort Marlborough, he commenced at once by liberating all the slaves. He then classified about 500 convicts, which had been sent hither from Bengal, into three divisions, according to their character; and he states that, in a very short time, "a large body of people, who had been living in the lowest state of degradation, became useful labourers, and happy members of society." He next assembled the native chiefs, and, finding them reasonable on all points connected with their privileges, he made with them a provisional treaty, by which,

1st, All former treaties were annulled; 2nd, It was provided, that in the name of the company he should administer the government of the country according to equity, justice, and good policy; and 3d, That the cultivation of pepper should be declared free, the people being at liberty to cultivate that article or not, as they might think fit. They were particularly anxious, however, to be freed from the disgrace which had been attached to their character by a prohibition against wearing their crees, according to an ancient custom of the country, which Sir Stamford immediately and without hesitation granted. The prohibition had originated in the murder of Mr. Parr, in 1801, who, as governor, had made himself obnoxious by endeavouring to force upon the people the culture of coffee in addition to that of pepper; besides which, an arbitrary interference with the native courts of justice, without the concurrence or advice of the chiefs, had excited their fears for their ancient customs and institutions. The measures taken on this catastrophe were highly impolitic: several of the natives were blown from the mouths of guns; an order was issued to burn and destroy every village within a certain distance, and the work of devastation was carried on as if the future security of the settlement depended on surrounding it with a desert. "The fruit-trees, venerable by their age, that surround a Malay village, are the protecting deities of the place, and are regarded with reverence; their destruction is looked upon as little less than sacrilege—yet the axe was laid to their roots; and whatever could afford shelter or protection was levelled with the ground, and the whole population of the suspected villages turned loose upon the country." On Sir Stamford's first arrival, no one thought of living out of the settlement, and no servant could be induced to venture three miles after sunset, such was the desolate state of the country by which Fort Marlborough was surrounded. Sir Stamford conceived the best way to repeople the country was, to set them an example, by building a house twelve miles out of the town. In a letter to the late duchess of Somerset, he says,—

"I ascended the first range of hills, and, having taken up a position on the Hill of Mists (Bukit Kabut), which commands a most extensive view of the surrounding country, and on which no European had before set foot, I determined to make it our country residence, and accordingly gave orders for clearing the forest, &c. In this I have already made considerable progress; a comfortable cottage is erected, and, as far as we can yet judge, the thermometer is at least six degrees lower than at Bencoolen. The only inconvenience will arise from the tigers and elephants, which abound in the vicinity; one of the villagers told me, that his father and grandfather were carried off by tigers, and there is scarcely a family that has not lost some of its members by them. In many parts the people would seem to have resigned the empire to these animals, taking but few precautions against them, and regarding them as sacred; they believe in transmigration, and call them their *nene* or grandfather. On the banks of one of the rivers of this coast upwards of a hundred people were carried off by tigers during the last year. When a tiger enters a village the foolish people frequently prepare rice and fruits, and placing them at the entrance as an offering to the animal, conceive that, by giving him this hospitable reception, he will be

pleased with their attention, and pass on without doing them harm. They do the same on the approach of the small-pox, and thus endeavour to lay the evil spirit by kind and hospitable treatment. I am doing all I can to resume the empire of man; and, having made open war against the whole race of wild and ferocious animals, I hope we shall be able to reside on the Hill of Mists without danger from their attacks."

In five years from the building of his house on the Hill of Mists, the whole intermediate space was chequered with villas and surrounded with plantations. At this time out of 100,000 nutmeg-trees which had been planted by Sir Stamford, one-fourth were in full bearing. The "clove-trees," says Lady Raffles, "as an avenue to a residence, are perhaps unrivalled; their noble height, the beauty of their form, the luxuriance of their foliage, and, above all, the spicy fragrance with which they perfume the air, produce, in driving through a long line of them, a degree of exquisite pleasure only to be enjoyed in the clear light atmosphere of these latitudes."

In another place she observes, that at this time "the appearance of the settlement was greatly changed. On Sir Stamford's first arrival in 1818 he found that every tree and shrub had been cut down (from fear of the natives) around the residence of the chief authority, which had in consequence a most desolate appearance: he immediately formed a garden and surrounded the government-house with plantations. As a proof of the luxuriance of vegetation in these islands, it may be stated that, during his absence of eleven months, the casuarina-trees had grown to the height of thirty and forty feet; and he had the pleasure on his return to see the house encircled by a shrubbery of nutmeg, clove, cocoa, and cassia trees, and of driving through an approach of alternate nutmeg and clove-trees; the place seemed to have been converted almost by magic from a wilderness into a garden. The nutmeg-tree is exceedingly beautiful; it bears in profusion, spreads its branches in a wide circle, and the fruit is perhaps the most beautiful in the world; the outside covering, or shell, is of a rich cream colour, and resembles a peach; this bursts and shows the dark nut, encircled and chequered with mace of the brightest crimson; and, when contrasted with the deep emerald green leaf, is delightfully grateful to the eye."

The same system of excluding respectable natives from the society of Europeans had been pursued in this settlement as is but too much the case in most other parts of India. Sir Stamford at once broke down this barrier, and opened his house to the chiefs and higher class of natives on all occasions; and this practice he continued during the whole period of his residence in Sumatra. His house was rarely without some of them; in short, he had constant opportunity of studying their feelings, sentiments, and manners; and such was the confidence they placed in him that in his measures for the good of the community they were at all times ready to give their cordial co-operation. Both chiefs and people were soon brought to consider him their best friend and adviser, yielded to his opinion upon all occasions, and harmony and good-will prevailed throughout the settlement.

Having procured from Bengal a young man, brought up in the principles and practice of our national schools, with a fount of types in the Roman and native characters, he appointed a committee and

established a plan of schools for educating the whole of the native population. In a letter to Mr. Wilberforce, detailing the progress made in these and other institutions, he thus expresses himself:—

"I must now carry you to a more extensive field, and endeavour to obtain all the aid of your powerful patronage and support for an institution which is to operate on a more enlarged and still more important scale, and which is intended to complete the design I had in view: it is the key-stone to the arch, and when once this is constructed and well cemented, bolder and better men may raise upon it such a superstructure as their duty to God may require. All that I attempt is to pave the way for better things; and although I am far from lukewarm towards higher ends, I am content to confine all my views to the enlargement of the human mind, and the general spread of moral principles. In the present state of these countries, these are the first to be attended to: to prepare the mind for religious truth and Christian discipline. It is true the people of these islands are distinguished by the absence of that spirit of intolerance and bigotry which prevails on the continent of India, and that they place the fullest confidence in the benevolence and liberality of our government and institutions; but we as yet only see them as the sea in a calm. I write these remarks to you, my dear Sir, without reserve, knowing that in your kindness and liberality they will meet with every indulgence. I am far from opposing missionaries, and the more that come out the better; but let them be enlightened men, and placed in connexion with the schools, and under due control.

"I must, however, return to my institution, which is intended to be a native college for the education of the higher orders of the natives, and to afford the means of instruction to ourselves in the native languages, and of prosecuting our researches into the history, literature, and resources of the further East. When I tell you that the effect of this institution is intended to be felt among a population of not less than thirty millions, and that its influence may eventually, and perhaps at no very distant date, extend over ten times that number, it is not necessary to say more on the extent and importance of the field; of its nature and interest I need only refer you to the map of the world, and request you to consider all those countries lying to the east and south of the Ganges as included within our range."

Sir Stamford was here as indefatigable as he had been in Java in his exertions for making a complete collection of specimens of natural history, particularly in the animal and vegetable creation; and in this he was most cheerfully assisted by the natives. He had, besides, the able assistance of Doctors Wallich and Horsfield, and of two French naturalists, one a nephew of Cuvier, whom he engaged to collect specimens exclusively for the East India Company's museum. He thus writes to the duke of Somerset:—

"Your grace would, I think, be amused were you to overlook our present occupations. Were it not for the Dutch, I should have little in politics to interest me; and as it is, I should have much leisure if I did not devote my time to natural history, in which we are daily making very important discoveries. The lower part of our house, at this moment, is more like the menagerie at Exeter 'Change than the residence of a gentleman. Fish, flesh, and fowl, alike contribute to the collection, and above stairs the rooms are

variously ornamented with branches and flowers, rendering them so many arbours. There are no less than five draftsmen constantly employed, and with all our diligence we can hardly keep pace with the new acquisitions which are daily made. I can assure your grace, that while directing these various departments we often think of the days that are to come, when quietly in Park Lane, or in the country, I may attempt to display to your domestic circle some of the riches and beauties with which nature has adorned these islands; but when will that day come? A year has nearly elapsed since we landed on Indian ground; that year has not been spent in idleness; but yet I must look through three or four more still longer years before I think of home; would that they were past too!"

In another letter he observes, "I have thrown politics far away; and since I must have nothing more to do with men, have taken to the wilder but less sophisticated animals of our woods. Our house is on one side a perfect menagerie; on another a perfect Flora; here a pile of stones, there a collection of seaweeds, shells, &c." To the duchess of Somerset he says:—

"Your grace will, I doubt not, be happy to hear that our prospects, even at Bencoolen, are improving; the place no longer has that gloomy and desolate appearance of which I first complained. Population and industry are increasing; the inland merchants begin to bring down the gold and cassia from the interior, and a stranger would hardly know the place again, so much is it changed from what it was two years ago. We have a good many comforts about us, and shall really regret any political necessity which obliges us to remove from what has now become our second home. We have a delightful garden, and so many living pets,—children, tame and wild; monkeys, dogs, birds, &c.,—that we have a perfect *regne animale* within our own walls, to say nothing of the surrounding forests now under contribution. I have one of the most beautiful little men of the woods that can be conceived; he is not much above two feet high, wears a beautiful surtout of fine white woollen, and in his disposition and habits the kindest and most correct creature imaginable; his face is jet black and his features most expressive; he has not the slightest rudiments of a tail, always walks erect, and would, I am sure, become a favourite in Park Lane."

Another letter, written about the same time, shows the happy state of mind enjoyed by this good man in contemplating the progressive improvement, moral and physical, of all around him:—

"Nothing very particular has occurred since my last, except the birth of another boy. My dear little Charlotte is of all creatures the most angelic I ever beheld. She has those inborn graces which, as she expands, must attract the admiration of every one; but she has a soft heart, and is so full of mildness and gentleness that I fear she will have many trials to go through in this unfeeling world. Her brother Leopold, however, will take her part, for he has the spirit of a lion, and is absolutely beautiful; but I will not tire you with any more family details: it will be sufficient to add that we are all well, and as happy as absence from dear relatives and friends will admit. My life is at present rather monotonous; not, however, unpleasantly so, for I have all the regular and substantial enjoyment of domestic comfort in the bosom of a happy and thriving family; and in the

daily pursuits of agriculture and magisterial duty I find abundance to interest and amuse; but I am no longer striding from one side of India to another, overleaping mountains, or forming new countries; I am trying to do the best I can with a very old and nearly worn-out one, in which I hope, by infusing a new spirit and encouraging habits of industry and motives of enterprise, much may be done. I am busily engaged in taking a census of the population, and enquiring into the processes of husbandry and the village institutions; and I think you would be amused to see me amid my rude and untutored mountaineers collecting the details, and entering into all the particulars, as if they were the peasants of my own estate. I am becoming so attached to these pursuits, and find them so much more satisfactory than political discussion, that I believe I shall be sorry to change this mode of life. Allow me, therefore, to indulge my whim for a short time longer, and then I shall be able to carry home such a weight of experience as may perhaps bring all your barren lands into cultivation. If I am not rich enough to have a farm of my own, I shall wish to become a farmer on your lands, and then . . . ."

We cannot resist the beautiful picture which Lady Raffles has sketched of their mode of life at this happy period, when every want and every wish appear to have been gratified.

"Perhaps this was one of the most happy periods in Sir Stamford's life; politically he had attained the object which he felt so necessary for the good of his country (the establishment of Singapore). He was beloved by all those under his immediate control, who united in showing him every mark of respect and attachment; and many were bound to him by ties of gratitude for offices of kindness, for private acts of benevolence and assistance, which he delighted to exercise towards them. The settlement, like many other small societies, was divided into almost as many parties as there were families on his first arrival; but these differences were soon healed and quieted, and a general interchange of good offices had succeeded. The natives and chiefs appreciated the interest which he took in their improvement, and placed implicit reliance upon his opinion and counsel.

"The consciousness of being beloved is a delightful happy feeling, and Sir Stamford acknowledged with thankfulness at this time that every wish of his heart was gratified. Uninterrupted health had prevailed in his family, his children were his pride and delight, and they had already imbibed from him those tastes it was his pleasure to cultivate: this will not be wondered at, even at their early age, when it is added, that two young tigers and a bear were for some time in the children's apartments, under the charge of their attendant, without being confined in cages; and it was rather a curious scene to see the children, the bear, the tigers, a blue mountain-bird, and a favourite cat, all playing together; the parrot's beak being the only object of awe to all the party.

"Perhaps few people in a public station led so simple a life; his mode of passing his time in the country has been already described. When he was in Bencoolen he rose early, and delighted in driving into the villages, inspecting the plantations, and encouraging the industry of the people; at nine a party assembled at breakfast, which separated immediately afterwards; and he wrote, read, studied natural history, chemistry, and geology, superintended the drafts-

men, of whom he had constantly five or six employed in a verandah, and always had his children with him as he went from one pursuit to another, visiting his beautiful and extensive aviary, as well as the extraordinary collection of animals which were always domesticating in the house. At four he dined, and seldom alone, as he considered the settlement but as a family of which he was the head; immediately after dinner all the party drove out, and the evening was spent in reading, and music, and conversation. He never had any game of amusement in his house. After the party had dispersed he was fond of walking out with the editor, and enjoying the delicious coolness of the night land-wind, and a moon whose beauty those only who have been in tropical climates can judge of; so clear and penetrating are its rays that many fear them as much as the glare of the sun. Though scarcely a day passed without reptiles of all kinds being brought in, and the cobra de capello in numbers, the editor never remembers these pleasures being interrupted by any alarm.

"Amidst these numerous sources of enjoyment, however, Sir Stamford never forgot that the scene was too bright to continue unclouded, and often gently warned the editor not to expect to retain all the blessings God in his bounty had heaped upon them at this time, but to feel that such happiness, once enjoyed, ought to shed a bright ray over the future, however dark and trying it might become."

Sir Stamford having made his arrangements for the conduct of his government, determined on making a journey into the interior to examine the state of the country and the condition of the people; and at the same time to add to his collection of subjects of natural history. Lady Raffles accompanied him, being the first European lady that had ever been seen beyond the confines of Bencoolen. An interesting account is given of this journey: in the course of which was discovered the largest and most extraordinary flower perhaps that exists in the whole creation—the *Rafflesia Arnoldi*, called by the natives the "devil's betel-box," and of which Sir Stamford says,—

"The most important discovery throughout our journey was a gigantic flower, of which I can hardly attempt to give any thing like a just description. It is perhaps the largest and most magnificent flower in the world, and is so distinct from every other that I know not to what I can compare it; its dimensions will astonish you; it measures across from the extremity of the petals rather more than a yard; the nectarium was nine inches wide, and as deep, estimated to contain a gallon and a half of water; and the weight of the whole flower fifteen pounds." But the whole vegetable part of the creation is here on a magnificent scale. "There is nothing more striking in the Malayan forests than the grandeur of the vegetation; the magnitude of the flowers, creepers, and trees, contrasts strikingly with the stunted, and I had almost said, pigmy vegetation of England. Compared with our forest-trees your largest oak is a mere dwarf. Here we have creepers and vines entwining larger trees, and hanging suspended for more than a hundred feet, in girth not less than a man's body, and many much thicker; the trees seldom under a hundred, and generally approaching a hundred and sixty to two hundred, feet in height. One tree that we measured was, in circumference, nine yards; and this is nothing to one I measured in Java." An occurrence is related which, while it shows the simplicity

of the natives, was rather of a vexatious nature, though quite pardonable, and even amusing. At a place where felspar, granite, quartz, and other minerals of primitive formation were found, mixed with a variety of volcanic productions:—"Dr. Horsfield got specimens of these, which he gave in charge to some coolies who attended him. After the day's journey he wished to examine this collection; the men produced their baskets full of stones; but on the doctor's exclaiming they were not what he had given them, and expressing some anger on the occasion, they simply observed, they thought he only wanted stones, and they preferred carrying their baskets empty; so they threw away what he gave them and filled them up at the end of the day's journey, and they were sure they gave him more than he collected."

Sir Stamford had been told that the people of the Passuma country were a savage, ungovernable race; he found them every thing the reverse; an agricultural people, reasonable and industrious, more sinned against than sinning. The villages were large, many of them having more than five hundred inhabitants. At one of these villages he says,—"The utmost good humour and affection seemed to exist among the people; they were as one family, the men walking about holding each other by the hand, and playing tricks with each other like children. They were as fine a race as I ever beheld; in general about six feet high, and proportionably stout, clear and clean skins, and an open, ingenuous countenance. They seemed to have abundance of every thing; rice, the staple food of the country, being five times as cheap as at Bencoolen, and every other article of produce in proportion. The women and children were decorated with a profusion of silver ornaments, and particularly with strings of dollars, and other coins, hanging two or three deep round the neck. It was not uncommon to see a child with a hundred dollars round her neck. Every one seemed anxious for medicine, and they cheerfully agreed to be vaccinated. The small-pox had latterly committed great ravages, and the population of whole villages had fled into the woods to avoid the contagion."

He also made another and a longer journey to the capital of Menangkabu, from whence all the Malayan governments acknowledge themselves to have derived their power. The account he gives of this journey, of the extensive population and the high state of cultivation in this distant and retired portion of Sumatra, the innumerable towns and villages that succeed each other, and shaded by the cocoa-nut and other fruit-trees; the remains of buildings and inscriptions, that proved a remote antiquity; the beautiful and majestic scenery, which, Sir Stamford says, more than equalled any thing he ever saw in Java, while the population is equally dense, and the cultivation equally rich, will be read with great interest. He estimates the population within a range of fifty miles round Pagerayong at not less than 1,000,000, spread over a fine undulating surface, with a lake in the centre, surrounded with towns and villages, and shut in by volcanic mountains, one of which is stated to be 15,000 feet above the level of the sea. Our limits will not permit us to give any details of this highly interesting tour; we must content ourselves with extracting the following passage, contained in a letter to Sir Robert Inglis:—

"We here found the wreck of a great empire, hardly known to us but by name, and the evident

source whence all the Malayan colonies now scattered along the coasts of the Archipelago first sprung,—a population of between one and two millions, a cultivation highly advanced, and manners, customs, and productions in a great degree new and undescribed. I can hardly describe to you the delight with which I first entered the rich and populous country of Menangkabu, and discovered, after four days' journey through the mountains and forests, this great source of interest and wealth. To me it was quite classical ground, and had I found nothing more than the ruins of an ancient city, I should have felt repaid for the journey; but when, in addition to this, I found so extensive a population, so fertile a country, and so admirable a post whence to commence and effect the civilization of Sumatra, the sensation was of a nature that does not admit of description. Instead of jealousy and distrust on the part of the natives, they received us with the utmost hospitality; and though their manners were rude, and sometimes annoying, it was impossible to misunderstand their intentions, which were most friendly. They had but one request, namely, that I would not allow the Dutch to come to Padang—for in the twenty-three years that the place had been in our possession, great changes had taken place, new interests had arisen, children then unborn had become men, and those who had been friends to the Dutch were now no more.' I pacified them by receiving an address, which they wrote in public to the king of England, soliciting his attention to their interests; and as I found, on subsequent inquiry, that the Dutch influence had never extended inland beyond the mountains, but had been expressly limited to the western side of them, I did not hesitate to enter into a conditional treaty of friendship and alliance with the sultan of Menangkabu, as the lord-paramount of all the Malay countries, subject, of course, to the approval of Lord Hastings."

Among the variety of people who inhabit the different portions of Sumatra must be mentioned one, the Battas, among whom the horrible custom of cannibalism unquestionably prevails.

"Now do not be surprised," says Sir Stamford to the duchess of Somerset, "at what I shall tell you regarding them, for I tell the truth, and nothing but the truth. To prepare you a little, I must premise that the Battas are an extensive and populous nation of Sumatra, occupying the whole of that part of the island lying between Acheen and Menangkabu, reaching to both the shores. The coast is but thinly inhabited, but in the interior the people are said to be 'as thick as the leaves of the forest;' perhaps the whole nation may amount to between one and two millions of souls. They have a regular government, deliberate assemblies, and are great orators: nearly the whole of them write, and they possess a language and written character peculiar to themselves. In their language and terms, as well as in some of their laws and usages, the influence of Hinduism may be traced; but they have also a religion peculiar to themselves; they acknowledge the one and only great God, under the title of *Dibata Assi Assi*, and they have a trinity of great gods, supposed to have been created by him. They are warlike, extremely fair and honourable in all their dealings, most deliberate in all their proceedings; their country is highly cultivated, and crimes are few."

The island of Sumatra, large as it is, was far too confined a sphere for the eager mind of Sir Stamford

Raffles, especially whenever an object presented itself where the interests of his country or of humanity were concerned. The island of Nias, opposite the settlement of Tappanooly, was considered to be an object of this description. He had learned what dreadful ravages this little island was exposed to from the operation of an active slave trade. A commission of inquiry was sent to collect information. From this mission he learnt that the population was not less than 230,000 souls; that they could export 12,000 bags of rice annually; and that the number of slaves sent from the island in each year exceeded 1500. The following is a brief description of this interesting island:—

"The island is in sight of Sumatra, and seen by most ships passing. I find, on a surface of about 1500 square miles, a population of about 153 to the square mile; the country most highly cultivated, the soil rich, and the people the finest without exception that I have yet met with in the East. They are fair, and a strong, athletic, active race; industrious, ingenious, and intelligent, and forming a striking contrast to their neighbours on the opposite coast of Sumatra. What has most astonished me is the high degree (comparatively) of civilization to which they have attained, without communication from without. We have no trace—no idea, whence or how the island became peopled. The people themselves say, a man and woman were first sent from heaven, from whom they are all descended. Their language, their habits, their character, and institutions, are strikingly different from all others with which we are acquainted. Hinduism never found its way to their shores; and only a few Mahometans, traders, are here and there to be found on the coast, but the religion itself has made no way. They dwell in excellent and commodious houses, the interiors of which are laid out with neatness, not devoid of elegance; streets are regularly formed and paved, with avenues of trees, and stone stairs to the pinnacles of the different hills on which their villages are mostly situated, embosomed in the richest foliage imaginable. The slopes of the hills and the valleys are covered with one continued sheet of the richest cultivation; and there is not a forest tree standing on the island, all have disappeared before the force of industry. To each village are attached stone baths appropriated to the different sexes, which remind us of Roman luxuries. They wear a profusion of gold and other ornaments, than which nothing can be conceived more original. We have discovered an excellent harbour, and made two military stations, merely on account of the flag; and hereafter I hope to have much satisfactory employment."

Eager to protect and encourage the people in habits of industry, Sir Stamford took effective measures to put a stop to the slave trade as the first step to the further civilization of the island. He had never doubted that this humane measure would be approved of by the authorities at home; but here he was disappointed; the court of directors "had no hesitation in declaring that his proceedings in regard to Pulo Nias were deserving of their decided reprehension, they were inclined to visit him with some severe mark of their displeasure for the steps he had taken," and they even threatened to remove him from his government.

The fact of the Dutch having possessed themselves of the only passes through which ships could sail

into the great Archipelago and the China seas, viz. the Straits of Sunda and Malacca; and such was the situation of Great Britain, that she had not left herself an inch of ground to stand upon in the whole track between the Cape of Good Hope and China, nor a single friendly port at which her ships could water, or obtain refreshment, was much regretted by Sir Stamford, who conceived that a personal communication with the governor-general might be useful, and with his usual decision and zeal immediately set out for Calcutta. Here it was arranged that, as the Straits of Sunda were completely in possession of the Dutch, Sir Stamford, as an authorized agent of the governor-general, should endeavour to find out some central station for the benefit of commerce within the Archipelago, so as to secure a free and uninterrupted passage with China through the Straits of Malacca. This was quite enough to stimulate his enterprising spirit. Sir Stamford had, in fact, already fixed in his own mind the position that would answer every purpose. In his own words, "he neither wanted people nor territory; all he asked was permission to anchor a line-of-battle ship, and hoist the English flag at the mouth either of the Straits of Malacca or of Sunda, and the trade of England would be secured." Singapore, at the mouth of the Straits of Malacca, was the spot to accomplish this, and there he accordingly, in February 1819, hoisted the British flag. In June of the same year he says, "My new colony thrives most rapidly. We have not been established four months, and it has received an accession of population exceeding 5000, principally Chinese, and their number is daily increasing. You may take my word for it, this is by far the most important station in the East; and as far as naval superiority and commercial interests are concerned, of much higher value than whole continents of territory." In 1822 he says, "My settlement of Singapore continues to prosper. The total tonnage in two years and a half has been upwards of 161,000 tons, and the estimated value of imports and exports 2,000,000*l.* sterling. At Bencoolen the public expenses in one month are more than they are at Singapore in twelve. The capital turned at Bencoolen never exceeds 400,000 dollars in a year, and nearly the whole of this is in company's bills on Bengal, the only returns that can be made. At Singapore, the capital turned in a year exceeds eight millions, without any government bills or civil establishment whatever." To his relation, the Rev. Dr. Raffles, he thus writes:—

"The progress of my new settlement is in every way most satisfactory, and it would gladden your heart to witness the activity and cheerfulness which prevail throughout; every day brings us new settlers, and Singapore has already become a great emporium. Houses and warehouses are springing up in every direction, and the inland forests are fast giving way before the industrious cultivator. I am now engaged in marking out the towns and roads, and in establishing laws and regulations for the protection of person and property. We have no less than nine mercantile houses (European), and there is abundant employment for capital as fast as it accumulates."

For this flourishing settlement Sir Stamford framed a code of laws and regulations, grounded on the simplest principles of equity and justice. He sets out with this declaration—"That the port of Singapore is a free port, and the trade thereat open to ships

and vessels of every nation, free of duty, equal and alike to all." Here also, as at Bencoolen, he immediately prohibited all gambling and cock-fighting; and persons found to have conducted a gaming-table or cock-pit were liable to the confiscation of their property and banishment from the settlement. He provided that no gaming debts could be recognised by the magistrates, but the winners were to be compelled to restore the amount to the losers. And the concluding enactment does him immortal honour:—"As the condition of slavery, under any denomination whatever, cannot be recognised within the jurisdiction of the British authority, all persons who may have been so imported, transferred, or sold as slaves or slave-debtors, since the 29th day of February, 1819, are entitled to claim their freedom on application to the registrar, as hereafter provided; and it is hereby declared that no individual can hereafter be imported for sale, transferred, or sold as a slave or slave-debtor, or, having his or her fixed residence under the protection of the British authorities at Singapore, can hereafter be considered or treated as a slave, under any denomination, condition, colour, or pretence whatever."

The Bengal government highly approved of Sir Stamford's regulations in the government of Singapore, and more particularly of his suppression of gaming and cock-fighting. Mr. Crawford, however, whom he had placed in charge of the settlement, anxious to raise a revenue at any cost, broke in upon the regulations, in so far as to license indulgences in both these pernicious vices, which were in consequence farmed out to the highest bidder. But the grand jury, highly to their honour, presented them as nuisances, stated them to be so at common law, and indictable as such; in consequence of which this demoralizing system, fostered by one of the noisiest of our Indian reformers, has been given up, and Sir Stamford's original regulations strictly enforced.

The interest which Sir Stamford Raffles took in promoting the welfare and the moral and intellectual improvement of this "child of his own," as he calls it, will appear from the following letter to his accomplished friend, Dr. Wallich:—

"I have just established an institution which will, I am sure, give you satisfaction. The particulars I shall hereafter communicate, not having time at present. The object is, the cultivation of Chinese and Malayan literature, with the improvement of the moral and intellectual condition of the people. The Anglo-Chinese college at Malacca is to be removed here, and united with a Malay college, and both form parts of the institution, which has a scientific department, and places for professors in natural philosophy, &c. &c. We have about 20,000 dollars in funds, and have voted 15,000 for the buildings; the site is fixed upon near the beach, and the plan and appearance will be very respectable.

"I trust in God this institution may be the means of civilizing and bettering the condition of millions; it has not been hastily entered into, nor have its possible advantages been overrated. Our field is India beyond the Ganges, including the Malayan Archipelago, Australasia, China, Japan, and the islands in the Pacific Ocean—by far the most populous half of the world! Do not, my dear friend, think that I am led to it by a vain ambition of raising a name,—it is an act of duty and gratitude only. In these coun-

tries has my little independence been gained; in these countries have I passed the most valuable, if not, perhaps, the whole period of my public life. I am linked to them by many a bitter, many a pleasant tie. It is here that I think I may have done some little good; and instead of frittering away the stock of zeal and means that may yet be left me in objects for which I may not be fitted, I am anxious to do all the good I can here, where experience has proved to me that my labours will not be thrown away. Ill health forces me to leave Singapore before even the material arrangements are made for its prosperity; but in providing for its moral improvement I look to its more certain and permanent advance. Would that I could infuse into the institution a portion of that spirit and soul by which I would have it animated, as easily as I endow it with lands, &c. It will long be in its infancy, and to arrive at maturity will require all the aid of friends and constant support. It is my last public act, and, rise or fall, it will always be a satisfactory reflection that I have done my best towards it. I pray you befriend it."

Having thus established this "child of his own" on the firm basis of freedom and equal rights, he now took his final departure, amidst the deep regrets of the whole settlement. Thus was established this most important commercial station, which, in spite of its being shackled in the same government with Penang on one side and Malacca on the other, not only continues to maintain its ground, but to advance in population, commerce, intelligence, and prosperity.

It is not to be supposed that such incessant activity of body and mind, in a latitude within a few degrees of the equator, could long be continued with unimpaired health. Three years had scarcely expired when Sir Stamford began at intervals to experience serious attacks of fever. Lady Raffles, too, suffered much from illness, and these continuing for two years more, a much longer residence in such an enervating climate could not be advisable, and his thoughts naturally began to turn towards home. Blessed with three lovely children, a most affectionate wife, and a moderate competency, he ventured to look forward to years of that domestic happiness in his native country, the blessings of which, with every drawback of climate, fatigue, and responsibility, he had so fully experienced here. But how uncertain are all human affairs,—how soon are sometimes clouded the brightest prospects,—how vain the most sanguine hopes,—and how often the moments of supreme felicity are changed into those of the deepest affliction! So fared it with this family. "Upwards of three years," says Lady Raffles, "had passed in uninterrupted health and happiness, but a sad reverse took place at this period; the blessings most prized were withdrawn; the child most dear to the father's heart, whose brightness and beauty were his pride and happiness, expired in all the bloom of infancy after a few hours' illness; and from this time until his return to England, sickness and death prevailed throughout the settlement, and in his own family." Sir Stamford thus writes to a friend:—

"My heart has been nigh broken and my spirit is gone; I have lost almost all that I prided myself upon in this world, and the affliction came upon us at a moment when we least expected such a calamity. Had this dear boy been such as we usually meet with in this world, time would ere this have reconciled us

to the loss—but such a child! Had you but seen him and known him you must have doted,—his beauty and intelligence were so far above those of other children of the same age, that he shone among them as a sun, enlivening and enlightening every thing around him. I had vainly formed such notions of future happiness when he should have become a man, and be all his father wished him, that I find nothing left but what is 'stale, flat, and unprofitable.' My remaining children are, I thank God, rather superior to the ordinary run; and Charlotte is every thing we could wish her. How is it that I feel less interest in them than in the one that is gone? Perhaps it is in our nature."

Within a few months this loss was followed by the death of two other children.

"You will, I am sure, grieve to learn what has befallen us. My last letter announced to your grace the loss of my dear Leopold. I have now to add, that during the last month and within a few days of each other, we have been successively deprived of my only remaining boy, and of Charlotte your goddaughter. We have now only one left, an infant, the little Ella; and that we may not run the risk of a tropical climate we send her home by the present opportunity, under the charge of our good old nurse. Such severe trials, in a climate by no means congenial to an European constitution, and broken down as we were by former afflictions, have had their effect in producing severe illnesses. I have had two of the most severe attacks I ever suffered; the last a fever, which fell on the brain, and I was almost mad. I am still an invalid, and confined to my room. How different are these communications to those I was so happy as to make during our first three years' residence! We were then, perhaps, too happy, and prided ourselves too highly on future prospects. It has pleased God to blight our hopes; and we must now lower our expectations more to the standard of the ordinary lot of human nature. God's will be done!"

"In a day or two," he adds, "we shall be left without a single child! What a change! We who had recently such a round and happy circle! All our fears were once that we should have too many; all our cares are now to preserve one—our only one. I cannot say any more; my heart is sick, and nigh broken."

An interesting anecdote is mentioned by Lady Raffles on the occasion of the death of their first child.

"Whilst the editor was almost overwhelmed with grief for the loss of this favourite child—unable to bear the sight of her other children—unable to bear even the light of day—humbled upon her couch with a feeling of misery—she was addressed by a poor, ignorant, uninstructed native woman of the lowest class (who had been employed about the nursery) in terms of reproach not to be forgotten. 'I am come because you have been here many days shut up in a dark room and no one dares to come near you. Are you not ashamed to grieve in this manner when you ought to be thanking God for having given you the most beautiful child that ever was seen? Were you not the envy of every body? Did any one ever see him or speak of him without admiring? and instead of letting this child continue in this world, till he should be worn out with trouble and sorrow, has not God taken him to heaven in all his beauty? What

would you have more? For shame! leave off weeping and let me open a window.' "

Broken down by sickness and affliction, all their friends day after day dying around them, Sir Stamford resolved at once to embark for England, and took his passage in the *Fame*. The fate of this ship will be seen from the following letter, dated Bencoolen, 4th February, 1824 :—

" We embarked on the 2nd instant and sailed at daylight for England, with a fair wind and every prospect of a quick and comfortable passage. The ship was every thing we could wish, and having closed my charge here much to my satisfaction, it was one of the happiest days of my life. We were perhaps too happy, for in the evening it was a sad reverse. Sophia had just gone to bed, and I had thrown off all my clothes, when a cry of 'Fire, fire!' roused us from our calm content, and in five minutes the whole ship was in flames! I ran to examine whence the flames principally issued, and found that the fire had its origin immediately under our cabin. 'Down with the boats. Where is Sophia?—Here. The children?—Here. A rope to the aide. Lower Lady Raffles. Give her to me (says one); I'll take her, says the captain. Throw the gunpowder overboard. It cannot be got at; it is in the magazine, close to the fire. Stand clear of the powder. Skuttle the water-casks. Water! water! Where's Sir Stamford? Come in the boat, Nilson! Nilson, come into the boat. Push off, push off. Stand clear of the after part of the ship.'

" All this passed much quicker than I can write it. We pushed off, and as we did so the flames burst out of our cabin-window and the whole of the after part of the ship was in flames. The masts and sails now taking fire, we moved to a distance sufficient to avoid the immediate explosion, but the flames were now coming out of the main hatchway; and seeing the rest of the crew with the captain still on board, we pulled back to her under the bows so as to be more distant from the powder. As we approached we perceived that the people on board were getting into another boat on the opposite side. She pushed off; we hailed her: 'Have you all on board?—Yes, all save one. Who is he?—Johnson, sick in his cot. Can we save him?—No, impossible.' The flames were issuing from the hatchway. At this moment the poor fellow, scorched I imagine by the flames, roared out most lustily, having run upon the deck. 'I will go for him,' says the captain. The two boats then came together, and we took out some of the persons from the captain's boat which was overladen. He then pulled under the bowsprit of the ship and picked the poor fellow up. 'Are you all safe?—Yes, we have got the man: all lives safe. Thank God! Pull off from the ship. Keep your eye on a star, Sir Stamford.—There's one scarcely visible.'

" We then hauled close to each other, and found the captain fortunately had a compass, but we had no light except from the ship. Our distance from Bencoolen we estimated to be about fifty miles in a south-west direction. There being no landing place to the southward of Bencoolen, our only chance was to regain that port. The captain then undertook to lead and we to follow in a N.N.E. course as well as we could: no chance, no possibility being left, that we could again approach the ship, for she was now one splendid flame, fore and aft and aloft, her masts

and sails in a blaze, and rocking to and fro, threatening to fall in an instant. 'There goes her mizen-mast: pull away, my boys: there goes the gunpowder. Thank God! thank God!'

" You may judge of our situation without further particulars. The alarm was given at about twenty minutes past eight, and in less than ten minutes she was in flames. There was not a soul on board at half-past eight, and in less than ten minutes afterwards she was one grand mass of fire.

" My only apprehension was the want of boats to hold the people, as there was not time to have got out the long-boat or to make a raft. All we had to rely upon were two small quarter-boats, which fortunately were lowered without accident; and in these two small open boats, without a drop of water or grain of food, or a rag of covering except what we happened at the moment to have on our backs, we embarked on the ocean, thankful to God for his mercies! Poor Sophia, having been taken out of her bed, had nothing on but a wrapper; neither shoes nor stockings. The children were just as taken out of bed, whence one had been snatched after the flames had attacked it. In short, there was not time for any one to think of more than two things. Can the ship be saved?—No. Let us save ourselves then. All else was swallowed up in one grand ruin.

" To make the best of our misfortune we availed ourselves of the light from the ship to steer a tolerably good course towards the shore. She continued to burn till about midnight, when the saltpetre which she had on board took fire, and sent up one of the most splendid and brilliant flames that ever was seen, illuminating the horizon in every direction to an extent of not less than fifty miles, and casting that kind of blue light over us which is of all others most horrible. She burnt and continued to flame in this style for about an hour or two, when we lost sight of the object in a cloud of smoke.

" Neither Nilson nor Mr. Bell, our medical friend who had accompanied us, had saved their coats; but the tail of mine with a pocket-handkerchief served to keep Sophia's feet warm, and we made coverings for the children with their neckcloths. Rain now came on, but fortunately it was not of long continuance, and we got dry again. The night became serene and star-light. We were now certain of our course, and the men behaved manfully: they rowed incessantly, and with good heart and spirit, and never did poor mortals look out more for day-light and for land than we did. Not that our sufferings or grounds of complaint were any thing to what has often befallen others, but from Sophia's delicate health as well as of my own, and the stormy nature of our coast, I felt perfectly convinced we were unable to undergo starvation and exposure to sun and weather many days; and aware of the rapidity of the currents, I feared we might fall to the southward of the port.

" At day-light we recognised the coast and Raffles Island, which gave us great spirits; and though we found ourselves much to the southward of the port, we considered ourselves almost at home. Sophia had gone through the night better than could have been expected, and we continued to pull on with all our strength. About eight or nine we saw a ship standing to us from the Roads. They had seen the flames on shore and sent out vessels to our relief: and here certainly came a minister of providence in

the character of a minister of the gospel, for the first person I recognised was one of our missionaries. They gave us a bucket of water, and we took the captain on board as a pilot. The wind, however, was adverse, and we could not reach the shore, and took to the ship, where we got some refreshment and shelter from the sun. By this time Sophia was quite exhausted, fainting continually. About two o'clock we landed safe and sound, and no words of mine can do justice to the expressions of feeling, sympathy, and kindness with which we were hailed by every one. If any proof had been wanting that my administration had been satisfactory here, we had it unequivocally from all. There was not a dry eye, and as we drove back to our former home, loud was the cry of 'God be praised!'

"But enough; and I will only add, that we are now greatly recovered, in good spirits, and busy at work, getting ready-made clothes for present use. We went to bed at three in the afternoon, and I did not awake till six this morning. Sophia had nearly as sound a sleep, and, with the exception of a bruise or two and a little pain in the bones from fatigue, we have nothing to complain of.

"The loss I have to regret beyond all is my papers and drawings, all my notes and observations, with memoirs and collections sufficient for a full and ample history, not only of Sumatra, but of Borneo, and almost every other island of note in the seas—my intended account of the establishment of Singapore—the history of my own administration—eastern grammars, dictionaries, and vocabularies—and last, not least, a grand map of Sumatra, on which I had been employed since my arrival here, and on which for the last six months I had bestowed almost my whole undivided attention. This, however, was not all: all my collections in natural history—all my splendid collection of drawings, upwards of 2000 in number—with all the valuable papers and notes of my friends, Arnold and Jack; and, to conclude, I will merely notice that there was scarce an unknown animal, bird, beast, or fish, or an interesting plant, which we had not on board;—a living tapir, a new species of tiger, splendid pheasants, &c., domesticated for the voyage: we were, in short, in this respect, a perfect Noah's ark.

"All, all has perished! but, thank God, our lives have been spared, and we do not repine."

In stating his misfortunes to the court of directors in a firm and manly tone, free from all murmuring or complaint, he thus continues, after describing the loss of the ship:—

"It however pleased the Almighty Disposer of events to temper his judgments with mercy, and to allay the storms and currents which so constantly prevail in these seas during the present monsoon; and through the steady and great exertions of the men in the boats, we had the satisfaction to make the land in the morning, within about fifteen miles from Bencoolen. The flames from the ship, which had served to assist us in keeping a direct course to the land, had likewise been seen on shore, illumining a circumference of not less than fifty miles, and boats had been sent out in every direction to our assistance. By the aid of one of these we reached Bencoolen about four o'clock in the afternoon of the next day, after having had to contend with an unfavourable current, and latterly a turbulent sea and adverse wind for upwards of sixteen hours, every moment of which,

under our destitute circumstances and the boisterous nature of this coast, was pregnant with a degree of anxiety and apprehension not to be described. The state both of Lady Raffles and myself, already worn down by illness and affliction to the last stage of existence, was ill calculated to support the privations and exposure to which we were subjected; and long before we reached the harbour she had fallen into a succession of fainting fits from which we with difficulty recovered her.

"It may, however, be satisfactory to state, in concluding this melancholy account, that no lives have been lost, and that the whole of the ship's company and passengers have reached this port in safety, thankful to the Almighty for his mercies.

"Submitting, as it is my duty to do, with patient resignation to this awful dispensation of providence, I make the following statement, not in the spirit of complaint, for I repine not, but simply as illustrative of my personal circumstances and prospects as they stand affected by this dire and unlooked-for calamity.

"After a service of nearly thirty years, and the exercise of supreme authority as a governor for nearly twelve years of that period, over the finest and most interesting, but perhaps least known, countries in creation, I had, as I vainly thought, closed my Indian life, with benefit to my country and satisfaction to myself; carrying with me such testimonials and information as I trusted would have proved that I had not been an unprofitable servant, or a dilatory labourer in this fruitful and extensive vineyard.

"This lovely and highly interesting portion of the globe had, politically speaking, long sunk into insignificance, from the withering effects of that baneful policy with which the Hollanders were permitted to visit these regions, when it fell to my lot to direct the course of the British arms to the island of Java; and there, on the ruins of monopoly, torture, and oppression, in all its shapes, to re-establish man in his native rights and prerogatives, and re-open the channel of an extensive commerce. Political events required our secession from that quarter; but the establishment of Singapore and the reforms introduced on this coast have no less afforded opportunities for the application and extension of the same principles.

"In the course of those measures, numerous and weighty responsibilities became necessary. The European world—the Indian world—(the continental part of it at least)—were wholly uninformed of the nature of these countries, their character, and resources. I did not hesitate to take these responsibilities as the occasion required them; and though, from imperfect information, many of my measures in Java were at first condemned, I had the satisfaction to find them, in the end, not only approved, but applauded, far beyond my humble pretensions, and even by those who at first had been most opposed to me. I need refer to no stronger case than that of the marquis of Hastings.

"During the last six years of my administration, and since I have ceased to have any concern in the affairs of Java, the situations in which I have been placed, and the responsibilities which I have been compelled to take in support of the interests of my country and of my employers, have been, if possible, still greater than during my former career; I allude to the struggle which I have felt it my duty to make against Dutch rapacity and power, and to the diffi-

culties that I had to contend with in the establishment of Singapore, and the reforms which have been effected on this coast.

"In addition to the opposition of avowed enemies to British power and Christian principles, I had to contend with deep-rooted prejudices and the secret machinations of those who dared not to act openly; and, standing alone, the envy of some and the fear of many, distant authorities were unable to form a correct estimate of my proceedings. Without local explanation, some appeared objectionable; while party spirit and Dutch intrigue have never been wanting to discolour transactions and misrepresent facts.

"It was at the close of such an administration that I embarked with my family in the *Fame*, carrying with me endless volumes and papers of information on the civil and natural history of nearly every island within the Malayan Archipelago, collected at great expense and labour, under the most favourable circumstances, during a life of constant and active research, and in an especial manner calculated to throw light, not only on the commercial and other resources of these islands, but to advance the state of natural knowledge and science, and finally to extend the civilization of mankind.

"These, with all my books, manuscripts, drawings, correspondence, records, and other documents, including tokens of regard from the absent, and memorials from the dead, have been all lost for ever in this dreadful conflagration; and I am left single and unaided, without the help of one voucher to tell my story and uphold my proceedings when I appear before your honourable court."

† And, never forgetful of those who were at any time placed under his care, he adds:—

"In expressing my deep-felt gratitude to the inhabitants of this settlement for their sympathy in our sufferings, and genuine hospitality, I can only say, that having been thrown back on their shores most unexpectedly,—we were naked, and they clothed us—hungry and athirst, and they fed us—wearied and exhausted, and they comforted and consoled us;—and I pray to God that your honourable court, as the immediate guardians of their interests, will bless this land of Sumatra in return, even for their sakes."

So heavy a misfortune was enough to have overwhelmed in deep despondency any ordinary man; but Sir Stamford rose superior to all such calamities. Lady Raffles observes that neither murmur nor lamentation ever escaped his lips; and on the ensuing Sabbath he publicly returned thanks to Almighty God for having preserved the lives of all present, under circumstances from which there appeared no human probability of escaping. His active mind was neither depressed nor damped, but instantly resumed its wonted ardour. After this irreparable loss of all he had been collecting for so many years, and which, we are told, filled 122 cases, the very next morning he re-commenced sketching out the map of Sumatra; set all his draftsmen to work in making new drawings of the most interesting specimens of natural history; despatched a number of people into the woods to collect animals; and though by death or absence he was deprived of all his scientific assistants, in the course of two months he succeeded in getting together a very respectable collection, part of which now forms the most valuable portion of the Zoological Museum. Indeed it was he who first suggested, and in co-operation with another star of our country

still more recently lost to our view, Sir Humphry Davy, planned and established that society as it now exists.

On the 8th April he embarked in the *Mariner*, and arrived at Plymouth on the 22nd August. It was not till April 1826 that Sir Stamford could obtain from the court of directors an opinion of his services, which at length they gave under the three heads of Java, Sumatra, and Singapore, cautious and qualified enough. They thus conclude with regard to his general services:—

"The government of Sir Stamford Raffles appears, with sufficient evidence, to have conciliated the good feelings of, at least, the great majority of the European and native population; his exertions for the interests of literature and science are highly honourable to him, and have been attended with distinguished success; and although his precipitate and unauthorized emancipation of the company's slaves, and his formation of a settlement at Pulo Nias, chiefly with a view to the suppression of a slave traffic, are justly censured by the court, his motives in those proceedings, and his unwearied zeal for the abolition of slavery, ought not to be passed over without an expression of approbation." Sir Stamford had vainly indulged in the hope of passing a few years in the tranquillity of domestic life, and with this view purchased a small estate at Hendon; but a sudden attack, which his friends fondly hoped was not apoplectic, had evidently shattered him. "My attack," he says, "was sudden and unexpected, but fortunately was not apoplectic, as was at first feared." He felt, however, that (as he says in one of his letters) "it had shaken his confidence and nerves," and that his "head was not quite what it should be." A very few weeks more and the final blow came. His lady thus concludes this interesting and instructive memoir:—

"The few letters which have been introduced in the last pages, are sufficient to prove that the death-blow had been struck—the silver cord was broken at the wheel. His sense of enjoyment, indeed, was as keen as ever, his spirit as gay, his heart as warm, his imagination still brighter, though his hopes in this world were less. He was contented with the happiness of the present moment, and only prayed for its continuance. That his prayer was not granted is his everlasting gain. Yet even here, and after so many trials and privations, he enjoyed no common pleasures: the delight of being united to friends from whom he had been so long separated; the charms of society; the interests of literature and science; the general improvement of man; and above all, the nearer charities of domestic life, all combined to engage and occupy his mind. His heart was full of enjoyment; and in the retirement for which he had so long sighed, and surrounded by all the ties which it had pleased God to spare to him, he indulged his happy spirit. In the midst of all these best of worldly treasures, in the bosom of his family, that spirit which had won its way through a greatly chequered course, was suddenly summoned to the throne of God, on the day previous to the completion of his forty-fifth year, the 5th of July, 1826."

RAIKES, ROBERT, a philanthropist, who was born at Gloucester in 1735. His father was the proprietor of the "*Gloucester Journal*," and young Raikes succeeded him in a good printing business. Having realized a handsome fortune, he employed it

and his pen in the service of his fellow-creatures. He is, however, best known for his institution of those admirable places, Sunday-schools, which he planned, conjointly with the Rev. Mr. Stoke, in 1781. Mr. Raikes closed his useful and benevolent life at Gloucester in 1811, deeply regretted by his friends.

RAINOLDS, JOHN, an English divine, who was born at Pinho, in Devonshire, and studied at Corpus Christi college, Oxford, where he took his degree of D.D. in 1585. The year after he was appointed reader of the Theological Lectures, founded by Sir Francis Walsingham. He subsequently became president of his college, and distinguished himself greatly at the Hampton Court conference in 1603, being considered as the head of the puritan party. At that meeting he suggested the necessity of that new translation of the Bible which is now the standard one, and in which he himself actively engaged. His death took place in 1607. Anthony Wood gives the following estimate of his personal character. He says, "It must not be forgotten that this year died Dr. John Rainolds, president of Corpus Christi college; one of so prodigious a memory that he might have been called a walking library; of so virtuous and holy life and conversation (as writers say), that he very well deserved to be red-lettered; so eminent and conspicuous, that, as Nazianzen speaketh of Athanasius, it might be said of him 'to name Rainolds is to commend virtue itself.' He had turned over (as I conceive) all writers, profane, ecclesiastical, and divine; all the councils, fathers, and histories of the church. He was most excellent in all tongues which might be any way of use or serve for ornament to a divine. He was of a sharp and nimble wit, of a grave and mature judgment, of indefatigable industry, exceeding therein Origen, surnamed Adamantius. He was so well versed in all arts and sciences as if he had spent his whole time in each of them. Eminent also was he accounted for his conference had with King James and others at Hampton Court, though wronged by the publisher thereof, as he was often heard to say; a person also so much respected by the generality of the academicians for his learning and piety, that happy and honoured did they account themselves that could have discourse with him. At times of leisure he delighted much to talk with young towardly scholars, communicating his wisdom to the encouraging them in their studies, even to the last. A little before his death, when he could not do such good offices, he ordered his executors to have his books (except those he gave to his college and certain great persons) to be dispersed among them. There was no house of learning then in Oxford, but certain scholars of each (some to the number of twenty, some less) received of his bounty in that kind, as a catalogue of them (with the names of the said scholars) which I have lying by me sheweth." This catalogue Wood prints in a note. It records the dispersion of a very considerable library among the students of the different colleges, to the number of 280, many of whom became afterwards men of great eminence in the church. He also bequeathed some books to the Bodleian, and some to his relations. He was interred with great solemnity in the chapel of Corpus Christi college, where a monument was erected to his memory by his successor in the presidentship, Dr. Spencer, with the following inscription: "Virtuti sacrum. Jo. Rainoldo S. Theol. D. eruditione, pietate, integritate incomparabile, hujus Coll. Præses,

qui obiit, &c. Jo. Spencer auditor, successor, virtutum et sanctitatis admirator H. M. amoris erga posuit." Dr. Rainolds wrote some controversial works published in his life-time, enumerated by Wood, and sermons on the prophecies of Obadiah and Haggai, which with some other works appeared after his death; that on Haggai was published during the rebellion, to enlist him on the side of those who were enemies to the church establishment, to which he ever appears to have been attached; although he may be ranked among doctrinal puritans.

His brother, William Rainolds, was educated in Winchester school, and became fellow of New College in 1562. The story of his turning Roman catholic, in consequence of a dispute with his brother John, seems discredited by Wood; and Dodd gives farther reason to question it on the authority of Father Parsons, who was told by Rainolds himself that his first doubts on the subject were occasioned by perusing Jewell's works, and examining the authors quoted by that learned prelate. It is certain, however, that he left a benefice he had in Northamptonshire and went to Rheims, where he could have the free exercise of his adopted religion, and was made professor of divinity and Hebrew. At last he returned to Antwerp, where he died in 1594. He wrote against Whitaker, and other works in the catholic controversy. Two letters to him are printed with his brother John's "Orationes."

RALEIGH, SIR WALTER, a distinguished writer, statesman, and soldier, who was born, in 1552, of an ancient family in Devonshire. Having completed the rudiments of his education, he was sent to Oriel college, Oxford, where he distinguished himself by his attention and proficiency in his academical studies. Having completed his studies, he was selected to form one of a troop of a hundred gentlemen, whom Queen Elizabeth permitted Henry Champernoun to transport to France to assist the persecuted protestants. Sir Walter appears to have been engaged for some years in military affairs, of which, however, we do not know the particulars. In 1575 or 1576 he was in London, exercising his poetical talents; for there is a commendatory poem by him prefixed, among others, to a satire called "The Steel Glass," published by George Gascoigne, a poet of that age. This is dated from the Middle Temple, at which he then resided, but with no view of studying the law; for he declared expressly at his trial that he had never studied it. On the contrary, his mind was still bent on military glory; and accordingly, in 1578, he went to the Netherlands with the forces which were sent against the Spaniards, commanded by Sir John Norris, and it is supposed he was at the battle of Rimenant. The following year, when Sir Humphrey Gilbert, who was his brother by his mother's side, had obtained a patent of the queen to plant and inhabit some northern parts of America, he engaged in that adventure; but returned soon after, the attempt proving unsuccessful. In 1580, on the breaking out of the Irish rebellion, he had a captain's commission under the lord deputy of Ireland, Arthur Grey, Lord Grey de Wilton. Here he distinguished himself by his skill and bravery. In 1581 the earl of Ormond departing for England, his government of Munster was given to Captain Raleigh, in commission with Sir William Morgan; and Captain Piers Raleigh resided chiefly at Lismore, and spent all this summer in the woods and country adjacent in continual action with the rebels. At his

return home he was introduced to court; and, as Fuller relates, upon the following occasion,—“Her majesty, taking the air in a walk, stopped at a splashy place, in doubt whether to go on; when Raleigh, dressed in a gay and genteel habit of those times, immediately cast off and spread his new plush cloak on the ground, on which her majesty gently treading, was conducted over clean and dry.” The truth is, Raleigh always possessed a commanding figure and a handsome person; a strong natural wit, and a better judgment; and that kind of courtly address which pleased Elizabeth and led to her favour. Such encouragement, however, did not reconcile him to an indolent life. In 1583 he set out with his brother Sir H. Gilbert in his expedition to Newfoundland; but within a few days was obliged to return to Plymouth, his ship's company being seized with an infectious distemper; and Sir H. Gilbert was drowned in coming home, after he had taken possession of that country. These expeditions, however, being much to Raleigh's taste, he in 1584 obtained letters patent for discovering unknown countries; he set sail to America, and took possession of a place to which Queen Elizabeth gave the name of Virginia.

Upon his return he was elected member of parliament for Devonshire, and soon after knighted; an honour which, from the sparing hand of that monarch, was considered as high distinction. About this period, also, he was favoured by a license to sell wines throughout the kingdom. In 1585 he appears several ways engaged in the laudable improvements of navigation; for he was one of the colleagues of the fellowship for the discovery of the north-west passage. The same year he sent his own fleet upon a second voyage to Virginia, and afterwards upon a third. It was this colony of Virginia which first brought tobacco to England, and Sir Walter Raleigh, who first introduced it into use. Queen Elizabeth had no objection to it as a valuable article of commerce; but her successor, James I., held it in such abhorrence as to use his utmost endeavours to prevent the use of it. About the same time Sir Walter was made seneschal of Cornwall and lord warden of the Stannaries. On the suppression of the rebellion in Munster, when the forfeited lands were divided in signories among those who had been active in its reduction, he obtained a grant of 12,000 acres in the counties of Cork and Waterford; which he planted at his own expense; and at the end of this reign sold to Richard Boyle, afterwards the great earl of Cork, who owned this purchase to have been the first step to his future vast fortune.

His favourite residence, a view of which is given in the annexed engraving, was originally the college or residence of the warden, fellows, &c., of the collegiate church of Youghal, and was founded in the year 1464. But its present appearance exhibits more of the ordinary style of the old English manor-house of the age of Elizabeth and the first James, having been repaired by Sir George Carew, lord president of Munster, in 1602, and again in a few years after, at considerable expense, by Sir Richard Boyle, afterwards earl of Cork, being reduced almost to ruins during the Desmond rebellion. It was successively used as a residence by Sir Richard Norris and Sir George Carew, lords presidents of Munster, and by Sir Richard Boyle, which was made one of the articles of complaint against the latter by the Lord Strafford. It subsequently became the property and residence, when at

Youghal, of Lord Cork's descendant, the duke of Devonshire. Since its restoration in the commencement of the seventeenth century, the college house has un-

dergone but little other change than the alteration of some of the windows; the walls are nearly five feet in thickness. The interior is in its original state; waincotted throughout with fine old Irish oak, in excellent preservation. The pannels in some of the rooms are richly carved, especially in the drawing-room, the chimney piece of which presents an exquisite specimen of the elaborate work of the day, being enriched with various grotesque figures and emblems. The roof, being also of Irish oak, has remained untouched, having apparently suffered nothing from the hand of time.

This interesting place derives its present name of Myrtle Grove from the many beautiful myrtle trees which still flourish luxuriantly here; some of them having attained a height of nearly twenty feet. The strawberry-arbutus also, and many other delicate shrubs, afford abundant evidence of the extreme mildness of the climate. These remind one strongly of the refined taste and feeling exhibited by Raleigh in the cultivation and adornment of this, for some time his favourite retreat from the turmoil and storms of court life. In these gardens we are told he first propagated the potatoe, which he brought from America. Tradition says that the person to whom he entrusted the care of those first planted, “imagining that the apple which grows on the stalk was the part to be used, gathered it; but not liking the taste, neglected the roots, till the ground being dug afterwards to sow some other grain, the potatoes were discovered therein, and, to the great surprise of the planter, vastly increased; and from those few Ireland was furnished with seed.”

It does not appear that Raleigh resided long here: a life of calm and unchequered repose seems to have been quite unsuited to his temperament. The following beautiful lines would almost induce one to think otherwise; but in truth nothing can be less indicative of the real tone of his enterprising mind, ever restless, ever bent on forming new projects. If, however, he wrote as he felt—and indeed every line seems convincingly to show that he did so—we have only here an additional proof of the manner in which men, for a while, can cheat themselves into an utterly illu-

sive estimate of their own dispositions and inclinations:—

" Heart-tearing cares and quiv'ring fears, :  
Anxious sighs, untimely tears,  
Fly, fly to courts,  
Fly to fond worldings' sports ;  
Where strain'd sardonic smiles are glowing still,  
And grief is forced to laugh against her will ;  
Where mirth's but mummery,  
And sorrows only real be."

Sir Walter was now become such a favourite with the queen that they who had at first been his friends at court began to be alarmed and to intrigue against him, particularly the earl of Leicester, his former patron, who is said to have grown jealous of his influence with her majesty, and to have set up, in opposition to him, Robert Devereux, the young earl of Essex. To this he appears to have paid little attention, but constantly attended his public charge and employments, whether in town or country, as occasion required. He was in 1586 a member of that parliament which decided the fate of Mary queen of Scots, in which he probably concurred. But still speculating on the consequences of the discovery of Virginia, he sent three ships upon a fourth voyage there in 1587. In 1588 he sent another fleet upon a fifth voyage to Virginia, and the same year took a brave part in the destruction of the Spanish armada sent to invade England. About this time he made an assignment to a company of London merchants of all his rights in the colony of Virginia. In April 1589 he accompanied Don Antonio, the expelled king of Portugal, then in London, to his dominions, when an armament was sent to restore him ; and, for his conduct on this occasion, was honoured by the queen with a gold chain. On his return to England the same year he touched upon Ireland, where he visited Spenser the poet, whom he brought to England, introduced into the queen's favour, and encouraged by his own patronage, himself being no inconsiderable poet. Spenser has described the circumstances of Sir Walter's visit to him in a pastoral, which about two years after he dedicated to him, and entitled "Collin Clout's Come Home Again." In 1592 he was appointed general of an expedition against the Spaniards at Panama ; and soon after this we find him again in the house of commons.

About 1593 Raleigh formed a strong attachment for the beautiful daughter of Sir Nicholas Throgmorton, an able statesman and ambassador, which so offended the queen that they were both confined for several months, and when set at liberty, forbidden the court. Sir Walter afterwards married the object of his affection, and always lived with her in the strictest conjugal harmony. The next year he was so entirely restored to the queen's favour that he obtained a grant from her majesty of the manor of Sherborne in Dorsetshire, which had been alienated from the see of Salisbury by Bishop Caldwell. During his disgrace he projected the discovery and conquest of the rich and beautiful empire of Guiana, in South America, and reached the Orinoco ; but was obliged by sickness and contrary winds to return, after having done little more than take a formal possession of the country in the name of Elizabeth. In 1596 he had so far regained favour that he had a naval command under the earl of Essex, with whom a difference ensued that laid the foundation of a lasting enmity between them. He witnessed the ruin of his antagonist the earl of Essex, whose execution he urged

and personally viewed from a window in the armoury. The speedy death of the queen, which this very catastrophe hastened, put a period to his prosperity. James I., whom, with some other courtiers, he sought to limit in his power of introducing the Scots into England, resented that attempt, and disliked him as the enemy of his friend the earl of Essex. Although received with external civility at court, he was deprived of his post of captain of the guards, and evidently discountenanced. This treatment preyed upon his high spirit, and a conspiracy having been formed for the purpose of placing upon the throne the lady Arabella Stuart, Sir Walter was accused of participating in it by Lord Cobham, to whose idle proposals he had given ear without approving them. By the base subservience of the jury he was brought in guilty of high treason, even to the surprise of the attorney-general Coke himself, who declared that he had only charged him with misprision of treason. Raleigh was reprieved and committed to the Tower, where his wife, at her earnest solicitation, was allowed to reside with him, and where his youngest son was born.

Though his estates in general were preserved to him, the rapacity of the king's minion, the infamous Car, seized on his manor of Sherborne upon a flaw found in his prior conveyance of it to his son. It was not until after twelve years' confinement that he obtained his liberation, during which interval he composed the greater part of his works, and especially his "History of the World." He was only released at last by the advance of a large sum of money to the new favourite, Villiers ; and to retrieve his broken fortunes he planned another expedition to America. He obtained a patent under the great seal for making a settlement in Guiana ; but, in order to retain a power over him, the king did not grant him a pardon for the sentence passed upon him for his alleged treason. How far Raleigh knowingly deceived the court by his representations of rich discoveries and gold mines, it is impossible now to ascertain ; but, having reached the Orinoco, he despatched a portion of his force to attack the new Spanish settlement of St. Thomas, which was captured, with the loss of his eldest son. The expected plunder, however, proved of little value ; and Sir Walter, after having in vain attempted to induce his captains to attack other Spanish settlements, arrived at Plymouth in July 1618. In the mean time the Spanish ambassador had produced such an effect upon James, who was seeking the hand of the infanta for his son Charles, that Raleigh was arrested and committed to the Tower. James had reason to be offended with the conduct of Raleigh against a power in amity with himself, and might have tried him for this new offence ; but, with his usual meanness and pusillanimity, determined to execute him on his former sentence. Being brought before the court of king's bench, his plea of an implied pardon by his subsequent command was overruled ; and the doom of death being pronounced against him, it was carried into execution on the 29th of October, 1618, in Old Palace Yard. His conduct on the scaffold was calm ; and, after addressing the people at some length in his own justification, he received the stroke of death with perfect composure. Thus fell Sir Walter Raleigh, in the sixty-sixth year of his age, by one of the most odious acts of the reign of James I.

As a politician and public character Sir Walter Raleigh is open to much animadversion ; but in extent

of capacity and vigour of mind he had few equals, even in an age of great men. His writings are on a variety of topics, poetical, military, maritime, geographical, political, and historical. Most of his miscellaneous pieces have ceased to be interesting, but his "History of the World" is one of the best specimens of the English writing of his day, being at once the style of the statesman and the scholar. The compass of the work did not admit fulness of narrative, but he is often an acute and eloquent reasoner on historical events.

RALPH, JAMES, a literary character, who was a native of Philadelphia, in North America, and came to England in 1725 in company with Benjamin Franklin. In 1728 Ralph published a poem, entitled "Night," to which Pope thus alludes in the "Dunciad":—

"Silence, ye wolves, while Ralph to Cynthia howls,  
Making night hideous,—answer him, ye owls!"

He afterwards attempted the drama, but without success; and having produced a tragedy, a comedy, an opera, and a farce, he took up the employment of a party writer. In 1742 he published an answer to the memoirs of Sarah, duchess of Marlborough; and in 1744 appeared his history of England during the reigns of Charles II., James II., William III., &c., which, as a work of research, is by no means destitute of merit. He was at length connected with the politicians and literary men who were attached to the service of Frederic, prince of Wales; in consequence of which, Ralph is said to have become possessed of a manuscript written by the prince, or under his direction, to which so much importance was attributed that a gratuity or a pension was bestowed on the holder as a compensation for surrendering it. He obtained a pension after the accession of George III., but he did not long enjoy it, as his death took place in 1762. Besides the works mentioned, he published a treatise on the use and abuse of parliaments, the case of authors by profession, and a number of political pamphlets.

RAMBERG, JOHN HENRY, an artist distinguished for his paintings and etchings, who was born in 1667 in Hanover. He first showed his talent by drawings of scenes in the Hartz mountains. These drawings became known to the king of England, his sovereign as elector of Hanover, who induced him to come to London, where he provided for him. He remained nine years in the capital, and perfected himself under Reynolds. Murphy, Bartolozzi, and other engravers of the first rank in this country, engraved drawings of his. In 1748 the king sent him to Italy, whence he returned to Hanover, where he was appointed painter to the court. Few painters and designers have produced so many works as he has; but this rapidity prevented the full development of his talent. Ramberg distinguished himself particularly in the humorous caricature. The drawings to the magnificent edition of Wieland's works are all by him: some he etched himself.

RAMLER, CHARLES WILLIAM, a German lyric poet, translator, and critic, who was born at Colberg in 1725, studied at Halle, and was a professor in the royal military school for young noblemen in Berlin in 1748. In 1790 he became co-director of the theatre of Berlin. He died in 1798. Ramler appeared at a period poor in poets, and attached his fame to that of Frederic the Great, whom he celebrated as Horace did Augustus. From this circumstance, and from his occasional imitations of Horace, he has been called

the German Horace, but is greatly below his model. Ramler had little poetical genius, but he did much to polish German versification. His ideas respecting German prosody were, however, very deficient. He translated many of the classics. His poetical works appeared in two volumes. Ramler wrote also in prose.

RAMEAU, JEAN PHILIPPE, an able French theorist in the science of music, who was a native of Dijon, and born in 1683. Having at an early age acquired some skill in music, he joined a strolling company of performers, by whose assistance a musical entertainment of his composition was represented at Avignon in the eighteenth year of his age. He was afterwards appointed organist in Clermont cathedral, applied himself to the study of the principles of his profession, and in 1722 printed the first fruits of his investigation in a treatise entitled "Traité de l'Harmonie." Four years after appeared his "Nouveau Système de Musique Théorique," which was followed by his "Génération Harmonique." In 1750 he published his celebrated "Dissertation sur le Principe de l'Harmonie," in which he reduces harmony to one single principle—the fundamental bass, on which he proves all the rest to depend. This work procured him an invitation from the court to superintend the opera at Paris. He possessed a great facility in adapting words to music, and piqued himself so much upon this talent, that he is said to have declared he would set a Dutch gazette if it was required of him. His remaining theoretical works are, "Remarks on the Demonstration of the Principles of Harmony," "Reply to a Letter of M. Euler on the Instinctive Love of Music in Man," "On the Mistakes of the Encyclopædia with Respect to Music," and "A Practical Code of Music." He was also the author of six operas, "Hippolyte et Aricie," "Castor et Pollux," "Dardanus," "Samson," "Pygmalion," and "Zoroaster," besides a great variety of ballets and other minor pieces. Louis XV. acknowledged his merits by the grant of a patent of nobility and the order of St. Michael. Rameau died at Paris in 1764.

RAMMOHUN ROY, RAJAH.—This celebrated Hindoo became a convert to Christianity and obtained distinction both by his writings and his diplomatic talents. The following details of the life of this extraordinary individual are abridged from a work by the celebrated Dr. Carpenter of Bristol. It was published under the title of "A Review of the Labours, Opinions, and Character of Rajah Rammohun Roy," and had a very extensive sale. He commences by saying, "Rammohun Roy was the son of Ram Kanth Roy. His grandfather resided at Moorshebad and for some time filled several very important offices under the Moguls; but, being ill-treated by them towards the end of his life, the son took up his abode in the district of Bordouan, where he had landed property. There Rammohun Roy was born, most probably about 1774. Under his father's roof he received the elements of native education, and also acquired the Persian language. He was afterwards sent to Patna to learn Arabic; and, lastly, to Benares, to obtain a knowledge of the Sanscrit, the sacred language of the Hindoos. His masters at Patna set him to study Arabic translations of some of the writings of Aristotle and Euclid; and it is probable that the training thus given his mind in acuteness and close reasoning, and the knowledge which he acquired of the Mahometan religion from Mussulmen whom he esteemed, contributed to cause that searching examination of the faith in

which he was educated, which led him eventually to the important efforts he made to restore it to its early simplicity.

His family was Brahminical, of high respectability; and, of course, he was a Brahmin by birth. After his death the thread of his caste was seen round him, passing over his left shoulder and under his right. His father trained him in the doctrine of his sect; but he very early observed the diversities of opinion existing even among the idolaters; and that while some exalted Brahma, the creator, others gave the ascendancy to Vishnu, the preserver; and others, again, to Siva, the destroyer. It is scarcely possible, too, but that his mind must have been struck by the simplicity of the Mahometan faith and worship; and, at any rate, it early revolted from the frivolous or disgusting rites and ceremonies of Hindoo idolatry. Without disputing the authority of his father, he often sought from him information as to the reasons of his faith: he obtained no satisfaction; and he at last determined, at the early age of fifteen, to leave the paternal home, and sojourn for a time in Thibet, that he might see another form of religious faith. He spent two or three years in that country, and often excited the anger of the worshippers of the Lama by his rejection of their doctrine, that this pretended deity—a living man—was the creator and preserver of the world. In these circumstances he experienced the soothing kindness of the female part of the family; and his gentle, feeling heart dwelt, with deep interest, at the distance of more than forty years, on the recollections of that period, which, he said, had made him always feel respect and gratitude towards the female sex, and which, doubtless, contributed to that unvarying and refined courtesy which marked his intercourse with them in this country. When he returned to Hindoostan, he was met by a deputation from his father, and received by him with great consideration. He appears, from that time, to have devoted himself to the study of Sanscrit and other languages, and of the ancient books of the Hindoos. He had frequent discussions with his father: through awe of him, however, he never avowed the scepticism which he entertained as to the present forms of their religion; but, from some indirect reproaches he received, he imagined that he had fallen under his father's suspicions.

His father had given him, for that country, a very superior education; but, having been brought up himself in the midst of the Mussulman court, he appears to have thought principally of those qualifications which would recommend his son to the ancient conquerors of India; and, till manhood, Rammohun Roy knew very little of the English language, and that little he taught himself. "At the age of twenty-two," says the editor of the English edition of the abridgment of the "Vedant" and the "Cena Upanishad," "he commenced the study of the English language; which, not pursuing with application, he, five years afterwards, when I became acquainted with him, could merely speak it well enough to be understood upon the most common topics of discourse, but could not write it with any degree of correctness. He was afterwards employed as dewan, or principal native officer, in the collection of the revenues, in the district of which I was for five years collector in the East India Company's civil service. By perusing all my public correspondence with dili-

gence and attention, as well as by corresponding and conversing with European gentlemen, he acquired so correct a knowledge of the English language as to be enabled to write and speak it with considerable accuracy." His father, Ram Kanth Roy, died in the year 1210 of the Bengal era, A. D. 1803, leaving three sons. Rammohun Roy was disinherited by his father on the ground of his having renounced the superstition of his forefathers. Nevertheless, as he some time after possessed considerable property, it is probable either that, though the sacrifice of his patrimonial rights was tendered at the shrine of truth and conscience, it was not eventually exacted from him, or that he received the property of his brothers on their decease. From this period he appears to have commenced his plans of reforming the religion of his countrymen; and, in the progress of his efforts to enlighten them, he must have expended large sums of money; for he gratuitously distributed most of the works which he published for the purpose. He now quitted Bordouan and removed to Moorshedabad; where he published, in Persian, with an Arabic preface, a work entitled "Against the Idolatry of all Religions." No one undertook to refute this book; but it raised up against him a host of enemies; and in 1814 he retired to Calcutta, where he again applied himself to the study of the English language, both by reading and by conversation; and he also acquired some knowledge of Latin, and paid much attention to the mathematics. At this time he purchased a garden, with a house, constructed in the European mode, in the circular road, at the eastern extremity of the city; and he gradually gathered round him enquiring intelligent Hindoos, of rank and opulence, some of whom united, as early as 1818, in a species of monotheistic worship.

The body of Hindoo theology is comprised in the "Veds," which are writings of very high antiquity, very copious, but obscure in style; and, about two thousand years ago, Vyas drew up a compendious abstract of the whole, accompanied with explanations of the more difficult passages. This digest Vyas called the "Vedant; or, the Resolution of all the Veds;" one portion of this respects the ritual, and another the principles, of religion. It is written in the Sanscrit language. Rammohun Roy translated it into the Bengalee and Hindoostanee languages, for the benefit of his countrymen; and afterwards published an abridgment of it, for gratuitous and extensive distribution. Of this abridgment he published an English translation in 1816, the title of which represents the "Vedant" as "the most celebrated and revered work of Brahminical theology, establishing the unity of the Supreme Being, and that he alone is the object of propitiation and worship." Towards the close of his preface, he thus writes:—"My constant reflections on the inconvenient, or rather, injurious rites introduced by the peculiar practice of Hindoo idolatry, which, more than any other pagan worship, destroys the texture of society,—together with compassion for my countrymen,—have compelled me to use every possible effort to awaken them from their dream of error; and, by making them acquainted with the (their) scriptures, enable them to contemplate, with true devotion, the unity and omnipresence of nature's God. By taking the path which conscience and sincerity direct, I, born a Brahmin, have exposed myself to the complainings and reproaches even of some of my rela-

tions, whose prejudices are strong, and whose temporal advantage depends on the present system. But these, however accumulated, I can tranquilly bear; trusting that a day will arrive when my humble endeavours will be viewed with justice—perhaps acknowledged with gratitude. At any rate, whatever men may say, I cannot be deprived of this consolation—my motives are acceptable to that Being who beholds in secret and compensates openly.”

After the publication of the “Vedant,” Rammohun Roy printed, in Bengalee and in English, some of the principal chapters of the Veds. The first of the series was published in 1816, and is entitled “A Translation of the ‘Cena Upanishad,’ one of the chapters of the Sama Veda, according to the Gloss of the celebrated Shancaracharya; establishing the Unity and sole Omnipotence of the Supreme Being, and that He alone is the Object of Worship.” This was prefixed to a reprint of the abridgment of the “Vedant,” published in London, in 1817, by some one who had enjoyed personal intimacy with him. The English preface contains a letter from Rammohun Roy to this gentleman, which shows how well he had, even at that time, overcome the difficulties of the English language. “The consequence of my long and uninterrupted researches into religious truth (he says in this letter) has been, that I have found the doctrines of Christ more conducive to moral principles, and better adapted for the use of rational beings, than any other which have come to my knowledge; and have also found Hindoos, in general, more superstitious and miserable, both in performance of their religious rites, and in their domestic concerns, than the rest of the known nations of the earth.” He then proceeds to state what he had done in order to render them “more happy and comfortable both here and hereafter;” and adds, “I, however, in the beginning of my pursuits, met with the greatest opposition from their self-interested leaders, the Brahmins, and was deserted by my nearest relations; and I, consequently, felt extremely melancholy. In that critical situation, the only comfort that I had was the consoling and rational conversation of my European friends, especially those of Scotland and England.” In that same letter he expresses his full expectation of speedily setting off for England; but says that he had been prevented from proceeding so soon as he could wish by the spread of his views, and the inclination manifested by many to seek for truth. It is not surprising that the interested advocates for heathen worship should endeavour to uphold it by imputations on the character of the reformer: and some one did publicly charge him with “rashness, self-conceit, arrogance, and impiety.” Every member of his own family opposed him; and he experienced even the bitter alienation of his mother, through the influence of the interested persons around her. He stated, however, that before her death she expressed her great sorrow for what had passed, and declared her conviction in the unity of God, and the futility of Hindoo superstition. D’Acosta, the editor of a journal at Calcutta, transmitted to the abbé Grégoire, in 1818, the various publications of this extraordinary man, with some account of his history; and through Grégoire, Rammohun Roy became extensively known and highly appreciated in France. D’Acosta says, that he carefully avoided every thing that could afford a pretext for excluding him from

his caste, since, as a Brahmin, it was his acknowledged duty to instruct his countrymen in the sense and real commands of their sacred books. He speaks of him as distinguished in his controversy more by his logical mode of reasoning than by his general views, though far from deficient in philosophy or information. He says that all his conversation, his actions, and his manners evince a powerful sentiment of individual dignity; while, in general, meanness and feebleness of mind are characteristic of the Hindoo; and that his ingenuous conversation often shows, in a strain half serious and half sportive, all that he wished to be able to do for his country. As to his personal exterior, at that period, D’Acosta says,—“He is tall and robust; his regular features, and habitually grave countenance, assume a most pleasing appearance when he is animated: he appears to have a slight disposition to melancholy.” “The moderation,” adds Abbé Grégoire, “with which he repels the attacks on his writings, the force of his arguments, and his profound knowledge of the sacred books of the Hindoos, are proofs of his fitness for the work he has undertaken; and the pecuniary sacrifices he has made, show a disinterestedness which cannot be encouraged or admired too warmly.”

It was about this period that Lieutenant-Colonel Fitzclarence (now the earl of Munster) became acquainted with Rammohun Roy. He speaks highly of this “most extraordinary” Brahmin, of his talents and learning; his intimate knowledge of our language, and eloquence in the use of it; his extensive acquaintance with our literature, as well as with the Arabic and Sanscrit; his clear intelligence of the politics of Europe, and especially of England; of his fine person, and most courtly manners. The representations of the earl indicate the amazing extent, tenaciousness, and accuracy of his memory; and in this and other respects fully accord with what we learn of him from other sources: the author was, however, mistaken in supposing that he had been “declared to have lost caste.” Rammohun Roy recently stated that every effort had been made for the purpose; and that he had been at an enormous expense to defend himself against a series of legal proceedings, instituted for the purpose of depriving him of caste, and thereby of his patrimonial inheritance. Through his profound acquaintance, however, with the Hindoo law, he baffled the efforts of his interested enemies, and proved in the courts of justice that he had not forfeited his rights. A part of his plan for correcting the errors of his countrymen, and disseminating the doctrine he had adopted, was the establishment of schools, at his own expense, with the aid of a few liberal and philanthropic individuals. The pupils of Rammohun’s school at Calcutta are likely to swell the sect of seceders from Brahminism, which now comprehends a considerable number of the rising generation. Another auxiliary part of his scheme was availing himself of the periodical press, the efficacy of which, in the propagation of truth, he could well appreciate. He was, at different times, the proprietor or publisher of newspapers in the native languages, one of which, the “Caumoodi” (set up by him in opposition to the Brahminical “Chundrika”), is now edited by his son, Radhaprasad Roy. In 1829 he became, in conjunction with Dwarkanath Tagore and Neel Rutton Holdar, a proprietor of an English newspaper, the

"Bengal Herald;" and was obliged, as such, to plead guilty in the supreme court of Calcutta to a libel on an attorney. This paper was soon after discontinued.

One of the great practical abuses against which Rammohun Roy early directed his assault was the practice of suttees. Prior to the death of his father he openly denounced this barbarous rite; and in 1810 he published, in Bengalee, for general circulation, a little tract, entitled "Conference between an Advocate for, and an Opponent of, the Practice of Burning Widows alive," and two years after a second Conference. The irresistible arguments contained in these little works silently prepared the way for the safe prohibition, by government, of this disgraceful custom. It is worthy of remark, however, that Rammohun Roy was long averse to the authoritative abolition of suttees. In the minute of Lord William Bentinck, proposing the regulation for that purpose, after referring to the opinion of Mr. H. H. Wilson, that the attempt to put down the practice would inspire extensive dissatisfaction, his lordship observes,—"I must acknowledge that a similar opinion, as to the probable excitation of a deep distrust of our future intentions, was mentioned to me in conversation by that enlightened native, Rammohun Roy, a warm advocate for the abolition of suttees, and of all other superstitions and corruptions engrafted on the Hindoo religion, which he considers originally to have been a pure deism. It was his opinion that the practice might be suppressed quietly and unobservedly, by increasing the difficulties, and by the indirect agency of the police. He apprehended that any public enactment would give rise to general apprehension; that the reasoning would be, 'While the English were contending for power they deemed it politic to allow universal toleration, and to respect our religion; but, having obtained the supremacy, their first act is a violation of their professions, and the next will probably be, like the Mahometan conquerors, to force upon us their own religion.'" When the resolution, however, was taken, and a remonstrance was got up by the anti-abolitionists, Rammohun Roy, in spite of threatened privation of caste, and even personal outrage, was one of the deputation who presented an address to Lord William Bentinck, expressive of native gratitude for this "everlasting obligation" conferred on the Hindoo community.

To the indefatigable endeavours of Rammohun to extinguish this and other deformities of the Brahminical system must be partly ascribed, amongst other effects, the hostility of the late rajah of Burdwan, one of his father's intimate friends, a powerful zemindar, distinguished for his bigotry as well as his immense wealth. Rammohun's daughter's son, Gooroodas Mookerjee, was dewan to Purtab Chunder, only son of the rajah of Burdwan: the young rajah died; and Rammohun's grandson acted as vakeel on behalf of the ranees, the wives of the deceased, against his father, in vindicating their rights in the courts. Tej Chund, the rajah of Burdwan, it would appear, attributed this proceeding to the advice of Rammohun, on account of the religious differences subsisting between them; and a suit which was instituted by the rajah in 1823, to recover the pretended balance of a bond given by the father of Rammohun, is expressly ascribed by the latter to personal resentment.

It has already been shown that as early as 1817 Rammohun Roy had directed his attention to the Christian religion; but he found himself greatly perplexed by the various doctrines which he saw insisted upon as essential to Christianity in the writings of Christian authors, and in conversation with those Christian teachers with whom he had communication; he resolved, therefore, to study the original Scriptures for himself, and for this purpose he acquired the knowledge of the Hebrew and Greek languages. Becoming strongly impressed with the excellence and importance of the Christian system of morality, he published in 1820, in English, Sanscrit, and Bengalee, a series of selections, principally from the first three gospels, which he entitled "The Precepts of Jesus, the Guide to Peace and Happiness." He passed by those portions of the evangelists which have been made the basis of distinctive doctrines; and also, except where closely interwoven with the discourses of Christ, the narratives of miracles—believing these to be less fitted to affect the convictions of his countrymen; while the preceptive part he deemed most likely "to produce the desirable effect of improving the hearts and minds of men of different persuasions and degrees of understanding." "This simple code of religion and morality," he says, at the close of his preface, "is so admirably calculated to elevate men's ideas to high and liberal notions of one God, who has equally subjected all living creatures, without distinction of caste, rank, or wealth, to change, disappointment, pain, and death, and has equally admitted all to be partakers of the bountiful mercies which he has lavished over nature; and is also so well fitted to regulate the conduct of the human race in the discharge of their various duties to God, to themselves, and to society, that I cannot but hope the best effects from its promulgation in the present form."

This work was published anonymously, but without concealment of the source. It brought upon him some severe and unexpected animadversions in "The Friend of India," the writer of which uncourteously, as well as most unjustly, spoke of the compiler as a heathen. Under the designation of "A Friend to Truth," Rammohun Roy published "An Appeal to the Christian Public in Defence of the Precepts of Jesus," in which he declares that the expressions employed in the preface should have shown the opponent "that the compiler believed not only in one God, whose nature and essence is beyond human comprehension, but in the truths revealed in the Christian system." He further maintains, that the "precepts of Jesus contain not only the essence of all that is necessary to instruct mankind in their civil duties, but also the best and only means of obtaining the forgiveness of our sins, the favour of God, and strength to overcome our passions, and keep his commandments." He defends the system which the compiler had adopted to introduce Christianity to the native inhabitants, by appealing to the fact that nearly three-fifths are Hindoos and two-fifths Mussulmans,—the latter devoted from their infancy to the belief in one God; and declares that, from his own experience in religious controversy with them, he is satisfied that he was rendering them most service by making them acquainted with those precepts (by which he appears to have meant, more generally, instructions), "the obedience to which he believed most peculiarly required of a Christian, and such as

could by no means tend in doctrine to excite the religious horror of the Mahometans or the scoffs of the Hindoos." "Such dogmas, or doctrinal and other passages," he afterwards says, "as are not exposed to those objections, and are not unfamiliar to the minds of those for whose benefit the compilation was intended, are generally included, in conformity with the avowed plan of the work; particularly such as seem calculated to direct our love and obedience to the beneficent Author of the universe, and to him whom he graciously sent to deliver those precepts of religion and morality, whose tendency is to promote universal peace and harmony." When replying to the objections of the reviewer, that the precepts of Christ do not show how to obtain the forgiveness of sins and the favour of God, the Friend of Truth extracts from the compilation "a few passages of that greatest of all prophets who was sent to call sinners to repentance;" and adds, "Numerous passages of the Old and New Testaments to the same effect, which might fill a volume, distinctly promise us that the forgiveness of God, and the favour of his Divine Majesty, may be obtained by sincere repentance, as required of sinners by the Redeemer."

On these anonymous publications Dr. Marsham, of Serampore college, published a series of animadversions, which led to a very remarkable reply from Rammohun Roy—the "Second Appeal"—with his name prefixed; which is distinguished by the closeness of his reasonings, the extent and critical accuracy of his scriptural knowledge, the comprehensiveness of his investigations, the judiciousness of his arrangement, the lucid statement of his own opinions, and the acuteness and skill with which he controverts the positions of his opponents. All the publications of this controversy were soon reprinted in London.

The "Second Appeal" called forth another work from Dr. Marsham, to which Rammohun Roy published a reply in 1823, under the title of the "Final Appeal." His preceding works had been printed at the Baptist missionary press; but the acting proprietor declined, "although in the politest manner possible," to print the "Final Appeal; and Rammohun Roy purchased type, and commenced an independent printing press for this and other similar publications.

This enlightened Hindoo had long wished to visit England, and in consequence of this predilection he, on the 15th of November, 1830, accompanied by his youngest son, Ram Roy, and two native servants, one of them a Brahmin, left Calcutta in the Albion, bound for Liverpool. The vessel touched at the Cape in January, and arrived on the 8th of April, 1831, at Liverpool, where Rammohun Roy landed, and soon after proceeded to London. His arrival excited much interest. It was at a period when the whole nation was in a state of intense excitement in connexion with parliamentary reform; and, being well versed in our national history, and intimately acquainted with our political institutions and parties, he saw at once the bearings of the great measure, which, he wrote, would "in its consequences promote the welfare of England and her dependencies, nay, of the whole world." His official character brought him immediately into communication with the ministers, who recognised his embassy and his title; and by this means, as well as by the intrinsic recommendations of his fame and character,

he mixed with the highest circles. The court of directors of the East India company, though they did not recede from their determination, treated him with honour. He was entertained at a dinner, on the 6th of July, in the name of the company, at the City of London tavern. In September he was presented to the king by the president of the board of control, and had a place assigned to him at the coronation among the ambassadors. He appears indeed to have had no reason for dissatisfaction with our government, either in his individual or in his official capacity.

Mr. Hare, an English gentleman residing at Calcutta, of well-known and great respectability, from his earnest attachment to the rajah, had urged his brothers to do every thing in their power for him. With great difficulty they at last prevailed upon him, some months after his arrival, to accept a home in their house; and when he went to France for a few weeks, one of them accompanied him to Paris, where he was more than once at the table of Louis Philip. He continued to reside with Mr. John and Mr. Joseph Hare till he left London for Bristol, to spend a few weeks at Stapleton Grove, where his son had been passing his vacation, and continued waiting the often delayed arrival of his father. It was the intention of the rajah to proceed thence to winter in Devonshire, visiting on his way, or on his return, an old and attached friend near Taunton.

He had, however, scarcely been ten days in Bristol when he was attacked by illness. A gentleman who had enjoyed much intercourse with the rajah during the preceding week, and had occasionally corresponded with him before he left India, called accidentally at Stapleton, where he then resided, and was informed that he had been indisposed since the preceding day, but had thought medical advice unnecessary as he had taken some of his usual remedies. He found the rajah so ill, with feverish symptoms, as to occasion him considerable alarm. Medicines were prescribed, and followed by some relief; but an extremely dry and glazed tongue, frequent pulse, and incessant restlessness (though without much increase of heat or local pain), indicated the continuance of serious disorder. On the following Saturday Dr. Prichard visited him; and Dr. Carrick attended in consultation on Monday the 23rd. Some of the symptoms in the progress of his illness led to the conclusion that his head was considerably affected, though no pain was felt there, the stomach being the part of which he most complained. "His indisposition experienced but a temporary check from the remedies: severe spasms, with paralysis of the left arm and leg, came on during Thursday last, and he fell into a state of stupor during the afternoon of that day, from which he never revived; but breathed his last, at twenty-five minutes after two, on Friday morning, the 27th inst." His son, Rajah Ram Roy, and two Hindoo servants, with several attached friends who had watched over him from the first day of his illness, were with him when he expired.

A short time before the rajah expired, his Brahmin servant was told that if there were any observances which were required by his master's caste, or which would be satisfactory to his own mind, or to his Indian friends, he might now perform them; and Ram Rotun accordingly uttered a prayer in his master's ear, in which the frequent repetition of the word "Om" was alone distinguished. He also placed

iron under his bolster. Rammohun Roy says, that "Om, when considered as one letter, uttered by the help of one articulation, is the symbol of the Supreme Spirit." "Om implies the Being on whom all objects, either visible or invisible, depend, in their formation, continuance, and change." What was the precise import of Rumi Rotun's prayer, we have no present means of ascertaining; but those who peruse the "Prescript for Offering Supreme Worship," from which the above interpretations are extracted, will not deem it improbable that the prayer was purely monotheistical; if it had been employed by the direction or even permission of the rajah himself, no doubt could have existed as to the object of it. Following some requirements of caste, he had been accustomed to employ, at stated times, prescribed forms of prayer derived from his ancient faith; and this was in no way inconsistent with his reception of the Saviour as the specially-appointed revealer of the will of God.

RAMSAY, DAVID, M. D., an eminent American physician and popular historian, who was born in April 1749, in Lancaster county, Pennsylvania. His father was an Irish emigrant and a respectable farmer. In 1765 he graduated at Princeton college, and for two years subsequently was tutor to the children of a wealthy gentleman of Maryland. He then studied medicine at Philadelphia till early in the year 1772. He commenced the practice of his profession in Maryland, and after a year removed to Charleston, South Carolina, where he soon acquired celebrity. He laboured zealously with his pen to promote the independence of his country. For some time he attended the army in the capacity of a surgeon, and was at the siege of Savannah. He was a leading member of the legislature of South Carolina from 1776 to the conclusion of the war, and he was a member of the privy council part of the time, and, with many of the most respectable citizens of Charleston, suffered banishment by the enemy to St. Augustine. He was released after an absence of eleven months, and resumed the legislature of the state, where he distinguished himself by opposing the acts confiscating the estates of those who adhered to Great Britain, many of whom he thought acted from feelings of duty. In 1782 he was elected a member of the continental congress, and continued in that body till the close of the war. In 1785 he was elected to represent the Charleston district in congress, and in consequence of the absence of Mr. Hancock he was chosen its president, *pro tempore*, and filled the station for a year with great credit. In the following year he again returned to his profession and literary pursuits. He died on the 8th of May, 1815, in consequence of wounds received two days previous from the pistol of a maniac in open day within a few paces of his dwelling. As a politician Dr. Ramsay was disinterested and patriotic, and always endeavoured to allay invidious passions and inculcate unanimity. Dr. Ramsay's character as an author is well known. In 1785 he published a history of the revolution in South Carolina, which was translated and published in France. In 1790 he published "The History of the American Revolution," which passed through two large editions; in 1801, "The Life of Washington;" in 1808, "The History of South Carolina," being an extension of a work entitled "A Sketch of the Soil, Climate, Weather, and Diseases of South Carolina," published in 1796. These are his most important publications.

Besides his published works, Dr. Ramsay left, among his manuscripts, a history of the United States from their first settlement as English colonies to the end of the year 1808, and a series of historical volumes, entitled "Universal History Americanized, or an Historical View of the World from the Earliest Records to the Nineteenth Century, with a Particular Reference to the State of Society, Literature, Religion, and Form of Government of the United States of America." The first was published early in 1817, with a continuation to the treaty of Ghent by the Rev. Samuel Stanhope Smith, and other literary gentlemen. The latter, which had occupied Dr. Ramsay's leisure during more than forty years, was published in 1819. In private life Dr. Ramsay was remarkable for all the virtues by which it is adorned. He never allowed himself any intermissions of study that were not indispensable for the preservation of health, and gave but four hours in the night to sleep.

RAMSAY, ANDREW MICHAEL, a clever Scottish writer who was born at Ayr in 1686. Having completed his studies he became a tutor to the son of Lord Wemys, and subsequently went to Holland, where, after wavering for some time, he became a convert to the catholic faith in 1709. He was employed to educate the children of the pretender to the British throne, but lost his post and returned to England, where he was admitted fellow of the royal society, and the honour of a doctor's degree was conferred on him at Oxford. Returning to France he became intendant to the prince de Turenne, and died at St. Germain-en-Laye, on the 8th of May, 1743. He was the author of several works of considerable merit, the principal of which is his "History of Marshal Turenne."

RAMSAY, ALLAN.—This highly gifted Scottish poet was born in 1685, in a little village in the south of Scotland, and was the son of a peasant. He went to Edinburgh at the beginning of the last century, as apprentice to a hair-dresser. Having obtained notice for his social disposition, and his talent for the composition of verses in the Scottish idiom, and having changed his occupation for that of a bookseller, he became intimate with many of the literary characters of his time. He published, in 1721, a volume of his own poetical compositions, which was favourably received, and undertook to make a collection of ancient Scottish poems, under the title of "The Evergreen." He was afterwards encouraged to present to the world a collection of Scottish songs. From what source he procured the latter is uncertain; but as, in "The Evergreen," he made attempts to improve on the originals of his ancient poems, he probably used still greater freedom with the songs and ballads. To several tunes, words were adapted worthy of the delightful melodies they accompanied. In the execution of this part of his undertaking Ramsay associated with himself several men of talent; but the respective shares of the editor of the Scottish songs and his coadjutors, in the original compositions, cannot now be ascertained. Ramsay's principal productions are, "The Gentle Shepherd," and two additional cantos of "Christie Kirk of the Grene," a tale, the first part of which is attributed to James I. of Scotland. The latter, though objectionable in point of delicacy, has been regarded as the happiest of the author's effusions. His chief excellence, indeed, lay in the description of rural characters, incidents, and scenery; and he was well ac-

quainted with the peasantry of Scotland, their lives, and opinions.

In his "Gentle Shepherd," which is a rural drama, the characters are delineations from nature; the descriptive parts are in a style of beautiful simplicity, and the passions and affections of rural life are finely delineated. Throughout the whole there is an air of reality which cannot but strike the most careless reader; and no poem, perhaps, ever acquired so high a reputation, in which truth received so little embellishment from the imagination. When he attempts descriptions of high life, and aims at pure English composition, he fails entirely, becoming feeble and uninteresting; neither are his familiar epistles and elegies in the Scottish dialect entitled to much approbation. He died in 1758.

RAMSDEN, JESSE, an eminent mechanist and optician, who was born at Halifax, in Yorkshire, in 1738. He applied himself to engraving, and, in the course of his employment, having to engrave several mathematical instruments, finally constructed them himself. He married a daughter of Mr. Dolland, the celebrated optician, and opened a shop in the Haymarket, whence he removed to Piccadilly, where he remained until his death in 1800. Ramsden obtained a premium from the board of longitude for the invention of a machine for the division of mathematical instruments; he also improved the construction of the theodolite, the pyrometer for measuring the dilatation of bodies by heat, the barometer for measuring the height of mountains, &c.; also the refracting micrometer and transit instrument and quadrant. He made great improvements in Hadley's quadrant and sextant, and procured a patent for an amended equatorial. Mr. Ramsden, who was chosen a fellow of the royal society in 1786, was distinguished during the whole of his life by an enthusiastic attention to his own profession, which formed his amusement as well as his occupation; and such was his reputation that his instruments were bespoken from every part of Europe; and, ultimately, to obtain the fulfilment of an order was deemed a high favour.

RAMUS, PETER, a philosopher of the sixteenth century who was a native of France. He went to Paris about 1523, when he was but eight years old, and became a lackey in the college of Navarre. Such was his strong inclination for learning, that he not only devoted to study all the time he could spare in the day, but also a part of the night. After attending a course of philosophy he was admitted to the degree of M. A., on which occasion he contested the infallibility of Aristotle. His opinions excited violent opposition, and the partisans of the Aristotelian philosophy had recourse to the civil power in order to silence their adversary. His publications were prohibited, and ordered to be burnt before the royal college of Cambray, and he was commanded to abstain from teaching his doctrines in 1543. Having obtained the patronage of the cardinal De Lorraine, the prohibition of lecturing was withdrawn in 1547; and in 1551 he was appointed royal professor of rhetoric and philosophy at Paris. His spirit of free inquiry ultimately led him to become a protestant. This change obliged him to flee from Paris, but in 1563 he was restored to his chair. In the massacre of St. Bartholomew's in 1571, Ramus was one of the victims. His works relating to grammar, logic, mathematics, &c., are numerous.

RANDOLPH, THOMAS, an English divine, who was born in 1523, and educated at Christ Church college, Oxford. He never rose to eminence in the church, but during the reign of Queen Elizabeth he was employed in several diplomatic missions to Paris, Edinburgh, and Moscow. He was rewarded by his royal mistress with the honour of knighthood, and died in 1590. Sir Thomas Randolph was the author of several works, the principal of which was an account of his embassy to Russia.

RANDOLPH, THOMAS, a celebrated English poet, who was born at Newnham in Northamptonshire. He was educated at Westminster school, from which foundation he was sent to Trinity college, Cambridge, in 1623, where he obtained a fellowship, and afterwards took his degree of master of arts. Very early in life he gave proofs of considerable talents, and was not only admired by the learned at the university, but was in equal favour with the wits and poets of the metropolis. His learning, gaiety of humour, and readiness of repartee, gained him admirers, procured him admission in society, and especially recommended him to Ben Jonson. As a dramatic writer his talents were entirely confined to comedy; and Baker pronounces his language elegant, and his sentiments just and forcible; his characters strongly drawn, and his satire well chosen and poignant; and this critic also recommended the altering his pieces so as to render them fit for the present stage, or, at the least, giving the world a correct and critical edition of them.

The dramas which he composed appeared in 1638, edited by his brother, Mr. Thomas Randolph, of Christ Church college, Oxford, along with his poems, some of which have considerable merit. Of his dramatic works, "The Muses' Looking Glass" is the most generally admired; in it there is great variety of characters of the passions and vices, drawn with much truth, and interspersed with many strokes of natural humour.

RANDOLPH, PEYTON, a celebrated American, who was descended from one of the most ancient and respectable families of Virginia. After passing with credit through the college of William and Mary, he came to England to pursue a course of legal study at the Temple. On his return to Virginia he entered at once into practice. In 1748, when he was about twenty-five years of age, he was the king's attorney-general for the colony, and the same year he was elected a member of the house of burgesses for the city of Williamsburg, and during the session was placed at the head of a committee appointed to prepare a general revisal of the laws of the colony. From this period he continued to be a conspicuous and useful member of the legislature. Lieutenant-governor Dinwiddie, soon after his arrival in 1752, attempted to impose an exorbitant charge for his signature to every patent for land. This being unauthorized by any law, the house of burgesses chose Mr. Randolph to oppose it before the king and council. He accordingly came to England and urged the suit, but without success. In 1755, when the defeat of General Braddock, and the retreat of Colonel Dunbar, had laid the frontiers of Pennsylvania, Maryland, and Virginia completely open to the inroads of the savages, Mr. Randolph, and various other gentlemen, formed themselves into a regiment, and marched to the frontier to join the colonial force under Colonel Washington, but the enemy retreated

to Fort Du Quesne without any engagement taking place. In 1764 he drew up an address from the house of burgesses to the king of Great Britain against the passage of the stamp act. In April 1766 he was chosen speaker of the house, and about the same time resigned the office of attorney-general. In all the measures of opposition to the English government he took a prominent part. He was chairman of the committee of correspondence, appointed by the legislature to obtain early and authentic information of all such acts of the British government as might bear upon the interests of the colonies, and to maintain a constant communication on these subjects with the legislatures of the other colonies, and which, by its recommendations, brought about the meeting of the first general congress at Philadelphia. To that assembly he was sent as a delegate from his native province, and was immediately elected its president. In consequence, however, of indisposition he retained it only for five or six weeks. On the 20th of the ensuing March he presided at the convention of deputies assembled at Richmond, and was again chosen a delegate to the congress which was to be held at Philadelphia on the 10th of May. A few days after the meeting of congress in May 1775, Lord North's conciliatory proposition having arrived in America, Mr. Randolph returned to Williamsburg, to be present at the assembling of the house of burgesses of Virginia, which the governor had summoned in order to lay before them the proposition. He resumed his situation as speaker of the house, and consigned to Jefferson the task of drawing up the answer to the British minister. After the adjournment of the house of burgesses he returned to congress, but his services there were of short continuance. A stroke of apoplexy put an end to his patriotic career on the 21st of October, 1775, in the fifty-third year of his age.

**RANDOLPH, THOMAS**, a celebrated English divine, who was born at Canterbury about the beginning of the last century, and after completing the rudiments of his education, was sent to Corpus Christi college, Oxford. In 1748 he was made president of the college in which he was educated, and also received several valuable church preferments, the last of which was being made archdeacon of Oxford. He died in 1783, leaving two sons, both of whom rose to eminence in the church. As a writer Dr. Randolph was principally distinguished for his controversial works; among them we may mention his celebrated "Vindication of the Trinity," and "A View of the Ministry of our Saviour Jesus Christ."

**RAPHAEL, RAFFAELLO, SANZIO DA URBINO**.—This distinguished modern painter was born at Urbino in 1483, and was the son of an artist, who placed him for improvement under Pietro Perugino for three years. At the end of that period he went with him to Sienna and Florence, where he remained for a considerable period of time. Among his earliest works we may mention his *Mater Dolorosa*, over which he delineated, in a second picture, God the Father, with some other easel-pieces, and a Christ, with God the Father surrounded by several Saints, for the small Camaldulian convent, which was his first painting in fresco. All these works partake somewhat of the style of his master, and do not exhibit the grandeur, dignity, and power of his later performances, but are distinguished for the sensibility and feeling belonging to the earlier school. His de-

sire for further improvement drew him a second time to Florence, where he zealously pursued his study of the old masters above mentioned, and where his acquaintance with Fra Bartolomeo gave him a more correct knowledge of colouring. He seems to have spent the whole time of his residence in that city in his studies, at least it is known that he executed there nothing but a few portraits, and the cartoon for his *Entombing of Christ*. This picture itself he painted in Perugia, whence it was afterwards transferred to the Borghese palace at Rome. It is a miracle of composition, design, and expression, and was surpassed in these respects by few of his subsequent performances. After finishing it Raphael returned for the third time to Florence, where his studies became again his chief employment; at least we are able to point out with certainty, as having been executed at this time, only the excellent *Madonna called La Bella Giardiniera*, and another *Madonna*, with the *Fathers of the Church*, neither of which was entirely finished by Raphael.

His repeated residence in Florence had the greatest influence, not only on himself, but on the whole of the modern school of art. He found that Cimabue, Giotto, Fiesole, and the Florentine artists of the time, could not only compete with his teacher, Perugino, in all the departments of art, but that some of them—Masaccio, Fra Filippo Lippi, Mariotto Albertinelli, Ghirlandaio, and Fra Bartolomeo—surpassed him in excellence of composition, correctness of design, and liveliness of colouring. In the works of Ghirlandaio, and above all of Masaccio, he found, what he most desired, a grander style in forms, drapery, and outline. As Raphael had already acquired the excellencies of the greatest masters of his time in Romagna, he now possessed himself of those of the Florentine school, for which he ever entertained a great esteem. A striking proof of this was his copying in his loggie, without the least alteration, two figures by Masaccio, which may still be seen in the Carmelite monastery at Florence, viz., Adam and Eve driven from Paradise by the Angel. Pope Julius II. had employed Bramante in rebuilding St. Peter's and in the embellishment of the Vatican. At Bramante's suggestion Raphael was in 1508 in-

vited to Rome. The pope received him with distinguished favour, and the artists of Rome with the greatest respect. Here he executed the *Disputa*, or *Dispute of the Fathers of the Church*, on the wall of the second chamber, called the *stanza della Segnatura*, next to the great hall of Constantine. Between this painting and his *Entombing of Christ* there is a similarity, which is not the case with his later performances. In the grouping, also, he has adhered to the style of his earlier predecessors, but the *Disputa* is by far the more perfect of the two. All is life, motion, action: the variety of the characters is admirable; every stroke is full of meaning.

If we divide Raphael's works into several periods, the first comprising his earliest performances executed in the manner of Perugino, the second comprising those which he executed in Urbino, Florence, &c., we recognise in the *Disputa* the transition to the third manner, which is still more clearly manifested in the *School of Athens*, the second grand painting in this chamber. This painting (which was probably preceded by the *Parnassus*, the third great painting of the room) displays far more freedom of handling, and more manliness and energy. By it Raphael gained so completely the favour of the pope, that he caused almost all the frescoes of other artists in the Vatican to be effaced, that the rooms might be adorned by him. Raphael painted in their stead, in the above-mentioned stanza, the allegorical figures of *Theology*, *Philosophy*, *Justice*, and *Poetry*, in the corners of the ceiling; the *Fall of Adam*, *Astronomy*, *Apollo and Marsyas*, and *Solomon's Judgment*; all having reference to the four principal figures of the apartment; and, lastly, on the fourth wall, over the windows, *Prudence*, *Temperance*, and *Fortitude*; below them the emperor *Justinian*, delivering the Roman law to *Tribonian*, and *Gregory the Tenth* giving the *Decretals* to an *Advocate*, and under them *Moses*, and an armed allegorical figure. In 1511 all the pieces of the first stanza or hall were finished. According to Vasari's account he now executed several less important but excellent frescoes, viz., *Isaiah in St. Augustine's*, the *Prophets and Sibyls in St. Maria della Pace*, and the celebrated *Madonna di Foligno in the Vatican*. The progress which Raphael made in his peculiar style is shown by his next painting in the stanza, the *Expulsion of Heliodorus from the Temple*. Here the style is far more earnest, grand, bold, and energetic, the execution far more spirited and masterly. This was followed in 1514, after the accession of the new pope, *Leo X.*, by his *Leo the Great* stopping the *Progress of Attila*, the *Deliverance of Peter from Prison*, and, on the ceiling of this stanza, *Moses viewing the burning Bush*, the *Building of the Ark*, the *Sacrifice of Isaac*, and *Jacob's Dream*. Nearly contemporary with them are the following easel paintings, the celebrated *Madonna del Pesce* in the *Escorial*, which was transferred in Paris from wood to canvass; his equally beautiful *Cecilia*, which is said to have been finished by *Giulio Romano*; a *Holy Family* called *La Perla*, in the *Escorial*; *Ezekiel's Dream*; among several *Madonnas* that called *Dell' Impaunato*; *Christ bearing the Cross*, known by the name of *Lo Spasimo di Sicilia*, now in *Madrid*; *Christ in Glory*, surrounded by *Saints*; *I cinque Santi*; his own portrait; the portrait of *Leo X.*, &c.

Albert Dürer, induced by Raphael's reputation, is

said to have made him an offer of his friendship, and to have sent him several of his own etchings, with his portrait, and to have received in return a number of drawings by Raphael's hand. With the *Conflagration of the Borgo*, extinguished by the *Prayers of Leo*, Raphael began the third stanza of the Vatican. This work is a master-piece for strength and truth of expression, beauty of forms, excellence of grouping, and variety. It was followed by the *Coronation of Charlemagne*, *Leo III.'s Vindication of Himself before Charlemagne*, and the *Victory of Leo IV. over the Saracens at Ostia*. He next completed the galleries of the Vatican palace, by which the rooms communicate, and which had been left unfinished by Bramante, and furnished designs for the paintings and stucco-work with which they were to be adorned. The execution of the paintings, excepting four done by himself, Raphael entrusted to *Giulio Romano* and some of his other pupils, and the stucco-work to *John of Udine*. In this way was formed a complete series of works of art, which have exalted the palace of the Vatican into a temple of the arts. The pope, charmed with the excellence of these performances, committed to Raphael the decoration of another stanza of the Vatican, with images of the saints and apostles, appointed him superintendent of all the embellishments of this palace, and loaded him with marks of honour. During this time Raphael produced many other excellent paintings, prepared designs for several palaces in Rome and other cities of Italy, and finished the *Madonna for the church of St. Sixtus in Piacenza*, unquestionably one of the master-works of his pencil. The loftiness, dignity, and sublimity, combined with sweetness, grace, and beauty which reign in this picture render it inimitable. Other works of this period are, *St. Michael*, the portraits of *Beatrice*, of *Ferrara*, of his beloved *Fornarina*, of *Carondelet*, of *Count Castiglione*, and of the beautiful *Joanna of Arragon*. Of the last there are two excellent copies, which are often represented as the work of the artist himself, one in the possession of *Count Fries at Vienna*, the other of *Woher at Basle*.

To this time, also, belong the frescoes in the *Farnesina*, representing the life of *Psyche* in twelve pictures, and *Galatea*, all, except the last, executed by his scholars; also the designs from the fable of *Psyche*, altogether different from the former, thirty-eight in number, and the *Madonna della Seggiola*. It was probably at a later period that Raphael prepared for *Augustino Ghigi* designs for the building and decoration of a chapel in *Sta Maria del Popolo*, and for *Leo X.* the celebrated cartoons for the tapestry of one of the chambers of the Vatican. These tapestries were afterwards annually exhibited in the Vatican, on the festival of *Corpus Christi*, but have lately been dispersed. This is the more to be lamented, since they have often been preferred to the stanza of Raphael, in point of composition, loftiness of character, variety of expression, grouping, attitudes, &c. For painting the fourth stanza—the hall of Constantine, in oil—Raphael left only a few sketches, especially of the battle between *Constantine and Maxentius*, which were used by *Giulio Romano* and his other scholars, to whom the labor was eventually entrusted. The pictures, however, of *Justice* and *Benignity*, in this hall, were probably executed by his own hand. Several easel-paintings, also, seem to have been executed by him about this period; among others, *John in the Desert*, of which

there exist several copies, viz. in Florence, in London, in the gallery of the king of the French, in Vienna, and in Darmstadt: the copies are so good, and so much alike, that the original cannot be distinguished, and is not known; his Madonna and Child, on whom an angel is strewing flowers, and a St. Margaret. Raphael's last and unfinished painting—the Transfiguration of Christ—is in the Vatican. Although critics have objected to this painting that it contains two subjects, and consists of two pictures, every one must concede that it is the most perfect masterpiece which modern art has produced. The composition is so noble, and the design so perfect, the expression so elevated and sublime, the characters so various, the colouring (as far as it proceeds from Raphael) so true and vigorous, that it surpasses all his other works in these points. The head of Christ, in which this combination is most admired, is said to have been his last labour. Attacked by a violent fever, which was increased by improper treatment, this great artist died at the age of thirty-seven years. His body was laid out in state in his study, before his Transfiguration, and consigned, with great pomp, to the church of Sta Maria Rotonda, which was formerly the Pantheon, where his bones still rest, with the exception of his skull, which was afterwards placed in the academy of St. Luke. His tomb is indicated by his bust, executed by Naldini, and placed there by Carlo Maratti, and by the epitaph of Cardinal Bembo:—

"Ille hic est Raphael, timuit quo sospite vinci  
Magna rerum parens, et moriente mori."

All contemporary authors describe Raphael as kind, obliging, modest, and amiable, equally respected and beloved by high and low. The beauty of his figure, and his noble countenance, which inspired confidence, prepossessed the beholder in his favour at first sight. He died unmarried, though by no means averse to women. In accordance with his last will, his property went to his favourite scholars, Giulio Romano and Francesco Penni. When we consider the number of Raphael's paintings, however severe we may be in judging of their genuineness, it seems hardly credible that the entire compass of a human life could be sufficient for their execution. They prove the wonderful fecundity of his genius, and the facility with which he executed. It is, moreover, to be considered that Raphael furnished the designs for a great number of pieces executed by his scholars; devoted much study to his most important paintings (as is shown by the numerous sketches of Madonnas, of the School of Athens, of the Dispute of the Fathers, &c.); and, in many cases, first drew all his figures naked, in order the better to adapt the drapery and its folds to their respective attitudes. And if we further reflect that the supervision of the building of St. Peter's church, and the preparation of designs for the erection of other churches and palaces, with several other collateral tasks, were imposed on him, we must be struck with the highest admiration of his genius. At first, his design, conformably with the taste of the times, and the instruction which he had received, was somewhat stiff and dry. After studying with assiduity nature and the antiques, he formed for himself an ideal, which, by its harmony with nature, touches the feelings, while the Greek ideal rather overpowers by its loftiness. In his manhood, his pencil acquired greater freedom, and his figures became full of life and motion. His

drapery, always simple and light, in his latest pieces generally forms large masses, and is excellently arranged, so as not to conceal the parts intended to be shown. In foreshortening, and in perspective, he was imperfect. In colouring, he was at first dry; till, taught by Fra Bartolomeo, he consulted nature alone. Although in this department of the art he never reached the excellence of Correggio or Titian, his colours always appearing too heavy and dull, yet his St. John in Florence, and Fornarina, and his Transfiguration, show how far he had advanced; and only from these pictures can we form a judgment; for his other works, of the best period, were generally executed by his scholars, or, at most, retouched by him. The distribution of light and shade Raphael understood very well; but, with respect to the *chiaro scuro*, he is by no means to be compared with the above-mentioned great colourists. On the other hand, composition and expression must almost be considered Raphael's exclusive property; and, in these respects, he has never found a rival. He always selected the moment of action which expressed most clearly the dispositions of the actors. Avoiding all unnecessary exertion of strength, all excess, occupied solely with the object to be represented, he endeavoured to give to his persons just so much motion as was requisite. Thence it is that we frequently find in his works straight, simple attitudes, which are, nevertheless, so beautiful in their place, and leave so much room for the expression of feeling. Unlike other artists, he first meditated on the whole of the scene to be represented, and the general character of the expression; next proceeded to the figures, and lastly to the single parts of them. In this way, his figures possess a harmony at which many other artists have aimed in vain. The most distinguished of his scholars were, Giulio Pippi Romano, Francesco Penni il Fattore, Polidoro Caldara di Caravaggio, Benvenuto Garofalo, John of Udine, Bartolomeo Ramenghi il Bagnacavallo. These, with their followers, and later imitators, constitute the Roman school, founded by Raphael, which has ever been distinguished above others for the excellences which belonged to its founder.

RAPIN DE THOYRAS, PAUL, an historian, born at Castres, in Languedoc, in 1661, and studied law under his father, who was an advocate, until the revocation of the edict of Nantes drove him to England, and subsequently to Holland, where he entered a company of French cadets. In 1689 he followed the prince of Orange into England, and distinguished himself at the battle of the Boyne. In 1707 he settled at Wesel, in the duchy of Cleves, and devoted himself to the composition of his celebrated "History of England." He died at Wesel in 1725. His great work, "L'Histoire d'Angleterre," has been twice translated into our own language, and Tindal continued it up to 1760. It is prolix and unanimated, but impartial, and contains much solid information.

RAVENSCROFT, THOMAS, an English musician, who was principally celebrated from being the author of a work entitled "A Brief Discourse of the True but Neglected Use of Characterizing the Degrees by their Perfection, Imperfection, and Diminution, in Measureable Musick, against the Common Practice and Custom of the Times." He died in 1640.

RAWLEY, WILLIAM.—This learned chaplain of the celebrated Sir Francis Bacon, and editor of his

works, was born at Norwich about the year 1588. He studied at Benet college, Cambridge; took a bachelor of arts degree in 1604, a master's in 1608, a bachelor of divinity's in 1615, and a doctor's in 1621. After he was chosen fellow of his college, he took holy orders, and was shortly after promoted to the rectory of Landbeach, near Cambridge. He held this living till his death, which took place on the 18th of June, 1667; nor does it appear that he had any other preferment, which may seem somewhat marvellous when it is considered that he was not only domestic chaplain to Lord Verulam, who had the highest opinion of his abilities, as well as the most affectionate regard for his person, but chaplain also to the kings, Charles I. and II.

**RAWLINSON, THOMAS**, a learned bibliomaniac or book collector of the last century. He was the son of Sir Thomas Rawlinson, who at one period was lord mayor of London. His father had him educated for the profession of the law. So strong, however, was his passion for collecting books, that while he resided in Lincoln's Inn he devoted four rooms to his library, and himself slept in a small closet adjoining. He subsequently removed his library to a large house in Aldersgate Street, where he made extensive additions to it; however, it was at last sold by auction. Mr. Rawlinson died in 1725, three years after the sale of his library.

**RAUCH, CHRISTIAN**, a celebrated professor of sculpture in the academy of fine arts in Berlin, who was born, in 1777, in Waldeck. After having spent some time in Berlin, he went in 1805 to Rome. In 1811 the king of Prussia invited him to Berlin to execute a mausoleum for the late queen in Charlottenburg. In 1814 this monument was erected, and forms one of the finest works of modern art. In 1815 he was charged by the king to execute the statues of Scharnhorst and Bülow, which are now standing in Berlin, nearly opposite the king's palace. He also made a model of a bronze statue of Blucher for the city of Breslau. Another statue of Blucher, made by him, eleven feet high, on a pedestal sixteen feet high, entirely of bronze, stands in Berlin. He also produced several other fine works.

**RAUCOURT, SOPHIA**, a French actress of eminence, whose proper name was Saucerote. She was born at Nancy in 1756, and was the daughter of a theatrical performer. She first appeared on the stage at Paris in 1772, in the character of Dido, and soon acquired great professional reputation, which she enjoyed till 1776, when she suddenly fled from France to avoid her creditors. Having returned to the Paris stage in 1779, she continued to be one of its principal ornaments till her imprisonment during the reign of terror in 1793. She was discharged after six months' confinement, but experienced other persecutions till she obtained the protection of Napoleon. Madame Raucourt died in January 1815.

**RAY, JOHN**, a distinguished English naturalist and philosopher, who was born at Black Notley, in Essex, on the 29th of November, 1628. Having completed the rudiments of his education he was sent to Cambridge, and entered at Catherine Hall; but subsequently removed to Trinity college, where he took his degree of B. A. In 1651 he was chosen Greek lecturer of the college, and two years after was appointed mathematical lecturer to the same foundation. In 1660 he published "A Catalogue of the Cambridge Plants," in order to promote the study of botany, which was

then much neglected, and the encouragement this work met with encouraged him to proceed further in his studies and observations. He extended his pursuits throughout the principal part of England, Wales, and Scotland; and in these journeys, though he sometimes went alone, yet he had generally the company of Mr. Willoughby, his pupil Sir Philip Skipton, &c. At the restoration of the king he resolved to enter holy orders, and was ordained by the bishop of Lincoln.

In April 1663 Mr. Ray, accompanied by several scientific gentlemen, went over to Calais, and thence through different parts of Europe; an account of which Mr. Ray, in 1673, published. He arrived in England in March 1665, and immediately recommenced his philosophical studies with his usual attention, and shortly after was made fellow of the royal society.

In the spring of 1669 Mr. Ray and Mr. Willoughby commenced experiments relative to the tapping of trees, and the ascent and descent of the sap; which are published in "The Philosophical Transactions." About this time Mr. Ray published his "Collection of English Proverbs." This book, though sent to Cambridge to be printed in 1669, was not published till 1672. He also prepared his "Catalogue of English Plants" for the press, which came out in 1670.

In 1672 he lost his friend Mr. Willoughby, who died in his thirty-seventh year at Middleton Hall, his seat in Yorkshire; "to the infinite and unspeakable loss and grief," says Mr. Ray, "of myself, his friends, and all good men." Mr. Willoughby made Mr. Ray one of the executors of his will, and charged him with the education of his sons. The eldest of these young gentlemen not being four years of age, Mr. Ray for their use composed his "Nomenclator Classicus." Francis, the eldest, dying before he was of age, the younger became Lord Middleton. Shortly after the death of Mr. Willoughby, Mr. Ray lost another of his friends, Bishop Wilkins.

About the end of 1673 he published his "Observations, Topographical, Moral, &c." made in foreign countries; to which was added his "Catalogus Scriptorum in Exteris Regionibus Observatarum;" and about the same time, his "Collection of Unusual or Local English Words." In 1674 Mr. Oldenburgh, the secretary of the royal society, renewed his cor-

respondence with Mr. Ray, which had been some time intermitted. Mr. Ray sent him "A Discourse concerning Seeds, and the Specific Differences of Plants;" which Oldenburg tells him, was so well received by the president and fellows of the royal society that they returned him their thanks.

The year 1674 he spent in preparing Mr. Willoughby's "Observations about Birds" for the press; which, however, was not published till 1678. About 1676 he quitted Middleton Hall, and retired with his wife to Sutton Cofield, about four miles from Middleton. Some time after he went into Essex to Faldorne Hall, where he continued till June 1679, and then removed to Black Notley, his native place. Being settled here and free from interruptions, he resumed his wonted labours, particularly in botany; and one of the first works he finished was his "*Methodus Plantarum Nova*," which was published in 1682. This was preparatory to his "*Historia Plantarum Generalis*;" the first volume of which was published in 1686, the second in 1687, and the third some years after. To the compiling of this history many learned contemporaries assisted. He had published his "Observations upon Birds" in 1678, and in 1685 he published his "History of Fishes."

Mr. Ray's health now began to be impaired by years and study; yet he continued his labours from time to time. He published, in 1688, "*Fasciculus Stirpium Britannicarum*;" and in 1690, "*Synopsis Methodica Stirpium Britannicarum*," which was republished, with great amendments and additions, in 1696. Shortly after he commenced his celebrated work, entitled "The Wisdom of God manifested in the Work of the Creation." It was followed by "Three Physico Theological Discourses concerning the Chaos, Deluge, and Dissolution of the World." Both these works have been reprinted with large additions.

Soon after these theological works came out, his "*Synopsis Methodica Animalium Quadrupedum*" was ready for the press, and published in June 1697, and soon after finished "A Synopsis of Birds and Fishes." He made a catalogue of Grecian, Syrian, Egyptian, and Cretan plants, which was printed with Rauwolf's travels; and the year after published his "*Sylloge Stirpium Europæarum extra Britanniam*." He lived, however, some years after the publication of these works; for his death did not take place till the 17th of January, 1705.

Almost the last letter which he wrote was addressed to Sir Hans Sloane, as follows:—

"Black-Notley, January 1, 1704.

"Dear Sir,—The best of friends: these are to take a final leave of you as to this world. I look upon myself as a dying man. God requite your kindness expressed any ways towards me an hundred fold: bless you with a confluence of all good things in this world, and eternal life and happiness hereafter. Grant us an happy meeting in heaven.

"I am, Sir, eternally yours,

"JOHN RAY."

"P. S. When you happen to write to my singular friend, Dr. Hotton, I pray tell him I received his most obliging and affectionate letter, for which I return thanks; and acquaint him that I was not able to answer it, or—"

The following account of Mr. Ray's dying words, is from a MS. of the Rev. Mr. Pyke, prebendary of Norwich, and at that time rector of Black Notley: "I am a priest of the church of England, ordained

by Dr. Sanderson, then bishop of Lincoln. That I did not follow the peculiar duties of my function more is now the greatest concern and trouble to me. I do here profess, that as I have lived so I desire, and by the grace of God resolve, to die in the communion of the catholic church of Christ, and a true though unworthy son of the church by law established in this kingdom. I do think, from the bottom of my heart, that its doctrine is pure, its worship decent and agreeable to the church and word of God, and in the most material point of both conformable to the faith and practice of the godly churches of Christ in the primitive and pure time. I am not led to this persuasion so much from force of custom and education as upon the clear evidence of truth and reason; and after a serious and impartial examination of the grounds thereof, I am fully persuaded that the scruples men raise against joining in communion with it are unreasonable and groundless; and that the separation which is made may very justly be charged upon the dissenters themselves as the blame-worthy authors of it."

RAYMOND, ROBERT BARON, a celebrated English lawyer, who lived about the time of the Hanover succession. At that period his father, Sir Thomas Raymond, was a judge in the king's bench, and in the reign of Queen Anne his son, the subject of the present memoir, was raised to the peerage, and was a commissioner of the great seal under two of her successors. He was the author of a folio volume of "Rubrics," in addition to which he compiled two volumes of "Reports."

REAUMUR, RENE ANTOINE DE, a celebrated French philosopher, who was born at Rochelle in 1683, and became distinguished for his knowledge in almost every branch of science. Among his most useful productions we may mention his work entitled "*Traite sur l'Art de Convertir le Fer en Acier et d'adoucir le Fer poudu*," but his most celebrated work was his "*Memoires pour servir à l'Histoire des Insectes*." The last named work placed him in the first rank of modern naturalists. His death took place on the 18th of October, 1757.

REED, JOSEPH, a distinguished American, who was born in New Jersey on the 27th of August, 1741. At the age of sixteen he graduated at Princeton college, and after studying law in that place he came to England, where he prosecuted his studies until the disturbances produced in the colonies by the stamp act. On his return he commenced the practice of his profession in Philadelphia, and met with distinguished success. He embarked actively in the political struggle of the day on the side of independence, and in 1774 was appointed one of the committee of correspondence of Philadelphia. He was in the same year also president of the first provincial convention held in Pennsylvania, and a delegate to the continental congress. On the formation of the army he resigned a lucrative practice, and, at the solicitation of General Washington, repaired to the camp at Cambridge, where he was appointed aide-de-camp and secretary to the commander-in-chief. Throughout this campaign, though acting merely as a volunteer, he displayed great courage and military ability. In the beginning of 1776 he was made adjutant-general, and contributed materially by his local knowledge to the success of the affairs at Trenton and Princeton. During the week which elapsed between the two actions, he proposed to six Philadelphian gentlemen,

members of the city troop, to accompany him on an excursion to obtain information. They advanced into the vicinity of Princeton where the enemy was stationed, and surprised twelve British dragoons in a farm-house, who surrendered to this party of half their number and were conducted by them to the American camp. At the end of the year he resigned the office of adjutant-general. In 1777, within a period of less than two months, he was appointed chief-justice of Pennsylvania, and named by congress a brigadier-general. He declined both offices, however, but continued to serve as a volunteer until the close of the campaign. He was present at almost every engagement in the northern and eastern section of the union; and, although at each of the battles of Brandywine, White Marsh, and Monmouth he had a horse killed under him, he had the good fortune never to receive a wound.

In 1778 he was elected a member of congress and signed the articles of confederation. About this time the British commissioners, Governor Johnstone, Lord Carlisle, and Mr. Eden, invested with power to treat concerning peace, arrived in America; the former of whom addressed private letters to Mr. Laurens, Mr. Dana, Mr. Morris, and Mr. Reed, offering them various inducements to lend themselves to his views. He caused information to be secretly communicated to General Reed that if he would exert his abilities to promote a reconciliation, 10,000*l.* sterling, and the most valuable office in the colonies, should be at his disposal. The answer of Reed was "I am not worth purchasing, but such as I am, the king of Great Britain is not rich enough to do it." In the same year he was unanimously elected president of the supreme executive council of Pennsylvania, and continued in that office for the constitutional period of three years. At the time there were violent parties in the state, and several serious commotions occurred, particularly a large armed insurrection in Philadelphia, which he suppressed, while he rescued a number of distinguished citizens from the most imminent danger of their lives at the risk of his own, for which he received a vote of thanks from the legislature of the state. The revolt of the Pennsylvania line also, in 1781, was suppressed through his instrumentality; and he was deputed with General Potter, by the council of the state, with ample powers, to redress the grievances complained of. To him likewise belongs the honour of having been the original detector and exposé of the character of Arnold, whom he brought to trial for malpractices while in command at Philadelphia, notwithstanding a violent opposition and the exertions of a powerful party in Pennsylvania. Amidst the most difficult and trying scenes the administration of Mr. Reed exhibited the most disinterested zeal and the greatest firmness and energy. His knowledge of law was very useful in a new and unsettled government; so that, although he found it in no small weakness and confusion, he left it at the expiration of his term of office, in 1781, in as much tranquillity and stability as could be expected from the time and circumstances of the war. He then returned to his profession. In 1784 he again visited England for the sake of his health, but his voyage was attended with but little good effect. On the 5th of March, in the following year, he died, in his forty-third year.

REES, ABRAHAM, a dissenting clergyman, who was born in Wales in 1743. Being intended for the

ministry he was placed at the Hoxton academy, where his progress was so rapid that in his nineteenth year he was appointed mathematical tutor to the institution, and soon after resident tutor, in which capacity he continued upwards of twenty-two years. In 1768 he became pastor to the presbyterian congregation of St. Thomas's, Southwark, and continued in that situation till 1783, when he accepted an invitation to become minister of a congregation in the Old Jewry, whose spiritual concerns he superintended till his death. On the establishment of the dissenting seminary at Hackney in 1786, Dr. Rees was elected resident tutor in the natural sciences, which place he held till the dissolution of the academy on the death of Dr. Kippis. In 1776 he was applied to by the proprietors of Chambers's Cyclopædia to superintend an enlarged edition of that compilation, which after nine years' incessant labour he completed in four folio volumes. The success of this work led to a new undertaking, similar in its nature but more comprehensive in its plan, projected and carried on by him under the title of the "New Cyclopædia." Dr. Rees obtained his degree from the university of Edinburgh, and he was also a fellow of the royal and Linnæan societies. His death took place in June 1825.

REEVE, CLARA.—This clever literary lady was born at Ipswich in 1738. Her father was a clergyman, who took great pains in the education of his children. After his death his widow resided at Colchester, and it was there that Miss Reeve first became an authoress by translating, from the Latin language, Barclay's fine old romance entitled "*Argenis*," published in 1762 under the title of "*The Phoenix*." It was in 1767 that she produced her first and most distinguished work. It was published by Mr. Dilly, of the Poultry (who gave 10*l.* for the copyright), under the title of "*The Champion of Virtue, a Gothic Story*." The work came to a second edition in the succeeding year, and was then first called "*The Old English Baron*." The cause of the change we do not pretend to guess; for if Fitzowen be considered as the old English baron, we do not see wherefore a character, passive in himself, from beginning to end, and only acted upon by others, should be selected to give a name to the story. The success of "*The Old English Baron*" encouraged Miss Reeve to devote more of her leisure hours to literary composition, and she published in succession the following works:—"The two Mentors, a Modern Story;" "*The Progress of Romance through Times, Countries, and Manners*;" "*The Exile, or Memoirs of Count de Cronstadt*," the principal incidents of which are borrowed from a novel by M. D'Arnaud; "*The School for Widows, a Novel*;" "*Plans of Education, with Remarks on the System of other Writers*," in a duodecimo volume; and "*The Memoirs of Sir Roger de Clarendon, a Natural Son of Edward the Black Prince, with Anecdotes of many other eminent Persons of the Fourteenth Century*."

The various novels of Clara Reeve are all marked by excellent good sense, pure morality, and a competent command of those qualities which constitute a good romance. They were, generally speaking, favourably received at the time, but none of them took the same strong possession of the public mind as "*The Old English Baron*," upon which the fame of the authoress may be considered as now exclusively rested. Miss Reeve led a retired life, and died on the 3rd of December, 1803, at Ipswich, her native

city, at the advanced age of seventy-eight years. She was buried in the church-yard of St. Stephen, according to her particular direction, near to the grave of her friend the Rev. Mr. Derby.

The authoress herself stated that "The Old English Baron" is the literary offspring of "The Castle of Otranto." She condemns Horace Walpole for the extravagance of several of his conceptions; for the gigantic size of his sword and helmet; and for the violent fictions of a walking picture, and a ghost in a hermit's cowl. A ghost, she contends, to be admitted as an ingredient in romance, must behave himself like ghosts of sober demeanour, and subject himself to the common rules still preserved in grange and hall, as circumscribing beings of his description.

Where, then, may the reader ask, is the line to be drawn? On this principle, we reply, solely that the author himself, being in fact the magician, shall evoke no spirits whom he is not capable of endowing with manners and language corresponding to their supernatural character. Thus Shakspeare, drawing such characters as Caliban and Ariel, gave them reality, not by appealing to actual opinions which his audience might entertain respecting the possibility or impossibility of their existence, but by investing them with such attributes as all readers and spectators recognised as those which must have corresponded to such extraordinary beings, had their existence been possible.

In this point of view our authoress has, with equal judgment and accuracy, confined her flight within those limits on which her pinions could support her, and though we are disposed to contest her general principle, we are willing to admit it as a wise and prudent one, so far as applied to regulate her own composition. In no part of "The Old English Baron," or of any other of her works, does Miss Reeve show the possession of a rich or powerful imagination. Her dialogue is sensible, easy, and agreeable, but neither marked by high flights of fancy nor strong bursts of passion.

REGIOMONTANUS.—This learned scholar, whose real name was John Müller, and who, according to the custom of his time, assumed that of Regiomontanus in allusion to the place of his birth, Königsberg, or king's mountain, in Franconia, was born in 1436. He exhibited great precocity of talent, and having received a classical education at Leipsic, placed himself under Purbachius, the professor of mathematics at Vienna. Under so able an instructor he made the greatest proficiency, and became one of the first astronomers as well as mechanics of that age. Regiomontanus, together with Purbachius, accompanied Cardinal Bessarion to Rome in 1461, where Beza gave him further instructions in Greek literature, which enabled him to complete a new abridgment in Latin of the *Almagest* of Ptolemy, and to correct many errors in the former translation made by George of Trebizond. In 1471 he built an observatory at Nuremberg, and established a press; but after a stay of little more than three years, returned to Rome on the invitation of Sixtus IV., who employed him in the reformation of the calendar, and rewarded his services by raising him to the bishopric of Ratisbon. He died in 1476, according to some, of the plague, according to others, by poison administered by the son of George of Trebizond out of revenge for his having exposed the errors of his father. Regiomontanus was the first in Germany to apply

himself to the cultivation of the neglected science of algebra. He made great improvements in trigonometry, into which he introduced the use of tangents. His refutation of a supposed discovery of the quadrature of the circle, and his numerous writings on various subjects of natural philosophy, display extensive learning and great acuteness. His astronomical observations, published under the title of "*Ephemerides*," are very accurate. Of his works, the most valuable are his "*Calendarium*," "*De Reformatione Calendarii*," "*Tabula Magna Primi Mobilis*," "*De Cometæ Magnitudine Longitudineque*," "*De Triangulis*."

REGNARD, JOHN FRANCIS, a comic poet, who was born at Paris in 1655. Having received a good education, and being set free from restraint by the death of his father, he went to Italy in 1676. He was fond of play, and being very fortunate, was returning home with a considerable addition of property, when he was captured by an Algerine corsair, and being sold for a slave, was carried to Constantinople. His skill in the art of cookery rendered him a favourite with his master; but at length he was ransomed, and returned home. He did not, however, remain there long; for in April 1681 he set off, in company with others, on a journey to Lapland, and after going as far north as Torneo, he returned through Sweden, Poland, and Germany. Regnard then retired to an estate near Dourdan, eleven leagues from Paris, where he died in September 1709. He wrote an account of his northern tour, a number of dramatic works, the best of which are, the "*Joueur*," "*Légataire Universel*," "*Distrain*," and "*Retour Imprévu*," poems, and other works, which have been often published.

REGNIER, MATHURIN, a satirical writer, who was born at Chartres in 1573, and early showed an irresistible inclination to satire. His poetical talents gained him powerful friends, and the cardinal François de Joyeuse took him to Rome, whither he also afterwards accompanied the French ambassador Philippe de Béthune. Some valuable benefices, which were conferred upon him, enabled him to lead a life of ease and pleasure. His works consist of satires, epistles, elegies, odes, epigrams, &c.; but his satires, sixteen in number, are the principal basis of his reputation. Persius and Juvenal are his models, which he surpasses in the licentiousness of his pictures. His colouring is vigorous, but his style is incorrect, and his jests are often low and indecent; yet he is not destitute of true poetical turns, delicate wit, and a pleasing humour. He died at Rouen in 1613.

REGNIER, DESMARAIS FRANÇOIS SERAPHIN, a French writer, who was born in Paris in 1632. While yet at college he translated the "*Batrachomyomachia*," and after travelling in the train of several men of distinction, he became secretary of legation to the duke de Créquy, French ambassador at Rome. Such was his knowledge of Italian that an ode written by him in that language was believed to be by Petrarch, and the academy della Crusca chose him a member of their body. He was equally well acquainted with the Spanish. In 1670 he was admitted into the French academy, of which in 1684 he became perpetual secretary. His labours in the compilation of the "*Dictionnaire de l'Académie*" were of the greatest value, and he was the author of the grammar which appeared under the name of the academy in 1676. In his eightieth year he collected

his poems under the title of "Poésies Françaises, Latines, Italiennes, et Espagnoles." His historical works are of less value. His death took place in 1713.

**REGULUS, MARCUS ATTILIUS**, a Roman general, celebrated for his patriotism and devotion in the service of his country. He was made consul a second time about 256 B. C., and with his colleague, Manlius Vulso, commanded in the first war against Carthage. Notwithstanding the little experience which the Romans then had in naval warfare, the consuls defeated a superior Carthaginian fleet, and effected a landing in Africa. Here Regulus followed up his victories so successfully that in a short time he presented himself before the capital of the enemy. Carthage, deprived of its fleet, and not accustomed to military operations by land, sued for peace. Regulus, more of a soldier than a politician, persisted, with the Roman haughtiness, in his demand of unconditional submission. The Carthaginians preferred to die rather than to accept such terms, and at this juncture were joined by a small body of Spartan volunteers under Xanthippus. The Grecian general gave battle to Regulus under the walls of Carthage, where 30,000 Romans fell, and Regulus was made prisoner.

Carthage could now hope to obtain a peace upon better terms. An embassy was, therefore, sent to Rome, accompanied by Regulus, who was obliged to bind himself by an oath to return to Carthage, if Rome should refuse the terms proposed. Regulus, however, considered it his duty, in opposition to the wishes of the Carthaginians, to advise the continuance of the war; and neither the prayers and tears of his wife and children, nor the entreaties of the senate and people, who were ready to save the liberty and life of such a citizen by any sacrifice, could bend him from his purpose. The prosecution of the war was, therefore, decided upon, and the Carthaginian ambassadors returned home astonished and irritated, and with them Regulus in obedience to his oath. The cruel revenge which the Carthaginians are said to have taken on Regulus is doubted by many modern inquirers, and the silence of Polybius and Diodorus Siculus upon this subject is certainly remarkable; however this may be, his firmness in refusing to purchase his life by the sacrifice of the public good is worthy of admiration.

**REICHARDT, JOHN FREDERIC**, a musical composer and author, who was a corresponding member of the French institute. He was born at Königsberg in 1751, studied in the university of Königsberg under Kant, travelled much, was appointed in 1775 master of the chapel for the Italian opera in Berlin, did a great deal for music under the reign of Frederic William II., was appointed in 1807, by the king of Westphalia, director of the French and German theatre, and died in 1814. His compositions are very numerous, among which are, the "Tamerlane" of Morel, and the "Panthea" of Berquin. Some of his lighter productions are very fine. His literary productions are, "Familiar Letters written during a Journey in France in 1792;" "New Familiar Letters during a Journey in France in 1803 and 1804;" "Familiar Letters on Napoleon Bonaparte and the French People under his Consulate." In 1804 and 1805 he was conductor of the "Musical Gazette" of Berlin. Reichardt was not a great musical genius, but had formed himself by study and an excellent taste.

**REICHENBACH, GEORGE OF**, a distinguished mechanical artist, who was born in August 1772 at Mannheim, and died at Munich in May 1826. In the establishments for the manufacture of optical instruments, which he founded at Munich and Benedictbeurn in 1805, in conjunction with Utzschneider and Fraunhofer, all the instruments necessary for astronomical and geodetical operations were made in great perfection. The great meridian circles of three feet diameter, the twelve-inch repeating circles, theodolites, &c., which proceeded from these manufactories, are unsurpassed in simplicity and convenience of construction, in the fineness and delicacy of their divisions, and in their whole arrangement. The telescopes from the optical manufactory of Fraunhofer at Benedictbeurn are distinguished for the excellence of their flint glass, and, in fact, their whole construction. The great equatorial instrument of Reichenbach and the heliometers of Fraunhofer have satisfied the highest expectations of astronomers. Reichenbach constructed a peculiar instrument for Baron Zach in 1812, which may be called a portable observatory, as it unites in itself the two principal instruments of an observatory—a perfect meridian telescope joined to a repeating circle, together with a repeating theodolite for the measurement of azimuths. He likewise distinguished himself by his ingenious constructions at the Bavarian salt works, and by his invention of iron bridges according to a new method, to which he devoted a particular treatise.

**REICHSTADT, DUKE DE.**—We have already briefly adverted to this young prince in the life of his father, Napoleon Bonaparte; but the interest naturally excited by his brief but unfortunate career has induced us to give a more lengthened account of his life. He was born on the 20th of March, 1811, and was named Napoleon Francis Charles Joseph, king of Rome. The latter title had for ages slumbered in the sepulchre of the Ostrogoths, and was then revived to give *éclat* to the son of the emperor of France. All Paris was acquainted with the state of the empress Maria Louisa, and as early as six in the morning of the 11th the garden of the Tuileries was crowded by persons of all ranks and conditions. It had been made known that there would be twenty-one discharges of cannon in the event of a girl being born, but that a hundred would announce the birth of a prince. No sooner had the first discharge taken place than the most profound silence reigned throughout a multitude previously beyond measure clamorous; but no sooner had the twenty-second report sounded than bursts of enthusiasm were heard in every direction. During that critical juncture, Napoleon, stationed behind one of the window-curtains of the apartment, enjoyed the scene of this universal intoxication of pleasure, which most sensibly affected him. The public regarded the child just born as a hostage of peace and tranquillity for France, trusting that the emperor would never sacrifice, at the shrine of his belligerent ambition, his personal glory, the repose of the country, and the welfare of his son. Such were the precise facts attending the birth of the king of Rome, who received an adulation surpassing any thing that had been witnessed for centuries. A day or two after the prince was held out in the arms of his imperial parent to receive the deafening plaudits of the multitude. Splendid medals were struck in honour of the event, among which, one in particular, representing Napoleon in the act above de-

scribed, is ranked among the *chefs-d'œuvres* of the medallic art.

Nothing could surpass the emperor's fondness for his boy, as a proof of which, during the disastrous campaigns that speedily followed his infancy his father never travelled without a beautiful small bust in bronze of his child, which the ungrateful Roustan, the Mameluke, had orders at night to place on a small table beside his iron camp bedstead, the image being by day deposited on his writing table. The bronze in question was supported by a pedestal of pure gold, and, on the emperor's first abdication and departure for the isle of Elba, Roustan purloined the image, and after divesting it of its valuable basement, sold the bust for 50*l*. The bust was exquisitely modelled, and deemed a perfect resemblance of the original. The following interesting anecdote is recorded of Napoleon, which, as applying to his son, deserves a place in the present sketch. A female one day presented herself at the entrance of the Tuileries, stating that she had a petition to deliver to the young king of Rome; it was in vain that the officers in attendance endeavoured to dissuade her from tendering the address—her importunities only increased, and at length the circumstance gained the ears of the emperor, who immediately ordered that the applicant should be admitted. On her appearance she was proceeding to the cradle, when Napoleon desired she would deliver the paper into his hands, with which having complied, he proceeded to the cradle of his child, reading the contents aloud, which were to entreat that the son of the applicant might not be sent to the army, having been drawn by the conscription law; as in such case the petitioning widow would be left without the means of support. The emperor, on concluding, demanded three times, in an audible voice, whether the young king of Rome complied with the prayer of the petitioner, to which, of course, receiving no answer, the emperor, turning to the female, informed her, that as no reply had been given, silence, of course, augured consent, and the youth was therefore freed from the obligation of serving. This circumstance is the more remarkable as there is scarcely an instance recorded of a person once drawn to serve, be his rank in life what it might, having escaped the peremptory ordinance of the conscription law.

On the attainment of his second year the young king of Rome uniformly attended the breakfast meals of his father, at which the empress was also present. Until the time of her confinement they had been accustomed to take breakfast at one o'clock precisely; but after the above period the emperor adopted his former habits, eating when he felt hungry, or when his occupations would so permit; but he had exacted that the empress should continue to take her morning meal at the accustomed hour. As soon as young Napoleon was able to speak, he, as is usually the case with children, became fond of asking questions. He was particularly pleased at seeing the company promenade in the garden of the Tuileries, who were in the habit of assembling in groups under the windows to see the child. It was not long ere he observed that crowds of persons entered the palace with large packets of papers in their hands, and he enquired of his governess what it meant. She informed the child that they were distressed persons who presented themselves to solicit favours of his father. From that time, as often as he saw a petitioner pass,

he screamed out, wept, and would not be quieted until the papers were brought to him, which he uniformly presented to his father the following morning while at breakfast. It is but natural to suppose that, as soon as this trait of the boy was made public, the child was inundated with petitions.

It is false that the rod was ever resorted to in the education of young Napoleon. Madame de Montesquieu, on the contrary, having recourse to more wise and useful means of correcting his faults. He was, on most occasions, good-natured and tractable, and would listen to reason, but he nevertheless partook of the nature of his father, being restless and impetuous in his temper at times, when he would give way to paroxysms of fury. One day, as he was rolling himself on the carpet, and uttering the most vehement cries, without paying the least attention to the remonstrances of his governess, the latter proceeded to close the windows and shut to the blinds, when the boy astonished, immediately rose, and forgetting the circumstance that had excited his rage, desired to know why Madame de Montesquieu had shut the windows, and enveloped the chamber in darkness. "It is under an apprehension that you would be heard," was the reply. "Do you imagine that the French people would wish for a prince like yourself if they knew that you were in the habit of throwing yourself in such passions?" "Do you believe they heard me?" exclaimed the prince; "I should be extremely sorry. Pardon me, Mamma Quion, (such was the appellation he gave to his governess), I will do it no more." It was in this manner the exemplary tutor of the young prince inspired in her pupil's mind a dread of blame, and instilled a respect for public opinion, so essentially requisite in all classes, while she toiled to cultivate those praiseworthy sentiments which had been implanted by nature. This circumstance, as the emperor observed to Count Las Cases at St. Helena, afforded a very different lesson to that addressed by M. de Villeroi to Louis XV.—"Behold all those people, my prince, they belong to you; all the men you see yonder are yours."

During the regency of Maria Louisa she had frequently corresponded with the emperor, and concealed nothing from him respecting the situation of affairs in the French capital, and the provinces where the general cry was for peace. His ministers, however, were less sincere, only dwelling on the inexhaustible resources of France, wherefore the emperor was led to imagine that he had at his disposal the last man as well as the last crown piece in the empire. The news of some trifling successes had reached the court, which inspired faint hopes, when there suddenly arrived at St. Cloud two travelling carriages, and it was speedily known that the emperor had unexpectedly returned to announce fresh disasters. The empress, fully acquainted with the conduct of Austria, had dreaded the return of her husband. She found him, however, calm and resigned, and as yet not despairing of a change of fortune, calculating the resources he still possessed, and showing no symptoms of making his wife responsible for the defection of her father. After the departure of the emperor to join his army, Maria Louisa and her son remained in the capital under protection of the national guard, to whom, on parting, the emperor had solemnly confided their safety, and who showed themselves in every respect worthy the confidence reposed in them. Joseph Bonaparte already contemplated the abandonment of

Paris, and strenuously advised the empress to adopt that measure. Jerome Bonaparte, who proceeded as far as the outposts, retired at full gallop, and infused the same terror in the council of the regency, as he had experienced at the sight of the enemy's troops, which he perceived in the distance by the aid of a telescope. Cambaceres, who on most occasions had been proud of his dignity, then regarded it only as a heavy burden of which he was anxious to rid himself in order to quit Paris, as did the majority of the senators, and a host of individuals, who during the preceding twenty-four hours had passed the barrier of Fontainebleau, being the only gate then free. Clarke, duke de Feltre, prevailed on the empress to fly, by perusing, in open council, a letter from the emperor, wherein he advised that the empress and his son should leave Paris in case it was menaced by an attack, adding, "that he would prefer seeing them both at the bottom of the Seine rather than behold them in the hands of the enemy." The departure, therefore, was determined upon during the night of the 28th and 29th of March, when, at six o'clock in the morning, the whole court set out for Rambouillet, in the route for Blois, abandoning the capital to its fate, without having adopted any precautionary measures, not even that, so essentially requisite, of transferring the sitting of the legislative body to some other city.

Previous to this ill-judged proceeding, a deliberation had been held by the council of the regency, where the specific commands of the emperor had been made known, which intimated his direct opposition to the raising his son to the throne while he continued to exist; a measure which Napoleon well knew had been advocated by many of his leading generals and a certain portion of the senate. Previous to their departure the following fact, in reference to young Napoleon, was remarked with astonishment, which, under ordinary circumstances, would have been looked upon as a mere fit of puerile perverseness. Just as the carriage drove up, the prince, who had been accustomed to take airings to St. Cloud, Compeigne, Fontainebleau, &c., refused to quit his chamber, uttering the most vehement screams, and rolling himself upon the floor, exclaiming, that he would continue at Paris and not go to Rambouillet. It was in vain that Madame de Montesquiou promised him new playthings; no sooner did she present her hand for the purpose of gently forcing him from the chamber, than he commenced anew his cries that he would not quit Paris, so that force was ultimately resorted to in order to place him in the vehicle. It was indeed the last time that himself or his mother saw the French capital, having from that moment bid adieu to Paris for ever.

Maria Louisa and her son were accompanied by all the members of the council, Talleyrand excepted, who continued in the capital, and Clarke, duke de Feltre, who did not leave Paris until the following day. The retreat of the empress proved a death-blow to the hopes of the Parisian national guard, while the veteran troops serving as her escort would have been better employed in facing the enemy's forces. The step thus resorted to was equally prejudicial to the interests of Napoleon and his son, as the abandonment of the capital was a tacit relinquishment of the existing government. It has been asserted that Talleyrand strenuously opposed the proceedings, and it was equally conjectured that the personage alluded to, with a minority of the senate, had formed the project

of proclaiming young Napoleon under the regency of his mother, aided by a council, in which that Machiavelian statesman of every period, and through every change of government, was to act the leading part.

On the 1st of April, Caulincourt, duke de Vicenza, was despatched to the emperor Alexander, being bearer of proposals which Napoleon deemed of a nature to disarm the hostile sentiments of the autocrat. Not only, however, did the minister plead in vain for his master, but all entreaties were alike ineffectual as regarded Maria Louisa and the king of Rome, the allied monarchs refusing every negotiation, as the proposals tendered were not such as the coalesced potentates conceived themselves entitled to expect, more particularly after the sentiments so openly promulgated by the Parisians and the French people.

On the 11th of the above month, Napoleon, in the name of himself and his heirs, renounced all right to the sovereignty as well of France as the kingdom of Italy, and every other territory over which his conquests had given him a claim. The island of Elba was allotted as the future place of his destination, to be considered, during his lifetime, a separate principality, held by him as an acknowledged sovereign. It was further stipulated that himself and family should receive from the principalities so surrendered, a revenue of five millions; that Maria Louisa should be recognised sovereign of the duchy of Parma and Placentia, the same to devolve to her son; and that a proper establishment should be appropriated out of the boundaries of France for Prince Eugene Beauharnois, viceroy of Italy.

On the 22nd of June, 1815, the second abdication of Napoleon took place after his return from Elba, and the reign of the hundred days, when, in his address to the French nation, he thus expressed himself:—"In commencing war to maintain the national independence I relied upon a union of the combined efforts and wishes of the people, as well as the concurrence of all the national authorities,—circumstances appear to me to be changed. My political life is at an end, and I proclaim my son for my successor, under the title of Napoleon the Second, Emperor of the French." Young Napoleon was deprived of his title of King of Rome, and declared duke de Reichstadt on the 22nd of July, 1818,—the latter dukedom being derived from a place of that name in Bohemia, having a castle and fine estate attached to the same. The empress Maria Louisa had been declared duchess of Parma and Placentia in 1814, which principality would have devolved to her son had he proved the survivor. In November 1819 the emperor of Austria gave a grand hunting match at Schlossoff, a magnificent sporting domain, about forty English miles east of Vienna, on the left bank of the Danube. The nobles of the court and all the foreign ambassadors were present during the amusement of the day's shooting. Young Napoleon, being of the party, begged to have a gun, which the emperor, after much entreaty, permitted, with strict injunctions that it might be charged with powder only. After two fires he was rallied upon being a bad shot, and told that he had better decline any further attempt. By what means we are not prepared to state, but at that moment he discovered the trick which had been put upon him, and remonstrated with his grandfather, when, after much pleading, he was allowed a small charge of shot. He brought down his first bird (a pheasant) to the inexpressible delight and admiration

of the emperor and all present. Monsieur Mery, a French gentleman, at the close of 1829, visited Vienna for the express purpose of procuring an interview with the duke de Reichstadt, from whom we learn the following particulars:—

He waited upon Count Czernine, grand chamberlain to the emperor, and made known the nature of his visit, when the count expressed no astonishment, but merely directed him to apply to Count Dietrichstein, to whose special care the education of the prince was consigned, permitting the traveller to present himself under his auspices. "To the functions of grand master of the duke de Reichstadt, the count united that of supreme director of the imperial library, and in such quality was empowered to inquire under what title, as a literary character, I presented myself before him. He was, I soon found, aware of the works I had produced, in conjunction with M. Barthelemy, and having purposely provided myself with a copy of our last production, I presented the same, which was most graciously accepted.

"M. le Comte," said I, "since you so far deign to favour me, I feel emboldened to supplicate that you would render me assistance on the subject that has prompted my visit to Vienna. I came for the express purpose of presenting a book to the duke de Reichstadt, than whom no person is so capable as yourself of seconding my views." Scarcely had I pronounced the opening words of this humble solicitation, than I saw the features of the count assume a different expression, who after a silence of some seconds, made answer—

"Is it really a fact, Sir, that you have journeyed to Vienna for the purpose of having an interview with the young prince? Who could have prompted you to undertake such a step? Is it possible that you can have calculated on the success of your journey? If such be the case, they must entertain very false and ridiculous ideas in France, concerning what occurs at Vienna."

"My reply was, I had no mission whatsoever from any one to fulfil in visiting Austria; that the journey was my own act and deed; while in France a general opinion prevailed, that there was no difficulty in procuring an introduction to the duke de Reichstadt; and that it was publicly believed Frenchmen were welcomed by him with particular cordiality. 'Perhaps,' added I, 'my zeal may appear somewhat importunate; yet consider, Monsieur le Comte, I have just published a poem on the subject of Napoleon, and is it then singular that I should be desirous of laying the production at the feet of his son? Do you imagine that a literary homage of this description can have any hidden motive? It only remains with yourself to certify to the contrary. I do not wish to confer with the prince alone; it shall be in your presence, nay, before ten persons, if requisite; and should a single word escape my lips, which could tend to awaken the most hidden policy, I am resigned to spend the remainder of my days in some Austrian fortress.'

"The grand master then proceeded to state, that all the reports disseminated in France on the subject of individuals having been admitted to the duke de Reichstadt were false; that he was fully persuaded the motives of my journey were purely connected with literature, and had no reference whatsoever to political views; that, nevertheless, it was impossible for him to trespass on his orders; that the commands issued on the subject of such instruc-

tions were peremptory; that the measure was not the result of momentary caprice, but a premeditated system pursued by the two courts; that they did not apply to me personally, but to every one who should attempt to approach the prince, and that it would be highly improper I should take any thing to myself; in short, added the count, what ought to excuse the rigorous conduct pursued, is any attempt that might be made upon the person of the young prince.

"True," said I, in answer, "an attempt of that description is always to be apprehended, for the duke de Reichstadt is not environed by guards; a resolute assassin might, at any time, surprise him, and a second of time would suffice to perpetrate the deed; your caution, however, on that side is defective. In the present instance you are, perhaps, apprehensive that too free an intercourse with strangers should reveal secrets to him and give birth to dangerous hopes; yet, notwithstanding all your rigour, is it possible to prevent a letter being openly or clandestinely conveyed to him; a petition, or advice, for instance, might be handed to him while taking the air; at the theatre or any other place. I, myself, instead of frankly addressing you as I have done, might have placed myself in his way, and then boldly approached him, and, even in your presence, remitted to his hand a copy of my poem. You see, I might by that means have rendered all your precautions nugatory, and accomplished my purpose (in an unlicensed manner I allow), but, at the same time, it is equally certain that the prince would have received my work, and perused it; at all events he would have known the title.

"The count Dietrichstein then replied, in a manner that curdled my blood with astonishment:— 'Hear me, Sir; rest assured, that the prince neither hears, sees, or reads any thing but what we are willing he should be acquainted with and witness. If by chance he received a letter, a slip of paper, or a volume, that had escaped our vigilance, rest assured, his first care would be to hand it over to us, ere he proceeded to inspect the contents; he would not take upon himself to glance at the writing until we had pronounced that he might inspect the same without danger.'

"From this it appears, count, that the son of Napoleon is far indeed from enjoying that freedom which we suppose is accorded him."

"The prince, Sir, is not a prisoner—but . . . . . he is placed in a very peculiar situation. May I solicit you will importune me by no more questions; I have it not in my power to give you the satisfaction you require; I beg you will abandon the project which led you hither; I repeat, your labour will be fruitless."

"If such be the case, count, you debar me from indulging a hope. I most certainly cannot think of addressing myself in any other quarter after such a decided interdict upon your part, and I feel that it would be useless to renew my importunities; but, at all events, you certainly cannot refuse to present my little work yourself, in the name of the author; he has, no doubt, a library, and this production is not of such a dangerous nature as to be expunged from the collection."

"The count Dietrichstein shook his head, in token of irresolution; I felt convinced that it became painful to him to pronounce a second refusal during the same interview; consequently, not being desirous to

compel him to enter into a more ample explanation, I took my leave, requesting that he would peruse my poem, in order to convince himself that it contained nothing of a seditious tendency, and to lead me to indulge a hope that, after such assurance, he might comply with my last solicitation.

"At the end of a fortnight I again called upon the grand master, and renewed my former application. He was obviously astonished at my determined perseverance. 'I really do not understand you, Sir,' said he; 'your wish to see the prince becomes too importunate; rest satisfied in knowing that he is happy, and divested of ambition; his career is already traced out; he will never approach the frontiers of France; he will not even indulge a thought of the kind. Repeat all I have said to your fellow-countrymen, let the veil of deception be torn from their eyes, if it is possible. I do not wish to bind you to secrecy respecting any thing I have uttered, nay, the very reverse; I beg that, on your return to France, you will publish every word, and annex your own comments. In respect to remitting the copy of your work, do not expect that I shall comply; your book, as a poem, is very clever, but it would be dangerous in the hands of the son of Napoleon; your style abounding in imagery, the glowing descriptions you give, and the lively colours in which your history is traced; every thing, in his youthful brain, might excite enthusiasm and kindle those germs of ambition which, without any possible result, would only serve to give him a distaste for his actual situation. Of history, he knows every thing which it is essential for him to learn, that is to say, names and dates; consequently you must be well aware that your pamphlet is by no means adapted for his perusal.'

"I still interceded for a time, but found that the grand master no longer attended to me with civility; when, not desirous to weary myself by fruitless importunities, at the same time fully convinced that I had indulged in a fruitless hope, I looked upon this visit as a farewell audience, and had nothing left but to retrace my steps to France.

"Until the moment of my departure I continued to visit the persons who had uniformly interested themselves so much in my behalf. On one of those occasions I learned the following anecdote of the duke de Reichstadt, which particularly struck me. I have it from an undeniable source, and did I not apprehend that some ill might result to my informant, I should give the name to the public. Let the reader, therefore, remain satisfied with knowing that the lady is in the habit of familiarly conversing with the prince almost daily. On a recent occasion the duke de Reichstadt seemed absorbed with some idea that appeared to have permanently taken possession of his mind; he did not attend to the accustomed course of his studies, when, on a sudden, striking his forehead with vehemence, at the same time testifying a degree of impatience, he suffered these words to escape him: 'But what do they intend to do with me then?—do they imagine that I possess the intellects of my father?'

"Hence we might be led to infer, that the rampart whereby the young prince was environed, had been scaled; that some letter or indiscreet slip of paper had reached him, and that for once he had dared infringe upon the commands prescribed, of his never perusing a line which had not first met the eyes of his preceptors.

"It was at the theatre of the court (*Hoftheater*) where I first had a sight of the duke de Reichstadt, the house being remarkable for the plainness and simplicity of its decorations. They perform, indiscriminately, both comedy and tragedy, and even low farces that would disgrace our third-rate play-houses. The young prince took his seat rather at the back part of the box, his visage was pale and melancholy, and no testimonials of applause were manifested on his arrival. His regard was constantly riveted on the business of the scene, he scarcely ever directed a glance at the audience, and on quitting the box, the same silence pervaded throughout the audience as had been manifested on his arrival. Were I to speak from the general appearance and manners of the youth, I should certainly pronounce that he was spirit-broken, and that a rooted sadness weighed at his heart; whether this was the result of a warped education, or a concomitant of the malady that was said to prey upon him, I will not take upon myself to determine."

The following touching remarks occurred in a letter from Vienna, inserted in a Paris paper:—"Apropos of Napoleon. His unfortunate son is certainly dying. Malpette, his physician, had for some time spoken of him in such a manner as to leave very little hope—but that little has now vanished. The duke of Reichstadt's disorder is a pulmonary phthisis, which slowly destroys him. The poor young man said a few days since, 'So young! is there then no remedy? My birth and my death will be the only point of remembrance.' Some time since his mother sent to him the superb cradle presented at his birth by the city of Paris. He deposited it in the imperial treasury, and recalling the circumstance to his mind a few days since, said, 'My tomb will be near my cradle.' I was at Paris," observes the writer, "at the time of his birth, and present at the grand review which Napoleon gave upon that occasion, in order to present to the troops the infant already decorated with a crown. Who would then have anticipated that, proscribed like him through civil discords, I should see him die at Vienna? His mother is ill at a distance from him. His loss will be much regretted; he is good and kind-hearted, as well as clever and handsome. The sacrament is to be administered to him this morning. What a mournful destiny is his! On the day preceding that of his death, the unfortunate prince said to his mother, 'The dream of life will soon be at an end. Do not weep, my dear mother; my life has been of short duration, but I have no enemies. My name will be transmitted to posterity.' The prince then gave Maria Louisa a portrait of Napoleon, in which he had mingled some of his own hair with that of his father. Shortly after the young prince expired. At the time of his death he had just entered his twenty-second year. It is universally believed that the disorder of which this unfortunate young prince died was a pulmonary complaint. But many have ascribed his death to poison. If any unfair means were resorted to it cannot for a moment be ascribed to his own family. By his grandfather, the emperor Francis, the duke de Reichstadt was beloved, and equally cherished by his uncle the archduke Charles. To speak of his mother would be preposterous; and as to Metternich, he is too shrewd a politician and German at heart, not to have been fully aware of

the valuable stake that remained in the hands of Austria, while the young prince existed, to have for a moment contemplated his death from any political motive whatsoever."

REID, THOMAS, an eminent Scottish divine and metaphysician, who was born on the 26th of April, 1710, at Strachen, in Kincardineshire. His education commenced at a school in Kincardine, and was completed at Marischal college, Aberdeen. His residence at the university was prolonged beyond the usual term in consequence of his appointment to the office of librarian, which had been endowed by one of his ancestors about a century before. The situation was acceptable to him, as it afforded an opportunity of indulging his passion for study, and united the charms of a learned society with the quiet of an academical retreat. During this period he formed an intimacy with John Stewart, afterwards professor of mathematics in Marischal college, and author of "A Commentary on Newton's Quadrature of Curves." His predilection for mathematical pursuits was confirmed and strengthened by this connexion, and he frequently after mentioned, with pleasure, the ardour with which they both prosecuted these fascinating studies, and the lights which they imparted mutually to each other, in their first perusal of the "Principia," at a time when a knowledge of the Newtonian discoveries was only to be acquired in the writings of their illustrious author. In 1736 Dr. Reid resigned his office of librarian, and accompanied Mr. Stewart on an excursion to England. They visited, together, London, Oxford, and Cambridge, and were introduced to the acquaintance of many persons of the first literary eminence. His relation to Dr. David Gregory procured him a ready access to Martin Folkes, whose house concentrated the most interesting objects which the metropolis had to offer to his curiosity. At Cambridge he saw Dr. Bentley, who delighted him with his learning, and amused him with his vanity; and enjoyed repeatedly the conversation of the blind mathematician, Saunderson; a phenomenon in the history of the human mind, to which he has referred more than once in his philosophical speculations. With the learned gentleman who was his companion in this journey, he maintained an uninterrupted friendship till 1766, when Mr. Stewart died of a malignant fever. His death was accompanied with circumstances deeply afflicting to Dr. Reid's sensibility; the same disorder proving fatal to his wife and daughter, both of whom were buried with him in one grave.

In 1737 Dr. Reid was presented, by the King's college of Aberdeen, to the living of New Machar in the same county; but the circumstances in which he entered on his preferment were far from auspicious. The intemperate zeal of one of his predecessors, and an aversion to the law of patronage, had so inflamed the minds of his parishioners against him that, in the first discharge of his clerical functions, he had not only to encounter the most violent opposition, but was exposed to personal danger. His unwearied attention, however, to the duties of his office, the mildness and forbearance of his temper, and the active spirit of his humanity, soon overcame all these prejudices; and, not many years afterwards, when he was called to a different situation, the same persons who had suffered themselves to be so far misled as to take a share in the outrages against him, followed him on his departure, with their blessings and tears.

Dr. Reid's popularity at New Machar increased considerably after his marriage, in 1740, with Elizabeth, daughter of his uncle, Dr. George Reid, physician, in London. The accommodating manners of this excellent woman, and her good offices among the sick and necessitous so endeared the family to the neighbourhood, that its removal was regarded as a general misfortune.

A paper which he published in "The Philosophical Transactions" of the royal society, for the year 1748, affords some light with respect to the progress of his speculations about this period. It is entitled "An Essay on Quantity, occasioned by reading a Treatise, in which Simple and Compound Ratios are applied to Virtue and Merit;" and shows plainly, by its contents, that although he had not yet entirely relinquished the favourite researches of his youth, he was beginning to direct his thoughts to other objects. The treatise alluded to in the title of this paper was manifestly the "Inquiry into the Origin of our Ideas of Beauty and Virtue," by Dr. Hutcheson of Glasgow. According to this very ingenious writer, the moment of public good produced by an individual, depending partly on his benevolence, and partly on his ability, the relation between these different moral ideas may be expressed in the technical form of algebraists, by saying that the first is in the compound proportion of the two others. Hence, Dr. Hutcheson infers, that "the benevolence of an agent (which in this system is synonymous with his moral merit) is proportional to a fraction, having the moment of good for the numerator, and the ability of the agent for the denominator." Various other examples of a similar nature occur in the same work, and are stated with a gravity not altogether worthy of the author. It is probable, that they were intended merely as illustrations of his general reasonings, not as media of investigation for the discovery of new conclusions; but they appeared to Dr. Reid to be an innovation which it was of importance to resist, on account of the tendency it might have (by confounding the evidence of different branches of science) to retard the progress of knowledge. The very high reputation which Dr. Hutcheson then possessed in the universities of Scotland, added to the then recent attempts of Arbuthnot and Cheyne to apply mathematical reasoning of medicine, would bestow, it is likely, an interest on Dr. Reid's Essay at the time of its publication, which it can scarcely be expected to possess at present. Many of the observations, however, which it contains, are acute and original; and all of them are expressed with that clearness and precision, so conspicuous in his subsequent compositions. The circumstance which renders a subject susceptible of mathematical consideration, is accurately stated, and the proper province of that science defined in such a manner as sufficiently to expose the absurdity of those abuses of its technical phraseology which were at that time prevalent.

In 1752 the professors of King's college elected Dr. Reid professor of philosophy, in testimony of the high opinion they had formed of his learning and abilities. The department of science which was assigned to him by the general system of education in that university, comprehended mathematics and physics as well as logic and ethics. A similar system was pursued formerly in the other universities of Scotland; the same professor then conducting his pupils through all those

branches of knowledge which are now appropriated to different teachers. And where he happened fortunately to possess those various accomplishments which distinguished Dr. Reid in so remarkable a degree, it cannot be doubted that the unity and comprehensiveness of method of which such academical courses admitted, must necessarily have possessed important advantages over that more minute subdivision of literary labour which has since been introduced. But as public establishments ought to adapt themselves to what is ordinary rather than to what is possible, it is not surprising that experience should have gradually suggested an arrangement more suitable to the narrow limits which commonly circumscribe human genius. Soon after Dr. Reid's removal to Aberdeen he projected, in conjunction with his friend Dr. John Gregory, a literary society, which subsisted for many years, and which seems to have had the happiest effects in awakening and directing that spirit of philosophical research which has since reflected so much lustre on the north of Scotland. The meetings of this society were held weekly, and afforded the members (beside the advantages to be derived from a mutual communication of their sentiments on the common object of their pursuit) an opportunity of subjecting their intended publications to the test of friendly criticism. The number of valuable works which issued nearly about the same time from individuals connected with this institution, more particularly the writings of Reid, Gregory, Campbell, Beattie, and Gerard, furnish the best panegyric on the enlightened views of those under whose direction it was originally formed. Among these works the most original and profound was unquestionably the "Inquiry into the Human Mind," published by Dr. Reid in 1764. The plan appears to have been conceived, and the subject deeply meditated, by the author long before. From a passage in the dedication it would seem, that the speculations which terminated in these conclusions had commenced as early as the year 1739, at which period the publication of Mr. Hume's "Treatise of Human Nature" induced him for the first time "to call in question the principles commonly received with regard to the human understanding." In his "Essays on the Intellectual Powers," he acknowledges that in his youth he had, without examination, admitted the established opinions on which Mr. Hume's system of scepticism was raised; and that it was the consequences which these opinions seemed to involve which roused his suspicions concerning their truth. "If I may presume," says he, "to speak my own sentiments, I once believed the doctrine of ideas so firmly as to embrace the whole of Berkeley's system along with it; till finding other consequences to follow from it, which gave me more uneasiness than the want of a material world, it came into my mind more than forty years ago, to put the question, What evidence have I for this doctrine, that all the objects of my knowledge are ideas in my own mind? From that time to the present I have been candidly and impartially, as I think, seeking for the evidence of this principle; but can find none excepting the authority of philosophers."

Mr. Hume read the manuscript previous to the publication of the work, and he addressed himself to the author in terms so candid and liberal, that it would be unjust to his memory to withhold from the public so pleasing a memorial of his character:—"By Dr. Blair's means," he says, "I have been fa-

voured with the perusal of your performance, which I have read with great pleasure and attention. It is certainly very rare that a piece so deeply philosophical is wrote with so much spirit, and affords so much entertainment to the reader; though I must still regret the disadvantage under which I read it, as I never had the whole performance at once before me, and could not be able fully to compare one part with another. To this reason, chiefly, I ascribe some obscurities which, in spite of your short analysis or abstract, still seem to hang over your system. For I must do you the justice to own, that when I enter into your ideas no man appears to express himself with greater perspicuity than you do; a talent which, above all others, is requisite in that species of literature which you have cultivated. There are some objections which I would willingly propose to the chapter, 'Of Sight,' did I not suspect that they proceed from my not sufficiently understanding it; and I am the more confirmed in this suspicion, as Dr. Blair tells me, that the former objections I made had been derived chiefly from that cause. I shall therefore forbear till the whole can be before me, and shall not at present propose any farther difficulties to your reasonings. I shall only say, that if you have been able to clear up these abstruse and important subjects, instead of being mortified, I shall be so vain as to pretend to a share of the praise; and shall think that my errors, by having at least some coherence, had led you to make a more strict review of my principles, which were the common ones, and to perceive their futility.

"As I was desirous to be of some use to you, I kept a watchful eye all along over your style; but it is really so correct and such good English, that I found not any thing worth the remarking. There is only one passage in this chapter, where you make use of the phrase 'hinder to do,' instead of 'hinder from doing,' which is the English one; but I could not find the passage when I sought for it. You may judge how unexceptionable the whole appeared to me when I could remark so small a blemish. I beg my compliments to my friendly adversaries, Dr. Campbell and Dr. Gerard; and also to Dr. Gregory, whom I suspect to be of the same disposition, though he has not openly declared himself such."

The impression produced on the minds of speculative men by the publication of Dr. Reid's Inquiry, was fully as great as could be expected from the nature of his undertaking. It was a work neither addressed to the multitude, nor level to their comprehension; and the freedom with which it canvassed opinions sanctioned by the highest authorities, was ill calculated to conciliate the favour of the learned. A few, however, habituated to the analytical researches of the Newtonian school, soon perceived the extent of his views, and recognised in his pages the genuine spirit and language of inductive investigation. Among the members of this university Mr. Ferguson was the first to applaud Dr. Reid's success; warmly recommending to his pupils a steady prosecution of the same plan, as the only effectual method of ascertaining the general principles of the human frame; and illustrating, happily, by his own profound and eloquent disquisitions, the application of such studies to the conduct of the understanding, and to the great concerns of life.

From the university of Glasgow, Dr. Reid's Inquiry received a still more substantial testimony of

approbation; the author having been invited in 1763, by that learned body, to the professorship of moral philosophy, then vacant by the resignation of Mr. Smith. The preferment was in many respects advantageous, affording an income considerably greater than he enjoyed at Aberdeen, and enabling him to concentrate to his favourite objects that attention which had been hitherto distracted by the miscellaneous nature of his academical engagements. It was not, however, without reluctance that he consented to leave a spot which he so much loved.

Animated by the busy scenes which his new residence presented in every department of useful industry, Dr. Reid entered on his functions at Glasgow with an ardour not common at the period of life which he had now attained. His researches respecting the human mind, and the principles of morals, which had occupied but an inconsiderable space in the wide circle of science allotted to him by his former office, were extended and methodised in a course, which employed five hours every week, during six months of the year: the example of his illustrious predecessor, and the prevailing topics of conversation around him, occasionally turned his thoughts to commercial politics, and produced some ingenious essays on different questions connected with trade, which were communicated to a private society of his academical friends.

As the substance of Dr. Reid's lectures at Glasgow, at least of that part of them which was most important and original, has been since given to the public in a more improved form, it is unnecessary to enlarge on the plan which he followed in the discharge of his official duties. We shall therefore only observe, that beside his speculations on the intellectual and active powers of man, and a system of practical ethics, his course comprehended some general views with respect to natural jurisprudence and the fundamental principles of politics. A few lectures on rhetoric, which were read, at a separate hour, to a more advanced class of students, formed a voluntary addition to the appropriate functions of his office, to which, it is probable, he was prompted, rather by a wish to supply what was then a deficiency in the established course of education, than by any predilection for a branch of study so foreign to his ordinary pursuits. Dr. Reid's "Essays on the Intellectual Powers of the Human Mind" was published in 1785, and three years later his "Essay on The Active Powers" appeared.

The general spirit of Dr. Reid's philosophy, as displayed in the works we have already alluded to, is hostile to the conclusions of the materialist. Not, however, because his system rests on the contrary hypothesis as a fundamental principle, but because his inquiries have a powerful tendency to wean the understanding gradually from those obstinate associations and prejudices to which the common mechanical theories of the mind owe all their plausibility. It is, in truth, much more from such examples of sound research concerning the laws of thought than from any direct metaphysical refutation, that a change is to be expected in the opinions of those who have been accustomed to confound together two classes of phenomena, so completely and essentially different.

The works already mentioned, together with the "Essay on Quantity," published in "The Philosophical Transactions" of the royal society of London,

and a short but masterly analysis of Aristotle's logic, which forms an appendix to the third volume of Lord Kames's "Sketches," comprehend the whole of Dr. Reid's publications. The interval between the dates of the first and last of these amounts to no less than forty years, although he had attained to the age of thirty-eight before he ventured to appear as an author. With the "Essays on the Active Powers of Man," he closed his literary career; but he continued, notwithstanding, to prosecute his studies with unabated ardour and activity. The more modern improvements in chemistry attracted his particular notice; and he applied himself, with his wonted diligence and success, to the study of its new doctrines and new nomenclature. He amused himself, also, at times, in preparing for a philosophical society, of which he was a member, short essays on particular topics, which happened to interest his curiosity, and on which he thought he might derive useful hints from friendly discussion. The most important of these were, "An Examination of Priestley's Opinions concerning Matter and Mind," "Observations on the Utopia of Sir Thomas More," and "Physiological Reflections on Muscular Motion." This last essay appears to have been written in the eighty-sixth year of his age, and was read by the author to his associates, a few months before his death. His "thoughts were led to the speculations it contains," as he himself mentions in the conclusion, "by the experience of some of the effects which old age produces on the muscular motions."—"As they were occasioned, therefore," he adds, "by the infirmities of age, they will, I hope, be heard with the greater indulgence."

Among the various occupations with which he thus enlivened his retirement, the mathematical pursuits of his earlier years held a distinguished place. He delighted to converse about them with his friends, and often exercised his skill in the investigation of particular problems. His knowledge of ancient geometry had not probably been, at any time, very extensive; but he had cultivated diligently those parts of mathematical science which are subservient to the study of Sir Isaac Newton's works. He had a predilection, more particularly, for researches requiring the aid of arithmetical calculation, in the practice of which he possessed uncommon expertness and address.

While he was thus enjoying an old age, happy in some respects beyond the usual lot of humanity, his domestic comfort suffered a deep and incurable wound by the death of Mrs. Reid. He had had the misfortune, too, of surviving, for many years, a numerous family of promising children; four of whom (two sons and two daughters) died after they attained to maturity. One daughter only was left to him when he lost his wife; and of her affectionate good offices he could not always avail himself, in consequence of the attentions which her own husband's infirmities required.

A short extract from a letter addressed by Dr. Reid to Dugald Stewart, which the latter gentleman inserted in his admirable life of Dr. Reid, he says: "By the loss of my bosom-friend, with whom I lived fifty-two years, I am brought into a kind of new world, at a time of life when old habits are not easily forgot, or new ones acquired. But every world is God's world, and I am thankful for the comforts he has left me. Mrs. Carmichael (his daughter) has

now the care of two old deaf men, and does every thing in her power to please them; and both are very sensible of her goodness. I have more health than at my time of life I had any reason to expect. I walk about; entertain myself with reading what I soon forget; can converse with one person, if he articulates distinctly, and is within ten inches of my left ear; go to church, without hearing one word of what is said. You know, I never had any pretensions to vivacity, but I am still free from languor and ennui. If you are weary of this detail, impute it to the anxiety you express to know the state of my health. I wish you may have no more uneasiness at my age; being yours most affectionately."

About four years after this event he was prevailed on, by his friend and relation Dr. Gregory, to pass a few weeks, during the summer of 1796, at Edinburgh. He was accompanied by Mrs. Carmichael, who lived with him in Dr. Gregory's house; a situation which united, under the same roof, every advantage of medical care, of tender attachment, and of philosophical intercourse. His faculties (excepting his memory which was considerably impaired) appeared as vigorous as ever; and, although his deafness prevented him from taking any share in general conversation, he was still able to enjoy the company of a friend.

He returned to Glasgow in his usual health and spirits, and continued for some weeks to devote, as formerly, a regular portion of his time to the exercise both of body and of mind. It appears, from a letter of Dr. Cleghorn's to Dr. Gregory, that he was still able to work with his own hands in his garden; and he was found, by Dr. Brown, occupied in the solution of an algebraical problem of considerable difficulty, in which, after the labour of a day or two, he at last succeeded.

This active and useful life was now, however, drawing to a conclusion. A violent disorder attacked him about the end of September; but does not seem to have occasioned much alarm to those about him till he was visited by Dr. Cleghorn, who soon after communicated his apprehensions in a letter to Dr. Gregory. Among other symptoms he mentions particularly "that alteration of voice and features which, though not easily described, is so well known to all who have opportunities of seeing life close." Dr. Reid's own opinion of his case was probably the same with that of his physician, as he expressed to him on his first visit his hope that he was "soon to get his dismissal." After a severe struggle, attended with repeated strokes of palsy, he died on the 7th of October, 1796.

In point of bodily constitution few men have been more indebted to nature than Dr. Reid. His form was vigorous and athletic; and his muscular force, though he was somewhat under the middle size, uncommonly great; advantages to which his habits of temperance and exercise, and the unclouded serenity of his temper, did ample justice. His countenance was strongly expressive of deep and collected thought, but, when brightened up by the face of a friend, what chiefly caught the attention was a look of goodwill and of kindness.

In private life no man maintained, more eminently or more uniformly, the dignity of philosophy, combining with the most amiable modesty and gentleness the noblest spirit of independence. The only preferments which he ever enjoyed he owed to the

unsolicited favour of the two learned bodies who successively adopted him into their number, and the respectable rank which he supported in society was the well-earned reward of his own academical labours. The studies in which he delighted were little calculated to draw on him the patronage of the great, and he was unskilled in the art of courting advancement, by "fashioning his doctrines to the varying hour."

We shall conclude this memoir of Dr. Reid by an interesting letter addressed to the Rev. William Gregory, then an undergraduate in Baliol college, Oxford. It relates to a remarkable peculiarity in Dr. Reid's physical temperament connected with the subject of dreaming; and is farther interesting as a genuine record of some particulars in his early habits, in which it is easy to perceive the openings of a superior mind. "The fact which your brother, the doctor, desires to be informed of was as you mention it. As far as I remember the circumstances they were as follow:—About the age of fourteen I was, almost every night, unhappy in my sleep from frightful dreams. Sometimes hanging over a dreadful precipice, and just ready to drop down; sometimes pursued for my life, and stopped by a wall, or by a sudden loss of all strength; sometimes ready to be devoured by a wild beast. How long I was plagued with such dreams I do not now recollect. I believe it was for a year or two at least, and I think they had quite left me before I was fifteen. In those days I was much given to what Mr. Addison, in one of his Spectators, calls castle-building; and in my evening solitary walk, which was generally all the exercise I took, my thoughts would hurry me into some active scene, where I generally acquitted myself much to my own satisfaction, and in these scenes of imagination I performed many a gallant exploit. At the same time, in my dreams, I found myself the most arrant coward that ever was. Not only my courage but my strength failed me in every danger; and I often rose from my bed in the morning in such a panic that it took some time to get the better of it. I wished very much to get free of these uneasy dreams, which not only made me unhappy in sleep, but often left a disagreeable impression in my mind for some part of the following day. I thought it was worth trying whether it was possible to recollect that it was all a dream, and that I was in no real danger. I often went to sleep with my mind so strongly impressed as I could with this thought, that I never in my lifetime was in any real danger, and that every fright I had was a dream. After many fruitless endeavours to recollect this when the danger appeared I effected it at last, and have often, when I was sliding over a precipice into the abyss, recollected that it was all a dream, and boldly jumped down. The effect of this commonly was that I immediately awoke. But I awoke calm and intrepid, which I thought a great acquisition. After this my dreams were never very uneasy, and in a short time I dreamed not at all.

"During all this time I was in perfect health, but whether my ceasing to dream was the effect of the recollection above mentioned, or of any change in the habit of my body, which is usual about that period of life, I cannot tell. I think it may more probably be imputed to the last. However, the fact was that for at least forty years after I dreamed none, to the best of my remembrance; and finding, from

the testimony of others, that this is somewhat uncommon, I have often, as soon as I awoke, endeavoured to recollect, without being able to recollect, any thing that passed in my sleep. For some years past I can sometimes recollect some kind of dreaming thoughts, but so incoherent that I can make nothing of them.

"The only distinct dream I ever had since I was about sixteen, as far as I remember, was about two years ago. I had got my head blistered for a fall. A plaster, which was put upon it after the blister, pained me excessively for a whole night. In the morning I slept a little, and dreamed very distinctly that I had fallen into the hands of a party of Indians, and was scalped.

"I am apt to think that as there is a state of sleep, and a state wherein we are awake, so there is an intermediate state which partakes of the other two. If a man peremptorily resolves to rise at an early hour for some interesting purpose, he will of himself awake at that hour. A sick-nurse gets the habit of sleeping in such a manner that she hears the least whisper of the sick person, and yet is refreshed by this kind of half sleep. The same is the case of a nurse who sleeps with a child in her arms. I have slept on horseback, but so as to preserve my balance; and if the horse stumbled I could make the exertion necessary for saving me from a fall as if I was awake.

"I hope the sciences at your good university are not in this state. Yet, from so many learned men so much at their ease, one would expect something more than we hear of."

REIL, JOHN CHRISTIAN, a learned writer, who was born in 1758 in East Friesland. In 1783 he was graduated at Halle, and after having practised medicine for some time he was appointed professor of therapeutics, in 1787, in Halle. He taught and practised there for twenty years, until the conquest of Germany by the French ruined this ancient university. In 1810 he was appointed professor in the newly created university of Berlin, and in 1813 he was appointed one of the highest medical officers in the military department, but before the time for his entry on his new avocation the typhus fever carried him off, on the 22nd of November, 1814. Reil had many excellent qualities. He was particularly distinguished for his skill in mental maladies, and has acquired a lasting reputation by his investigations into the structure of the brain and his new physiological views. His work "On the Symptoms and Cure of Fever" will long survive him.

REINHARD, FRANCIS VOLKMAR, a celebrated protestant preacher, who was born in 1753, and was a native of the duchy of Sulzbach in Germany. He was instructed by his father, who was a clergyman, till he was sixteen, when he was admitted into the gymnasium of Ratisbon, where he remained five years, and in 1773 he was removed to the university of Wittenberg. The study of sacred eloquence especially attracted his attention, and his reputation procured him in 1782 the chair of theology, to which in 1784 was added the offices of preacher at the university church and assessor of the consistory. In 1792 he was invited to Dresden to become first preacher to the court of Saxony, ecclesiastical counsellor, and member of the supreme consistory. After filling these stations with high reputation for about twenty years, he died in 1812. His principal works

are, "A System of Christian Morality," "An Essay on the Plan formed by the Founder of Christianity for the Happiness of the Human Race," "Sermons," "Letters of F. V. Reinhard on his Sermons, and on his Education as a Preacher," and "Lectures on Dogmatic Theology."

REINHOLD, CHARLES LEONARD, an Austrian writer, who was born in Vienna in 1758, and became professor of philosophy, first in Jena and then at Kiel, where he died in April 1823. His catholic parents destined him for the church and sent him to study with the Jesuits in Vienna. When the order was abolished in 1774 he entered the college of the regulated priors of St. Paul, where he became, at the age of twenty-two years, professor of philosophy. During the reign of Joseph II. he distinguished himself by many philosophical treatises in periodical works. But his vigorous and inquiring mind could not fail to discover the weakness of many catholic dogmas. He left Austria in 1787, and the same year was appointed professor at Jena, having written a celebrated vindication of the reformation against two chapters in Schmidt's "History of the Germans." Jena owed to him much of its reputation. We cannot enumerate his many works, but they are all remarkable as the productions of a mind which freed itself by its own efforts from the prejudices of education. In his philosophy he followed Kant, Fichte, Bardili, and Jacobi. Professor Ernest Reinhold, his son, published, in 1825, in Jena, his life, with a number of letters addressed to him by Kant, Fichte, and many celebrated philosophers.

REISKE, JOHN JAMES, a distinguished German philologist, who was born at Zörbig, in Saxony, in 1716. He was the son of a tanner who was able to do but little for his education. After studying from 1728 to 1732 in the orphans' school at Halle, he went in 1733 to the university of Leipsic. Rendered gloomy and melancholy by his monastic education at Halle he did not attend any lectures at Leipsic, but studied by himself without method. He here studied the Arabic language, devoting to that object all the resources at his command, and in 1738, though entirely destitute, undertook a journey to Leyden, then the seat of Arabic literature. In Hamburg he found a patron in Professor Reimar, who enabled him to accomplish his wishes. In Leyden, Schultens gave him access to the library, of which he made diligent use, and D'Orville and Burmann, who employed him in making translations and correcting the press, became his patrons. Reiske pursued his philological studies with the greatest zeal, and at the same time attended to theoretical medicine, and received the degree of doctor free of expense from the medical faculty. He had gained much reputation in Leyden for learning and industry, but he refused offers which were made him in the hope, which was never, however, fulfilled, of better. He might have succeeded in Holland, if he had not made enemies by his self-will and love of independence. He returned to Leipsic in 1746, but was there also unable to procure any place, except that, in 1748, by the favour of the elector, he received the title of professor of Arabic, and was obliged to gain his subsistence by private instruction, writing of books, correcting the press, translating, and by contributions to critical journals. Meanwhile he was always pressed for want of money, as he spent almost all which he acquired in purchasing books, especially in Greek

and Arabic literature, and turned his works to little account. In 1756, by the explanation of an Arabic inscription, he attracted the notice of the count of Wackerbarth, who procured him in 1758 the rectorship in St. Nicholas's school at Leipsic; the duties of which he discharged with fidelity for sixteen years, notwithstanding his numerous literary labours. In 1768 he married Ernestine Christina Müller, a lady of uncommon talents and learning, who assisted him in his labours and was his faithful companion till his death in 1774. Greek literature is indebted to Reiske for excellent editions of Theocritus. Uncommon erudition and critical acuteness are displayed in his "*Animadversiones in Græcos Auctores*," containing emendations of a great number of passages of the Greek classics. His collection of manuscripts, chiefly Arabic, which he had himself transcribed or purchased, was bought after his death by Suhm of Copenhagen. His life, written by himself with impartiality and frankness, was continued to his death by his wife, and published at Leipsic in 1783.

REMBRANDT, VAN RHYN PAUL, one of the most celebrated painters and engravers of the Dutch school, who was born, in 1606, in a mill near Leyden, which belonged to his father. His passionate love for art disappointed his father's desire of educating him as a scholar. Paul received instruction from James Van Zwanenburg, a painter of little note, and afterwards studied in Amsterdam under Lastmann, Pinas, and Schooten. But he soon returned home, and pursued his labours there, taking nature as his sole guide; the nature which he consulted was, however, low; his situation was by no means adapted to lead him to a conception of the truly beautiful, sublime, and ideal; and, as he made no effort to correct the defects of his early education, it was natural that he should confine himself to delineations of common life and find pleasure in them alone. Throughout his whole life he retained both this view of art and the same mode of living, associating only with common people, and never acquiring a taste for better society. About 1630 Rembrandt removed to Amsterdam, and married a handsome peasant girl, whom we find often copied by him. His paintings were soon in extraordinary demand, and his avarice induced him to abandon his former careful and finished execution for a hasty manner. He also took a great number of pupils, of whom he received a high price for his instructions, selling their works, retouched by himself, for his own. His avaricious shifts have given rise to several erroneous statements respecting his life; thus, for example, he dated several of his etchings at Venice to make them more saleable, and this circumstance led some of his biographers to believe that he was actually in Venice in 1635 and 1636. But he never left Amsterdam again, though he was constantly threatening to quit Holland in order to increase the demand for his works.

As early as 1628 he had applied himself zealously to etching, and soon acquired great perfection in the art; his etchings were esteemed as highly as his paintings, and he had recourse to several artifices to raise their price, which are still employed by celebrated engravers. For example, he sold impressions from unfinished plates, then finished them, and after having used them, made some slight changes, and thus sold the same works three or four times. He would secretly buy up, at auction sales or otherwise, his own works, and then cause them to be secretly

offered for sale by his son, as if they had been stolen from his father, &c. By these tricks, and by his parsimonious manner of living, Rembrandt amassed a considerable fortune. Rembrandt was master of all that relates to colouring, distribution of light and shade, and the management of the pencil; but he has no claims to the other requisites of a true artist—composition, grouping, dignified expression, design, perspective, drapery, and taste. He drew, indeed, from undraped models, for which he used his scholars. In his composition and grouping he followed common nature alone, and his humour at the moment; in designing he followed his model. He generally concealed the naked parts as much as possible, rarely allowing the hands or feet to be seen, because he was unable to execute them correctly, almost always making them too large or too small. His drapery is fantastical and almost without judgment. He purchased a collection of all sorts of foreign dresses, arms, and utensils, which he introduced into his pictures. Notwithstanding his great readiness of touch, his designs, even in portraits, and his drapery, are said to have cost him infinite pains. It cannot be denied that his works possess expression and character; his pencil is masterly and unique, possessing an energy and effect belonging to no other artist, and in this consists his peculiar talent. His colouring is magical. Each tint he applied in its proper place, with the greatest correctness and harmony. His pictures are, therefore, all full of warmth, and his *chiaroscuro* replete with inimitable truth. In his lights he laid on the colours so unsparingly that they project far from the surface, and thereby much increase the effect. He generally introduced very strong lights in his pictures. He always preferred light from above, and therefore had a small aperture made in his chamber, by which alone his model was lighted. To this uniform method it must be ascribed that his colouring is almost always alike, and somewhat monotonous. His numerous paintings are dispersed in various public and private cabinets. The most celebrated are Tobias and his Family kneeling before the Angel, the Two Philosophers, Christ at Emmaus, the Workshop of a Carpenter, the Good Samaritan, the Presentation in the Temple, the Portrait of Himself and his Wife, the Threatening Prisoner, Sampson and Delilah, a Descent from the Cross, Christ among the little Children, the Apostle Paul, the portraits of his Mother and Himself, a Holy Family, Hagar, Christ in the Temple, a Burial of Christ, the Sacrifice of Manoah, the Feast of Ahasuerus, Ganimede, portraits of Himself and his Mother and Daughter (the girl with the Carnation), Saul and David, Tobias, a Circumcision, Himself and Family, and landscapes. Rembrandt's engravings possess a wonderful freedom, facility, and boldness, and are truly picturesque.

REMUSAT, JEAN PIERRE ABEL, one of the most distinguished linguists of Europe, who was born at Paris in 1788. Having studied medicine he received the degree of doctor in 1814, but at the same time followed his inclinations, which led him to the study of the oriental languages, particularly the Tartar, Chinese, Thibetan, &c. In 1811 appeared his "*Essai sur la Langue et la Littérature Chinoise*," which attracted the attention of the learned, and opened to him the doors of the academies at Grenoble and Besançon. Some other writings on the Chinese soon followed. In 1814 Louis XVIII. appointed him

professor, and in 1816 he was admitted into the academy of inscriptions. After Visconti's death in 1818 he was appointed editor of the "*Journal des Savans*." Many excellent treatises by him have appeared in the "*Moniteur*," in the "*Journal des Savans*," in the "*Fundgruben des Oriens*," &c., some of which have also been published separately. His principal works, besides the "*Essai*," are his "*Plan d'un Dictionnaire Chinois*," "*Le Livre des Récompenses et des Peines*," which was translated from the Chinese in 1817. He also assisted in the "*Mémoires concernant les Chinois*," and in 1820 made known to us a second Plato in the Chinese philosopher Lahotsé. His "*Mélanges Asiatiques*" contain treatises upon the religion, morals, language, history, and geography of the nations of the east.

RENNEL, JOHN, a celebrated traveller who was born in 1742, and at thirteen was sent on board a ship-of-war as a midshipman, and served in India. In 1766 he entered into the East India Company's military service, and was afterwards appointed surveyor-general of Bengal. He soon after gave to the world his "*Bengal Atlas*," and "*An Account of the Ganges and Burrampooter*." He returned to England in 1782, and published "*A Map of India*," accompanied by a memoir. Besides the works already mentioned, he was the author of "*Memoir on the Geography of Africa*," with a map, "*The Marches of the British Army in the Peninsula of India*," "*Elucidation of African Geography*," a second and third "*Memoir of the Geography of Africa*," "*The Geographical System of Herodotus Explained*," "*Observations on the Topography of the Plain of Troy*." He died in 1830.

RENNEL, THOMAS, an eminent divine and writer, who was born at Winchester in 1787. He was educated at Eton, where he distinguished himself by his rapid progress in classical literature, and won Dr. Buchanan's prize for the best Greek "*Sapphic Ode*." About the same time he joined with three of his contemporaries in the production of a series of essays, under the title of "*The Miniature*," having "*The Microcosm*" for its prototype. Of this publication, which went through two editions, it is enough to say that, considered as the production of boys, which it exclusively was, it is a striking evidence of early genius and acquirements; and that the papers in particular, which the letter affixed to them marks as Rennell's, exhibit a strength of intellect and an elevation of thought far beyond his years. It was, indeed, the manliness of his understanding and taste by which, at this period of his life, he was chiefly characterised. Nor was he less exemplary in conduct than eminent for talents and proficiency in learning. Deeply impressed from his very childhood with sentiments of genuine and practical piety, he was habitually virtuous upon religious principles, and exhibited in his life lucid proof that power of mind finds its best ally in purity of heart; and that genius and licentiousness have no natural union with each other. In 1806 Mr. Rennell was removed, in the regular course of succession, from Eton, to King's college, Cambridge; and here the gifts, which had already more than begun to open themselves, found ampler space for expansion and luxuriance. He brought with him, indeed, from school, the somewhat questionable advantage of a very high reputation; but his course in the university only proved how well he had earned his title to it.

In 1808 Sir William Brown's annual medal for the best Greek ode was adjudged to Mr. Rennell's beautiful composition on "*Veris Comites*;" in which he has touched, with exquisite simplicity and pathos, upon man's mortal and uncertain state. During the period of his residence at Cambridge, and occasionally afterwards, he was also a contributor to "*The Museum Criticum*," published at irregular intervals by some eminent scholars of the university. He was, in a word, unceasingly active, always engaged in honourable and useful pursuits. But all his studies had a tendency to that sacred profession for which he entertained a strong predilection.

Accordingly, soon after taking his bachelor of arts' degree, he entered into holy orders. He was then immediately appointed by his father to the office of assistant preacher at the Temple, for which he was well qualified. Nor was it long before an opportunity was afforded him of manifesting, in another way, his professional zeal and ability. On the appearance of a publication, entitled "*An Improved Version of the New Testament*," accompanied with an introduction and notes, Mr. Rennell thus described the principles of its authors in the preface to his "*Animadversions*:"—"No redeemer nor intercessor; no incarnation nor atonement; no sanctifying nor comforting spirit is to be found in their creed; both heaven and hell, angels and devils, are equally banished from their consideration." In 1811, under the title of "*A Student in Divinity*," he put forth "*Animadversions on the Unitarian Translation or Improved Version of the New Testament*." About this time, too, he undertook the important and laborious charge of the editorship of "*The British Critic*;" and he was himself also a frequent contributor to its pages.

In 1816 Mr. Rennell was promoted from the Temple to the vicarage of Kensington, and he the same year was elected Christian advocate in the university of Cambridge, and soon after published a work entitled "*Remarks on Scepticism*, especially as it is connected with the Subjects of Organization and Life; being an Answer to the Views of M. Bichat, Sir T. C. Morgan, and Mr. Lawrence, upon those points."

A remarkable proof of the impression which this publication produced was afforded by the fact that an attempt was made to exclude Mr. Rennell from the royal society, for admission into which he was about that time proposed. This attempt, however, failed. Another work Mr. Rennell published in his capacity of Christian advocate, was entitled "*Proofs of Inspiration, or the Grounds of Distinction between the New Testament and the Apocryphal Volume: occasioned by the recent Publication of the Apocryphal New Testament by Hone*." In this work, the first edition of which appeared in 1822, he has exposed and repelled, in a very decisive manner, the insidious attack made upon the authority of the New Testament itself, through the medium of the unauthorized contents of the Apocryphal volume.

In 1823 he was promoted by the bishop of Salisbury, to whom he had been for many years examining chaplain, to the mastership of St. Nicholas's hospital, and the prebend of South Grantham, in the church of Salisbury; and in the same year he published "*A Letter to Henry Brougham, Esq., M.P., upon his Durham Speech*, and the Three Articles in the last Edinburgh Review, upon the Subject of the Clergy." Besides the publications already noticed, Mr. Rennell sent to the press two excellent sermons; one in 1820

entitled "The Value of Human Life under the Gospel," and preached before the corporation of the Trinity House; the other in 1822, entitled "The Unambitious Views of the Church of Christ," and preached at the anniversary of the sons of the clergy. He also preached, but did not publish, the Warburtonian Lectures at Lincoln's Inn. In the autumn of 1823 he was united by marriage to the eldest daughter of the late John Delafield, Esq., of Kensington. But the seeds of decay and dissolution were at this very time rapidly working within him. Not many weeks after his marriage, Mr. Rennell was attacked by a fever, from which he was for some time in imminent danger. From the immediate attack of the disease he recovered; but the utmost efforts of his medical attendants were unavailing to counteract the fatal effects which were left behind. A gradual decline ensued, interrupted, indeed, by occasional rallyings of his constitution; which, added to the vivacity of spirits and vigour of intellect still exhibited by him, served to keep alive, in his family and friends, hopes of his ultimate recovery. But while his body languished his mind still was active; and anxious that no part of his life should be without its fruits, he employed the intervals of ease which were afforded him in preparing a last tribute to the holy cause which he had so earnestly embraced and so effectually supported. "Munter's Narrative of the Conversion and Death of Struensee," first translated from the German into English in 1774, was a book upon which he had long and justly set a very high value, as admirably calculated for the counteraction of irreligious and licentious principles. As, therefore, it had become scarce, and was but little known, he thought that he should render good service to the world by introducing it anew to public notice. This he accordingly did by putting forth a new edition of it (which he only just lived long enough to complete), with notes, substituting English books for the German ones, recommended by the original, and with a short but useful, and very impressive introduction, breathing the purest spirit of piety and benevolence. He now fell into a confirmed and hopeless atrophy; and having vainly tried the effects of sea air, retired into the bosom of his family at Winchester, where at length he expired in peace, on the last day of June, 1824.

**RENNIE, JOHN.**—This celebrated engineer was born near Linton in East Lothian, on the 7th June, 1761. His father, who was a respectable farmer, gave him a good education and placed him with an eminent millwright. Having completed his term of apprenticeship, he commenced business as a master millwright in his native country; but ambition and perseverance being the leading features of his character, he soon perceived that the occupation of a millwright in that country was far from affording lucrative prospects. About 1783 Mr. Watt had just began to apply the steam-engine to mill-work, and the Albion mill, at Blackfriars Bridge was projected. Mr. Rennie accordingly applied to Messrs. Bolton and Watt for employment, which he obtained at a fixed salary of a guinea per week. The Albion mill was soon afterwards undertaken, and Mr. Rennie's department was to manage the mill and grinding part, neither of which Mr. Watt or any of his assistants perfectly understood. Mr. Rennie's attention and integrity gave great satisfaction to his employers, and the Albion mill being completed, he

continued to superintend and put the whole in order. The machinery of Whitbread's brewhouse was soon after constructed under Mr. Rennie's directions, and an opening thus presented for him to commence

business on his own account. About this time Mr. Smeaton, the celebrated engineer, died, and left a chasm in that department of science; and a more favourable combination of circumstances for Mr. Rennie's establishment could not have presented itself. A new power for moving machines had just then been invented, and Mr. Rennie was protected by, and connected with, the inventor and patentee. From the year 1794 to the day of his death, Mr. Rennie was at the head of the list of civil engineers, and became connected with every undertaking of magnitude,—canals, bridges, harbours, wet docks, and machines of every description, were executed under his direction, and at the same time he employed several workmen as an executive millwright. The Bell Rock light-house, on the same plan as that on the Eddystone rocks, constructed by Smeaton, may, perhaps, be considered as the masterpiece of his great genius. Among his public works, the Breakwater at Plymouth, Ramsgate harbour, the London docks, and the Waterloo and Southwark bridges, will not hastily be forgotten: but they form only a small part of his numerous undertakings. His indefatigable industry was almost without parallel, and on going to France for a short time in 1816 he declared it to be the first relaxation he had taken for nearly thirty years. His habits of business were very early; he frequently made appointments at five o'clock in the morning, and was incessantly occupied till nearly nine at night, and frequently later. In the estimates of his work he was often too low; but in the execution of them he spared no expense which might add to their solidity and durability. He never occupied himself in literature, and consequently has left no record of his talents as an author; neither had he any of those failings so frequently attendant on great genius. Order, regularity, and real business, were alike his maxims and practice; by them his success became unprecedented, and he accumulated a fortune. This eminent and highly useful individual died, after a long illness, at his house in Stamford Street, Blackfriars, and was

succeeded in his business by his son, who promises to exceed even his father in the magnitude and extent of his undertakings.

M. Dupin, a celebrated French engineer, when speaking of Mr. Rennie, observes that "he raised himself by his merit alone. In a country in which education is general, he received from his infancy the benefit of instruction, which he afterwards knew how to appreciate. Scotland has the glory of having produced the most of the civil engineers, who, for nearly a century, have executed the finest monuments of the three kingdoms, and the most ingenious machines: James Watt, John Rennie, Thomas Telford, &c. seconded with so much ability by the Nimmos, the Jardines, and the Stevensons." After enumerating the works executed by Mr. Rennie for Messrs. Watt and Bolton, and his application of steam to machinery for clearing canals, he observes,—

"Mr. Rennie learned immediately from Smeaton the art of directing hydraulical constructions; he formed himself by the counsels and examples of that great engineer, and by the study of the works of a master whom he was to equal in some respects, and surpass in many others." M. Dupin then alludes to the East India, the London, and the West India docks, he observes,—“At the very moment he was snatched from us by death, he was busied in finishing a new construction, equally ingenious for its architecture and its mechanism. Vast roofs, supported by lofty columns of cast-iron, presented in the middle of their structure aerial roads, on which are made to run carriages, whose mechanism is so contrived, that by their means enormous mahogany trees, kept in these fine magazines, may be raised and let down at pleasure. By means of this ingenious system, a few workmen now execute in a few minutes what required, formerly, whole hours and a number of workmen.”

Our limits will not allow us to follow M. Dupin through his account of the various works of Mr. Rennie. We cannot, however, omit the following observations, with which he concludes his notice of the Breakwater of Plymouth:—

"This unalterable solidity, secured by the judiciousness of the forms and the prudence of the dimensions, appears to us to be the essential and distinctive character of the great works of Mr. Rennie. This character is particularly remarkable in the two most beautiful bridges which adorn the metropolis of the British empire.

"The Southwark bridge is the first in which the bold idea of using cast-iron in solid masses, and of an extent greatly surpassing that of the largest stones employed in arches. The arches of this bridge are formed by metallic masses, of a size which could only be cast in a country in which metallurgy is carried to the highest degree of perfection. Mr. Rennie derived from this advanced state of industry all the advantage which it could furnish to his talents. When we consider the extent and the elevation of the arches of this bridge, and the enormity of the elements of which it is composed, we acquire a higher idea of the force of man, and we exclaim involuntarily, in our admiration of this *chef d'œuvre*, 'This is the bridge of giants!'

"If, from the incalculable effect of the revolutions which empires undergo, the nations of a future age should demand one day, what was formerly the New

Sidon, and what has become of the Tyre of the West, which covered with her vessels every sea?—most of the edifices, devoured by a destructive climate, will no longer exist to answer the curiosity of man by the voice of monuments; but the bridge built by Rennie, in the centre of the commercial world, will subsist to tell the most distant generations, here was a rich, industrious, and powerful city. The traveller, on beholding this superb monument, will suppose that some great prince wished, by many years of labour, to consecrate for ever the glory of his life by this imposing structure. But if tradition instruct the traveller that six years sufficed for the undertaking and finishing of this work; if he learns that an association of a number of private individuals was rich enough to defray the expense of this colossal monument, worthy of Sesostris or Cæsar, he will admire still more the nation in which similar undertakings could be the fruits of the efforts of a few obscure individuals, lost in the crowd of industrious citizens."

Among Mr. Rennie's public works we may instance—the London and East India docks, the harbours of Portsmouth, Plymouth, Liverpool, Hull, Greenock, Leith, Holyhead, Port Patrick, Howth, Dunleary, &c., which were all constructed on plans furnished by the subject of this memoir. The construction of the Bell Rock light-house, at the mouth of the Tay, and the quay of Woolwich, were also superintended by Mr. Rennie. But the most important of his works, and that which is likely to perpetuate his name, is the Waterloo bridge.

RENNIGER, MICHAEL, a learned English divine and scholar, who was born in Hampshire in 1529, and took his degree at Magdalen college, Oxford. On the accession of Mary, being of the reformed religion, he left England, but when Elizabeth ascended the throne he returned and became chaplain to the queen. He obtained the archdeaconry of Winchester and a prebend of St. Paul's. He died in 1609. His works were very numerous, the principal one was his "De Pii V. et Gregorii XIII. Furoribus contra Elizabetham Reginam Angliæ."

REPIN, NICHOLAS WASILIEWITSCH, a Russian field-marshal, a son of a prince of the same name, who served in the army of Peter I. He was born in 1734, and distinguished himself in the seven years' war in the French army. After the elevation of Stanislaus Poniatowski to the throne of Poland in 1764, he became Russian minister at Warsaw, and for some years governed the Poles in effect. In 1774 he was sent ambassador to Constantinople, and in 1778 to Breslau as general and negotiator, where he contributed to the treaty of Teschen. In 1789 he commanded the army of the Ukraine, and formed the blockade of Ismail, afterwards taken by Suwarrow. In July 1791 he defeated the grand-vizier Yussuf. He was afterwards governor of Livonia. After the last partition of Poland, he received the government of Lithuania, and subsequently served under Suwarrow. Paul I., in 1796, made him a field-marshal, and in 1798 sent him on a secret mission to Berlin. He died in May 1801.

REPTON, HUMPHREY, a private gentleman, who became distinguished for his skill in ornamental gardening. He was born at Bury St. Edmund's, in Suffolk, in 1752. Having acquired the friendship of Mr. Windham, he accompanied that gentleman to Ireland in 1783, and obtained a lucrative situation in

the castle of Dublin, which, however, he gave up when his friend quitted Ireland. On his return to London, he professionally applied himself to the improvement of gardening and the laying out of pleasure grounds.

In 1791 he was employed by Lord Darnley at Cobham Hall. There, in the double capacity of architect and landscape gardener, he certainly contrived to render a palace of the age of Elizabeth at once comfortable and magnificent; for while the noble gallery and the capacious hall still retained an air of ancient grandeur, the interior arrangements were convenient and commodious in no small degree. The approaches too were altered, and the grand entrance was changed, while new and extensive plantations attracted the eye and embellished the landscape. By this time his fame had reached "the bowers of Woburn," which had recently escaped from the improvements of a gentleman, eminent indeed as an architect, but who had never been distinguished as a fancy gardener. Repton was an admirer of water, and he accordingly suggested an artificial river, fed from those very springs formerly so useful to the ancient monks. Here, too, he altered the approach, called in all the beauties of the country, and proposed the construction of a winter-garden. The beautiful corridor, formed under his immediate inspection and after his own plan, was fully completed, and he ever after spoke of this as one of his favourite achievements. In 1805, when the king invited Lord Sidmouth to reside in his neighbourhood, Mr. Repton advised many alterations at White Lodge in Richmond Gardens. Some of his plans were adopted, but the treillages and garlands of flowers suggested by him, and of which he was a great admirer, were never completed. At Ashbridge too his hand is still visible, and the gardens there were always considered "as his youngest favourite—the child of his age and declining years."

As an author, he first distinguished himself as a statistical writer, having presented the public with an account of the hundred of North Erpingham, in which he had resided during several years. He was accustomed about this period to frequent all the exhibitions of pictures in the metropolis, and thus acquired a certain degree of taste, the result of which, in the shape of occasional criticisms, was freely communicated by him to the public. The prints which accompanied most of his subsequent publications were all executed after his own drawings, and coloured under his own inspection. In 1816 appeared Mr. Repton's last and greatest work, of which an analysis is here attempted. It is entitled "Fragments on the Theory and Practice of Landscape-Gardening; including some remarks on the Grecian and Gothic Architecture, collected from various manuscripts in the possession of the noblemen and gentlemen, for whose use they were originally written; the whole tending to establish fixed principles in their respective arts." On this occasion he was assisted by his son, J. Adey Repton, F. A. S. We are assured in the preface, "that the following fragments have been selected from more than fourteen hundred different reports in MS.," and it is easy to perceive that the materials are both copious and interesting. "The art of landscape-gardening" (which more peculiarly belongs to this country), we are told, "is the only art which every one professes to understand, and even to practise without having studied its rudi-

ments. No man supposes he can paint a landscape or play on an instrument without some knowledge of painting and music, but every one supposes himself competent to lay out grounds, and sometimes to plan a house for himself, or to criticise on what others propose, without having bestowed a thought on the first principles of landscape-gardening or architecture.

"That these two sister arts are, and must be inseparable, is obvious from the following consideration. The most beautiful scenes in nature may surprise at first sight, or delight for a time, but they cannot long be interesting unless made habitable; therefore the whole art of landscape-gardening may properly be defined,—the pleasing combination of art and nature adapted to the use of man.

"During the last ten years," continues our author, "the art of landscape-gardening, in common with all other arts that depend on peace and patronage, has felt the influence of war and war-taxes, which operate both on the means and the inclination to cultivate the arts of peace. These have languished under the impoverishment of the country, while the sudden acquisition of riches by individuals has diverted wealth into new channels; men are solicitous to increase property rather than to enjoy it; they endeavour to improve the value rather than the beauty of their newly purchased estates. The country-gentleman in the last century took more delight in the sports of the field than in the profits of the farm; his pleasure was to enjoy in peace the venerable home of his ancestors; but the necessity of living in camps, and the habit of living in lodgings or at watering places, have of late totally changed his character and pursuits; and at the same time, perhaps, tended to alienate half the ancient landed property of the country.

"It is not therefore to be wondered at, that the art of landscape-gardening should have slowly and gradually declined. Whether the influence of returning peace may revive its energies, or whether it is hereafter to be classed among the *artes peritæ*, the author hopes its memory may be preserved a little in the following pages."

When rather advanced in life, Mr. Repton settled at Hare Street, near Romford, in the county of Essex. His newly-acquired tenement originally exhibited an appearance very inconvenient, the foot passengers, waggons, and stage coaches, passed close to the entrance, and a butcher's shop was distinctly visible from his windows. A speedy transformation immediately ensued both within and without. His apartments were rendered commodious and even tasteful; he did not aspire at being the proprietor of a villa, but obtained all he aimed at, as the possessor of a beautiful little cottage secluded from observation. By procuring leave to remove the paling only twenty yards, "a frame to his landscape" was immediately acquired, and he took care to adorn and embellish this in a simple but appropriate manner. The obnoxious shop was now concealed by baskets of roses, while the extension of his premises prevented all annoyance from carts and carriages. It was here that he spent many of the happiest years of his life, and here also that he experienced its decline. Lassitude, weakness, and disease, at length ensued, and he contemplated, in this favourite spot, the approach of death with calmness and resignation. Indeed, he felt his "ruling passion" strong and powerful at the

brink of the grave; for so long as health would permit, he was eager to revisit the flowers and the shrubs which he himself had sown and planted, while during the two winters that immediately preceded his dissolution he was busily employed in collecting the materials for his last and most splendid work.

"I have lived," observes he in 1816, "to see many of my plans beautifully realised, but many more cruelly marred, sometimes by false economy, sometimes by injudicious extravagance. I have also lived to reach that period when the improvement of houses and gardens is more delightful to me than that of parks and forests, landscapes, or distant prospects. I can now expect to produce little that is new, I have therefore endeavoured to collect and arrange the observations of my past life. This has formed my amusement during the intervals of spasms, from a disease incurable, during which I have endeavoured to call up (by my pencil) the places and scenes of which I was most proud, and marshalled them before me; happy in many pleasing remembrances, which revive the sunshine of my days, though sometimes clouded by the recollection of friends removed, of scenes destroyed, and of promised happiness changed to sadness." During his latter years Mr. Repton delighted chiefly in his own home. He there felt "how many joys, and comforts, and luxuries, may be preserved beyond that period of life when youth and health require no special indulgences." "Having so long dedicated the active part of my professional career to increasing the enjoyment of rural scenery for others," adds he, "my own infirmities have lately taught me how the solace of garden scenery, and garden delights, may be extended a little further when the power of walking fails, and when it is no longer for decrepit age to reach the ground, to gather fruits, or to pluck, and smell, and admire, those humble flowers which grow near the earth."

He also discovered that "the loss of loco-motion may be supplied by the Bath chair;" but at the same time he constantly testified his abhorrence of "the grinding of the wheels along a gravel walk, when the shaking and rattling soon become intolerable to an invalid." Accordingly, with his usual professional zeal, he recommends glades of fine mown turf, or broad verges of grass, both for ease and comfort.

Meanwhile, old age crept on apace, and aggravated the infirmities produced by disease. At intervals, however, he still continued to cultivate those studies and pursuits which had ever been dear to him; but at length he became unable to revisit his favourite haunts, or to contemplate his little parterres, filled with the choicest flowers; yet even then his portfolio occasionally afforded him delight, until his pencil was arrested by the hand of death, in the year 1818. He left several sons, one of whom married the daughter of the earl of Eldon.

RESENIUS, PETER, a learned writer, who was born at Copenhagen in 1625, in which city his father was professor of ethics, and afterwards became bishop of Zealand. Having completed his education, young Resenius travelled through all the principal cities of Europe, and in Padua took his diploma of LL.D. Returning to Copenhagen, he commenced the study of Danish antiquities, and was shortly after appointed professor of ethics, and obtained the second chair of jurisprudence in the university, besides several other

valuable posts. His death took place in June 1688. He left his rich library to the university of Copenhagen, and published, in 1685, a catalogue of his collection, to which is added an interesting sketch of his life. His principal works are his editions of the "Islandic Edda," "Inscriptiones Havnienses," "Lexicon Islandicum Gudmundi Andreae," and "Leges Cimbricæ Waldemari Secundi Regis Danici."

RETZ, JOHN FRANCIS PAUL DE GONDI, a distinguished French politician, who was born at Montmiral in 1614. He became a doctor of the Sorbonne, and afterwards coadjutor to his uncle the archbishop of Paris. At the age of twenty-three he entered into a conspiracy against the life of Cardinal Richelieu. It has been said that he was the first bishop who carried on a war without the mask of religion; but his schemes were so unsuccessful that he was obliged to quit France. He then went into Spain and Italy, and assisted at the conclave at Rome, which raised Alexander VII. to the pontificate; but this pontiff not making good his promises to the cardinal, he left Italy, and went into Germany, Holland, and England. After having spent the life of an exile for five or six years, he obtained leave upon certain terms to return to his own country; which was the more safe, as his friend Cardinal Mazarine died in 1661. He afterwards went to Rome, and assisted in the conclave which chose Clement IX.; but, upon his return to France gave up all thoughts of public affairs, and died at Paris on the 24th of August, 1679. The latter part of his life is said to have been tranquil and exemplary. At this period he wrote his memoirs, in which there is a considerable air of impartiality. Some friends, with whom the cardinal entrusted the original MS., fixed a mark on those passages where they thought he had not done justice to himself, in order to have them omitted, as they were in the first edition, but they have since been restored.

REVELEY, WILLIAM, an English architect and antiquary, who studied under Sir William Chambers. He travelled through Greece to obtain information respecting the remains of ancient art, and brought home a valuable collection of original drawings. As an architect he distinguished himself by the erection of a church in the town of Southampton called All Saints, and died in the prime of life on the 6th of July, 1799.

REYNOLDS, EDWARD, an English prelate, who was born in Southampton about 1569, and received his education at Merton college, Oxford. Having entered holy orders he obtained the living of Braynton in Northants, and on the breaking out of the civil war he distinguished himself by his violence against the court party. He formed one of the assembly of divines who met at Westminster, and also assisted at the conference held in the Savoy, which was followed by his advancement to the deanery of Christchurch. From this preferment he was, however, ejected for declining the test in 1651. In 1660 he was restored to his post, and raised to the bishopric of Norwich, where he remained till his death, which took place in 1676.

REYNOLDS, SIR JOSHUA, an eminent English painter, who was born at Plympton in Devonshire in 1723, being the tenth child of the master of the grammar-school of that town. He early discovered a predilection for the art of drawing, which induced his father to place him, at the age of seventeen, with Hudson, the most celebrated portrait-

painter in London, with whom he remained three years, and then, upon some disagreement, returned into Devonshire. He passed some time without any determinate plan, and from 1746 to 1749 pursued his profession in Devonshire and London, and acquired numerous friends and patrons. Among the latter was Captain, afterwards Lord, Keppel, whom he accompanied on a cruise in the Mediterranean. He then proceeded to Rome, in which capital and other parts of Italy he spent three years. On his return to London he painted a full-length portrait of Captain Keppel, which was very much admired, and at once placed him at the head of the English portrait-painters. Rejecting the stiff, unvaried, and unmeaning attitudes of former artists, he gave to his figures air and action adapted to their characters, and thereby displayed something of the dignity and invention of history. Although he never attained to perfect correctness in the undraped figure he has seldom been excelled in the ease and elegance of his faces, and the beauty and adaptation of his fancy draperies. His colouring may be said to be at once his excellence and his defect. Combining, in a high degree, the qualities of richness, brilliancy, and freshness, he was often led to try modes which, probably from want of a due knowledge in chemistry and the mechanism of colours, frequently failed, and left his pictures after a while

in a faded state. He, however, rapidly acquired opulence; and, being universally regarded as at the head of his profession, he kept a splendid table, which was frequented by the best company in the kingdom, in respect to talents, learning, and distinction.

On the institution of the royal academy in 1769 he was unanimously elected president, on which oc-

casione the king conferred upon him the honour of knighthood. Although it was no prescribed part of his duty to read lectures, yet his zeal for the advancement of the fine arts induced him to deliver annual or biennial discourses before the academy on the principles and practice of painting. Of these he pronounced fifteen from 1769 to 1790, which were published in two sets, and form a standard work. In 1781 and 1783 he made tours in Holland and Flanders, and wrote an account of his journey, which consists only of short notes of the pictures which he saw, with an elaborate character of Rubens. He was a member of the celebrated club which contained the names of Johnson, Garrick, Burke, and others of the first rank of literary eminence, and seems to have been universally beloved and respected by his associates. He is the favourite character in Goldsmith's poem of "Retaliation," and Johnson characterized him as one whom he should find the most difficulty how to abuse. In 1784 he succeeded Ramsay as portrait-painter to the king, and continued to follow his profession, of which he was enthusiastically fond, until he lost the sight of one of his eyes. He, however, retained his equable spirits until threatened, in 1791, with the loss of his other eye, the apprehension of which, added to his habitual deafness, exceedingly depressed him. He died in 1792, in his sixtieth year, unmarried, and was interred in St. Paul's cathedral.

Sir Joshua Reynolds, although there was scarcely a year in which his pencil did not produce some work of the historical kind, ranks chiefly in the class of portrait-painters. His Ugolino, and his Death of Cardinal Beaufort, are, however, deemed, in grandeur of composition and force of expression, among the first performances of the English school. But on the whole his powers of invention were inadequate to the higher flights of historic painting, although inexhaustible in portrait, to which he gave the most delightful variety. His character as a colourist has been already mentioned; and, though not a thorough master in drawing, he gave much grace to the turn of his figures, and dignity to the airs of his heads. As a writer he obtained reputation by his discourses, which are elegant and agreeable compositions, although sometimes vague and inconsistent.

**RICARDO, DAVID.**—This distinguished Jewish writer was born on the 19th of April, 1772, and in point of education enjoyed the same advantages as are usually allotted to those who are destined for the mercantile profession. Early in life he was sent to Holland, as his father's business connexions lay principally in that country. After two years' absence he returned home, and continued the common school-education till his father took him into business. At his intervals of leisure he was allowed any masters for private instruction whom he chose to have: but he had not the benefit of a classical education; and it is doubtful whether it would have been a benefit to him, or whether it might not have led his mind to a course of study, in early life, foreign to those habits of deep thinking, which in the end enabled him to develop the most abstruse and intricate subjects, and to be the author of important discoveries, instead of receiving passively the ideas of others.

At the early age of fourteen his father began to employ him in the Stock Exchange, where he placed great confidence in him, and gave him such power as is rarely granted to persons considerably older

than himself. At the age of sixteen he was entrusted with the care of two of his younger brothers, to convey them to Holland; and neither his father nor his mother felt the smallest anxiety for the charge which was confided to him. When young, Mr. Ricardo showed a taste for abstract and general reasoning; and though he was without any inducement to its cultivation, or rather lay under positive discouragement, yet at the age of nineteen and twenty, works of that description which occasionally occupied his attention afforded him amusement and cause for reflection.

His father was a man of good intellect, but uncultivated. His prejudices were exceedingly strong; and they induced him to take the opinion of his forefathers in points of religion, politics, education, &c., upon faith, and without investigation. Not only did he adopt this rule for himself, but he insisted on its being followed by his children; his son, however, never yielded his assent on any important subject until after he had thoroughly investigated it. It was perhaps in opposing these strong prejudices that he was first led to that freedom and independence of thought for which he was so remarkable, and which has indeed extended itself to the other branches of his family. Soon after he had attained the age of twenty-one Mr. Ricardo married; and this threw him upon his own resources, as he quitted his father at the same time. The general estimation in which he was held now manifested itself. All the most respectable members of the Stock Exchange came forward to testify the high opinion they entertained of him, with their eagerness to assist him in his undertakings. His father's name stood as high as possible for honour and integrity, qualities of the first recommendation in a field where transactions of the utmost magnitude rest upon them as their only security. Sharing this character with his father, and possessing talents and other excellent qualities which had endeared him to all, he embarked with the fairest prospect of success. This success answered his most sanguine expectations; and in a very few years, certainly not wholly without some anxiety at first, he had secured to himself a handsome independence. During this time his mind was chiefly occupied by his business, but as his solicitude for its success lessened, he turned his attention to other subjects. About the age of twenty-five, by the example of a friend with whom he was then very intimate, his leisure hours were devoted to some of the branches of mathematics, chemistry, geology, and mineralogy. He fitted up a laboratory, formed a collection of minerals, and was one of the original members of the geological society, but he never entered very warmly into the study of these subjects, and his interest in them totally vanished when he became deeply involved in the investigation of his favourite topic; but it was not till Mr. Ricardo was somewhat advanced in life that he turned his attention to the subject of political economy. While on a visit at Bath he took up, and read, the work of Adam Smith. It pleased him; and it is probable that the subject from that time occupied, with the other objects of his curiosity, a share of his thoughts, though it was not till some years after that he appeared to have fixed upon it much of his attention.

The immense transactions which he had with the bank of England in the course of business, tallying with the train of study on which he was then en-

gaged, led Mr. Ricardo to reflect upon the subject of the currency, to endeavour to account for the difference which existed between the value of the coin and the bank notes, and to ascertain from what cause the depreciation of the latter arose. This occupied much of his attention at the time, and it formed a frequent theme of conversation with those among his acquaintance who were inclined to enter upon it. He was induced to put his thoughts upon paper, without the remotest view at the time to publication.

The late Mr. Perry, proprietor of "The Morning Chronicle," was one of the few friends to whom Mr. Ricardo showed his manuscript. Mr. Perry urged him to allow it to be published in "The Morning Chronicle," to which, not without some reluctance, Mr. Ricardo consented; and it was inserted in the shape of letters under the signature of R., the first of which appeared on the 6th day of September, 1810. These letters produced various answers; among the rest was one signed by "A Friend to Bank Notes, &c.," whom Mr. Ricardo soon after found to be an intelligent friend of his own. The interest which the subject excited was a motive with him for enlarging upon it, and publishing his views very shortly after in the form of a pamphlet, entitled "On the Depreciation of the Currency." Many were the publications which this elicited, some in defence of, and some in opposition to it. To one by Mr. Bosanquet he replied, but not so much with a view to refute the arguments which that gentleman advanced, as to give still further and stronger support to opinions which he thought of great practical utility. Some time after the late Mr. Horner brought the question before parliament, and obtained a committee to investigate the subject; the result of the inquiry was a confirmation of Mr. Ricardo's doctrines. The celebrated bullion report coincided mainly with his pamphlet; and the facts elicited from the evidence collected by the committee afforded practical illustrations of the accuracy of his speculation. Among the other effects of this pamphlet it is not surprising that it should have been the means of introducing Mr. Ricardo to a number of first-rate literary characters. His society was courted by many, and his talents were duly appreciated by all who knew him. About this time, too, he became acquainted with Mr. Mill, the distinguished author of "The History of British India," an acquaintance which ultimately grew into a warm and sincere attachment.

Mr. Ricardo's next essay was on rent; and the suggestions of Mr. Malthus, who had previously written upon the same subject, were followed up by him so ably, and the true nature of rent was so admirably expounded, that there was nothing further left for explanation upon that point. It is well known that Mr. Grenfell for some time had been engaged, as a member of parliament, in the investigation of the affairs of the bank. Mr. Ricardo took great interest in his proceedings. As his reputation was now high as a writer on the subject of money he was urged to lend his aid to the work which was so laudably begun. He expressed great reluctance, from that unfeigned distrust of himself with which he was habitually impressed; at last he yielded to persuasion, and his masterly exposition of the affairs of the bank, together with his proposal for an economical currency, was the result. The high ascendancy which the bank directors had acquired over

the great mass of proprietors of bank stock prevented those few who wished to have their transactions examined into from gaining their point. Many ineffectual attempts had been made: the majority of proprietors still supported the wish of the directors for secrecy; and they, shielding themselves behind that majority, withheld all account of their accumulated gains. Mr. Ricardo took a view of their various transactions; showed what their annual savings ought to have been; and, following up the examination to the time at which he wrote, clearly pointed out to what, under proper management, their accumulation would have amounted. In this pamphlet Mr. Ricardo suggested his plan for an economical currency. If there was any suggestion which emanated from him, upon which he seemed to pride himself more than any other, it was certainly this; and his wish to see it brought into effect at the time induced him to step out of his usual course. He addressed a letter to Mr. Perceval, then chancellor of the exchequer, upon the subject; but that gentleman expressed his dissent from Mr. Ricardo's opinions, and on that account declined adopting his advice. Mr. Ricardo's next undertaking was his work on the "Principles of Political Economy and Taxation,"—a work abounding with as strong marks of deep thought, and masterly comprehension of a difficult subject, as any that was ever published. The train of arguments is derived from a few luminous principles, and one is so consequent upon another that the work cannot be examined in detail; it must be taken as a whole, and as such its conclusions are demonstrated with almost mathematical precision.

Mr. Ricardo never appeared more cheerful, or in better health, than he did during his last retirement in the country, just previous to his death. This event was occasioned by an affection of the ear, which ultimately extended itself to the internal part of the head. Mr. Ricardo had for many years not been entirely free from this complaint, of which he thought but slightly, for it had never before occasioned him any very serious inconvenience. He was attended through his last illness by one of his brothers, who had retired from the medical profession, and who was then on a visit to him. There were no symptoms that could excite the smallest anxiety about his recovery till a very short time before his decease, when the transition was sudden, and he died on Thursday the 11th of September, 1823.

**RICCI, LORENZO.**—This distinguished Florentine was born in 1703, and was the last general of the Jesuits previously to their suppression by Pope Clement XIII. He entered the order at the age of fifteen, and after having been professor of rhetoric and philosophy at Sienna, he became spiritual director at the Roman college and secretary of his order. In 1758 he succeeded to the office of general on the death of Centurioni. Resisting the suppression of the Jesuits he was sent to the castle of St. Angelo, where he died in 1775.

**RICCI, SCIPIO**, a celebrated bishop of Pistoia and Prato, who was born at Florence in 1741. Being favoured by the grand duke of Tuscany, Leopold, he opened at Pistoia, in 1786, a synod with a view to the propagation of some new religious doctrines, by which he incurred the displeasure of the pope, and was obliged to resign his see. In 1799 he was imprisoned for declaring in favour of the decrees of the constituent assembly, which had been formed under

the influence of the French. Being set at liberty he signed, in 1805, a formula of adhesion to the bulls which he had objected to, and became reconciled to the holy see. He died in 1810. In 1824 appeared the "*Vie et Mémoires de Scipio Ricci*," by M. de Potter. This work was translated into English by T. Roscoe, Esq., in 1829.

**RICCOBONI, LODOVICO.**—This popular Italian dramatist was born at Modena in 1677, manifested an early passion for the theatre, and having become the director of a theatrical company at the age of twenty-two years, he endeavoured to reform the Italian theatre by substituting regular pieces for the miserable farces which then had possession of the stage in Italy. Wearied with the opposition made to his efforts by the perverse taste of his countrymen he went to Paris with his company, and associated himself with Dominique and Romagnesi with great success. In 1729 the duke of Parma appointed him inspector of the theatres in his dominions, but in 1731 he returned to Paris, where he devoted his last years to literature, and died in 1753. He was the author of a great number of comedies, and translated several pieces from the French. We have also by him an "*Histoire du Théâtre Italien*." His wife distinguished herself on the stage, and by her poetical compositions, which procured her admission into several Italian academies. Their son Francesco, who was born at Mantua in 1707, and died at Paris in 1772, was more successful as a dramatic writer than as an actor. Besides his comedies, which were very popular, he wrote a work entitled "*L' Art du Théâtre*," and his wife was considered one of the best French novelists. She suffered much from the neglect of her husband, and died in poverty in 1792. Her complete works have been several times published.

**RICHARD I.**, surnamed *Cœur de Lion*, was a celebrated English monarch, being the second son of Henry II., by Eleanor of Guienne, and was born in 1157. In 1173 he was induced by his mother to unite with his brothers, Henry and Geoffry, and other co-federates, in a rebellion against his father, which, however, that active prince soon quelled. This conduct he repeated on more than one occasion, until, in 1189, he openly joined the king of France, and in the war which ensued, pursued the unhappy Henry from place to place, who, being at the same time deserted by his youngest son, died, worn out with chagrin and affliction, at Chinon, cursing his undutiful and ungrateful children with his latest breath. On this event Richard succeeded to the throne of England, and visiting his father's corpse the day after his decease, expressed great remorse at his own conduct. Having settled his affairs in France he sailed to England, and was crowned at Westminster. He prudently gave his confidence to his father's ministers, and discountenanced all who had abetted his own rebellion. He had taken the cross previously to his accession, and now bent all his views to the gratification of his martial ardour in the fields of the East. He raised money by the sale of the crown property and offices, and by every other means he could devise, including the remission of a large sum of the vassallage imposed by his father upon Scotland. He then sought an interview with Philip of France, who had also taken the cross, in which mutual conditions respecting their joint operations were agreed upon. A great number of English barons and others took the cross on this occasion, to which enterprise

a massacre of the Jews in several of the principal towns of the kingdom formed a prelude. At midsummer, 1190, Richard and Philip united 100,000 of their bravest subjects on the plains of Vezelai. Richard then proceeded to embark at Marseilles, and the two kings met at Messina, where they spent the winter. Here Richard was joined by Berengaria, daughter of Sanchez, king of Navarre, his intended wife; but, without staying to celebrate his nuptials, he put to sea with his fleet, which was soon after dispersed by a storm. The king got into Crete, but those of his ships which had his bride and his sister, the queen of Sicily, on board, were driven into Cyprus, where the king of that island imprisoned the crew and refused to deliver up the princesses. In revenge for this insult Richard landed his army, and obliged the king to surrender himself and his sovereignty. In Cyprus he consummated his nuptials and then embarked for Palestine.

At this period the siege of Acre was carrying on by the remnant of the army of the emperor Frederic, and other Christian adventurers, and defended by a Saracen garrison, supported by the celebrated Saladin. The arrival of the two kings infused new vigour into the besiegers, and the place surrendered in July 1191. This advantage was, however, succeeded by mutual jealousies, more especially excited by a contest for the crown of Jerusalem between Lusignan and Conrad of Montferrat, the former being supported by Richard, and the latter by the king of France. At length, disgusted with a warfare in which he only acted a secondary character, the latter returned to Europe, leaving 10,000 men with Richard. A general engagement took place, in which Richard, by the greatest bravery and military skill, gained a complete victory, which was followed by the possession of Joppa, Ascalon, and other places. Richard advanced within sight of Jerusalem, but, the greater part of the auxiliaries refusing to concur in the siege, he retired to Ascalon, and, perceiving his difficulties increase, concluded a truce with Saladin, on condition that Acre, Joppa, and the other seaports of Palestine, should remain in the hands of the Christians, who were also to enjoy full liberty of performing pilgrimages to Jerusalem. Richard now prepared to return to England, but previously concurred in the election of Conrad, who was almost immediately after assassinated, to the nominal sway of Jerusalem, and bestowed his conquered kingdom of Cyprus upon Lusignan. He embarked at Acre in October 1192, and sailed for the Adriatic, but was wrecked near Aquileia. Taking the disguise of a pilgrim, he pursued his way through Germany, until, being discovered near Vienna, he was arrested by the order of Leopold, duke of Austria, who, having received an offence from him in Palestine, seized this opportunity to gratify his avarice and revenge. The emperor, Henry VI., who had also a quarrel with Richard for his alliance with Tancred, the usurper of the crown of Sicily, hearing of his captivity, demanded him from Leopold, who gave him up on the stipulation of a portion of his ransom. While Richard was imprisoned, his brother John had taken up arms in England in concert with the king of France. Richard bore his misfortunes with courage, and when the emperor charged him before the diet of Worms with various imaginary offences, he refuted these accusations with so much spirit that the assembly loudly exclaimed against his detention. At length a treaty

BIOGRAPHY.—VOL. II.

was concluded for his liberation on the payment of a ransom of 150,000 marks, which being raised in England, Richard obtained his liberty. He embarked at the mouth of the Scheldt, and safely reached England in March 1194, to the great joy of his subjects.

After being re-crowned in England he landed in France in May 1194, where he was met by his brother John, who threw himself at his feet, and, under the mediation of his mother, entreated forgiveness. "I forgive him," said Richard, "and I hope I shall as easily forget his injuries as he will my pardon." In the ensuing war with Philip, Richard gained some advantages, but a truce soon suspended their hostilities. Leopold, having received an accidental hurt which proved mortal, expressed remorse for his treatment of Richard, and gave up all claim to the remainder of his ransom. The emperor also offered to remit the remainder of his debt provided he would join him in an offensive alliance against France, which was readily agreed to. England, during this period of useless contention, partly through the rapacity of government, and partly through unpropitious seasons, productive of famine and pestilence, was in a state of great depression. A lasting accommodation with France was in agitation preparatory to another crusade, when the life and reign of Richard were suddenly brought to a close. A considerable treasure having been found in the land of the viscount of Limoges, he sent part of it to Richard as his feudal sovereign. The latter, however, demanded the whole, which being refused, he invested the castle of Chalus, where the treasure was concealed, and, having refused terms of surrender to the garrison in the openly expressed determination of hanging the whole of them, was wounded by a shot from the cross-bow of Bertrand de Gourdon. The assault was, however, successfully made and all the garrison hanged, with the exception of Gourdon, who was reserved for a more cruel death. Richard, apprized that his wound was mortal, asked him what had induced him to attempt his life. The man replied, "You killed my father and my brother with your own hand, and designed to put me to an ignominious death." The prospect of death had inspired Richard with sentiments of moderation and justice, and he ordered Gourdon to be set at liberty and allowed a sum of money; but the savage Marcadée, who commanded the Brabançons, which the king had hired for the expedition, caused the unhappy man to be flayed alive. Richard died of his wound on the 6th of April, 1199, in the forty-second year of his age and tenth of his reign, leaving no issue. This monarch was buried at Fonteverard, and a view of his tomb is given in the ensuing page. The character of this king was strongly marked. He was the bravest among the brave, often frank and liberal, and not devoid of generosity. At the same time he was haughty, violent, unjust, rapacious, and sanguinary; and, to use the expression of Gibbon, united the ferocity of a gladiator to the cruelty of a tyrant. His talents were considerable both in the cabinet and in the field, and he was shrewd in observation, eloquent, and very happy at sarcasm. He was also a poet, and some of his reputed compositions are preserved among those of the Troubadours. On the whole, a sort of romantic interest is attached to the character and exploits of this prince, which, in the eye of reason, they little merit, as the career of Richard produced calamities but poorly

atoned for by the military reputation which alone attended it.

**RICHARD II., king of England.**—This unfortunate monarch, who was a son of Edward the Black Prince, and grandson of Edward III., was born in 1366. He succeeded the latter in 1377, in his eleventh year, the chief authority of the state being in the hands of his three uncles, John of Gaunt, duke of Lancaster; Edmund, earl of Cambridge, afterwards duke of York; and Thomas of Woodstock, subsequently duke of Gloucester. The earlier years of the king's minority passed in wars with France and Scotland, the expense of which led to exactions that produced the insurrection headed by Wat Tyler. Its termination in the death of its chief leader in Smithfield, by the hand of the lord mayor of London, in the presence of the young king, afforded the latter an opportunity to exhibit a degree of address and presence of mind which, in a youth of fifteen, was very remarkable. Whilst the rioters stood astonished at the fall of their leader, the young king calmly rode up to them, and declaring that he would be their leader, drew them off almost involuntarily into the neighbouring fields. In the mean time an armed force was collected by the lord mayor and others, at the sight of which the rioters fell on their knees and demanded pardon, which was granted them on the condition of their immediate dispersion. Similar insurrections took place in various parts of the kingdom, all of which were, however, put down, and Richard, now master of an army of 40,000 men, collected by a general summons to all the retainers of the crown, found himself strong enough to punish the ringleaders with great severity, and to revoke all the charters and manumissions which he had granted as extorted and

illegal. The promise of conduct and capacity which he displayed on this emergency was but ill answered in the sequel, and he very early showed a predilection for weak and dissolute company and the vicious indulgences so common to youthful royalty. In his sixteenth year he married Anne, daughter of the emperor Charles IV., and, soon after, was so injudicious as to take the great seal from Scroop for refusing to sanction certain extravagant grants of lands to his courtiers. Wars with France and Scotland, and the ambitious intrigues of the duke of Lancaster, disquieted some succeeding years.

The favourites of Richard were Michael de la Pole, earl of Suffolk and chancellor, and Robert de Vere, earl of Oxford, the latter of whom he created duke of Ireland, with entire sovereignty in that island for life. The duke of Lancaster, being then absent, prosecuting his claim to the crown of Castile, the king's younger uncle, the duke of Gloucester, a prince of popular manners, and unprincipled ambition, became the leader of a formidable opposition, which procured an impeachment of the chancellor, and influenced the parliament so far that it proceeded to strip the king of all authority, and obliged him to sign a commission appointing a council of regency for a year. Being now in his twenty-first year, this measure was very galling to Richard, who, in concert with the duke of Ireland, found means to assemble a council of his friends at Nottingham, where the judges unanimously declared against the legality of the extorted commission. Gloucester, at these proceedings, mustered an army in the vicinity of London, which being ineffectually opposed by a body of forces under the duke of Ireland, several of the king's friends were executed, and the judges who had given their opinion in his favour were all found guilty of high treason, and sentenced to imprisonment for life in Ireland. A reaction was soon produced by the tyranny of the ascendant party; so that, in 1389, Richard was encouraged to enter the council, and, in a resolute tone, to declare that he was of full age to take the government into his own hands; and no opposition being ventured upon, he proceeded to turn out the duke of Gloucester and all his adherents. This act

he rendered palatable to the nation by publishing a general amnesty, and remitting the grants of money made by the late parliament. Several years of internal tranquillity ensued, which was promoted by the return of the duke of Lancaster, who formed a counterbalance to the influence of the duke of Gloucester; and Richard prudently kept on the best terms with him. However, by his fondness for low company, spending his time in conviviality, and amusement with jesters and persons of light behaviour, the king forfeited the respect of his subjects, while his weak attachment to his favourites placed all things at their disposal, and made a mere cipher of himself.

Encouraged by these follies, the duke of Gloucester once more began to exercise his sinister influence, and, the most criminal designs being imputed to him, Richard caused him and his two chief supporters, the earls of Arundel and Warwick, to be arrested. The earl of Arundel was executed, and the earl of Warwick condemned to perpetual banishment. The duke of Gloucester had been sent over to Calais for safe custody, and was there suffocated. A quarrel between the duke of Hereford, son of John of Gaunt, and the duke of Norfolk, was the incidental cause of the revolution which terminated this unsettled reign. The king banished both the dukes—Norfolk for life, and Hereford for ten, afterwards reduced to six years. It was, however, declared that each of them should be duly entitled to any inheritance which might fall to them during their absence; but, on the death of John of Gaunt, in 1399, the unprincipled Richard seized his property as forfeited to the crown. The king having embarked for Ireland, to revenge the death of his cousin, the earl of March, who had been killed in a skirmish with the natives, Henry of Bolingbroke, as the duke of Hereford was now called, made use of this opportunity to land in Yorkshire, with a small body of forces, and, being joined by the earls of Northumberland and Westmoreland, and other influential leaders, proceeded southward, at the head of 60,000 men, nominally to recover his duchy of Lancaster. When Richard, upon this intelligence, landed at Milford Haven, he found himself so much deserted, that he withdrew to North Wales, with a design to escape to France. He was, however, decoyed to a conference with Henry, seized by an armed force, and led by his successful rival to London. As they entered the capital, Henry was hailed with the loudest acclamations, and the unfortunate Richard treated with neglect and even contumely. His deposition was now resolved upon, to be preceded by a forced resignation of the crown. Thirty-five articles of accusation were accordingly drawn up against him, of which several were exaggerated, false, and frivolous, but others contained real instances of tyranny and misgovernment; and King Richard was solemnly deposed on the 30th of September, 1399. Henry then claimed the crown, which was awarded to him, and Richard was committed, for safe custody, to the castle of Pomfret. Of the manner of his death no certain account has been given; but a popular notion prevailed that his keeper and guards killed him with halberds. It is more probable that starvation or poison was had recourse to, for his body, when exposed, exhibited no marks of violence. He died in the thirty-fourth year of his age, and twenty-third of his reign.

RICHARD III., king of England.—This celebrated monarch was born in 1450, and was the youngest son of Richard duke of York. On the accession of his brother, Edward IV., he was created duke of Gloucester, and, during the early part of Edward's reign, served him with great courage and fidelity. He partook of the ferocity which was ever a dark feature in the character of the Plantagenets; and is said to have personally aided in the murder of Edward prince of Wales, after the battle of Tewkesbury, and to have been the author, if not the perpetrator, of the murder of Henry VI. in the Tower. This bloody disposition was, however, united in him with deep policy and dissimulation, which rendered him still more dangerous. He married, in 1473,

Anne, who had been betrothed to the murdered prince of Wales, joint heiress of the earl of Warwick, whose other daughter was united to the duke of Clarence. Quarrels arose between the brothers on the division of the inheritance of their wives; and Richard, who found his elder brother an obstacle to his views of aggrandizement, combined in the accusations against that weak and versatile prince, which brought him to destruction. On the death of Edward in 1483, the duke of Gloucester was appointed protector of the kingdom; and he immediately caused his nephew, the young Edward V., to be declared king, and took an oath of fealty to him. The two ascendant factions, that of the queen's relatives, headed by her brother, Earl Rivers, and that of the more ancient nobility, who were led by the duke of Buckingham and Lord Hastings, courted the favour of the protector, who dissembled with each, while he was secretly pursuing the schemes of his own dark ambition. His first object was to get rid of those who were connected with the young king by blood; and, after spending a convivial evening with Rivers, Grey, and Sir Thomas Vaughan, he had them arrested the next morning, and conveyed to Pomfret, where they were soon after executed without trial. Alarmed at the arrest of her relatives, the queen dowager took refuge in the sanctuary at Westminster, with her younger son, the duke of York, and her daughter. As it was necessary, for the protector's purposes, to get both his nephews

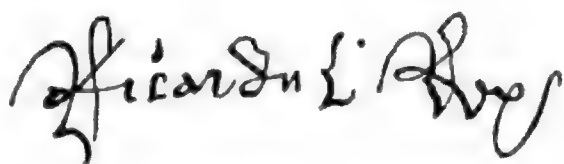

into his hands, he persuaded two prelates to urge the queen to deliver the duke of York into his hands, upon the most solemn assurances of safety. Lord Hastings, although opposed to the queen's relatives, being the steady friend of her children, was next arrested, while sitting in council, and led to immediate execution.

After this bold and bloody commencement, he proceeded in an attempt to establish the illegitimacy of Edward's children, on the pretence of a previous marriage with the lady Eleanor Talbot, daughter of the earl of Shrewsbury, and scrupled not to countenance an attack on the character of his own mother, who was affirmed to have given other fathers to Edward and Clarence, and to have been true to her husband only in the birth of Richard. All these pleas were dwelt upon in a sermon preached at St. Paul's cross. The duke of Buckingham afterwards, in a speech before the corporation and citizens of London, enlarged upon the title and virtues of the protector, and then ventured to ask them whether they chose the duke of Gloucester for king. On their silence, he repeated the question, and a few prepared voices exclaimed, "God save King Richard!" This was then accepted as the public voice, and Buckingham, with the lord mayor, repaired to the protector with a tender of the crown. He at first affected alarm and suspicion, and then pretended loyalty to his nephew, and unwillingness to take such a burden upon himself, but finally acceded; and he was proclaimed king on the 27th of June, 1483, the mock election being secured by bodies of armed men, brought to the metropolis by himself and Buckingham. The deposed king and his brother were never more heard of, and, according to general belief, they were smothered in the Tower of London, by order of their uncle. The new reign commenced with rewards to those who had been instrumental to the change, and with endeavours to obtain popularity. Richard, with a splendid retinue, made a progress through several provincial towns, and was crowned a second time at York, on which occasion he created his only son prince of Wales.

But hatred and abhorrence of Richard soon became the general sentiment of the nation, and all men's eyes were turned towards Henry earl of Richmond, maternally descended from the Somerset branch of the house of Lancaster. Buckingham, not thinking himself adequately rewarded, entered into a conspiracy against him, with other malcontents in the south and west of England, but was suddenly deserted by his followers, betrayed into the hands of the king, and executed without trial. About the same time, the earl of Richmond, who had embarked with a fleet from St. Malo, encountered a violent storm, and was obliged to return. The death of his son, the prince of Wales, was a severe stroke to Richard; and such was the odium attached to his character, that the death of his wife, which followed soon after, was, without the least evidence, attributed to poison. He immediately determined to marry his niece Elizabeth, the daughter of his brother Edward, and legitimate heiress of the crown, in order to prevent her union with Richmond. In August 1485, Richmond landed with a small army at Milford Haven. Richard, not knowing in what quarter to expect him, was thrown into much perplexity, which was aggravated by his suspicion of the fidelity of his nobles, and especially the Stanleys, the chief of

whom had become the second husband of Margaret, the earl of Richmond's mother. When informed of the advance of his rival, he, however, took the field with great expedition, and met him with an army of 15,000 men at Bosworth, in Leicestershire. Richmond had only 6000 men, but relied on the secret assurances of aid from Stanley, who commanded a separate force of 7000. The battle was fought on the 23rd of August, 1485; and, in the midst of it, Stanley, by falling on the flank of the royal army, secured the victory to Richmond. Richard, finding his situation desperate, rushed against his competitor, slew his standard-bearer, and was on the point of encountering Richmond himself, when he sunk under the number of his assailants. The body of Richard was found in the field stripped naked, in which condition it was carried across a horse to Leicester, and interred in the Grey Friars' churchyard. Thus fell Richard in his thirty-fifth year, after possessing the crown, which he had acquired by so many crimes, for two years and two months. Richard possessed courage, capacity, eloquence, and most of the talents which would have adorned a lawful throne. Many of his bad qualities have probably been exaggerated, but undeniable facts prove his cruelty, dissimulation, treachery, and relentless ambition. We subjoin the autograph of this monarch:

RICHARD, a learned English physician, who lived about 1230. He studied first at Oxford, and then at Paris. He left many valuable MSS., which are in New College library, Oxford.

RICHARD, abbot of St. Victor, an ecclesiastical of the twelfth century, who was a native of Scotland. After such education as his country afforded, in literature and mathematics, which we are told were the objects of his early studies, he went, as was then the custom, to Paris. Here the fame of Hugh, abbot of St. Victor, induced him to retire into that monastery, that he might pursue his theological studies under so great a master. At the regular period he took the habit, was admitted into holy orders, and stood so high in the opinion of his brethren, that in 1164, upon the death of Hugh, they unanimously chose him their prior, in which station he remained until his death, in 1173. During this time he composed many treatises on subjects of practical divinity, and on scripture criticism, particularly on the description of Solomon's temple, Ezekiel's temple, and on the apparent contradictions in the books of Kings and Chronicles, respecting the reigns of the kings of Judah and Israel.

RICHARD OF CIRENCESTER, an early English historian who was named after his birthplace. Little is known of his early history, but in 1350 he entered the Benedictine monastery of St. Peter's, Westminster, and immediately directed his attention to the study of British and Anglo-Saxon antiquities and history, in which he made such progress that he is said to have been honoured with the name of the Historiographer. Pits informs us, that Richard visited dif-

ferent libraries and ecclesiastical establishments in England, in order to collect materials. It is at least certain that he obtained a license to visit Rome, from his abbot, William of Colchester, in 1391, and there can be little doubt that a man of his curiosity would improve his knowledge on such an occasion. He is supposed to have performed this journey in the interval between 1391 and 1397, for he appears to have been confined in the abbey infirmary in 1401, and died in that or the following year. His works are, "*Historia ab Hengista ad ann. 1348*," in two parts. The first contains the period from the coming of the Saxons to the death of Harold, and is preserved in the public library of Cambridge. Whitaker, the historian of Manchester, speaks of this as evincing very little knowledge or judgment; the second part is a MS., with the title of "*Britonum Anglorum et Saxonum Historia*." His theological writings were, "*Tractatus super Symbolum Majus et Minus*," and "*Liber de Officiis Ecclesiasticis*," in the Peterborough library. But the treatise to which he owes his celebrity is that on the ancient state of Great Britain, "*De Situ Britanniae*," first discovered by Charles Julius Bertram, professor of the English language in the royal marine academy at Copenhagen, who transmitted to Dr. Stukeley a transcript of the whole in letters, together with a copy of the map. In the same year the original itself was published by Professor Bertram at Copenhagen, in a small octavo volume, with the remains of Gildas and Nennius, under the title "*Britannicarum Gentium Historiæ Antiquæ Scriptores Tres, Ricardus Corinensis, Gildas Badonicus, Nennius Banchorensis*," &c. This work has long been scarce, and in very few libraries; but in 1809, a new edition, with an English translation, &c., was published.

**RICHARDSON, SAMUEL.**—But few novelists in this country have attained the same degree of popularity as this amiable and well-intentioned writer. The great business of his life appears to have been the instruction and moral improvement of the female sex; and though the improved tone of writing in the present day has rendered it advisable to prune some of his pages, his works yet rank amongst the best literary productions of the last century. Mr. Richardson was born in 1689, and his father was in very humble circumstances; so much so, indeed, that his education was much neglected. In 1706 he was apprenticed to Mr. Wilde, a printer, and here he paid the greatest attention to the duties of the office; but we cannot do better than take his own words, when speaking of his initiation into the typographical art:—"I served," he says, "a diligent seven years to it; to a master who grudged every hour to me that tended not to his profit: even of those times of leisure and diversion which the refractoriness of my fellow servants obliged him to allow them, and were usually allowed by other masters to their apprentices. I stole from the hours of rest and relaxation my reading times, for the improvement of my mind; and being engaged in a correspondence with a gentleman greatly my superior in degree, and of ample fortune, who, had he lived, intended high things for me, those were all the opportunities I had in my apprenticeship to carry it on. But this little incident I may mention: I took care that even my candle was of my own purchasing, that I might not, in the most trifling instance, make my master a sufferer (and who used to call me the pillar of his house); and not to disable myself, by

watching or sitting up, to perform my duty to him in the day time."

Several years more were spent in the obscure drudgery of the printing-office ere Richardson took out his freedom and set up as a master printer. His talents for literature were soon discovered, and, in addition to his proper business, he used to oblige the booksellers by furnishing them with prefaces, dedications, and such like garnishing of the works submitted to his press. He printed several of the popular periodical papers of the day; and at length, through the interest of Mr. Onslow, the speaker, obtained the lucrative employment of printing the journals of the house of commons, by which he must have reaped considerable advantages. Punctual in his engagements, and careful in the superintendence of his business, fortune and respect, its sure accompaniments, began to flow in upon Richardson. In 1754 he was chosen master of the stationers' company, and in 1760 he purchased a moiety of the patent of printer to the king, which seems to have added considerably to his revenue.

Mr. Richardson was twice married, first to Allington Wilde, his master's daughter, and after her death in 1731, to the sister of James Leake, bookseller, who survived her distinguished husband. He has made a feeling commemoration of the family misfortunes which he sustained, in a letter to Lady Bradshaigh. "I told you, madam, that I have been married twice, both times happily; you will guess so, as to my first, when I tell you that I cherish the memory of my lost wife to this hour; and as to the second, when I assure you that I can do so without derogating from the merits of, or being disallowed by, my present, who speaks of her on all occasions as respectfully and affectionately as I do myself. By my first wife I had five sons and one daughter; some of them living to be delightful prattlers, with all the appearance of sound health, lively in their features, and promising as to their minds; and the death of one of them I doubt, accelerating, from grief, that of the otherwise laudably afflicted mother. I have had, by my present wife, five girls and one boy; I have buried of these the promising boy and one girl: four girls I have living, all at present very good; their mother a true and instructing mother to them. Thus have I lost six sons (all my sons), and two daughters; every one of which, to answer your question, I parted with with the utmost regret. Other heavy deprivations of friends, very near and very dear, have I also suffered. I am very susceptible, I will venture to say, of impressions of this nature. A father, an honest worthy father, I lost by the accident of a broken thigh, snapped by a sudden jerk, endeavouring to recover a slip, passing through his own yard. My father, whom I attended through every stage of his last illness, I long mourned for. Two brothers, very dear to me, I lost abroad. A friend, more valuable than most brothers, was taken from me. No less than eleven affecting deaths in two years! My nerves were so affected with these repeated blows, that I have been forced, after trying the whole *materia medica*, and consulting many physicians, as the only palliative (not a remedy to be expected), to go into a regimen; and for seven years past have I forborne wine and flesh, and fish; and at this time I and all my family are in mourning for a good sister, with whom neither I would have parted could I have had my choice. From these affecting dispensations, will you not allow

me, madam, to remind an unthinking world, immersed in pleasures, what a life this is that they are so fond of, and to arm them against the affecting changes of it?"

It has been justly observed, that the predominant failing of Richardson seems certainly to have been vanity—vanity naturally excited by his great and unparalleled popularity at home and abroad, and by the continual and concentrated admiration of the circle in which he lived. Such a weakness finds root in the mind of every one who has obtained general applause; but Richardson fostered and indulged its growth, which a man of firmer character would have crushed and restrained. The cup of Circe converted men into beasts; and that of praise, when deeply and eagerly drained, seldom fails to make wise men in some degree fools. There seems to have been a want of masculine firmness in Richardson's habits of thinking, which combined with his natural tenderness of heart in inducing him to prefer the society of women; and women, from the quickness of their feelings, as well as their natural desire to please, are always the admirers, or rather the idolaters, of genius, and generally its willing flatterers. Richardson was in the daily habit of seeing, conversing, and corresponding with many of the fair sex; and the unvaried and, it would seem, the inexhaustible theme, was his own writings. Hence Johnson, whose loftier pride never suffered him to cherish the meaner foible of vanity, has passed upon Richardson, after a just tribute to his worth, the severe sentence recorded by Boswell:—"I only remember that he expressed a high value for his talents and virtues, but that his perpetual study was to ward off petty inconveniences, and to procure petty pleasures; that his love of continual superiority was such that he took care always to be surrounded by women, who listened to him implicitly, and did not venture to contradict his opinions; and that his desire of distinction was so great that he used to give large vails to Speaker Onslow's servants that they might treat him with respect." An anecdote which seems to confirm Johnson's statement, is given by Boswell, on authority of a lady who was present when the circumstances took place. A gentleman who had recently been at Paris, sought, while in a large company at Richardson's villa of North-End, to gratify the landlord by informing him that he had seen his "Clarissa" lying on the king's brother's table. Richardson, observing that a part of the company were engaged in conversation apart, affected not to hear what had been said, but took advantage of the first general pause to address the gentleman with, "Sir, I think you were saying something about—;" and then stopped, in a flutter of expectation, which his guest mortified by replying:—"A mere trifle, Sir, not worth repeating." The truth seems to be, that Richardson, by nature shy, and of a nervous constitution, limited also by a very narrow education, cared not to encounter in conversation with those rougher spirits of the age, where criticism might have had too much severity in it.

An appetite for praise, and an over-indulgence of that appetite, not only teaches an author to be gratified with the applause of the unworthy, and to prefer it to the censure of the wise; but it leads to the less pardonable error of begrudging to others their due share of public favour. Richardson was too good, too kind a man to let literary envy settle deep in his bosom; yet an overweening sense of his own import-

ance seems to have prevented his doing entire justice to the claims of others. He appears to have been rather too prone to believe ill of those authors against whose works exceptions, in point of delicacy, might justly be taken. He has inserted in his Correspondence an account of Swift's earlier life, highly injurious to the character of that eminent writer; and which the industry of Dr. Barret has since shown to be a gross misrepresentation. The same tone of feeling has made him denounce, with the utmost severity, the indecorum of "Tristram Shandy," without that tribute of applause which, in every view of the case, was so justly due to the genius of the author. Richardson is well known for his literary correspondence; and Lady Bradshaigh, to gratify the strong propensity she felt to engage in literary intercourse with an author of his distinction, had recourse to the romantic expedient of entering into correspondence with him under an assumed name, and with all the precautions against discovery which are sometimes resorted to for less honest purposes. Richardson and his incognita maintained a close exchange of letters, until they seem on both sides to have grown desirous of becoming personally known to each other; and the author was induced to walk in the Park at a particular hour, and to send an accurate description of his person, that his fair correspondent might be able, herself unknown, to distinguish him from the vulgar herd of passengers. The following portrait exhibits all the graphical accuracy with which the author was accustomed to detail the appearance of his imaginary personages, and is at the same time very valuable, as it describes a man of genius in whom great powers of observing life and manners were combined with bashful and retired habits:—"I go through the Park once or twice a week to my little retirement; but I will for a week together be in it every day three or four hours, at your command, till you tell me you have seen a person who answers to this description; namely, short; rather plump than emaciated, notwithstanding his complaints; about five feet five inches; fair wig; lightish cloth coat, all black besides; one hand generally in his bosom, the other a cane in it, which he leans upon under the skirts of his coat usually, that it may imperceptibly serve him as a support when attacked by sudden tremors or startings, and dizziness, which too frequently attack him, but, thank God, not so often as formerly; looking directly fore-right, as passers-by would imagine, but observing all that stirs on either hand of him without moving his short neck; hardly ever turning back; of a light brown complexion; teeth not yet failing him; smoothish-faced and ruddy-cheeked; at some times looking to be about sixty-five, at other times much younger; a regular even pace, stealing away ground rather than seeming to rid it; a grey eye, too often overclouded by mistiness from the head; by chance lively; very lively it will be if he have hope of seeing a lady whom he loves and honours; his eye always on the ladies; if they have very large hoops, he looks down and supercilious, and as if he would be thought wise, but perhaps the sillier for that; as he approaches a lady his eye is never fixed upon her face, but upon her feet, and thence he raises it up pretty quickly for a dull eye; and one would think (if we thought him at all worthy of observation), that from her air, and (the last beheld) her face, he sets her down in his mind as so or so, and then passes on to the next object he meets; only then looking back if he greatly likes or

dislikes, as if he would see if the lady appear to be all of a piece in the one light or in the other. Are these marks distinct enough, if you are resolved to keep all the advantages you set out with? And from this odd, this grotesque figure, think you, madam, that you have any thing to apprehend? Any thing that will not rather promote than check your mirth? I dare be bold to say (and allow it too) that you would rather see this figure than any other you ever saw, whenever you should find yourself graver than you wish to be."

It was by mere accident that Richardson appears to have struck out the line of composition so peculiarly adapted to his genius. He had at all times the pen of a ready correspondent; and, from his early age, had been accustomed to lend it to others, and to write, of course, under different characters from his own. There can be no doubt that, in the service of the young females who employed him as their amanuensis and confidant, this natural talent must have been considerably improved; and as little that the exercise of such a power was pleasing to the possessor. Chance at length occasioned its being employed in the service of the public. The account will be best given in the words of his own letter to Aaron Hill, who, in common with the public at large, had become pressingly anxious to know if there was any foundation in fact for the history of Pamela. "I will now write to your question—whether there was any original ground-work of fact for the general foundation of Pamela's story. About twenty-five years ago, a gentleman, with whom I was intimately acquainted, but who, alas, is now no more! [probably the correspondent of fortune and rank, mentioned p. 773.] met with such a story as that of Pamela, in one of the summer tours which he used to take for his pleasure, attended with one servant only. At every inn he put up at, it was his way to inquire after curiosities in its neighbourhood, either ancient or modern; and particularly he asked who was the owner of a fine house, as it seemed to him, beautifully situated, which he had passed by (describing it), within a mile or two of the inn. It was a fine house, the landlord said, the owner was Mr. B—, a gentleman of a large estate in more counties than one. That his and his lady's history engaged the attention of every body who came that way, and put a stop to all other inquiries, though the house and gardens were well worth seeing. The lady, he said, was one of the greatest beauties in England; but the qualities of her mind had no equal; beneficent, prudent, and equally beloved and admired by high and low. That she had been taken at twelve years of age, for the sweetness of her manners and modesty, and for an understanding above her years, by Mr. B—'s mother, a truly worthy lady, to wait on her person. Her parents, ruined by suretiships, were remarkably honest and pious, and had instilled into their daughter's mind the best principles. When their misfortunes happened first, they attempted a little school, in their village, where they were much beloved; he teaching writing and the first rules of arithmetic to boys; his wife, plain needle-work to girls, and to knit and spin; but that it answered not; and when the lady took their child, the industrious man earned his bread by day-labour, and the lowest kind of husbandry. That the girl, improving daily in beauty, modesty, and genteel and good behaviour, by the time she was fifteen, engaged the attention of her lady's son, a young gentleman of free principles,

who, on her lady's death, attempted, by all manner of temptations and devices, to seduce her. That she had recourse to as many innocent stratagems to escape the snares laid for her virtue; once, however, in despair, having been near drowning; that at last, her noble resistance, watchfulness, and excellent qualities, subdued him, and he thought fit to make her his wife. That she behaved herself with so much dignity, sweetness, and humility, that she made herself beloved of every body, and even by his relations, who at first despised her; and now had the blessings both of rich and poor, and the love of her husband. The gentleman who told me this added, that he had the curiosity to stay in the neighbourhood from Friday to Sunday, that he might see this happy couple at church, from which they never absented themselves: that, in short, he did see them; that her deportment was all sweetness, ease, and dignity mingled; that he never saw a lovelier woman: that her husband was as fine a man, and seemed even proud of his choice; and that she attracted the respect of the persons of rank present, and had the blessings of the poor.—The relator of the story told me all this with transport. This, sir, was the foundation of Pamela's story; but little did I think to make a story of it for the press. That was owing to this occasion.

"Mr. Rivington and Mr. Osborne, whose names are on the title-page, had long been urging me to give them a little book (which, they said, they were often asked after) of familiar letters on the useful concerns in common life; and at last I yielded to their importunity, and began to recollect such subjects as I thought would be useful in such a design, and formed several letters accordingly, and, among the rest, I thought of giving one or two as cautions to young folks circumstanced as Pamela was. Little did I think, at first, of making one, much less two volumes of it. But when I began to recollect what had, so many years before, been told me by my friend, I thought the story, if written in an easy and natural manner, suitable to the simplicity of it, might possibly turn young people into a course of reading different from the pomp and parade of romance writing, and, dismissing the improbable and marvellous, with which novels generally abound, might tend to promote the cause of religion and virtue. I therefore gave way to enlargement; and so Pamela became as you see her. But so little did I hope for the approbation of judges, that I had not the courage to send the two volumes to your ladies until I found the books well received by the public.

"While I was writing the two volumes, my worthy-hearted wife, and the young lady who is with us, when I had read them some part of the story, which I had begun without their knowing it, used to come into my little closet every night, with—'Have you any more of Pamela, Mr. R? we are come to hear a little more of Pamela,' &c. This encouraged me to prosecute it, which I did so diligently, through all my other business, that, by a memorandum on my copy, I began it November 10, 1739, and finished it January 10, 1740. And I have often, censurable as I might be thought for my vanity for it, and lessening to the taste of my two female friends, had the story of Molière's 'Old Woman' in my thoughts upon the occasion. If justly low were my thoughts of this little history, you will wonder how it came by such an assuming and very impudent preface. It

was thus :—The approbation of these two female friends, and of two more, who were so kind as to give me prefaces for it, but which were much too long and circumstantial, as I thought, made me resolve myself on writing a preface. I therefore, spirited by the good opinion of these four, and knowing that the judgments of nine parts in ten of readers were but in hanging-sleeves, struck a bold stroke in the preface you see, having the umbrage of the editor's character to screen myself behind.—And thus, sir, all is out."

Eight years after the appearance of "Pamela," Richardson published "Clarissa," the work on which his fame, as a classic novelist, mainly rests. The tale, like that of its predecessor, is very simple, but the scene is laid in a higher rank of life, the characters are drawn with a bolder pencil, and the whole accompaniments are of a far loftier mood. Clarissa, a character as nearly approaching to perfection as the pencil of the author could draw, is persecuted by a tyrannical father and brother, an envious sister, and the other members of a family, who devoted every thing to its aggrandizement, in order to compel her to marry a very disagreeable suitor. These intrigues and distresses she communicates, in a series of letters, to her friend Miss Howe, a young lady of an ardent, impetuous disposition, and an enthusiast in friendship. After a series of sufferings, rising almost beyond endurance, Clarissa is tempted to throw herself upon the protection of her admirer Lovelace, a character, in painting whom, Richardson has exerted his utmost skill, until he has attained the very difficult and critical point of rendering every reader pleased with his wit and abilities, even while detesting the villainy of his conduct. Lovelace is represented as having devoted his life and talents to the subversion of female virtue; and not even the charms of Clarissa, or her unprotected situation, can reconcile him to the idea of marriage. This species of perverted Quixotry is not much understood in the present age, when a modern voluptuary seeks the gratification of his passions where it is most easily obtained, and is seldom at the trouble of assault, when there is any probability of the fortress being resolutely defended. But, in former days, when men, like Lord Baltimore, were found, at the risk of life itself, capable of employing the most violent means for the ruin of innocence, a character approaching that of Lovelace was not perhaps so unnatural. That he should have been so successful in previous amours is not very probable; and, as Mrs. Barbauld justly observes, he was more likely to have been run through the body long before ever he saw Colonel Morden. But some exaggeration must be allowed to the author of a romance; and, considering the part which Lovelace had to perform, it was necessary that his character should be highly coloured. This perfidious lover, actuated, it would seem, as much by the love of intrigue and of enterprise, as by his desire to humble the Harlowe family, and lower the pride of this their beloved daughter, whose attachment to him was not of the devoted character which he conceived was due to his merits, forms a villainous scheme for the destruction of her virtue. Without the least regard for the character of a woman whom he always seems to have intended for his wife at some future period, he contrives to lodge her with the keeper of a common brothel, and to place around her the inmates of such a place. At length

every effort to accomplish his guilty purpose having failed, he administers opiates, and violates the person of his victim while under their influence. But he obtains nothing by his crime, save infamy and remorse. The lady dies of a broken heart, and he himself falls by the sword of one of her kinsmen.

The subject of the third and last novel of this eminent author seems to have been in a great degree dictated by the criticism which *Clarissa* had undergone. To his own surprise, as he assured his correspondents, he found that the gaiety, bravery, and, occasionally, generosity of Lovelace, joined to his courage and ingenuity, had, in spite of his crimes, made him find too much grace in the eyes of his fair readers. He had been so studious to prevent this, that when he perceived his rake was rising into an undue and dangerous degree of favour with some of the young ladies of his own school, he threw in some darker shades of character. In this, according to the eulogy of Johnson, he was eminently successful; but still Lovelace appeared too captivating in the eyes of his fair friends, and even of Lady Bradshaigh: so that nothing remained for the author, in point of morality, but to prepare with all speed an antidote to the poison which he had incautiously administered. With this view, the author tasked his talents to embody the *beau ideal* of a virtuous character, who should have all the title to admiration which he could receive from wit, rank, figure, accomplishment, and fashion, yet compounded inseparably with the still higher qualifications which form the virtuous citizen and the faithful votary of religion. It was with this view that Richardson produced the work originally denominated "The Good Man," a title which, before publication, he judiciously exchanged for that of "Sir Charles Grandison." It must be acknowledged that, although the author exerted his utmost ability to succeed in the task which he had assumed, and, so far as detached parts of the work are considered, has given the same marks of genius which he employed in his former novels, yet this last production has neither the simplicity of the first two volumes of "Pamela," nor the deep and overwhelming interest of the inimitable "Clarissa," and must, considering it as a whole, be ranked considerably beneath both these works. The principal cause of failure may be perhaps traced to Richardson's too strong recollection of the aversion which his friendly critics and correspondents had displayed, to the melancholy scenes in "Clarissa," in which, darkening and deepening as the story proceeds, his heroine is involved, until the scene is closed by death.

"Sir Charles Grandison" is represented as a man of large fortune and high rank, and discharging, with the most punctilious accuracy, his duties in every relation of life. But, in order to his doing so, he is accommodated with all those exterior advantages which command awe, and attract respect, although entirely adventitious to excellence of principle. He is munificent, but his fortune bears out his generosity; he is affectionate in his domestic relations, but the devoted attachment of his family leaves him no temptation to be otherwise; his temperament is averse from excess, his passions are under the command of his reason; his courage has been so often proved, that he can safely, and without reproach of the world, prefer the dictates of Christianity to the rules of modern honour; and, in adventuring himself into danger, he has all the strength and address

of Lovelace himself to trust to. Sir Charles encounters no misfortunes, and can hardly be said to undergo any trials. Indeed, the only dilemma to which he is exposed in the course of the seven volumes, is the doubt which of two beautiful and accomplished women, excellent in disposition and high in rank, sister excellencies as it were, both being devotedly attached to him, he shall be pleased to select for his bride; and this with so small a shade of partiality towards either, that we cannot conceive his happiness to be endangered wherever his lot may fall, except by a generous compassion for her whom he must necessarily relinquish. Whatever other difficulties surround him occasionally, vanish before his courage and address; and he is almost secure to make friends, and even converts, of those whose machinations may for a moment annoy him.

The structure of "Sir Charles Grandison," being wholly different from that of "Pamela" and "Clarissa," enabled the author entirely to avoid, in his last work, some free and broad descriptions, which were unavoidable while detailing the enterprises of Mr. B—— or Lovelace. But though he was freed from all temptation to fall into indelicate warmth of description, a fault which the grosser age of our fathers endured better than ours, Richardson was still unfortunate in assuming the tone of elegance and of high fashion, to which, in his last work, he evidently aspired. Mr. B—— is a country squire; the Harlowes, a purse-proud and vulgar race; Lovelace himself a *roué* in point of manners; Lord M—— has the manners and sentiments of an old rural gossip; and the vivacity of Miss Howe often approaches to vulgarity. Many models must have been under the observant eye of Richardson, extensive as his acquaintance was through all excepting the highest circle of fashion, from which he might have drawn such characters, or at least have borrowed their manners and language. But our author's aspiring to trace the manners of the great, as in "Sir Charles Grandison," has called down the censure of an unquestionable judge, and who appears, in his case, disposed to be a severe critic. Lady Mary Wortley Montague, in her inimitable "Letters," has the following passages:—"His Anna Howe and Charlotte Grandison are recommended as patterns of charming pleasantries, and applauded by his saint-like dames, who mistake folly for wit and humour, and impudence and ill-nature for spirit and fire. Charlotte behaves like a humoursome child, and should have been used like one, and whipped in the presence of her friendly confederate, Harriet. He (Richardson) has no idea of the manners of high life; his old Lord M—— talks in the style of a country justice; and his virtuous young ladies romp like the wenches round a May-pole. Such liberties as pass between Mr. Lovelace and his cousin are not to be excused by the relationship."

Despite of the severity of this criticism, "Sir Charles Grandison" and the other productions of this novelist met with high applause from every class of readers, and Mr. Richardson's literary labours were productive of considerable profit. He died in his seventy-second year from a gradual decay of nature, but he continued to carry on his business till within a few days of his death.

RICHARDSON, JONATHAN, a painter and writer of considerable eminence, who was born in 1665. He married the niece of Riley the painter,

and, after the death of Kneller and Dahl, was at the head of his profession in England. As an author he is known by his "Essay on the Whole Art of Criticism in Relation to Painting," and "An Argument in behalf of the Science of a Connoisseur." He also, in conjunction with his son, published "Explanatory Notes and Remarks on Milton's Paradise Lost." His death took place in 1745.

RICHARDSON, JOSEPH, a writer of some eminence, who was born at Hexham in Northumberland in 1774, and was educated at St. John's college, Cambridge. He subsequently entered the Middle Temple, but devoted more of his time to literature than to the study of the law. The result of his studies appeared in the part he took in the celebrated political satires called the "Rolliad," and the "Probationary Odes." He also wrote a popular comedy entitled the "Fugitive," which had great success at the period. His death took place in 1803.

RICHARDSON, WILLIAM, an English divine, who was born in Bedfordshire in 1698. He was educated at Oxford, and, after entering holy orders, obtained some good church preferments and the mastership of the college in which he was educated. His principal literary production was a new and improved edition of Bishop Godwin's treatise entitled "De Præsulibus Anglorum." His death took place in 1775.

RICHARDSON, WILLIAM, an agricultural writer, who was for many years rector of Clonfeckle, in the county of Antrim, Ireland. As a writer he is best known from his "Essay on Fiorin Grass," which he much wished to bring into cultivation. He also wrote an account of the Giant's Causeway, and died in 1820.

RICHARDSON, WILLIAM, a voluminous Scottish writer, who was educated at the university of Glasgow, where he received the degree of M.A. His principal literary works are, "An Analysis and Illustration of some of Shakspeare's most remarkable Characters," and the "Maid of Lochlin." His death took place in 1814.

RICHELIEU, ARMAND JEAN DU PLESSIS, DUKE DE.—This great French statesman was born at Paris in 1585, and at the age of twenty-two years was made bishop of Luçon. His country had already been restored from its long troubles to tranquillity, prosperity, and order, by Henry IV. and his great minister Sully. In 1616 the queen-mother, Mary of Medici, into whose favour Richelieu had insinuated himself, made him her grand almoner and one of the secretaries of state. On the disgrace of the queen he continued attached to her cause, and effected a reconciliation between her and her son Louis XIII., which, however, was soon interrupted by her intrigues against the constable Luynes, the favourite of the king. Richelieu, who was thus placed between the two contending parties, loved by neither, but considered by both as a useful instrument, had a difficult part to act, and it required all his prudence to enable him to keep his position. In 1622 he obtained the cardinal's hat, through the influence of Mary, and in 1624 entered the council of state, and was soon at the head of affairs. The premier now felt himself in a condition to drop the mask which he had hitherto worn, and Mary too late regretted the protection she had extended to him. The adherence of this princess to the political system of the house of Hapsburg was injurious to the interests of France. Almost all the

French princes had kept up a constant opposition to that powerful family, and no sooner was Richelieu seated in his high post than he began systematically to extend the power of the crown by overthrowing the privileges of the great vassals, and to increase the influence of the French monarchy by undermining that of the Hapsburgs, both beyond the Pyrenees and in Germany.

Louis XIII., who was sensible of the energy of his minister, favoured his plans, while he always showed a dislike for the man, whom he would gladly have destroyed had he been able to govern without him. The Huguenots in France had for a long time resisted the royal power; and bloody insurrections in several preceding reigns had arisen from their struggles with the spiritual and temporal authorities in defence of their civil rights and freedom of conscience. The wisdom and mildness of Henry IV. had assuaged the excitement of the contending parties, but his reign was too short to extinguish the fires which still glowed beneath the embers. The struggle for religious freedom was too often, indeed, made a pretext by the nobles and even the princes of the blood royal, to cloke and further their own ambitious designs; and both religious parties, catholics as well as protestants, had thus alternately served as a check upon the despotic exercise of the royal power. Richelieu, therefore, resolved to crush the weaker by the aid of the stronger party, and thus to deprive those, who should be disposed to resist his schemes, of their main prop. By the edict of Nantes, the Huguenots had been placed on nearly the same footing with the other subjects of the kingdom: there were some provinces in which they had the ascendancy, and their armed force was sufficient to shake the throne, should they be excited to rise against it. Their rallying point was Rochelle; and Richelieu neglected no means to make himself master of that city. In the celebrated siege of Rochelle he commanded the army in person. The attack and defence of the place are considered as affording models of perseverance, valour, and military skill. Rochelle, supported by England, from which it continually received supplies, held out for a long time against all the efforts of the cardinal; and the hope of reducing it was already nearly abandoned, when Richelieu, by the erection of an immense mole, cut off the communication by sea, and finally compelled it to surrender by famine. The second step of Richelieu was the removal of the queen-mother from court. That princess endeavoured to effect the fall of the minister: she had already gained over the king to her purpose, in a secret interview; when Richelieu entered the cabinet, the queen overwhelmed him with reproaches. He continued calm, had recourse to prayers and tears, and finally requested the king's permission to leave the court. The preparations were already made for his departure; but the king, who was not less offended by the violence of the queen than pleased by the respectful demeanour of the cardinal, asked the advice of his favourite, St. Simon. The latter represented to him the services of Richelieu, and the impossibility of dispensing with his aid. Louis, therefore, ordered him to Versailles, and assigned him apartments in the palace directly below his own. This day, which was the 10th of November, 1630, on which the hopes of the queen and of the cardinal's enemies were disappointed, was called the "day of the dupes." As the queen continued to declare herself irreconcilable with Riche-

lieu, the cardinal prevailed upon the king to banish her to Compiègne, removed her friends from place, and threw some of them into the Bastille. This step, and the almost total annihilation of the privileges of the parliaments and the clergy, excited all classes against the despotic administration of the cardinal, and the discontents broke out in numerous risings and conspiracies, which, however, were not only suppressed by the prudence and vigour of his measures, but also contributed to the furtherance of his plans, and gradually rendered the royal power entirely absolute.

In 1632 the royal arms, directed by Richelieu, suppressed the rebellion of the dukes of Orleans and Montmorency, the adherents of the banished queen, and Montmorency perished on the scaffold, although the royal family itself interceded in his behalf.—Equally unsuccessful were the attempts of the dukes of Lorraine, Guise, Bouillon, &c.; even those whom the king privately favoured were obliged to yield to the all-powerful minister, and paid with their lives for their rashness in venturing to oppose him, as in the instance of Cinqmars, who, a short time before Richelieu's death, had entered into a conspiracy against him, which the king was, not without reason, believed to have favoured. While the minister was thus extending the power of the crown at home, he did not neglect the aggrandizement of the monarchy abroad. The thirty years' war gave him an opportunity of effecting this object. The same man who persecuted with the greatest severity the protestants in France, employed all the arts of negotiation and even force of arms to protect the same sect in Germany, for the purpose of humbling the house of Austria. The king of Sweden, the great bulwark of religious liberty in Germany, received aid of every kind from Richelieu, so long as he was not in danger of becoming formidable to France; but when the brilliant victories of Gustavus Adolphus gave the cardinal reason to consider his power as more dangerous than that of Austria, he abandoned that prince in the midst of his successes. The war which he undertook against Spain, and which continued till 1659, put France in possession of Catalonia and Roussillon, and the separation of Portugal from Spain was effected by his assistance. He also endeavoured to weaken the Austrian influence in Italy, and procured the transfer of the duchy of Mantua to the duke of Nevers.

In general, however objectionable may have been his character as a man, the duke de Richelieu must be allowed to have deserved the character of a great statesman: he cannot be denied the glory of having raised the power of the sovereign in France to its highest pitch; but he was proud, arrogant, vindictive, and unprincipled. The protection which he gave to letters and art cannot reconcile us to his faults. Richelieu died on the 4th of December, 1642, after having indicated Mazarin as his successor. Louis XIII. died a few months after him; but in the long reign of Louis XIV. the effects of Richelieu's policy became visible.

**RICHELIEU, LOUIS FRANCOIS ARMAND DU PLESSIS, DUKE DE,** marshal of France.—This nobleman was born at Paris in 1596. His handsome person, his vivacity, and his wit, early made him a favourite at court, and particularly with the duchess of Burgundy. His childish follies were made a handle of by malice, and the *jolie poupée*, as

he was called at court, was thrown into the Bastille. After his release he was made aide-de-camp of Marshal Villars, who was pleased with his liveliness, and his free and reckless manners. He was distinguished, even at the court of the regent, for his amours and affairs of honour, and was twice confined in the Bastille. In the twenty-fourth year of his age the French academy chose him one of its members, although he had never written any thing beyond a *billet doux*, and was entirely ignorant of orthography. Fontenelle, Campistron, and Destouches, each prepared for him an inaugural discourse, from each of which he selected such parts as he liked to form a whole. He distinguished himself at the siege of Philipsburg, and in the battle of Fontenoy, by his courage and presence of mind. On the occasion of the marriage of the dauphin with the princess of Saxony he was sent as ambassador to the court of Dresden, where he made the most extraordinary display of pomp. Nothing, however, could equal the magnificence of his entry into Vienna, as ambassador to that court, when the horses of his retinue were shod with silver, in such a manner that the shoes should fall off, to be picked up by the populace. In 1756 he was created marshal, and commanded at the siege of Mahon, which was occupied by the English. After the capture of that place in June 1756 he received the command of the French army in Germany. But the marshal had offended Madame de Pompadour, by rejecting her proposal of a match between his son and her daughter, and after the convention of Closter Seven in 1757 he was recalled. He had enriched himself while in Germany, where he had also indulged his soldiers in license and plunder, by his exactions. It should always be remembered to his credit that he dissuaded Louis XV. from persecuting the protestants. His example contributed greatly to extend the prevalence of licentiousness in France, since he was the dictator of fashion. He continued to prosecute affairs of gallantry even in his old age, and was married the third time at the age of eighty-four years. The "*Mémoires du Maréchal de Richelieu*" were written, under his direction, by Soulavie. He died in August 1788, ninety-three years old; and two days before his death, a lady having observed to him that his face still retained its beauty, he replied, "Madame, you take my face for your mirror." Marshal Richelieu had the courage, the fortune, and the talents of a great general—the sagacity, prudence, and penetration of a great statesman; but, with these and many amiable qualities, he chose to be nothing but a common courtier.

**RICHELIEU, ARMAND EMANUEL DU PLESSIS, DUKE DE.**—This French statesman was the minister of state under Louis XVIII. He was born at Paris in 1766, and, after studying in the college of Plessis, travelled in Italy, whence he returned at the commencement of the revolution in 1789. He soon after obtained permission from the king to go to Vienna, where he was well received by the emperor Joseph II.; but he soon quitted that capital with the young prince de Ligne, and entered into the service of Catharine II., then at war with the Turks. He distinguished himself at the taking of Ismail by Suwarrow, and was rewarded with the rank of major-general. In 1794 he was with Louis XVIII. in England, whence he returned to Russia; but, not being well treated by the emperor Paul, he quitted that country, and after the peace of 1801 revisited

France, where Bonaparte in vain attempted to attach him to his service. He went again to St. Petersburg, and at the commencement of 1803 was nominated civil and military governor of Odessa, a Russian colony on the Black Sea, which flourished greatly under his superintendence. On the restoration of Louis XVIII. the duke de Richelieu took his seat in the chamber of peers, and resumed his functions as first gentleman of the bed-chamber. In March 1815 he accompanied the king to Ghent, and, returning with him to Paris after the battle of Waterloo, he was appointed president of the council of ministers, and placed at the head of the foreign department. He presided at the installation of the four academies in April 1818, and in September following he was made president of the French academy. In the same month he appeared at the congress of Aix-la-Chapelle. He subsequently resigned his office as minister of state, but on the assassination of the duke de Berry in 1820 he again became president of the council. He fruitlessly opposed the establishment of the censorship of the press, and, finding he had lost his influence, he again retired from office, and died soon after in May 1822.

**RICHTER, JEAN PAUL FREDERIC**, a German writer of the first rank in belles-lettres, who was born in March 1763 at Wunsiedel, in the Fichtelgebirge, and died in November 1825 at Baireuth. His father was, at the time of his birth, rector at Wunsiedel, at a later period pastor at Schwarzback on the Saale. In 1780 Richter entered the university of Leipsic, in order to study theology, but soon changed his plan, and devoted himself to belles-lettres. As early as 1798 he was known as a distinguished writer at Leipsic. He went to Weimar, Berlin, Meiningen, &c., and settled at Baireuth, having been made counsellor of legation by the duke of Saxe-Hildburghausen, and having received from the prince primate a pension, which the king of Bavaria continued after Baireuth had fallen to him. He seldom left his home, and only to make short journeys to the Rhine, Berlin, Dresden, &c. He had married during his early stay at Berlin, and had two daughters. Secured by his pension from want, happy in his domestic relations, blessed with numerous friends, and an almost childlike amiableness, he enjoyed, to the last, the pleasures of nature as if they had been always new; having millions of admirers; unambitious of vain distinctions, or objects beyond his reach; with a heart susceptible of the noblest emotions; believing in man's goodness, and firmly relying on the immortality of the soul; he may be said to have been one of the happiest men that ever trod this earth. His death corresponded with his life—he calmly fell asleep. It would be difficult to give a distinct idea of Jean Paul's works (this was the name under which he wrote) in a brief sketch like ours. Jean Paul is a humorous writer, but his humour is of a peculiar sort. The want of a public life obliges the Germans to live much in reflection, the effect of which is visible in almost all their writings, and has left its traces in those of Jean Paul. His humour is deeply reflecting and philosophic, at the same time often truly comic. He frequently rises to the highest regions, where he can speak only in bold metaphors; and, before we are aware, we hear his inspiring tones die away like those of a lark, when the bird has come again to the ground. If it can be said of any man's writings that

they are poetry in a prose form, it is true of many passages in Jean Paul's works. His writings are generally in the form of novels, but they have little of the character of what we generally understand by novels. He seems to have liked particularly to analyze emotions, to dissect individual character in every station, even the humblest. He does not exhibit man under those general influences which operate on large masses of men, but deals almost exclusively with the individual considered as such. He very frequently recurs to the immortality of the soul, and in his writings, as in his life, he appears amiable in the highest degree. His works are the following:—"Greenland Processes," "Selection from the Papers of the Devil," "The Invisible Lodge," "Hesperus," "Quintus Fixlein," "Biographical Entertainments under the Skull of a Giantess," "Flower, Fruit, and Thorn Pieces," "The Jubelsenor," "The Valley of Campan, with a Satirical Appendix," "Palingenesis," "Letters, and Future Course of Life," "Titan," "Die Flegeljahre," "Katzenberger's Journey to the Watering Place," "The Field Preacher Schmelzle's Journey to Flötz," &c. In 1804 he produced his first philosophical work of importance, his "Introduction to Aesthetics," to which he added, in his last years, a "Nachschule, with an Appendix containing Reviews." It is full of original and discriminating views, yet hardly a philosophically systematic work. In 1807 he published his "Levana," a work on education full of intelligent views. We must mention, also, his "Fibel (Spelling-book)," "Peace Sermon," "Change of Throne between Mars and Phœbus in 1814," "Political Sermons in Lent," several essays, for instance, in his "Museum," and "Herbstblumen." In 1820 appeared his "Comet, or Nic. Markgraf," a comic work. Shortly before his death he began a new edition of his complete works, and after his death appeared his unfinished work, "Selina, or on Immortality." From memorandums left by him a work was prepared after his death, called "Truths from Jean Paul's Life."

RICHMOND, CHARLES.—This nobleman received a considerable share of celebrity from the duel which took place between him and his royal highness the duke of York. He was the son of Lord George Lennox by Lady Louisa Kerr, and was born in 1764. After finishing his education he entered the army, and obtained a commission in the coldstream guards, which was soon after commanded by his royal highness the duke of York. A company, which includes the rank of lieutenant-colonel in the army, was in due time attained. In 1795 he became colonel, in 1803 he was nominated to the command of the 35th regiment, and in 1814, after passing through the immediate gradations of major-general and lieutenant-general, he obtained that of full general, with the colonelcy of the 35th regiment of foot. While in the guards, a dispute unhappily took place between Colonel Lennox and the commander-in-chief. This produced a duel, on which occasion the marquis of Hastings acted as second to the duke of York, while the earl of Winchelsea was selected by his opponent. At the meeting, which took place on Wimbledon Common, his royal highness received the fire of his adversary, but declined to return it; and although no blood was spilt, yet it has been said that the shot grazed one of the side curls of the duke of York's hair. Unfortunately, however, another affair of honour arose out of this; for Mr. Swift, a colla-

teral descendant of the famous Dean Swift, having reflected on the conduct of Colonel Lennox, a duel ensued, and the former was wounded in the body. Soon after this period, Lord George Lennox having retired from parliament, a seat for Sussex became vacant. On this occasion Colonel Lennox was elected, and continued for many years to represent that county. His politics, like those of his uncle, the late master-general of the ordnance, were favourable to Mr. Pitt's administration, and that minister accordingly obtained their invariable support. In 1783 Mr. Lennox married Lady Charlotte Gordon, daughter of the duke of Gordon. By this lady he had fourteen children. In 1808, his grace, for he had now succeeded to his uncle's title, was appointed lord-lieutenant of Ireland, where he remained for six years. On this occasion a distinguished nobleman superintended the political department as secretary of state; and as the viceroy was not averse to the pleasures of the table, his administration, notwithstanding the critical nature of the times, was not unpopular.

The duke of Richmond was afterwards appointed governor-general of the British settlements of North America. On this occasion part of his family accompanied him, and his son-in-law, Sir Charles Maitland, was at the same time nominated lieutenant-governor of Upper Canada. Immediately on his arrival, he expressed the most zealous attachment to the prosperity of the provinces entrusted to his care. He encouraged fresh settlements, received a multitude of emigrants with kindness and hospitality, and prepared, by new fortifications, for the defence of the British colonies in case of any future attack. But a most unfortunate and unexpected event suddenly put an end to his life. Having left Quebec, his grace repaired to his summer residence at William Henry, where he spent some time. While there he was bitten by some rabid animal, either a tame fox or a lap-dog, for the truth is not exactly known; but as no symptoms appeared for a long time after, and the accident was entirely forgotten, his excellency set forward on his intended journey to the upper country. We learn from an official despatch, that "on the morning of the 23rd of August, the duke dined with a detachment of officers stationed at Perth; and it was only on the 25th that the first symptoms of that disorder presented themselves, which three days afterwards terminated in death. Early on that morning his valet found his grace alarmed at the appearance of some trees, which were near a window where he slept, and which he insisted were people looking in; and shortly afterwards, when a basin of water was presented to him, he exhibited evident abhorrence at the sight of it; and on several other occasions on that day, and on the 26th, the same symptoms were but too obvious whenever any liquor was presented, and which it now appeared his grace partook of with extreme reluctance. On this day, at dinner, he had requested Lieutenant-colonel Cockburne to take wine with him; but his grace had so soon lifted the liquid to his lips, than, unable to controul the violence of his disease, he replaced the glass on the table, observing, 'Now is not this excessively ridiculous? Well, I'll take it when I don't think of it.' The same evening an assistant surgeon, the only one in the vicinity, was sent for, who bled him; and his excellency found, apparently, so much relief from it that he rose early the next morning, and proposed walking through Richmond Wood to

the new settlement of that name. He had, in his progress through the wood, started off at hearing a dog bark, and was with difficulty overtaken; and on the party's arrival at the skirts of the wood, at the sight of some stagnant water, his grace hastily leaped over a fence, and rushed into an adjoining barn, whither his dismayed companions eagerly followed him. The paroxysm of his disorder was now at its height. It was almost a miracle that his grace did not die in the barn. He was with difficulty removed to a miserable hovel in the neighbourhood; and early in the morning of the 28th, the duke of Richmond expired in the arms of a faithful Swiss, who had never quitted his master for a moment. Whilst in this miserable log-hut, reason occasionally resumed her empire; and his grace accordingly availed himself of these lucid intervals to address a letter to Lady Mary Lennox, in which he reminded her that a favourite dog belonging to the household, being in a room at the castle of St. Louis, at a time (five months before) when the duke, shaving, cut his chin, the dog was lifted up to lick the wound, when the animal bit his grace's chin. The recollection of this circumstance gave his grace but too sure a presentiment (the dog having subsequently run mad) of his approaching fate; and his grace, therefore, in his letter to Lady Mary, expressed his conviction (which, indeed, appears an irresistible conclusion) that his disorder was hydrophobia. His grace recommended the line of conduct to be observed by his children, in the painful situation in which they would be placed at his death; and, it is said, requested to be buried in Quebec, on the ramparts, like a soldier, there to remain. The duke died August 28th, 1819, in the fifty-fifth year of his age. The corpse was conveyed, first to Montreal, and then to Quebec by water. From the 2nd to the 4th of September, the body lay in state at the Chateau de St. Louis, on which last day it was interred in the cathedral church.

RICHMOND, LEGH, an English writer, who was born on the 29th of January, 1772, at Liverpool, and was the descendant of an ancient and honourable family. A remarkable casualty befel him in his childhood, the effects of which he never recovered. At a very early age, in leaping from a wall, he contracted an injury in his left leg, which eventually produced incurable lameness. It is somewhat singular, that an accident nearly similar occurred to his younger and only brother, and also to his second son. Each of them, in infancy, fell from an open window. The former was killed, and the latter was ever after afflicted in the same limb, with the same kind of lameness as his father. After a private preparatory education, Mr. Richmond was admitted a member of Trinity college, Cambridge. While an under-graduate, he pursued his studies with great zeal, and took his degree of B. A. in 1794; and, with some intermissions, he resided in the university three years longer. In the summer of 1797 he became, within the space of a very few weeks to borrow his own words, "academically a master of arts, domestically a husband, parochially a deacon." He had been originally destined to the law; but having imbibed a distaste for that profession, his attention was subsequently directed to the church, and he was now admitted to the sacred office. Brading, a secluded village in the Isle of Wight, was the scene of his earliest pastoral labours. He was ordained to the curacy of this place and the little adjoining village of Yaver-

land. It was soon after this period that the perusal of Mr. Wilberforce's "Practical View of Christianity" effected a great revolution in Mr. Richmond's mind, and established those peculiar religious principles and feelings which manifested themselves so strongly throughout the remainder of his life. After a residence of about seven years in the Isle of Wight, Mr. Richmond removed to London, where he was to have taken a share in the duties of the Lock chapel. Scarcely, however, was he well settled in this new scene, when, in the year 1805, he was presented, by Miss Fuller, to the rectory of Turvey, in Bedfordshire. It was here that most of Mr. Richmond's publications were undertaken. He had previously printed two or three single sermons; but it was at Turvey that his great work, "The Fathers of the English Church," was carried on. While in the Isle of Wight, he had commenced an acquaintance with the writings of our earlier and greatest theologians; and the study of them he had ever after zealously prosecuted. To a familiar acquaintance with the works of those divines, Mr. Richmond united the greatest impartiality and judgment in forming his selections from them. His work, therefore, presents, in a comparatively small compass, a large proportion of the most valuable of the remains of our martyrs and confessors.

It was during his residence at Turvey, also, that Mr. Richmond drew up several little narratives, under the titles of "The Dairyman's Daughter," "The Negro Servant," "The Young Cottager," "The Cottage Conversation," "A Visit to the Infirmary," &c., which were originally inserted in the earlier numbers of "The Christian Guardian," and were afterwards published in a volume entitled "Annals of the Poor." These narratives consist of the stories of several of Mr. Richmond's parishioners, who had either spontaneously imbibed his own pious views, or on whom he enforced those views with a zeal and an anxiety which could spring only from the purest and most laudable motives. Of these productions millions have been calculated, and they have been translated into twenty languages. During his residence at Turvey, also, Mr. Richmond became extensively known to the public as the cordial friend and ready advocate of the different religious societies which have, within the last thirty years, sprung up in this country. It is believed that his earliest appearance in this character was on the ninth anniversary of the church missionary society, before whom he was appointed, in 1809, to preach their annual sermon.

In 1814 Mr. Richmond was appointed chaplain to the late duke of Kent, by whom he was honoured with a share of his royal highness's friendship. In 1817 he was presented, by the late emperor Alexander of Russia, with a splendid ring, as a testimony of the approbation with which his imperial majesty viewed the narratives in "The Annals of the Poor." Many peaceful years were passed by Mr. Richmond at Turvey. Happy in the bosom of his family, no man more excelled as a pattern of domestic virtues. At length, in 1825, his peace sustained a severe blow by the death of his second son, a youth in his nineteenth year. In a few months the stroke was repeated; intelligence arrived that his eldest son, who had been absent many years, had died on his voyage from India to England. These events had a great effect upon Mr. Richmond. His bodily health de-

**RIDLEY, SIR THOMAS**, an eminent English civilian, who lived in the reign of James I. He was a native of the isle of Ely, and became provost of Eton college, and, in addition to which, he obtained several other valuable appointments. He was the author of a work entitled "A View of the Civil and Ecclesiastical Law," for writing which King James bestowed on him the honour of knighthood. His death took place in 1629.

**RIEDELSEL, FREDERICA CHARLOTTE LOUISA, BARONESS**.—This lady was the daughter of the Prussian minister of state, Massow, and was born at Brandenburg in 1746. At the age of sixteen she was married to Lieutenant-colonel Riedesel, who commanded the Brunswick troops employed in the English service in America in 1777. Madame Riedesel, who accompanied her husband, wrote an interesting account of her adventures, published by her son-in-law, the count de Reuss, under the title of "Voyage to America, or Letters of Madame von Riedesel." She returned to Europe in 1783, and having lost her husband, who had been made a general, in 1800, she fixed her residence at Berlin, where she died in 1808.

**RIEGO Y NUNEZ, RAFAEL DEL**, a celebrated Spanish patriot, who was born of a noble family in the province of Asturias in 1785. After having been liberally educated, he entered the army, and served during the invasion of Spain by Bonaparte. He was taken prisoner; and on his liberation, the constitutional general, Abisbal, gave him a staff appointment; and when that chief betrayed the cause of independence, Riego retired from the service in disgust, and for a time led a private life. In the beginning of 1820, at the head of a battalion, he proclaimed the Spanish constitution, and traversing a large extent of country, shut himself up in a fortress, with the small number of troops who had the patriotism and courage to follow his example. Being threatened by

a powerful army, and aware of the danger of delay, he sallied forth from the isle of Leon with a few hundred brave men, made his way through the forces that opposed his passage, visited several large towns, intimidated the authorities, fought obstinately, lost the greater part of his troops, and retired to the mountains, with the determination to defend himself

to the last extremity rather than submit to the mercy of his enemies. But the spirit of freedom which he had excited was not extinguished; the provinces ranged themselves under the banners of independence, and Riego received the homage of national gratitude. His popularity excited the jealousy of those in power, and he was calumniated as a promoter of anarchy and disorder; his army was dissolved and he was proscribed. But he preserved the confidence of the people, and was appointed a deputy to the cortes of 1822, of which assembly he became the president, and in this arduous station displayed prudence and firmness, with a conciliatory disposition that did him honour. When King Ferdinand refused to maintain the constitution which he had sworn to observe, Riego again appeared in arms to assert the liberty of his country; but it was destined to fall before foreign foes. He was taken prisoner after the surrender of Cadiz to the French, under the duke d'Angouleme, and being conveyed to Madrid, was executed as a traitor on the 7th of November, 1823. His widow, who sought refuge in England, died at Chelsea, in June, 1824.

**RIENZI, NICHOLAS GABRINI DE**.—This brave but unfortunate tribune was a native of Rome, and in the fourteenth century became celebrated by his attempts to restore the Roman republic. Although the son of one of the lowest order of tavern-keepers, he received a literary education, and early distinguished himself by his talents, parts, and elevated sentiments. The glory of ancient Rome excited his enthusiasm, and he was regarded by the common people as an extraordinary person, destined to rescue them from the tyranny of the aristocracy, which, on the removal of the popes to Avignon, had become in the highest degree oppressive. He obtained the post of public scribe or notary, and in 1346 was joined in a deputation to Pope Clement VI., at Avignon, to exhort him to bring back the papal court to its original seat. He acted on this occasion with so much energy and eloquence that the pope created him an apostolic notary, which office, on his return, he executed with strict probity. He let no opportunity escape to excite the discontent of the people, by haranguing against the nobility and the defects of the public administration. Having prepared men's minds for a change, and engaged persons of all orders in his designs, in the month of April, 1347, during the absence of Stephen Colonna, the governor of Rome, he summoned a secret assembly upon Mount Aventine, before which he made an energetic speech, and induced them all to subscribe an oath for the establishment of a plan of government, which he entitled the good estate. He had even the address to gain over the pope's vicar, and, in a second assembly in the capitol, produced fifteen articles as the basis of the good estate, which were unanimously approved; and the people conferred upon him the title of tribune, with the power of life and death, and all the other attributes of sovereignty. The governor, Colonna, upon his return, threatened him with punishment, but was himself constrained to quit the city, and Rienzi banished several of the noble families, after capitally punishing such as were convicted of oppression and injustice.

In the first exercise of his authority, he conducted himself with a strict regard to justice and the public good; and even the pope was induced to sanction his power. The reputation of the new tribune ex-

tended throughout Italy, and his friendship was even solicited by the king of Hungary and the emperor Louis. Petrarch was highly interested in his proceedings; and there are extant several eloquent letters, in which that poet exhorts him to persevere in his glorious undertakings. But the intoxication of supreme power began to betray him into extravagances. He caused himself to be created a knight, with a mixture of religious and military ceremonies, and cited the two rival emperors, Charles and Louis, to appear before him to justify their pretensions. He also dismissed the pope's legate, and, reducing the nobles into complete humiliation, commenced a reign of terror. But at length, finding that he had lost the affection and confidence of the people, he withdrew in 1348 from Rome, and remained in Naples until 1350, when he took advantage of the jubilee to return secretly to Rome; but, being discovered, he withdrew to Prague. Thence he came into the hands of Pope Clement at Avignon, who confined him three years, and appointed a commission to try him; his successor, Innocent VI., released Rienzi, and sent him to Rome to oppose another popular demagogue, named Boroncelli. The Romans received him with great demonstrations of joy, and he recovered his former authority; but after a turbulent administration of a few months, the nobles excited another sedition against him, in which he was massacred in October 1354. His last brief career had been marked with great cruelty, which excited the populace to treat his remains with indignity. Rienzi, who possessed a union of fanaticism and artifice, was more energetic in speech and council than in action, and failed in courage and presence of mind in great emergencies.

**RIES, FERDINAND**, a distinguished piano-forte player and composer, who was born in Bonn, on the Rhine. Beethoven was his teacher, and under his direction he appeared before the public in Vienna, in 1804 and 1805. After several journeys he settled in London as teacher and composer. In 1817 he also became director of the philharmonic concert. In 1825 he retired to Bonn. His productions are very numerous.

**RIGBY, EDWARD**, a medical practitioner, who was a fellow of most of the learned societies both in this country and abroad. Besides several medical tracts, he published "An Account of Holkham and its Agriculture." In August 1815 his lady presented him with three sons and a daughter at one time. Before the birth of these little ones Dr. Rigby was the father of eight children, the two eldest of whom were twins. Remarkable as was the above event, there were circumstances which rendered it peculiarly so. Dr. Rigby was a great-grand father; and probably never before was born, at one birth, three great uncles and one great aunt—such being the relationship between the above-mentioned parties and the infant son of Mr. John Bowtree, jun., of Colchester. The corporation of Norwich voted a piece of plate of twenty-five guineas value to Dr. Rigby and his lady as a memento of the memorable birth of their four children, the event to be recorded in the city-books, and the names of the children to be inscribed on the plate. None of these children lived quite twelve weeks. Besides the works already alluded to Dr. Rigby published some papers "On the Uterine Hemorrhage," "On the Use of the Red Peruvian Bark in the Cure of Intermittents," "On the Theory of Animal Heat,"

and "Chemical Observations on Sugar," &c. Dr. Rigby died in 1821, in his seventy-fourth year.

**RILEY, JOHN**, an English artist, who was born in London in 1646, and was instructed in his profession by Fuller and Zoust. Lord Orford considered him the best native artist that England had ever produced, and says that "there are draperies and heads painted by him which would do honour to Lely or Kneller." He died, at a comparatively early age, in 1691.

**RIPPERDA, JOHN WILLIAM, BARON OF**.—This nobleman was born, in 1680, in Groningen, and was educated under the Jesuits of Cologne, but, on marrying a protestant lady, conformed to her religion. He rose to the rank of colonel in the Dutch service, and in 1715 was sent on a mission to Philip V. of Spain, when he returned to the catholic religion and settled at Madrid, and the king finally made him duke of Ripperda and his prime minister; but, from his inefficiency, incurring the displeasure of the king, he was dismissed and confined in the castle of Segovia, whence he escaped and came to England, where he remained until 1730, when he crossed over to the Hague, and resumed the protestant religion. But his restless and ambitious disposition would not allow him to remain tranquil, and in 1731 he went to Morocco, where he was favourably received by Muley Abdalla, and declaring himself a convert to the Mohammedan religion, and taking the name of Osman, he obtained the chief command of the Moorish army at the siege of Ceuta. On the defeat of the Moors he fell under the displeasure of the emperor, and for a time he lived in retirement. He then formed a new project for the consolidation of different religions, particularly the Jewish and Mohammedan, and it is said that he even made some converts. He finally retired to Tetuan, but his projecting spirit animated him to the last, and he advanced considerable sums to Theodore, Baron Neuhof, to assist his attempts on the crown of Corsica. His death took place in 1737.

**RISDON, TRISTRAM**, an English topographical writer, who was born at Winscot, in Devonshire, in 1580. He was educated at Oxford, and on leaving the university he went to reside on his own estate in his native county, and devoted nearly all his time to the illustration of Devonian antiquities and topography. He died in 1640, leaving, in manuscript, "A Description or Survey of the County of Devon." This work was not published till 1723.

**RISHTON, EDWARD**, a learned catholic divine, who was a native of Lancashire, and received his education at Brazenose college, Oxford. He suffered much on account of his religion, and died in banishment in 1586. His best known work is entitled "Synopsis Rerum Ecclesiasticarum ad Annum." He also published Sanders's "History of the English Schism."

**RITCHIE, JOSEPH**, an enterprising English traveller, who was engaged, under the auspices of the African association, in a scientific mission into the interior of Africa. He was a young man, and possessed of all the qualities requisite to bring the prosecution of his arduous undertaking to a successful result, being well-informed, zealous, patient, and enterprising. Had he been able to penetrate to Timbuctoo there can be no doubt that the geography and customs of Africa would have received much new illustration. Mr. Ritchie was a native of Otley, in Yorkshire, and had, we understand, been for a con-

siderable period in the service, and inured to a hot climate. How many men of science have fallen victims to their thirst for knowledge! Of six persons who accompanied Niebuhr, the Danish traveller, in his tour through Arabia, he alone survived. Since then Mungo Park, Horneman, Captain J. R. Tuckey, Brown, Burckhardt, Clapperton, and others have fallen a sacrifice to a climate which seems peculiarly obnoxious to European constitutions. Mr. Richie's death took place at Mourzouk on the 19th of November, 1819; and we believe his last illness arose almost entirely from vexation of mind and the hardships which he had, in conjunction with Captain Lyon, endured in that grave of Europeans—the interior of Africa.

RITSON, JOSEPH, an English lawyer and antiquary, who was born at Stockton, in the county of Durham, but settled in London, where he carried on the business of a conveyancer. As an antiquary he displayed much industry and intelligence, especially with regard to our early national poetry; but his eccentricities, which were displayed in his critical remarks on Thomas Warton, Dr. Percy, and other learned men of the day, admit of no excuse but insanity; indeed, his death took place in a madhouse in Hoxton, on the 9th of September, 1803. His principal works are, "A Collection of English Songs," "The English Anthology," "Robin Hood, a Collection of English Ballads," and "The Bibliographia Poetica."

RITTENHOUSE, DAVID, a distinguished American astronomer, who was born near Germantown, Pennsylvania, in April 1732. During his early years he was employed on his father's farm, yet even there his peculiar genius manifested itself. His younger brother used to say that while David was employed in the fields he repeatedly observed the fences, and even the plough with which he had been working, marked over with mathematical figures. The construction of a wooden clock exhibited the first evidence of his mechanical talents. He was then but seventeen years of age, and had never received any instruction either in mathematics or mechanics. The delicacy of his constitution, and the irresistible bent of his genius, soon after induced his parents to allow of his giving up husbandry, and to procure for him the tools of a clock and mathematical instrument maker. From the age of eighteen to twenty-five he applied himself with the greatest assiduity both to his trade and to his studies. Engaged throughout the day in the former, it was only the time commonly assigned to rest, or, to use his own expression, his idle hours, that he could devote to the latter. Yet, with so little time at his command, with but two or three books, and without the least instruction, he acquired so considerable a knowledge of the mathematical sciences as to be able to read the "Principia" of Newton. It is even asserted that he discovered the method of fluxions, and that he did not know, until some years afterwards, that Newton and Leibnitz had contested the honour of an invention of which he deemed himself the author.

It was during this double employment of his time in labour and in study that Mr. Rittenhouse planned and executed an instrument, in which his mathematical knowledge and his mechanical skill were equally required. This instrument was the orrery. Machines intended to give to the student of astronomy a general conception of the relative motions of the heavenly bodies had been constructed before; but

the object of Mr. Rittenhouse was to construct an instrument by means of which he could exhibit, with accuracy, the positions of the planets and their satellites at any given period of the world, past, present, or future. It was, in fact, to make a kind of perpetual astronomical almanac, in which the results, instead of being given in tables, were to be actually exhibited to the eye. In this attempt he succeeded. Two of these orreries were made by his own hands. One belongs to the university of Pennsylvania, the other to the college of Princeton. In 1769 Mr. Rittenhouse was named one of the committee appointed by the American philosophical society to observe the transit of Venus over the sun's disk, which took place on the 3rd of June in that year. A temporary observatory was directed to be built for the purpose near his residence. In silence and trembling anxiety Mr. Rittenhouse and his friends waited for the predicted moment of observation; it came and brought with it all that had been wished for and expected by those who saw it. In Mr. Rittenhouse it excited, in the instant of one of the contacts of the planet with the sun, an emotion of delight so exquisite and powerful as to induce fainting. The reputation which Mr. Rittenhouse had now so justly acquired as an astronomer attracted the attention of the government, and he was employed in several operations of great public importance.

In 1779 he was appointed, by the legislature of Pennsylvania, one of the commissioners for adjusting a territorial dispute between that state and Virginia, and the success of this commission is ascribed in a great degree to his skill and prudence. In 1786 he was employed in fixing the northern line which divides Pennsylvania from New York. In the same year he was employed in settling the limits between New York and New Jersey; and in 1787 he was called upon to assist in fixing a boundary line between the states of Massachusetts and New York. Mr. Rittenhouse was elected a member of the American academy of arts and sciences at Boston in 1782, and of the royal society of London in 1795. In 1791 he was chosen the successor of Dr. Franklin in the presidency of the American philosophical society. All his philosophical communications were made through the medium of the Transactions of this society, and the list of his papers printed in the first three volumes shows his zeal for science and the fertility of his genius. In 1777 Dr. Rittenhouse was appointed treasurer of Pennsylvania, in which office he continued until 1789. In 1792 he was appointed, by the general government, director of the Mint of the United States. The mechanical skill of Dr. Rittenhouse rendered him a highly useful officer. In 1795 he was obliged to resign in consequence of the state of his health. His constitution, naturally feeble, had been rendered still more so by sedentary labour and midnight studies, and on the 26th of June, 1796, he died. His last illness was short and painful, but his patience and benevolence did not forsake him. Upon being told that some of his friends had called at his door to inquire how he was, he asked why they were not invited into his chamber to see him. "Because," said his wife, "you are too weak to speak to them." "Yes," said he, "that is true, but still I could have pressed their hands." In private life Dr. Rittenhouse exhibited all those mild and amiable virtues by which it is adorned. As a husband, a father, and a friend, he was a model of excellence. Immediately after his

decease the American philosophical society decreed him the honour of a public eulogium, and this duty was executed in the ablest manner by Dr. Rush. In 1813 a large volume of memoirs of his life was published by his relative, William Barton, Esq., of Lancaster, the materials for which were derived from the work just mentioned.

**RITTER, JOHN WILLIAM**, a distinguished natural philosopher, who was born in 1776 at Samitz, near Hainau, in Silesia, and died in 1810 at Munich. He distinguished himself by the study of galvanism; but excessive labour, exhausting experiments, a bad wife, and consequent intemperance, brought him early to the grave. His works, which are of uncommon importance, as far as galvanism is concerned, are, "Contributions to the Better Understanding of Galvanism," "Proof that a continual Galvanism accompanies the Process of Life," "Physico-Chemical Treatises," and "Fragments of the Papers of a Young Philosopher." They were all in the German. He contributed many articles to Gilbert's "Annals of Physics," and Voigt's "Magazine of Natural Science."

**RIVINGTON, CHARLES**, an eminent London bookseller, who was one of the sons of John Rivington, Esq., who carried on a considerable business as a bookseller in St. Paul's Churchyard, for more than half a century, where he died in 1792. He was succeeded in business by his sons, Messrs. Francis and Charles Rivington. Francis Rivington died in October 1822, leaving his eldest son, John Rivington, as his representative in the firm. The various members of the house of Rivington have now, we believe, for upwards of a century continued booksellers to the society for promoting Christian knowledge, and been uniformly patronised by the episcopal bench, and the higher order of the clergy: innumerable, therefore, are the valuable works on theology and ecclesiastical affairs that have been published at their expense, or under their auspices. The family of Mr. Charles Rivington have also been always much connected with the company of stationers. At one time his father, two uncles, and three brothers were, with himself, liverymen of the company. His youngest brother, Henry Rivington, died clerk of the company, in June 1829, when he was succeeded in that office by a son of Charles Rivington. His father served the office of master of the company in 1775, his brother Francis in 1805, and he himself in 1819. He had previously assiduously served the company for many years in the arduous office of one of the stock-keepers. He left a nephew and four sons, liverymen of the company, and four daughters. His death was very sudden. He was on the point of removal from his residence in Waterloo Place to a house he had taken in Brunswick Square, and in the interval had accepted the invitation of his sister-in-law, Mrs. Curling, to sleep at her house in the King's Road. As he did not come down to breakfast, one of his nephews entered his bedroom, and found him on the floor quite dead. It is supposed that he died whilst dressing himself.

**RIZZIO, or RICCI, DAVID**.—This celebrated favourite of the queen of Scotland was the son of a professor of music and dancing at Turin, where the subject of this article was born in the earlier part of the sixteenth century. His musical abilities procured him notice at the court of Savoy, while his talents as a linguist caused him to be selected by the ambas-

sador from the grand-duke to Mary queen of Scots, as a part of his suite. In 1564 he made his first appearance at Holy Rood House, where he soon became so great a favourite with the queen that he was appointed her secretary for foreign languages. The distinction with which he was treated by his mistress soon excited the envy of the nobles and the jealousy of Darnley; the hatred of the former being increased as much by the religion as by the arrogant deportment of the new favourite, while the suspicions of the latter were excited by his address and accomplishments. A conspiracy, with the king at its head, was formed for his destruction, and before he had enjoyed two years of court favour, the lord Ruthven, and others of his party, were introduced by Darnley into the queen's apartment, where they dispatched the object of their revenge by fifty-six stabs, in the presence of his mistress, in 1566. Popular tradition assigns to Rizzio the amelioration of the Scottish style of music. His skill in the performance of the national melodies on his favourite instrument, the lute, tended not a little to their general improvement and popularity with the higher classes; but it is evident that the style of Scottish music was determined long before the time of Mary; and many of the airs which have been ascribed to Rizzio are easily traced to more distant periods.

**ROBERTS, PETER**, a learned writer on British history and controversial theology. He was a native of North Wales, and received his education at the university of Dublin, where he took his degree of M.A. Having entered holy orders, he obtained the living of Hatkin, in Flintshire, and there devoted the whole of his leisure to literature. He published a number of valuable works; among the most important we may mention his "Chronicle of the Kings of Britain," and "A Sketch of the Early History of the Ancient Britons." He died in 1819.

**ROBERTSON, WILLIAM**.—This eminent Scottish historian was born in 1721, at Borthwick, in Mid-Lothian, where his father was then minister. He received the rudiments of his education at the school of Dalkeith, and removed to Edinburgh in 1733. Dr. Robertson's studies at the university being completed, he was licensed to preach by the presbytery of Dalkeith in 1741, and in 1743 he was presented to the living of Gladsmuir in East Lothian, by the Earl of Hopeton. The income was but inconsiderable (the whole emoluments not exceeding one hundred pounds a-year); but the preferment, such as it was, came to him, at a time singularly fortunate, for, not long afterwards, his father and mother died within a few hours of each other, leaving a family of six daughters and a younger son, in such circumstances as required every aid which his slender fortune enabled him to bestow. Dr. Robertson's conduct in this trying situation, while it bore the most honourable testimony to the generosity of his disposition, and to the warmth of his affections, was strongly marked with that manly decision in his plans, and that persevering steadiness in their execution, which were characteristic features of his mind. Undeterred by the magnitude of a charge which must have appeared fatal to the prospects that had hitherto animated his studies, and resolved to sacrifice to his sacred duty all personal considerations, he invited his father's family to Gladsmuir, and continued to educate his sisters under his own roof, till they were settled respectably in the world. Nor did he then

himself at liberty, till then, to complete an union which had been long the object of his wishes, and which may be justly numbered among the most fortunate incidents of his life. He remained single till 1751, when he married his cousin Miss Mary Nisbet, daughter of the reverend Mr. Nisbet, one of the ministers of Edinburgh.

While he was thus engaged in the discharge of those family duties which had devolved upon him by the sudden death of his parents, the rebellion of 1745 broke out in Scotland, and afforded him an opportunity of evincing the sincerity of that zeal for the civil and religious liberties of his country which he had imbibed with the first principles of his education; and which afterwards, at the distance of more than forty years, when he was called on to employ his eloquence in the national commemoration of the revolution, seemed to rekindle the fires of his youth. His situation as a country clergyman confined, indeed, his patriotic exertions within a narrow sphere; but even here his conduct was guided by a mind superior to the scene in which he acted. On one occasion (when the capital of Scotland was in danger of falling into the hands of the rebels) the state of public affairs appeared so critical that he thought himself justified in laying aside, for a time, the pacific habits of his profession, and in quitting his parochial residence at Gladsmuir, to join the volunteers of Edinburgh; and when, at last, it was determined that the city should be surrendered, he was one of the small band who repaired to Haddington, and offered their services to the commander of his majesty's forces.

The duties of his sacred profession were, in the mean time, discharged with a punctuality which secured to him the veneration and attachment of his parishioners; while the eloquence and taste that distinguished him as a preacher drew the attention of the neighbouring clergy, and prepared the way for that influence in the church which he afterwards attained. A sermon which he preached in the year 1755, before the society for propagating Christian knowledge, and which was the earliest of all his publications, affords a sufficient proof of the eminence he might have attained in that species of composition, if his genius had not inclined him more strongly to other studies. This sermon, the only one he ever published, has been long ranked, in both parts of our island, among the best models of pulpit eloquence in our language. It has passed through many editions, and is well known, in some parts of the continent, in the German translation of Mr. Ebeling. A few years before this period he made his first appearance in the debates of the general assembly of the church of Scotland. The questions which were then agitated in that place have long ceased to be interesting; but they were highly important at the time, as they involved, not only the authority of the supreme court of ecclesiastical judicature, but the general tranquillity and good order of the country.

The establishment of the "Select Society" in Edinburgh, in the year 1754, opened another field for the display and for the cultivation of his talents. This institution, intended partly for philosophical inquiry, and partly for the improvement of the members in public speaking, was projected by Mr. Allan Ramsay the painter, and a few of his friends; but soon attracted so much of the public notice, that in the following year the number of members exceeded

a hundred, including all the individuals in Edinburgh and the neighbourhood who were most distinguished by genius or by literary attainments. The society subsisted in vigour for six or seven years, and produced debates such as have not often been heard in modern assemblies;—debates, where the dignity of the speakers was not lowered by the intrigues of policy, or the intemperance of faction; and where the most splendid talents that have ever adorned this country were roused to their best exertions by the liberal and ennobling discussions of literature and philosophy. To this institution, while it lasted, Dr. Robertson contributed his most zealous support; seldom omitting an opportunity of taking a share in its business, and deriving from it considerable addition to his own fame.

In the spring of 1757 he came to London to concert measures for the publication of his "History of Scotland"—a work of which the plan is said to have been formed soon after his settlement at Gladsmuir. It was published on the 1st of February, 1759, and was received by the world with such unbounded applause, that before the end of that month he was desired by his bookseller to prepare for a second edition. From this moment the complexion of his fortune was changed. After a long struggle, in an obscure though a happy and hospitable retreat, with a narrow income and an increasing family, his prospects brightened at once. He saw independence and affluence within his reach, and flattered himself with the idea of giving a still bolder flight to his genius, when no longer depressed by those tender anxieties which so often fall to the lot of men whose pursuits and habits, while they heighten the endearments of domestic life, withdraw them from the paths of interest and ambition. In venturing on a step, the success of which was to be so decisive, not only with respect to his fame, but to his future comfort, it is not surprising that he should have felt, in a more than common degree, "that anxiety and confidence so natural to an author in delivering to the world his first performance."—"The time," (he observes in his preface) "which I have employed in attempting to render it worthy of the public approbation, it is perhaps prudent to conceal, till it shall be known whether that approbation is ever to be bestowed."

The long and uninterrupted friendship which subsisted between Dr. Robertson and Mr. Hume is well known; and it is certainly a circumstance highly honourable to both, when we consider the wide diversity of their sentiments on the most important subjects, and the tendency which the coincidence of their historical labours would naturally have had to excite rivalry and jealousy in less liberal minds. The following passages from Mr. Hume's letters place in a most amiable light the characters both of the writer and of his correspondent:—"You have very good cause to be satisfied with the success of your history, as far as it can be judged of from a few weeks' publication. I have not heard of one who does not praise it warmly; and were I to enumerate all those whose suffrages I have either heard in its favour, or been told of, I should fill my letter with a list of names. Mallet told me that he was sure there was no Englishman capable of composing such a work. The town will have it that you was educated at Oxford, thinking it impossible for a mere untravelled Scotchman to produce such language. In short, you may depend on the success of your work, and that your

name is known very much to your advantage. I am diverting myself with the notion how much you will profit by the applause of my enemies in Scotland. Had you and I been such fools as to have given way to jealousy, to have entertained animosity and malignity against each other, and to have rent all our acquaintance into parties, what a noble amusement we should have exhibited to the blockheads, which now they are likely to be disappointed of. All the people whose friendship or judgment either of us value, are friends of both, and will be pleased with the success of both, as we will be with that of each other. I declare to you I have not of a long time had a more sensible pleasure than the good reception of your history has given me within this fortnight."

Of this work, so flattering to the author by its first success, no fewer than fourteen editions were published before his death, and he had the satisfaction to see its popularity increase to the last, notwithstanding the repeated assaults it had to encounter from various writers distinguished by their controversial acuteness, and seconded by all the prepossessions which are likely to influence the opinions of the majority of readers. The character of Mary has been delineated anew, and the tale of her misfortunes has again been told, with no common powers of expression and pathos, by an historian more indulgent to her errors, and more undistinguishing in his praise: but after all, it is in the history of Dr. Robertson that every one still reads the transactions of her reign; and such is his skilful contrast of light and shade, aided by the irresistible charm of his narration, that the story of the beautiful and unfortunate queen, as related by him, excites on the whole a deeper interest in her fortunes, and a more lively sympathy with her fate, than have been produced by all the attempts to canonize her memory, whether inspired by the sympathetic zeal of the church of Rome, or the enthusiasm of Scottish chivalry.

During the time that the "History of Scotland" was in the press, Dr. Robertson removed with his family from Gladsmuir to Edinburgh, in consequence of a presentation which he had received to one of the churches in that city. His preferments now multiplied rapidly. In 1759 he was appointed chaplain of Stirling Castle; in 1761, one of his majesty's chaplains in ordinary for Scotland; and in 1762 he was chosen principal of the university. Two years afterwards the office of king's historiographer for Scotland (with a salary of 200*l.* a year) was revived in his favour.

The revenue arising from these different appointments, though far exceeding what had ever been enjoyed before by any presbyterian clergyman in Scotland, did not satisfy the zeal of some of Dr. Robertson's admirers, who, mortified at the narrow field which this part of the island afforded to his ambition, wished to open to it the career of the English church. Dr. Robertson's own ambition was, in the mean time, directed to a different object. Soon after the publication of his Scottish history, we find him consulting his friends about the choice of another historical subject,—anxious to add new laurels to those he had already acquired. Dr. John Blair urged him strongly on this occasion to write a complete history of England; and mentioned to him, as an inducement, a conversation between Lord Chesterfield and Colonel Irwin, in which the former said, "that he would not scruple, if Dr. Robertson would undertake such a

work, to move in the house of peers that he should have public encouragement to enable him to carry it into execution." But this proposal he was prevented from listening to by his unwillingness to interfere with Mr. Hume; although it coincided with a favourite plan which he himself had formed at a very early period of his life. The two subjects which appear to have chiefly divided his choice were the history of Greece, and that of the emperor Charles the Fifth. Between these he hesitated long, balancing their comparative advantages and disadvantages, and availing himself of all the lights that his correspondents could impart to him.

After much deliberation Dr. Robertson resolved to undertake the "History of Charles V.,"—a determination not less fortunate for the public than for his own fame; as it engaged him, unexpectedly perhaps, in a train of researches not confined to the period, or to the quarter of the globe that he had originally in view; but which, opening as he advanced, new and more magnificent prospects, attracted his curiosity to two of the greatest and most interesting subjects of speculation in the history of human affairs;—the enterprises of modern ambition in the western world, and the traces of ancient wisdom and arts existing in the east. The progress of the work, however, was interrupted for some time, about a year after its commencement, by certain circumstances which induced him to listen more favourably than formerly to the entreaties of those friends who urged him to attempt a history of England. The motives that weighed with him on this occasion are fully explained in a correspondence still extant, in which there are various particulars tending to illustrate his character and his literary views. From a letter of Lord Cathcart to Dr. Robertson, the revival of this project would appear to have originated in a manner not a little flattering to the vanity of an author. . . . . "Lord Bute told me the king's thoughts, as well as his own, with respect to your 'History of Scotland,' and a wish his majesty had expressed to see a history of England by your pen. His lordship assured me, every source of information which government can command would be opened to you; and that great, laborious, and extensive as the work must be, he would take care your encouragement should be proportioned to it. He seemed to be aware of some objections you once had, founded on the apprehension of clashing or interfering with Mr. David Hume, who is your friend; but as your performance and his will be upon plans so different from each other, and as *his* will, in point of time, have so much the start of yours, these objections did not seem to him such as, upon reflection, were likely to continue to have much weight with you."

A paper which was accidentally preserved among the letters addressed to Dr. Robertson by his friends, furnishes the following interesting details in answer to the letter just quoted:—"After the first publication of the 'History of Scotland,' and the favourable reception it met with, I had both very tempting offers from booksellers, and very confident assurances of public encouragement, if I would undertake the history of England. But as Mr. Hume, with whom, notwithstanding the contrariety of our sentiments both in religion and politics, I live in great friendship, was at that time in the middle of the subject, no consideration of interest or reputation would induce me to break in upon a field of which he had

taken prior possession; and I determined that my interference with him should never be any obstruction to the sale or success of his work. Nor do I yet repent my having resisted many solicitations to alter this resolution. But the case I now think is entirely changed. His history will have been published several years before any work of mine on the same subject can appear; its first run will not be marred by any justling with me, and it will have taken that station in the literary system which belongs to it. This objection, therefore, which I thought, and still think, so weighty at that time, makes no impression on me at present, and I can now justify my undertaking the English history to myself, to the world, and to him. Besides, our manner of viewing the same subject is so different or peculiar, that (as was the case in our last books) both may maintain their own rank, have their own partisans, and possess their own merit, without hurting each other. I am sensible how extensive and laborious the undertaking is, and that I could not propose to execute it in the manner I could wish, and the public will expect, unless I shall be enabled to consecrate my whole time and industry to it. Though I am not weary of my profession, nor wish ever to throw off my ecclesiastical character, yet I have often wished to be free of the labour of daily preaching, and to have it in my power to apply myself wholly to my studies. This the encouragement your lordship mentions will put in my power. But as my chief residence must still be in Scotland, where I would choose, both for my own sake and that of my family, to live and to compose, as a visit of three or four months now and then to England will be fully sufficient for consulting such manuscripts as have never been published, I should not wish to drop all connexion with the church of which I am a member, but still to hold some station in it without being reduced entirely to the profession of an author. Another circumstance must be mentioned to your lordship. As I have begun the 'History of Charles V.,' and have above one-third of it finished, I would not choose to lose what I have done. It will take at least two years to bring that work to perfection; and after that I shall begin the other, which was my first choice, long before Mr. Hume undertook it, though I was then too diffident of myself and too idle to make any progress in the execution of it, farther than forming some general ideas as to the manner in which it should be prosecuted. As to the establishment to be made in my favour, it would ill become me to say any thing. Whether the present time be a proper one for settling the matter finally I know not. I beg leave only to say, that however much I may wish to have a point fixed so much for my honour, and which will give such stability to all my future schemes, I am not impatient to enter into possession before I can set to work with that particular task for which my appointments are to be given."

After an interval of eight years from the publication of "Charles the Fifth," Dr. Robertson produced the "History of America;"—a work which, by the variety of research and of speculation that it exhibits, enables us to form a sufficient idea of the manner in which he had employed the intervening period. In undertaking this task, the author's original intention was only to complete his account of the great events connected with the reign of Charles V.; but perceiving, as he advanced, that a history of America, con-

fined solely to the operations and concerns of the Spaniards, would not be likely to excite a very general interest, he resolved to include in his plan the transactions of all the European nations in the New World. The origin and progress of the British empire there, he destined for the subject of one entire volume; but afterwards abandoned, or rather suspended the execution of this part of his design, for reasons mentioned in his preface. We should here remark that the penetration and sagacity displayed in his delineation of savage manners, and the unbiassed good sense with which he has contrasted that state of society with civilized life (a speculation in the prosecution of which so many of his predecessors had lost themselves in vague declamation or in paradoxical refinement), have been much and deservedly admired. His industry also and accuracy in collecting information with respect to the Spanish system of colonial policy have received warm praise from his friends and from the public. But what perhaps does no less honour to the powers of his mind than any of these particulars is, the ability and address with which he has treated some topics that did not fall within the ordinary sphere of his studies; more especially those which border on the province of the natural historian. In the consideration of these, although we may perhaps, in one or two instances, have room to regret that he had not been still more completely prepared for the undertaking by previous habits of scientific disquisition, we uniformly find him interesting and instructive in the information he conveys; and happy, beyond most English writers, in the descriptive powers of his style. The species of description too in which he excels is peculiarly adapted to his subject; distinguished, not by those picturesque touches which vie with the effects of the pencil in presenting local scenery to the mind, but by an expression, to which language alone is equal, of the grand features of an unsubdued world. In these passages he discovers talents, as a writer, different from any thing that appears in his other publications; a compass and richness of diction the more surprising, that the objects described were so little familiarized to his thoughts, and, in more than one instance, rivalling the majestic eloquence which destined Buffon to be the historian of nature. After all, the principal charm of this, as well as of his other histories, arises from the graphical effect of his narrative, wherever his subject affords him materials for an interesting picture. What force and beauty of painting is exhibited in his circumstantial details of the voyage of Columbus; of the first aspect of the new continent; and of the interviews of the natives with the Spanish adventurers! With what animation and fire does he follow the steps of Cortes through the varying fortunes of his vast and hazardous career; yielding, it must be owned, somewhat too much to the influence of the passions which his hero felt; but bestowing, at the same time, the warm tribute of admiration and sympathy on the virtues and fate of those whom he subdued! The arts, the institutions, and the manners of Europe and of America; but above all, the splendid characters of Cortes and of Guatimozin, enable him, in this part of his work, to add to its other attractions that of the finest contrasts which occur in history. On these and similar occasions he seizes more completely than any other modern historian the attention of his reader, and transports him into the midst of the transactions which he records. His

own imagination was warm and vigorous; and, although in the conduct of life it gave no tincture of enthusiasm to his temper, yet, in the solitude of the closet, it attached him peculiarly to those passages of history which approach to the romantic. Hence many of the characteristical beauties of his writings; and hence too, perhaps, some of their imperfections. A cold and phlegmatic historian, who surveys human affairs like the inhabitant of a different planet, if his narrative should sometimes languish for want of interest, will at least avoid those prepossessions into which the writer must occasionally be betrayed, who, mingling with a sympathetic ardour among the illustrious personages whose story he contemplates, is liable, while he kindles with their generous emotions, to be infected by the contagion of their prejudices and passions.

The Spanish nation were not insensible of what they owed to Dr. Robertson for "the temperate spirit" (as Mr. Gibbon expresses it) with which he had related this portion of their story. "On the 8th of August, 1777, he was unanimously elected a member of the royal academy of history at Madrid; in testimony of their approbation of the industry and care with which he has applied to the study of Spanish history, and as a recompence for his merit in having contributed so much to illustrate and spread the knowledge of it in foreign countries." The academy at the same time appointed one of its members to translate the "History of America" into Spanish; and it is believed that considerable progress had been made in the translation when the Spanish government, judging it inexpedient that a work should be made public in which the nature of the trade with America and the system of colonial administration were so fully explained, interposed its authority to stop the undertaking.

The caution which Dr. Robertson observed in his expressions concerning the American war suggests some doubts about his sentiments on that subject. In his letters to Mr. Strahan he writes with greater freedom, and sometimes states without reserve his opinions of men and measures. One or two of these passages will serve to illustrate Dr. Robertson's political views on this subject. In a letter dated October 6, 1775, he writes thus:—"I agree with you in sentiment about the affairs of America. Incapacity, or want of information, has led the people employed there to deceive ministry. Trusting to them, they have been trifling for two years when they should have been serious, until they have rendered a very simple piece of business extremely perplexed. They have permitted colonies disjoined by nature and situation to consolidate into a regular systematical confederacy; and when a few regiments stationed in each capital would have rendered it impossible for them to take arms, they have suffered them quietly to levy and train forces, as if they had not known and seen against whom they were prepared. But now we are fairly committed, and I do not think it fortunate that the violence of the Americans has brought matters to a crisis too soon for themselves. From the beginning of the contest I have always asserted that independence was their object. The distinction between taxation and regulation is mere folly. There is not an argument against our right of taxing that does not conclude with tenfold force against our power of regulating their trade. They may profess or disclaim what they please, and hold the language

that best suits their purpose; but if they have any meaning, it must be that they should be free states connected with us by blood, by habit, and by religion, but at liberty to buy and sell and trade where and with whom they please. This they will one day attain, but not just now, if there be any degree of political wisdom or vigour remaining. At the same time one cannot but regret that prosperous and growing states should be checked in their career. As a lover of mankind, I bewail it; but as a subject of Great Britain, I must wish that their dependence on it should continue. If the wisdom of government can terminate the contest with honour instantly, that would be the most desirable issue. This, however, I take to be now impossible; and I will venture to foretel, that if our leaders do not at once exert the power of the British empire in its full force, the struggle will be long, dubious, and disgraceful. We are past the hour of lenitives and half exertions. If the contest be protracted, the smallest interruption of the tranquillity that now reigns in Europe, or even the appearance of it, may be fatal. It is lucky that my American history was not finished before this event. How many plausible theories, that I should have been entitled to form, are contradicted by what has now happened!"

Dr. Robertson does not appear to have projected any other work after this period. He seems indeed to have abandoned all thoughts of writing any more for the public, and to have indulged the idea of prosecuting his studies in future for his private amusement. His circumstances were independent; he was approaching to the age of sixty, with a constitution considerably impaired by a sedentary life; and a long application to the compositions he had prepared for the press had interfered with much of the gratification he might have enjoyed if he had been at liberty to follow the impulse of his own taste and curiosity. He retired from the business of the ecclesiastical court about the same time, and for seven or eight years divided the hours which he could spare from his professional duties between the luxury of reading and the conversation of his friends. The activity of his mind in the mean time continued unimpaired; and the habits of study he had so long been accustomed to, gave a certain scope and connexion even to his historical recreations. To one of these, which from an accidental connexion with some of his former work engaged his attention more closely than his ordinary pursuits, the public is indebted for a valuable performance, of which the materials almost incessantly swelled to a volume long after his most intimate friends imagined that he had renounced all thoughts of the press. "The Disquisition concerning Ancient India," which closed his historical labours, took its rise (as he himself informs us) "from the perusal of Major Rennell's memoir for illustrating his 'Map of Indostan.'" This suggested to him the idea of examining, more fully than he had done in the introductory book to his 'History of America,' into the knowledge which the ancients had of that country, and of considering what is certain, what is obscure, and what is fabulous, in the accounts of it which they have handed down to us." "In undertaking this enquiry," he adds, "he had originally no other object than his own amusement and instruction; but in carrying it on, and consulting with care the authors of antiquity, some facts hitherto unobserved, and many which had not been examined with proper attention,

occurred ; new views opened ; his ideas gradually extended and became more interesting ; till at length he imagined that the result of his researches might prove amusing and instructive to others."

Such is the account given by himself of the origin and progress of a disquisition begun in the sixty-eighth year of his age, and in twelve months brought to a conclusion ; exhibiting nevertheless, in every part, a diligence in research, a soundness of judgment, and a perspicuity of method, not inferior to those which distinguish his other performances. From the nature of the subject it was impossible to render it equally amusing to ordinary readers, or to bestow on his language the same splendour and variety ; but the style possesses all the characteristic beauties of his former compositions, as far as they could with propriety be introduced into a discourse of which the general design excluded every superfluous and ambitious ornament. The observations in the Appendix upon the character, the manners, and the institutions of the people of India, present a valuable outline of all the most important information concerning them which was then accessible to the philosophers of Europe ; and, if they have already lost part of their interest in consequence of the astonishing discoveries which have since been brought to light in Asia, by a fortunate and unexampled combination of genius, learning, and official rank, in a few individuals whose names do honour to this country ; they, at least, evince that ardent and enlightened curiosity which animated the author's enquiries in his most advanced years, and afford a proof that his mind kept pace to the last with the progress of historical knowledge. In these observations, too, we may occasionally trace the influence of still higher motives, to which he has himself alluded with an affecting solemnity in the last sentences which he addressed to the public. "If I had aimed," says he, "at nothing else than to describe the civil polity, the arts, the sciences, and religious institutions, of one of the most ancient and most numerous races of men, that alone would have led me into enquiries and discussions both curious and instructive. I own, however, that I have all along kept in view an object more interesting, as well as of greater importance ; and entertain hopes that if the account which I have given of the early and high civilization of India, and of the wonderful progress of its inhabitants in elegant arts and useful science, shall be received as just and well established, it may have some influence upon the behaviour of Europeans towards that people. It was by an impartial and candid enquiry into their manners that the emperor Akber was led to consider the Hindoos as no less entitled to protection and favour than his other subjects, and to govern them with such equity and mildness as to merit from a grateful people the honourable appellation of 'the Guardian of Mankind.' If I might presume to hope that the description I have given of the manners and institutions of the people of India could contribute in the smallest degree, and with the most remote influence, to render their character more respectable and their condition more happy, I should close my literary labours with the satisfaction of thinking that I have not lived or written in vain."

The characteristic of Dr. Robertson's eloquence was persuasion ; mild, rational, and conciliating ; yet manly and dignified. In early life, when forced as a partisan to expose himself to the contentious heat of popular discussion, he is said to have been distin-

guished by promptitude and animation in repelling the attacks which he occasionally encountered ; but at a later period he became the acknowledged head of his party, and generally spoke last in the debate ; resuming the arguments on both sides with such perspicuity of arrangement and expression, such respect to his antagonists, and such an air of candour and earnestness in every thing he said, that he often united the suffrages of the house in favour of the conclusions he wished to establish. His pronunciation and accents were strongly marked with the peculiarities of his country ; nor was this defect compensated by the graces of his delivery. His manner, however, though deficient in ease, was interesting and impressive, and had something in its general effect neither unsuitable to his professional station nor to the particular style of his eloquence. His diction was rich and splendid, and abounded with the same beauties that characterize his writings.

In consequence of the various connexions with society which arose from these professional duties, and from the interest which he was led to take, both by his official situation and the activity of his public spirit, in the literary or the patriotic undertakings of others, a considerable portion of Dr. Robertson's leisure was devoted to conversation and company. No man enjoyed these with more relish, and few have possessed the same talents to add to their attractions. A rich stock of miscellaneous information, acquired from books and from an extensive intercourse with the world, together with a perfect acquaintance at all times with the topics of the day, and the soundest sagacity and good sense applied to the occurrences of common life, rendered him the most agreeable and instructive of companions. He seldom aimed at wit ; but with his intimate friends he often indulged a sportive and fanciful species of humour. He delighted in good-natured characteristic anecdotes of his acquaintance, and added powerfully to their effect by his own enjoyment in relating them. He was, in a remarkable degree, susceptible of the ludicrous ; but on no occasion did he forget the dignity of his character, or the decorum of his profession ; nor did he even lose sight of that classical taste which adorned his compositions. His turn of expression was correct and pure ; sometimes, perhaps, inclining more than is expected, in the carelessness of a social hour, to formal and artificial periods ; but it was stamped with his own manner no less than his premeditated style : it was always the language of a superior and a cultivated mind, and it embellished every subject on which he spoke.

It only now remains to advert to his exemplary diligence in the discharge of his pastoral duties ; a diligence which, instead of relaxing as he advanced in life, became more conspicuous when his growing infirmities withdrew him from business and lessened the number of his active engagements. As long as his health allowed him he preached regularly every Sunday ; and he continued to do so occasionally till within a few months of his death. The particular style of his pulpit eloquence may be judged of from the specimen which has long been in the hands of the public ; and it is not improbable that the world might have been favoured with others of equal excellence, if he had not lost, before his removal from Glasgow, a volume of sermons which he had composed with care. The facility with which he could arrange his ideas, added to the correctness and fluency

of his extemporary language, encouraged him to lay aside the practice of writing, excepting on extraordinary occasions, and to content himself in general with such short notes as might recal to his memory the principal topics on which he meant to enlarge. To the value, however, and utility of these unpremeditated sermons we have the testimony of his learned and excellent colleague, who heard him preach every week for more than twenty years. "His discourses from this place," says Dr. Erskine, "were so plain that the most illiterate might easily understand them, and yet so correct and elegant that they could not incur their censure whose taste was more refined. For several years before his death he seldom wrote his sermons fully, or exactly committed his older sermons to memory: though, had I not learned this from himself, I should not have suspected it; such was the variety and fitness of his illustrations, the accuracy of his method, and the propriety of his style."

Dr. Robertson's health began to decline about the end of the year 1791. Till then it had been more uniformly good than might have been expected from his studious habits; but about this period he suddenly discovered strong symptoms of jaundice, which gradually undermined his constitution, and terminated at length in a lingering and fatal illness. He had the prospect of death long before him; a prospect deeply afflicting to his family and his friends; but of which, without any visible abatement in his spirits, he happily availed himself to adorn the doctrines which he had long taught, by an example of fortitude and of Christian resignation. Dr. Robertson's death took place on the 11th of June, 1793.

**ROBERTSON, ABRAHAM.**—This gentleman was for many years professor of astronomy and superintendent of the Radcliffe observatory at Oxford. He was born at Dunse, in the county of Berwick, on the 4th of November, 1751, and was placed early in life in a school near his birthplace. Before he had attained his twenty-fourth year he came up to London in hopes of obtaining a situation in the East Indies. The friend on whose patronage he depended, died before any provision could be made for him, and he was left to find some other means of support. Confidence in his own powers persuaded him to try his fortune in the university of Oxford, and the event was equally honourable to himself and to the place which he had selected. He went there without any personal friend to assist or even introduce him; and he rose to the highest stations which were open to his particular line of studies. His knowledge of mathematics led him to Dr. Smith, the Savilian professor of geometry; he was afterwards patronised by Mr. Alexander, afterwards chief baron of the exchequer, who was then a gentleman-commoner of Christ Church, and who, with the assistance of Dr. Berkeley, procured him admission, in 1775, into that society. The way was now open to him; and his talents, industry, and good conduct, secured his future advancement. He became bachelor of arts in June 1779, and took orders at the following Christmas, when Dr. Bagot, who had recently succeeded Dr. Markham in the deanery, made him one of the chaplains of Christ Church. In 1782 he gained the chancellor's prize for an English essay "On Original Composition," and in the following December he proceeded to the degree of master of arts.

Dr. Smith was established as a physician at Chel-

tenham, and was in the habit of engaging some able mathematician from among the resident masters at Oxford to read lectures as his substitute. This office had been held by Dr. Austin, of Wadham college; and when he left the university for London, about 1784, Mr. Robertson was fixed upon to discharge those duties, which he continued to do for the remainder of Dr. Smith's life. His manner of lecturing was deliberate and perspicuous; and he was always ready to assist and encourage the students who attended him; he frequently lent them his papers to examine at their leisure; and, as he found that the fifth definition of the fifth book of Euclid was often the occasion of much difficulty to beginners, he printed expressly for their use a demonstration of this fundamental property of proportional quantities. In 1789 Mr. Robertson was presented by the dean and canons of Christ Church to the vicarage of Ravensthorpe, near Northampton, and soon after married. His principal residence, however, still continued to be at Oxford, or in its neighbourhood. This was necessary for his scientific and literary pursuits. The university having undertaken to publish the works of Archimedes, which Torelli had prepared for the press, the care of superintending it was entrusted to Mr. Robertson. This was completed in 1792, and in the same year he brought out his large work, entitled "Sectionum Conicarum Libri VII.," &c., which he dedicated to his firm and active friend and patron, Dr. Cyril Jackson, who, in 1783, had become dean of Christ Church. It was likewise in 1792 that Archdeacon Nares and his friends commenced the publication of "The British Critic;" and Mr. Robertson showed his attachment to the cause of social order by contributing to the earlier volumes several articles of criticism in his own department. In 1795 he was elected a fellow of the royal society, and his demonstration of the binomial theorem was published in the "Philosophical Transactions" for that year. In 1797 he succeeded, on Dr. Smith's death, to the Savilian professorship of geometry; and the next year he engaged in a work which occupied a considerable time. Dr. Hornsby having seen the first volume of Bradley's "Astronomical Observations" through the press, was obliged by ill health to relinquish the undertaking, and the labour of superintending the publication of the second volume fell on Mr. Robertson. This he completed in 1805, but without neglecting his public lectures, or his other pursuits. In his "Treatise of Conic Sections" he had endeavoured to collect together all that had been written on the subject, and he had subjoined to it a most valuable historical notice of the progress of this branch of science; but the book, with all its merits, was too large and written in too diffuse a manner for the ordinary student. He therefore, in 1802, published a shorter treatise; and this he further abridged in 1818, when he published his "Elements of Conic Sections," a second edition of which came out in 1825. A plan having been suggested for replacing London Bridge by a single iron arch, the committee of the house of commons sent a list of questions on the subject to the most distinguished men of science in the country. Mr. Robertson was included in the number, and his answers will be found annexed to the report which was printed in 1801. In 1805 the late earl of Liverpool published his work on the coins of the realm. Mr. Robertson had been engaged by him

lordship to make the necessary calculations for him, and the "Appendix, containing an account of the relative value of gold and silver among the Persians, Grecians, and Romans," was drawn up by Mr. Robertson.

In the "Philosophical Transactions" for 1806 there is a republication and extension of his demonstration of the binomial theorem; and in those for 1807 there is a paper of his on the precession of the equinox. Some severe strictures on these induced him in 1808 to publish "A Reply to a Monthly and Critical Reviewer." This pamphlet was printed during his absence in London, where he was engaged, in 1807, in making the calculations for Lord Grenville's system of finance; and, in 1808, in drawing up the tables for Mr. Perceval's plan of increasing the sinking fund, by granting life annuities on government security. In 1807 he took the degree of D.D., and in 1810 he succeeded Dr. Hornsby in the care of the Radcliffe observatory, the electors of Sir Henry Savile's professors having permitted him to exchange the chair of geometry (which he had occupied so much to the credit and advantage of the university) for that of astronomy. When he undertook this charge, it was proposed that the observations should be published every year; but the expense was considered to be so far beyond the probable advantage of such a measure that it was afterwards abandoned. The Radcliffe trustees, however, were anxious that the observations should be made accessible to those men of science who might wish to consult them; they therefore directed that one manuscript copy should be annually deposited in the Radcliffe library at Oxford, and that a second should be presented to the royal society. This has been regularly executed, and evinces the attention with which the duties of the observer's office have been performed. There are two papers of Dr. Robertson's in the "Philosophical Transactions" for 1816; the one on calculating the eccentric anomaly of planets, the other on Dr. Maskelyne's formulæ for finding the longitude and latitude of a celestial body from its right ascension and declination.

Dr. Robertson's sufferings during his last illness were severe, but he bore them with the greatest fortitude: his mind retained its clearness to the last, but his bodily powers gradually gave way, and the beginning of his seventy-sixth year was the painful end of his existence upon earth. He was buried, by his own direction, in the churchyard of St. Peter's in the East, in the same vault with his wife, whom he had lost a few years after he became professor of geometry, and by whom he had no family. Dr. Robertson's manners were marked by great simplicity. Though his habits, from the circumstances of his early life, were economical, they were not penurious. He was indulgent to those about him; generous and charitable, whenever there was any reasonable call on him; he was always ready to recede from his due; large sums, which he had destined for relations after his death, he gave up to them during his life, when he thought they could be more serviceable to them; and in addition to what he gave away in his immediate neighbourhood, he used to send money to the clergyman of Dunse, to be distributed by him among those who wanted it. It is probable that his charities of this kind were not confined to his native place; but, as he found his end approaching, he had employed him-

self in destroying his papers, so that it was only from a letter which had been accidentally overlooked that his benevolence in this particular instance was accidentally discovered.

ROBERTSON, JOSEPH, a learned divine and writer, who was born at Knipe in Westmoreland, in 1726, and was educated at Queen's college, Oxford. After entering holy orders he became curate to the celebrated Dr. Sykes, of Rayleigh in Essex, and subsequently received several good livings; the last of which was the vicarage of Horncastle in Lincolnshire. In 1775 a remarkable incident occurred, which excited the public attention. A Miss Butterfield was accused of poisoning Mr. Scawen, of Woodcote Lodge, in Surrey. Mr. Robertson thought her very cruelly treated, and took an active part in her defence. On this occasion he published a letter to Mr. Sanxay, a surgeon, on whose testimony Miss Butterfield had been committed to prison; in which he very severely animadverted on the conduct and evidence of that gentleman. After she had been honourably acquitted at the assizes at Croydon, he published a second pamphlet, containing "Observations on the Case of Miss Butterfield," showing the hardships she had sustained, and the necessity of prosecuting her right in a court of justice: that is, her claim to a considerable legacy, which Mr. Scawen had bequeathed her by a will, executed with great formality, two or three years before his death. The cause was accordingly tried in Doctors' Commons. But, though it was universally agreed that this unfortunate young woman had been unjustly accused, and that Mr. Scawen had been induced, by false suggestions, to sign another testamentary paper, in which her name was not mentioned, yet no redress could be obtained, as the judge observed "that it was the business of the court to determine the cause according to what the testator had done, not according to what he ought to have done." Mr. R. is said to have been the author of a useful tract, published in 1781, "On Culinary Poisons." In 1782 he published an elegant little volume for the improvement of young people in reading, entitled "An Introduction to the Study of Polite Literature." This was mentioned as the first volume of an intended series on the same subject; but the second never appeared, owing, as it is supposed, to part of it having been reprinted in a tract without his consent. He also published several other works, and died in January 1820.

ROBERTSON, THOMAS, an English grammarian, who was born in Yorkshire, and was partly educated at Queen's college, Oxford; but he continued his studies in Magdalen college, and succeeded the celebrated John Stanbridge as master of the school adjoining to that college. He took his degree of M. A. in 1525, and in 1532 he was collated to the prebend of Welton-Westhall, in the cathedral of Lincoln; in the year following to that of Sleaford, and in 1534 to that of Greeton, in the same church. It seems probable that he took his degree of B.D. in 1539, at which time Wood says Robertson was esteemed the "*flos et decus Oxoniæ*," and was treasurer of the church of Salisbury. He held also the archdeaconry of Leicester and vicarage of Wakefield, to which Browne Willis adds the rectory of St. Laud's, at Sherrington, Bucks. In 1549 he was associated with the other divines, ordered by Edward VI.'s council to form a new liturgy or Common

Prayer; and thus far, as Dodd remarks, he complied with the reformers; but it does not appear that he advanced much further. In Queen Mary's reign, 1557, he was made dean of Durham, and refused a bishopric. This dignity he might have retained when Elizabeth came to the throne, or have obtained an equivalent; but he refused to take the oath of supremacy. Nothing more is known with certainty of his history but that he died about 1560. Among the records collected at the end of Burnet's "History of the Reformation," are Robertson's "Resolutions of some Questions concerning the Sacraments," and "Resolutions of Questions relating to Bishops and Priests." His grammatical tracts, entitled "Annotationes in Lib. Gulielmi Lili de Lat. Nom. Generibus," &c., were printed together at Basle, in 1532. His reputation as a correct grammarian and successful teacher was very great.

ROBERTSON, WILLIAM, a learned divine, who was born at Dublin in 1705. He was sent to the university of Glasgow, and while he was carrying on his studies a dispute was revived, which had been often agitated before, between Mr. Sterling the principal, and the students, about a right to choose a rector, whose office and power nearly resemble those of the vice-chancellor of Oxford or Cambridge. Mr. Robertson took part with his fellow-students, and was appointed by them, together with William Campbell, whose family has since succeeded to the estates and titles of Argyle, to wait upon the principal with a petition signed by more than sixty matriculated students, praying that he would, on the 1st day of March, according to the statutes, summon an university meeting for the election of a rector; which petition he rejected with contempt. Upon which William Campbell, in his own name and in the name of all the petitioners, protested against the principal's refusal, and put instruments in the hands of Cuthbert Steward, notary public: and all the petitioners went to the house of Hugh Montgomery, Esq., the unlawful rector, and there Mr. Robertson read aloud the protest against him and his authority. Mr. Robertson, by these proceedings, became the immediate object of indignation, and was the only one of all the subscribers to the petition that was proceeded against. He was cited before the principal and the professors of the university, and, after a trial which lasted several days, had the sentence of expulsion pronounced against him; of which sentence he demanded a copy; by which it appears that Mr. Robertson was so fully persuaded of the justice of his cause, and the propriety of his proceedings, that he most openly and strenuously acknowledged and adhered to what he had done. Mr. Robertson went immediately to London, and presented a memorial to John duke of Argyle, containing the claims of the students of the university of Glasgow, their proceedings in the vindication of them, and his own particular sufferings in the cause. The duke received him very kindly, but said that "he was little acquainted with things of this sort;" and advised him "to apply to his brother Archibald, earl of Ilay, who was better versed in such matters than he." Accordingly he waited on Lord Ilay, who, upon reading the representation of the case, said "he would consider of it." In the summer of the year 1726, the earl of Ilay with the other visitors repaired to Glasgow, and, upon a full examination into the several injuries and abuses complained of, they restored to the students

the right of electing their rector; called the principal to a severe account for the public money that he had embezzled; recovered the right of the university to send two gentlemen, upon exhibitions, to Balliol college in Oxford; took off the expulsion of Mr. Robertson, and ordered that particularly to be recorded in the proceedings of the commission; annulled the election of the rector who had been named by the principal; and assembled the students, who immediately chose the master of Ross, son of Lord Ross, to be their rector, &c.

Lord Ilay had introduced Mr. Robertson to Bishop Hoadly; and as he was then too young to be admitted into orders, employed his time in London in visiting the public libraries, attending lectures, and improving himself. The first person whom Dr. Hoadly ordained, after he was consecrated bishop of Ferns, was Mr. Robertson; and shortly after the bishop nominated him to the cure of Tullow, in the county of Carlow; and he was also presented by Lord Carteret, then lord-lieutenant of Ireland, to the rectory of Ravilly, in the county of Carlow, and to the rectory of Kilravelo, in the county of Wicklow, and soon after was collated to the vicarages of the said parishes by the bishop of Ferns. These were the only preferments he had till the year 1738, when Dr. Synge, bishop of Ferns, collated him to the vicarages of Rathmore and Straboe, and the perpetual cure of Rahil, in the county of Carlow. But as almost the whole lands of those parishes were employed in pasture, the tithes would have amounted to more than twice that sum if the herbage had been paid for black cattle, which was certainly due by law. Several of the clergy of Ireland had, before him, sued for this herbage in the court of exchequer, and obtained decrees in their favour. Mr. Robertson, encouraged by the example of his brethren, commenced some suits in the exchequer for this herbage, and succeeded in every one of them. But when he had by this means doubled the value of his benefices, the house of commons in Ireland passed several severe resolutions against the clergy who had sued or would sue for this "new demand." This proceeding of the commons provoked Dean Swift to write "The Legion Club." Mr. Robertson soon after published a pamphlet, entitled "A Scheme for Utterly Abolishing the Present Heavy and Vexatious Tax of Tithe," the purport of which was to pay the clergy and impropiators a tax upon the land in lieu of all tithes. This work went through several editions. In 1739 Lord Cathcart appointed him his chaplain. Mr. Robertson had, in 1728, married Elizabeth, daughter of Major William Baxter. By this lady, who was extremely beautiful, Mr. Robertson had one-and-twenty children.

In 1743 Mr. Robertson obtained the bishop's leave to nominate a curate at Ravilly, and to reside for some time in Dublin for the education of his children. Here he was immediately invited to the cure of St. Luke's parish, and in this he continued five years and then returned to Ravilly. In 1758 he lost his wife. In 1767 Mr. Robertson presented one of his theological works to his old alma mater, the university of Glasgow, and received in return the degree of D.D. In 1768 the mastership of the free grammar school at Wolverhampton, in Staffordshire, becoming vacant, the company of merchant tailors, the patrons, unanimously conferred it on him. In 1772 he was chosen one of the committee to carry on the business

of the society of clergymen, &c., in framing and presenting the petition to the house of commons, praying to be relieved from the obligation of subscribing assent and consent to the Thirty-nine Articles, and all and every thing contained in the Book of Common Prayer. He lived many years at Wolverhampton, and died there in May 1783, in the seventy-ninth year of his age, and was buried in the church yard of the new church there.

Dr. Robertson's appointment to the mastership of the grammar-school of Wolverhampton, though highly honourable to his patrons, was not very lucrative to himself. His own account will best explain the nature of his new situation. "I am here" (writes he in a letter dated in September 1769) "in a very strange way. The salary is 70*l.* a year; but there is a pension of 40*l.* paid out of that to an old gentleman who resigned the school upon that condition ten years ago, and is now in as good a state of health as a man of eighty can be; so that there remains but 30*l.* for me, loaded with the wages of school-servants, school-firing, window-money, and other taxes, which in all come to about 7*l.* a year, without any emolument of any kind; so that my necessary expenses have been five times as much as the salary." In a subsequent letter, dated May 1770, he seems to have recovered in some degree the disagreeable apprehensions he had formed, for therein he writes:—"Your concern for me makes you imagine that I have abandoned and lost a great deal in this world. Indeed, according to the common estimation of things, your conjecture is right. But I assure you that I weighed the matter long ago, and many things which are of great show and consequence in the general opinion weighed very light in my scale, when set against others which were to me of infinitely greater moment. For the last three months I have been much afflicted with the gout, so that pain and business have filled up all my time. However, I thank God I go on pretty well, and find my health improve as the weather grows warm, so that I am in hopes I shall have a tolerable summer. I make no apology for troubling you with the recital of my little affairs, as I think myself happy in having a friend to whom I can say any thing as to my real prospects in life.

In March 1779 Dr. Robertson concludes a letter to Dr. Disney with an affecting recital of some of his more severe trials, not forgetting, however, his wonted submission on all occasions to the will of God. "I have lived," says he, "almost seventy-four years, and enjoyed many, many comforts in this life, so that I may now thankfully rise from table as a guest fully satisfied with my entertainment. Indeed, in the last three years I have suffered what the generality of the world call great afflictions in my health and in my family. In the year 77 I lost my beloved daughter, whom you are pleased to lament. In the year 78 my eldest son, who was a lieutenant, fell at Rhode Island; and already, in 79, I have received an account of the death of my other daughter in Dublin. But I have been so accustomed to the death of my children that at last I see nothing strange in it. I only wonder that I have stayed so long behind them. I think my case is extraordinary, that of twenty-one children which my wife brought me I have outlived them all but one; so that I have often occasion to say with Job, 'The Lord gave, and the Lord hath taken away, blessed be the name of

the Lord.' " It was, however, the will of God that his family afflictions should not have their end even here, for he lived to bury that one and only surviving child out of so great a number.

**ROBESPIERRE, MAXIMILIAN ISIDORE.**—This celebrated leader of the French revolution was born at Arras in Flanders, in 1759. Robespierre's father was a man of amiable disposition, but satirical in his conversation, and in the pleadings which he published for his clients. He was also expensive in his habits, and was thus prevented from laying up any fortune for his family, whom his sudden and premature death placed in the most distressing situation. The bishop of Arras had formed, in his episcopal town, an establishment for the gratuitous education of a certain number of poor children, who might appear desirous of embracing the ecclesiastical profession. He was told of the two orphan sons of the late M. Robespierre, and he received them into his little seminary, adapted as it was for their improvement and instruction, besides affording consolation to the rest of this poor family. The elder Robespierre began with success his career among his schoolfellows; and at the end of some time he was sent by the care, and at the expense of the prelate, to the college of Louis the Great at Paris, there to complete his studies. The young man was here no less successful, and carried off several prizes at the annual competitions. But it was already remarked that his character was of that factious kind which afterwards turned out so fatal to his country. He, however, completed his youthful studies in a manner creditable to his talents and application, and at this period is said to have derived an attachment to republicanism from the lessons of one of his tutors, M. Hérivaux, who was an enthusiastic admirer of the heroes of ancient Greece and Rome. In 1775, when Louis XVI., after his accession to the crown, made his entry into Paris, Robespierre was deputed by his fellow-students to present their homage to the new sovereign. Having adopted the law as a profession, he became an advocate of the council of Artois; and previous to the revolution he was advantageously known, both on account of his professional abilities and the liberal and enlightened spirit which he exhibited in his conduct and writings. In 1789 he was elected a deputy from the *tiers état* of the province of Artois to the states-general. In that assembly he advocated the liberty of the press, and other popular topics of discussion; but his eloquence did not attract much attention, and he attached himself, in the first instance, so closely to Mirabeau, that he acquired the epithet of *Le Singe de Mirabeau*. At this time, however, he frequented the Jacobin assemblies and clubs of the lower orders, over whom he gained an ascendancy, of which he afterwards availed himself to make his way to despotic power. In January 1791 he spoke repeatedly on criminal legislation; and he subsequently displayed so much moderation in discussions relative to the emigrants and the priests, as led to suspicions that he was actuated by some secret motives. In a speech on the 30th of May he recommended the abolition of capital punishments. He is said to have been much alarmed at the flight of the king from Paris, and equally rejoiced at his forced return from Varennes; and from that period he seems to have used all his influence in overturning the monarchy. His projects now gradually became developed; and, at the tumultuary

meeting in the Champ de Mars, on the 17th of July, an altar with the inscription, *A celui qui a bien mérité de la Patrie*, and below it the name of Robespierre, testified his high favour with the people.

The closing of the constituent assembly afforded him another triumph, when the mob presented him with a garland of oak leaves, and, taking the horses from his carriage, drew him through the streets, exclaiming, "Behold the friend of the people, the great defender of liberty!" It does not appear that he actively interfered in the riot of the 10th of August, 1792, or in the massacres which took place in the prisons of Paris in the beginning of September; but he was connected with Marat and Danton, of whose crimes, and those of their associates, he had sufficient address to reap the fruits, and, like other tyrants, at length made his instruments his victims. After the execution of the king, in promoting which the Brissotins, or Girondists, co-operated with Robespierre and the Jacobins, the former were sacrificed to the ascendancy of the latter. The Hebertists, who had joined in this work of destruction, were the next victims to the jealousy of the dictator, who had no sooner sent them to the scaffold with the assistance of Danton and his friends, than he adopted measures for the ruin of that popular demagogue, whom he dreaded as his most dangerous rival. His next measure was to throw the imputation of atheism and irreligion on those whom he had destroyed, and to establish a species of religious worship. Barrère, by his direction, promulgated his new system of worship, and on the 8th of June, 1794, Robespierre in person celebrated what he termed "the feast of the Supreme Being."

His power seemed now to be completely established, and the reign of terror was at its height; but his cruel tyranny and mysterious denunciations had alarmed many of those who had been most intimately connected with him, and a conspiracy was formed for his destruction. At this critical juncture, far from acting with the decision which previously marked his conduct, he waited for the attack of his enemies, and secluded himself from the public for more than a month, during which period he is said to have been employed in preparing an elaborate defence of his conduct, to be delivered in the national convention, where he made his appearance for that purpose on the 26th of July, 1794. He was indirectly attacked by Bourdon de l'Oise; after which Vadier, Cambon, Billaud-Varennes, and several other members spoke against him. He now perceived the extent of his danger, and the ensuing night was passed in consultation with St. Just and others of his most intimate partisans; but their deliberations led to no decisive results. The next day, when they appeared in the convention, Tallien and Billaud openly accused Robespierre of despotism. A tumult ensued, and amidst cries of *A bas le tyran!* he in vain endeavoured to obtain a hearing. At length a decree of arrest was carried against him; and his brother, and his friends St. Just, Couthon, and Le Bas, were included in it. Robespierre was sent to the Luxembourg prison; but in the night he was set free by the keeper, and was conducted to the hall of the commune of Paris, where Henriot, commander of the national guard, Fleuriot, the mayor of Paris, and others of his creatures, had assembled forces for his defence.

This was the critical moment; but neither Henriot

nor Robespierre himself had spirit to head the mob and lead it against the convention. While they deliberated, their opponents proceeded to action. Barras and others having been appointed commissioners to direct the armed force of the metropolis, they without difficulty secured the persons of the fallen tyrant and his associates, who were all guillotined the next day, July the 28th, 1794. Robespierre endeavoured in vain to escape a public execution, by shooting himself with a pistol at the moment of his seizure; but he only fractured his lower jaw, and thus subjected himself to protracted suffering, which excited no compassion. Of the wretches who disgraced the revolution, Robespierre was the most notorious, but not the most infamous. He did not court the dregs of the people, like Marat; he amassed no money. He was politically insane; and was not, moreover, the author of all the enormities with which he has been charged. Among his colleagues of the committees, and especially those who were sent into the departments, many exercised cruelties which far exceeded their instructions. Those who contributed most to his overthrow, and were loudest in their accusations against him, had profited by his crimes, in which they were deeply involved; and, like the scapegoat of the Jews, he was charged with the sins of the whole nation, or rather of the Jacobin government. In the memorial from St. Helena, Napoleon is stated to have said that Robespierre displayed in his conduct more extensive and enlightened views than have been generally ascribed to him; and that he intended to re-establish order, after he had overturned the contending factions; but not being powerful enough to arrest the progress of the revolution, he suffered himself to be carried away by the torrent, as was the case with all before Napoleon himself, who engaged in a similar attempt. As a proof of this, the emperor asserted that, when with the army at Nice, he had seen in the hands of the brother of Maximilian Robespierre letters in which he expressed an intention to put an end to the reign of terror. On the whole, it is reasonable to conclude that something like principle and genuine enthusiasm guided this hateful and unhappy man in the first instance; but, wholly unable to govern the elements of wild disorder afloat around him, the characteristic cruelty of perplexed cowardice at length became his only instrument either of action or self-defence. However stimulated, his career exhibits one of the most signal instances of cruelty upon record. Among the published works of Robespierre are, "*Plaidoyer pour le Sieur Vissery*," in favour of the right of setting up electrical conductors against lightning; "*Discours couronné par la Soc. Roy. de Metz sur les Peines Infamantes*;" "*Eloge de Gresset*," in which the author displays an attachment to monarchical government and religious institutions; "*Eloge de François Dupaty*;" and a political journal, called "*Le Défenseur de la Constitution*." The "*Mémoires de Riouffe*," and the "*Papiers trouvés chez Robespierre*," &c., contain much curious information concerning him.

ROBINS, BENJAMIN, an eminent mathematician, who was born in the city of Bath in 1707. He received but a limited education, and it was entirely by his own industry that he acquired a sufficient amount of knowledge to enable him to become a teacher of mathematics. In 1742 he published a treatise on the new principles of gunnery, containing the result of a series of experiments which he had made

relative to the force of gunpowder and the resistance of the atmosphere. On the return of Commodore Anson, Mr. Robins was employed to draw up a narrative of the expedition: this work became one of the most popular works of the kind in our language. Mr. Robins became engineer-general to the East India company, and went out in that capacity, but died at Fort St. David, in July 1751.

ROBINSON, ANASTASIA, an accomplished musical performer, who was the daughter of a portrait painter in good practice. Her father had her instructed in music by the first masters of the period, at first only as an accomplishment, but afterwards it became her profession, as her father lost his sight, and was therefore for many years dependent on his daughter for support. She made her first appearance in public at the concerts in York Building, and her success was complete. Mrs. Delany, who was her friend and contemporary, thus describes her personal appearance, and the most interesting period of her life. She says, "Mrs. Anastasia Robinson was of a middling stature, not handsome, but of a pleasing, modest countenance, with large blue eyes. Her deportment was easy, unaffected and graceful, her manner and address very engaging, and her behaviour on all occasions that of a gentlewoman with perfect propriety. She was not only liked by all her acquaintance, but loved and caressed by persons of the highest rank, with whom she appeared always equal, without assuming. Her father's house in Golden Square was frequented by all the men of genius and refined taste of the times. Among the number of persons of distinction who frequented Mr. Robinson's house, and seemed to distinguish his daughter in a particular manner, were the earl of Peterborough and General H—: the latter had shown a long attachment to her, and his attentions were so remarkable that they seemed more than the effects of common politeness; and as he was a very agreeable man, and in good circumstances, he was favourably received, not doubting but that his intentions were honourable. A declaration of a very contrary nature was treated with the contempt it deserved, though Mrs. A. Robinson was very much prepossessed in his favour.

"Soon after this, Lord Peterborough endeavoured to convince her of his partial regard for her; but, agreeable and artful as he was, she remained very much upon her guard, which rather increased than diminished his admiration and passion for her. Yet still his pride struggled with his inclination; for all this time she was engaged to sing in public,—a circumstance very grievous to her; but, urged by the best of motives, she submitted to it in order to assist her parents, whose fortune was much reduced by Mr. Robinson's loss of sight, which deprived him of the benefit of his profession as a painter.

"At length Lord Peterborough made his declaration to her on honourable terms; he found it would be vain to make proposals on any other; and as he omitted no circumstance that could engage her esteem and gratitude, she accepted them, as she was sincerely attached to him. He earnestly requested her keeping it a secret till it was a more convenient time for him to make it known, to which she readily consented, having a perfect confidence in his honour. Among the persons of distinction that professed a friendship for Mrs. A. Robinson were the earl and countess of Oxford, daughter-in-law to the lord treasurer Oxford, who not only bore every public testi-

mony of their affection and esteem for Mrs. Robinson, but Lady Oxford attended her when she was privately married to the earl of Peterborough, and Lady Peterborough ever acknowledged her obligations with the warmest gratitude; and after Lady Oxford's death she was particularly distinguished by the duchess of Portland, Lady Oxford's daughter, and was always mentioned by her with the greatest kindness for the many friendly offices she used to do her in her childhood when in Lady Oxford's family, which made a lasting impression upon the duchess of Portland's noble and generous heart.

"Mrs. A. Robinson had one sister, a very pretty accomplished woman, who married Dr. Arbuthnot's brother. After the death of Mr. Robinson, Lord Peterborough took a house near Fulham, in the neighbourhood of his own villa at Parson's Green, where he settled Mrs. Robinson and her mother. They never lived under the same roof till the earl, being seized with a violent fit of illness, solicited her to attend him at Mount Bevis, near Southampton, which she refused with firmness but upon condition that, though still denied to take his name, she might be permitted to wear her wedding-ring; to which, finding her inexorable, he at length consented.

"His haughty spirit was still reluctant to the making a declaration that would have done justice to so worthy a character as the person to whom he was now united; and, indeed, his uncontrollable temper and high opinion of his own actions made him a very awful husband, ill suited to Lady Peterborough's good sense, amiable temper, and delicate sentiments. She was a Roman catholic, but never gave offence to those of a contrary opinion, though very strict in what she thought her duty. Her excellent principles and fortitude of mind supported her through many severe trials in her conjugal state. But at last he prevailed on himself to do her justice, instigated, it is supposed, by his bad state of health, which obliged him to seek another climate, and she absolutely refused to go with him unless he declared his marriage: her attendance upon him in his illness nearly cost her her life.

"He appointed a day for all his nearest relations to meet him at the apartment over the gateway of St. James's Palace, belonging to Mr. Pointz, who was married to Lord Peterborough's niece, and at that time preceptor to Prince William, afterwards duke of Cumberland. Lord Peterborough also appointed Lady Peterborough to be there at the same time. When they were all assembled, he began a most eloquent oration, enumerating all the virtues and perfections of Mrs. A. Robinson, and the rectitude of her conduct during his long acquaintance with her, for which he acknowledged his great obligations and sincere attachment, declaring he was determined to do her that justice which he ought to have done long ago, which was presenting her to all his family as his wife. He spoke this harangue with so much energy, and in parts so pathetically, that Lady Peterborough, not being apprized of his intentions, was so affected that she fainted away in the midst of the company.

"After Lord Peterborough's death she lived a very retired life, chiefly at Mount Bevis, and was seldom prevailed on to leave that habitation but by the duchess of Portland, who was always happy to have her company at Bulstrode when she could obtain it, and often visited her at her own house.

"Among Lord Peterborough's papers she found

his memoirs, written by himself; in which he declared he had been guilty of such actions as would have reflected very much upon his character; for which reason she burnt them. This, however, contributed to complete the excellency of her principles, though it did not fail giving offence to the curious inquirers after anecdotes of so remarkable a character as that of the earl of Peterborough."

ROBINSON, SIR CHRISTOPHER, was born in 1766, and educated at Magdalen college, Oxford, with the intention of entering the church; however, he changed his mind and chose that of the bar instead. Having entered on his new studies, he, by the advice of Sir William Scott, commenced a series of reports in the high court of admiralty: the first appeared in 1797, and the last in 1808. Though unproductive in a pecuniary sense, and in some years attended with positive loss to the editor, they were of exceeding value to him in extending his connexions. He had the year before advanced his fortune by a marriage with Catharine, daughter of Ralph Nicholson, Esq., a gentleman of independent property at Liverpool, and descended from an old family in Berkshire. In February 1805, nine years after his admission, he was promoted to the lucrative office of king's advocate, and knighted. Many of the prize causes and captures of which he had the management by virtue of his office, were of great importance to the public, and attended with considerable private emolument, several of them realizing to him more than 1000*l*. In 1812 he is said to have acquitted himself exceedingly well in the conduct of a prosecution against the marquis of Sligo, for enticing seamen and persuading them to desert from the king's service. It appeared that two of them had been intoxicated by the marquis's servants at Malta, and inveigled on board his yacht; and when the vessel was searched the marquis of Sligo pledged his honour that they were not on board. The king's advocate warmed into an orator (he was not one by nature) at this unworthy cheat; and the peer being found guilty, was sentenced to pay a fine of 5000*l*. and to be imprisoned four months in Newgate. In 1818, at the request of ministers, but contrary to his own inclination, he obtained a seat in parliament for the close borough of Callington. On the dissolution of parliament in 1820 he was again returned for Callington, at the instance of government; but a petition being presented against the return, and bribery having been proved against his agents, he was unseated and saddled with an expense of 5000*l*. Sir Christopher Robinson succeeded Lord Stowell in the offices of chancellor of the diocese of London, and judge of the prerogative court and court of peculiars, on the presentation of the archbishop of Canterbury and bishop of London. He trod in the path of his predecessor, and emulated with success his patient diligence and ever-watchful accuracy in determining the grave and delicate questions of marriage and divorce. Owing to the increasing infirmities of Lord Stowell, he undertook for several years to transcribe and read in court the decrees of that venerable judge, and at length, on his retirement in 1827, was called upon to fill the vacant seat in the court of admiralty. Sir Christopher presided over the admiralty court in a period of profound peace, when there were no cases of momentous interest involving the credit of the flag of England and the polity of nations, such as are wont to present themselves in a time of war. They consisted chiefly

of claims of salvage and mariners' wages, and construction of the pilot act, and to what officer properly belong the royal fish described by charter, to wit, "sturgeons, grampuses, whales, porpoises, dolphins, riggs, graspes, and generally whatever other fish, having in themselves great and immense size, or fat." Such topics do not require much research or legal acumen, but all that was requisite they obtained at the hands of this pains-taking judge. His mental energies were of late in some degree dulled by a disease, which proved to be an effusion of water on the brain, and terminated fatally on the night of Sunday, April 21, 1833. He had complained of indisposition, which was attributed to the prevailing influenza, and retired to rest a few hours before his death, in the full expectation of being able on the morrow to resume the duties of his office. He had attained his sixty-seventh year. His remains were interred in the churchyard of St. Benedict, Doctors' Commons.

The work which has been already referred to proves that the subject of this brief notice was a good classical scholar, and well versed in modern languages. He published, in addition, "A Report of the Judgment of the High Court of Admiralty on the Swedish Convoy, pronounced by Sir W. Scott, June 11th, 1790;" "A Translation of the Chapters 273 and 287 of the *Consolato del Mare*, relating to the Prize Law," 1800; and "Collectanea Maritima; being a Collection of Public Instruments tending to illustrate the History and Practice of Prize Law," 1801.

ROBINSON, JOHN, a celebrated minister of the English church in Holland, to which the first settlers of New England belonged. He was born in Great Britain in 1575, and educated at Cambridge. He for some time held a benefice in the established church, but in 1602 became pastor of a dissenting congregation in the north of England, and in consequence of persecution went with them to Holland in 1608. After a short residence at Amsterdam they removed to Leyden. His talents and reputation were such that he held a public disputation with Episcopius in 1613. A part of his church emigrated to Plymouth in 1620, and it was his intention to follow them with the remainder; but his sudden death, in March 1623, prevented it. He was distinguished for learning, liberality, and piety.

ROBINSON, MARY, a female whose great personal beauty, combined with some literary as well as histrionic talent, procured her, in the latter part of the last century, a degree of attention much increased by the notoriety of a temporary connexion established between her and the then heir-apparent. Mrs. Robinson was married very early in life to a husband who had but little to maintain her, and for some time she shared in his misfortunes; but at length she had recourse to the stage; and while performing the character of Perdita in Shakspeare's "Winter's Tale," captivated the youthful affections of the distinguished personage already alluded to. This connexion lasted about two years. After a short recess from a mode of life into which her "Apologies" tell us she was driven by necessity, she formed another connexion of the same kind, which they allow was from choice, with a gentleman of the army, and lavished the whole of her disposable property on this new favourite. She also lost the use of her limbs in following him, during a severe winter night, to a sea-port where she hastened to relieve him from a temporary embarrassment. Not long after she went to the continent for her health.

and remained there about five years. On her return in 1788 she commenced her literary career, in which she had considerable success. In 1800 her health began to decline rapidly, principally for want of proper exercise, for she never recovered the use of her limbs; and after lingering for some time, she died at Englefield Green, on the 28th of December in that year, and was buried in Old Windsor churchyard. The following is a list of her publications: "Poems," in two volumes; "Legitimate Sonnets, with Thoughts on Poetical Subjects, and Anecdotes of the Grecian Poetess Sappho;" "A Monody to the Memory of the Queen of France;" "A Monody to the Memory of Sir Joshua Reynolds;" "Modern Manners, a Satire, in two Cantos;" "The Sicilian Lover, a Tragedy, in five acts;" "Sight, The Cavern of Woe, and Solitude, three Poems;" a pamphlet in vindication of the queen of France, published without a name; A pamphlet entitled "Thoughts on the Condition of Women, and the Injustice of Mental Subordination;" "Vicenza," a romance; "The Widow," a novel; "Angelina," a novel; "Hubert de Sevrac," a romance; "Walsingham," a novel; "The False Friend," a novel; "The Natural Daughter;" "Lyrical Tales;" "A Picture of Palermo, Translated from Dr. Hager;" "The Lucky Escape;" and "Nobody," a comedy. Of all the above works, it is probable that her poems will longest continue to be read. She had in her earliest efforts of this kind adopted the false style of the Della Crusca school, so happily ridiculed by the author of the "Baviad" and "Mæviad;" but her later productions displayed a more correct taste, and more ease and elegance of versification, with equal richness of imagination.

ROBINSON, ROBERT, an eminent dissenting divine, who was born in Norfolk in 1735, and educated at a grammar-school in his native county; but owing to the loss of his father and the humble circumstances of his mother, he was apprenticed at the age of fourteen to a hair-dresser in London. Having attached himself to George Whitefield, he became a preacher among the Calvinistic Methodists, but subsequently relinquished his connexion with the Methodists and established an independent congregation at Norwich, over which he presided. He was afterwards chosen pastor to a small Anabaptist congregation at Cambridge, and retained this situation during the remainder of his life. In 1773 he removed to Chesterton, near Cambridge, where he engaged in trade as a farmer, corn-dealer, and coal-merchant. His learning and abilities procured him much respect from the members of the university and other persons belonging to the established church; and he received offers of promotion if he would become a conformist, which he declined. In 1774 he published a translation of the sermons of Saurin, with memoirs of the reformation in France, and the life of Saurin. In 1776 was published his "Plea for the Divinity of Jesus Christ," &c. Among his other works are his "Plan of Lectures on Nonconformity," "The General Doctrine of Toleration," "Slavery Inconsistent with Christianity," and "Sixteen Discourses," which had been delivered extempore to illiterate audiences in the vicinity of Cambridge. These were very liberal on doctrinal points; and his tendency to unitarian principles soon became known, although he still continued his ministerial labours at Cambridge. He died in 1790, in the fifty-fifth year of his age.

ROBINSON, THOMAS, a theological writer, who was born in 1749 at Wakefield, in Yorkshire. After receiving the rudiments of a good education in his native town, he removed to Trinity college, Cambridge, where he obtained a fellowship in 1772. He was the author of several devotional works, the principal of which was called "The Christian System Unfolded." He died in 1813 in Leicester, at which town he had held a living for thirty-five years.

ROB-ROY, or ROBERT THE RED, a celebrated Highland chief, whose true name was Robert Macgregor, but who assumed that of Campbell on account of the outlawry of the clan Macgregor by the Scotch parliament in 1662. He was born about 1660. His mother was a Campbell of Glenlyon, and his wife, Helen, a Campbell of Glenfalloch. Like many other Highland gentlemen, Rob-Roy was a drover previous to the rebellion of 1715, in which he joined the adherents of the pretender. On the suppression of the rebellion the duke of Montrose, with whom Rob-Roy had previously had a quarrel, took the opportunity to deprive him of his estates; and the latter began to indemnify himself by a war of reprisals upon the property of the duke. An English garrison was stationed at Inversnaid, near Aberfoyle, the *clachan* residence of Rob-Roy; but his activity and courage saved him from the hands of his enemies, from whom he continued for some time to levy black-mail. He died in 1743. His fortunes and those of his clan form the subjects of the popular romance of "Rob-Roy."

ROBSON, GEORGE FENNEL, a talented English artist, who was a native of Durham, and at a very early age displayed his love for painting, all his leisure being devoted to the improvement of his peculiar talent. If an artist visited Durham for the purpose of sketching its beautiful and romantic scenery, George Robson was to be found hanging on his footsteps, walking by his side, and eagerly watching the progress of his labours. At length he was put under Mr. Harle, the only drawing-master the city furnished; but he refused to take money for the lessons he gave, saying the boy had already got beyond his instruction. Before he was twenty he came to London, and was soon known as a most active and persevering student. His first publication was a view of his native city, the profits of which enabled him to visit the Highlands of Scotland—a visit which he had long ardently desired. In the habit of a shepherd, with a wallet at his back, and Scott's poem, "The Lay of the Last Minstrel," in his pocket, he wandered over the mountains winter and summer, till he became familiar with the various aspects they presented under the different changes of season, and laid up a stock of materials which lasted him his life. On his return he published outlines of the Grampian mountains.

In 1813 he first appeared as an exhibitor in the ninth annual exhibition of the society of painters in water-colours, and was elected a member the following year. But it was not till the exhibition of 1815 that his works commanded that public attention which gained for him extensive and abundant patronage. From this time his interests became identified with the interests of the society. All his private cares, all his public exertions, were directed into this one channel. He laboured hard and effectively.

As an artist Mr. Robson was remarkable for vigour of execution. His conception of form might be sometimes wanting in grandeur, but his effect and colour

licentious merriment which wine incites, his companions eagerly encouraged him in excess, and he willingly indulged, till, as he confessed to Dr. Burnet, he was for five years together "continually drunk," or so much inflamed by frequent ebriety, as in no interval to be master of himself. "In this state he played many frolics, which it is not for his honour that we should remember, and which are not now distinctly known. He often pursued low amours in mean disguises, and always acted with great exactness and dexterity the characters which he assumed; indeed, he once erected a stage on Tower Hill and harangued the populace as a mountebank, and, having made physic part of his study, is said to have practised it successfully. Rochester was so much in favour with King Charles that he was made one of the gentlemen of the bedchamber and comptroller of Woodstock Park. Having an active and inquisitive mind he never, except in his paroxysms of intemperance, was wholly negligent of study; he read what is considered as polite learning so much that he is mentioned by Wood as the greatest scholar of all the nobility. Sometimes he retired into the country, and amused himself with writing libels in which he did not pretend to confine himself to truth. His favourite author in French was Boileau, and in English, Cowley."

"Thus," observes Dr. Johnson, "in a course of drunken gaiety and gross sensuality, with intervals of study perhaps yet more criminal, with an avowed contempt of all decency and order, a total disregard to every moral, and a resolute denial of every religious obligation, Rochester lived worthless and useless, and blazed out his youth and his health in lavish voluptuousness, till, at the age of one and thirty, he had exhausted the fund of life and reduced himself to a state of weakness and decay. At this time he was led to an acquaintance with Dr. Burnet, to whom he laid open, with great freedom, the tenour of his opinions and the course of his life, and from whom he received such conviction of the reasonableness of moral duty, and the truth of Christianity, as produced a total change both of his manners and opinions. The account of these salutary conferences is given by Burnet in a book entitled "Some Passages of the Life and Death of John, Earl of Rochester," which the critic ought to read for its elegance, the philosopher for its arguments, and the saint for its piety."

The work which Johnson thus strongly eulogises deserves all the praise he has given it, and, as the labours of Burnet really led the way to the reformation of this dissolute nobleman, we cannot do better than narrate them in his own words. He says "The three chief things we talked about were morality, natural religion, and revealed religion, Christianity in particular. For morality, he confessed, he saw the necessity of it both for the government of the world, and for the preservation of health, life, and friendship, and was very much ashamed of his former practices, rather because he had made himself a beast, and had brought pain and sickness on his body, and had suffered much in his reputation, than from any deep sense of a Supreme Being or another state. But so far this went with him that he resolved firmly to change the course of his life, which he thought he should effect by the study of philosophy, and had not a few no less solid than pleasant notions concerning the folly and madness of vice. But he confessed that he had no remorse for his past actions as

BIOGRAPHY.—VOL. II.

offences against God, but only as injuries to himself and to mankind. Upon this subject I showed him the defects of philosophy for reforming the world. That it was a matter of speculation which but few either had the leisure or the capacity to enquire into; but the principle that must reform mankind must be obvious to every man's understanding. That philosophy, in matters of morality, beyond the great lines of our duty, had no very certain fixed rule, but, in the lesser offices and instances of our duty, went much by the fancies of men and customs of nations, and, consequently, could not have authority enough to bear down the propensities of nature, appetite, or passion; for which I instanced in these two points; the one was about that maxim of the Stoics, to extirpate all sort of passion and concern for anything. That, take it by one hand, seemed desirable, because, if it could be accomplished, it would make all the incidents of life easy; but I think it cannot, because nature, after all our striving against it, will still return to itself; yet, on the other hand, it dissolved the bonds of nature and friendship, and slackened industry, which will move but dully without an inward heat, and, if it delivered a man from any troubles, it deprived him of the chief pleasures of life, which arise from friendship. The other was concerning the restraint of pleasure, how far that was to go. Upon this he told me the two maxims of his morality then were, that he should do nothing to the hurt of any other, or that might prejudice his own health; and he thought that all pleasure, when it did not interfere with these, was to be indulged as the gratification of our natural appetites. It seemed unreasonable to imagine these were put into a man only to be restrained or curbed to such a narrowness; this he applied to the free use of wine and women.

"To this I answered, that if appetites being natural was an argument for the indulging them, then the revengeful might as well allege it for murder, and the covetous for stealing, whose appetites are no less keen on those objects, and yet it is acknowledged that these appetites ought to be curbed. If the difference is urged from the injury that another person receives, the injury is as great if a man's wife is defiled or his daughter corrupted; and it is impossible for a man to let his appetites loose to vagrant lusts, and not to transgress in these particulars, so there was no curing the disorders that must arise from thence but by regulating these appetites. And why should we not as well think that God intended our brutish and sensual appetites should be governed by our reason as that the fierceness of beasts should be managed and tamed by the wisdom and for the use of man? So that it is no real absurdity to grant that appetites were put into men on purpose to exercise their reason in the restraint and government of them, which to be able to do ministers a higher and more lasting pleasure to a man than to give them their full scope and range. And, if other rules of philosophy be observed, such as the avoiding those objects that stir passion, nothing raises higher passions than ungoverned lust; nothing darkens the understanding and depresses a man's mind more; nor is any thing managed with more frequent returns of other immoralities, such as oaths and imprecations, which are only intended to compass what is desired: the expense that is necessary to maintain these irregularities makes a man false in his other dealings. All this he freely confessed was true; upon which I urged

3 E

that if it was reasonable for a man to regulate his appetite in things which he knew were hurtful to him, was it not as reasonable for God to prescribe a regulation of those appetites whose unrestrained course did produce such mischievous effects? That it could not be denied, but doing to others what we would have others do unto us was a just rule: those men, then, that knew how extremely sensible they themselves would be of the dishonour of their families in the case of their wives or daughters, must needs condemn themselves for doing that which they could not bear from another; and if the peace of mankind, and the entire satisfaction of our whole life, ought to be one of the chief measures of our actions, then let all the world judge whether a man that confines his appetite, and lives contented at home, is not much happier than those that let their desires run after forbidden objects. The thing being granted to be better in itself, then the question falls between the restraint of appetite in some instances, and the freedom of a man's thoughts, the soundness of his health, his application to affairs, with the easiness of his whole life; whether the one is not to be done before the other? As to the difficulty of such a restraint, though it is not easy to be done when a man allows himself many liberties in which it is not possible for him to stop, yet those who avoid the occasions that may kindle these impure flames, and keep themselves well employed, find the victory and dominion over them no such impossible or hard matter as may seem at first view; so that, though the philosophy and morality of this point were plain, yet there is not strength enough in that principle to subdue nature and appetite. Upon this I urged that morality could not be a strong thing unless a man were determined by a law within himself; for, if he only measured himself by decency, or the laws of the land, this would teach him only to use such cautions in his ill practices, that they should not break out too visibly, but would never carry him to an inward and universal probity; that virtue was of so complicated a nature, that unless a man came entirely within its discipline he could not adhere steadfastly to any one precept, for vices are often made necessary supports to one another; that this cannot be done, either steadily or with any satisfaction, unless the mind does inwardly comply with, or delight in, the dictates of virtue; and that could not be effected except a man's nature were internally regenerated and changed by a higher principle: till that came about corrupt nature would be strong and philosophy but feeble, especially when it struggled with such appetites or passions as were much kindled or deeply rooted in the constitution of one's body.

"When I pressed him with the secret joys that a good man felt, particularly as he drew near death, and the horrors of ill men, especially at that time, he was willing to ascribe it to the impressions they had from their education; but he often confessed that, whether the business of religion was true or not, he thought those who had the persuasions of it, and lived so that they had quiet in their consciences, and believed God governed the world, and acquiesced in his providence, and had the hope of an endless blessedness in another state, the happiest men in the world, and said he would give all that he was master of to be under those persuasions, and to have the supports and joys that must needs flow from them. I told him the main root of all corruptions in men's

principles was their ill life, which, as it darkened their minds and disabled them from discerning better things, so it made it necessary for them to seek out such opinions as might give them ease from those clamours that would otherwise have been raised within them. He did not deny but that after the doing of some things he felt great and severe challenges within himself, but he said he felt not these after some others which I would perhaps call far greater sins than those that affected him more sensibly. This, I said, might flow from the disorders he had cast himself into, which had corrupted his judgment and vitiated his taste of things, and by his long continuance in, and frequent repeating of, some immoralities, he had made them so familiar to him that they were become, as it were, natural; and then it was no wonder if he had not so exact a sense of what was good or evil, as a feverish man cannot judge of tastes. He did acknowledge the whole system of religion, if believed, was a greater foundation of quiet than any other thing whatsoever; for the quiet he had in his mind was, that he could not think so good a being as the Deity would make him miserable."

Our space will not permit us to trace this interesting discussion to the point where the licentious materialist, and debauched courtier, became convinced of the error of his ways, and a firm believer in the truths of Christianity; and it may be enough that we add his own written declaration to that effect. It was signed a few days prior to his death, which took place July 26th, 1680.

"For the benefit of all those whom I may have drawn into sin by my example and encouragement, I leave to the world this my last declaration, which I deliver in the presence of the great God, who knows the secrets of all hearts, and before whom I am now appearing to be judged. That, from the bottom of my soul, I detest and abhor the whole course of my former wicked life; that I think I can never sufficiently admire the goodness of God, who has given me a true sense of my pernicious opinions and practices, by which I have hitherto lived without hope and without God in the world; have been an open enemy to Jesus Christ, doing the utmost despite to the Holy Spirit of grace. And that the greatest testimony of my charity to such is, to warn them, in the name of God, and, as they regard the welfare of their immortal souls, no more to deny his being, or his providence, or despise his goodness; no more to make a mock of sin, or condemn the pure and excellent religion of my ever blessed Redeemer, through whose merits alone, I, one of the greatest sinners, yet hope for mercy and forgiveness. Amen."

ROCKINGHAM, CHARLES WATSON WENTWORTH, MARQUIS OF.—This nobleman was born in 1730, and succeeded his father in his titles and estates in 1750, and in 1765 became first lord of the treasury and prime minister. American affairs formed at that time a leading subject of discussion, and Rock-

ingham took the middle way of repealing the stamp act, and declaring the right of Great Britain to tax the colonies. He was therefore deserted by some of his supporters, among others by Chatham, and retired from the ministry in 1766. He afterwards acted in concert with Chatham, in opposition to the North ministry, on the fall of which, in 1782, he was again placed at the head of the treasury, but died in the same year, and was succeeded by Lord Shelburne.

RODNEY, CÆSAR, a celebrated American patriot, who was born at Dover, Delaware, about the year 1730. His father went over to that country with William Penn, and, after a short residence in Philadelphia, settled in Kent, a county upon the Delaware. His eldest son, the subject of this sketch, inherited from him a large landed estate in consequence of the system of entail then in use. At the age of twenty-eight years Cæsar Rodney was appointed high-sheriff, and, on the expiration of his term of service, was created a justice of peace and a judge of the lower courts. In 1762, and perhaps even earlier, he represented his county in the provincial legislature, by which, in 1765, he was sent, in conjunction with Mr. M'Kean and Mr. Kollock, to the congress that met at New York for the purpose of consulting upon the measures to be adopted in consequence of the stamp act, and other oppressive acts of the British government. In 1769 he was elected speaker of the house of representatives, and continued to occupy the chair for several years. About the same time he was appointed chairman of the committee of correspondence with the other colonies; and when, in 1774, the combined efforts of the various committees had brought about the measure of a general congress, he was chosen one of the delegates to it from his native province. He was re-elected in the following year, and also made a brigadier-general in the colony. At the time when the question of independence was brought before congress, Mr. Rodney was on a tour through the southern part of Delaware for the purpose of quieting the discontent prevalent in that quarter of the country, and preparing the minds of the people for a change of their government. His two colleagues, Mr. M'Kean and Mr. Read, were divided upon the subject, the former being favourable, the latter opposed to a declaration of independence. Mr. M'Kean, being acquainted with the views of Mr. Rodney, despatched an express, at his private expense, to inform him of the delicate posture of affairs, and urge him to hasten his return to Philadelphia. He did so immediately, and, by great exertion, arrived just as the members were entering the house for the final discussion. He entered the hall with his spurs on his boots, and soon afterwards the great question was put. By his vote in the affirmative he secured that union among the colonies in the matter which was all-important to the cause of independence.

In the autumn of 1776 a convention was called in Delaware for the purpose of framing a new constitution and appointing delegates to the succeeding congress. In this assembly a majority was opposed to Mr. Rodney, who failed, in consequence, in obtaining a re-election. This circumstance was principally attributable to the royalists, who abounded especially in the lower counties. Mr. Rodney, however, still continued a member of the council of safety, and of the council of inspection, the functions of both of which offices he assiduously discharged, being particularly active in collecting supplies for the

troops of the state, then with Washington in New Jersey. In 1777 he repaired in person to the camp near Princeton, where he remained for nearly two months engaged in laborious services. In the autumn of the same year he was again chosen a member of congress, but before taking his seat he was chosen president of his state. In this station he remained for four years, during which he had frequent communications from Washington relative to the distressed condition of the army, and exerted his utmost ability in affording aid. In 1782 he was compelled to retire by the delicate state of his health, and died in 1783.

RODNEY, GEORGE BRYDGES, BARON.—This brave naval commander was born in Somersetshire, in 1717, of a good family. His father was a naval captain, and had his son educated for the same profession. He obtained a ship in 1742, and two years after he was appointed to the command of the Ludlow Castle of forty-four guns. He did not, however, long remain in that vessel, for in 1746 he was made captain of the *Eagle*, a new ship of sixty guns, then employed as a cruiser on the Irish station. While there he captured two large privateers. He continued in the *Eagle* during the remainder of the war, and was one of the commanders under the orders of Rear-admiral Hawke, when, in 1747, he defeated L'Etendiere's squadron. On this occasion Captain Rodney behaved with much spirit, and may be said to have then laid the foundation of that popularity he afterwards in so high a degree possessed. On the conclusion of the war he was, in March, 1749, appointed to the *Rainbow*, a fourth rate, and in May following was nominated governor and commander-in-chief in and over the island of Newfoundland. Immediately afterwards he proceeded thither with the small squadron annually sent there in time of peace for the protection of the fishery.

In 1757 he was engaged, under the command of Admirals Hawke and Boscawen, to attempt a descent on the coast of France, near Rochefort; and in 1759 he was advanced to rear-admiral of the blue. In this same year he was sent to bombard Havre de Grace, where a large force was collected for the purpose of attempting an invasion of this country. He executed the trust committed to him so completely that the town itself was several times on fire, and the magazines of stores and ammunition burnt with fury upwards of six hours, notwithstanding the exertions used to extinguish it. In 1761 Admiral Rodney was very instrumental in the capture of the islands of St. Pierre, Granada, St. Lucia, and St. Vincent, when the whole Caribbees came into the possession of the English. For his skill and bravery in the war, he was, after the conclusion of it, raised to the dignity of a baronet. In the month of October 1770 he was progressively advanced to be vice-admiral of the white and red squadrons, and, in the month of August 1771, to be rear-admiral of Great Britain. In the very early part of this year he resigned the mastership of Greenwich hospital, to which he had been appointed in 1765, and was immediately after made commander-in-chief on the Jamaica station, whither he repaired, having his flag on board the *Princess Amelia* of eighty guns. The appointment of this ship to that service was intended as a particular and pointed compliment, it being extremely unusual to send a three-decked ship on that station, except in time of actual war. It is said that the command in India

was offered to him, which he declined, entertaining hopes of being appointed governor of Jamaica in case of the death of Sir William Trelawney; but in this he was disappointed. After his return to England, at the expiration of the time allotted for the continuance of his command, he retired to France, where he lived some years in obscurity, hoping to retrieve the losses he had suffered at the Northampton election when he got into parliament, but with a great pecuniary loss. It is said that the French king wished to take advantage of his pecuniary embarrassments, and, through the duke de Biron, made him the most unbounded offers if he would quit the English for the French service. In reply to this proposal he said, "My distresses, Sir, it is true, have driven me from the bosom of my country, but no temptation can estrange me from her service. Had this offer been voluntary on your part, I should have deemed it an insult, but I am glad to learn it proceeds from a source that can do no wrong." Before this event the French had united with the Americans in a war against this country, and about the close of 1779 the chief command of the Leeward Islands was given to Sir George Rodney, upon which he hoisted his flag on board the *Sandwich*. From this time he was very successful against his majesty's enemies. In the first year he obtained a vote of thanks from the house of lords and the freedom of the cities of London and Edinburgh; but his great triumph was on the 12th of April, 1782, in an engagement in the West Indies with Count de Grasse.

After the fall of St. Kitt's, in 1782, Great Britain retained, of all her former West India possessions, only the islands of Jamaica, Barbadoes, St. Lucie, and Antigua; and of the preservation of these, great doubts were entertained. Jamaica, in particular, which had been frequently threatened, now appeared to be in greater danger than ever: for, whilst the count de Grasse was riding superior in the Caribbean sea, the Spaniards were in great strength at Cuba and Hispaniola; and the fleets of the two nations, if combined, would have consisted of sixty ships of the line, while their land forces would have constituted a powerful army.

In this state of things, Sir George Rodney arrived at Barbadoes on the 19th of February, with twelve sail of the line, and made a junction with Sir Samuel Hood's squadron. He was soon after reinforced by three ships of the line from England; so that his fleet consisted of thirty-six vessels of the line. His first object was to intercept a French convoy, which had sailed from Brest on the 11th of February, with naval stores, artillery, ammunition, and other supplies for the count de Grasse; but being disappointed in this, he put into St. Lucie, while the count was lying at Martinico, with thirty-four ships of the line, studious to avoid an engagement till he had effected a junction with the Spaniards. For that purpose he sailed from Fort Royal Bay on the 8th of April, with a large convoy, keeping close under the islands. Intelligence of this movement being directly conveyed to the British admiral, a pursuit was instantly begun, and the fleets came in sight of each other the same night off Dominica. So sudden a pursuit was as little expected by the French admiral as it was welcome; but he lost no time in accommodating himself to the emergency, and early in the morning of the 9th formed the line of battle to windward, to afford his convoy an opportunity of proceeding on its course.

On the other hand, Sir George Rodney had thrown out signals, soon after five in the morning, for forming his line; but the fleet was long becalmed under the highlands of Dominica, while the enemy, who were farther advanced towards Guadaloupe, had sufficient wind for their movements. The breeze at length reaching the van of the British fleet, they began to close with the French centre, whilst their own centre and rear were still becalmed. The action commenced about nine o'clock; the attack being led by the *Royal Oak*, Captain Burnet, and seconded by the *Alfred* and *Montague*, with the most impetuous bravery. The whole division was in a few minutes closely engaged, and for upwards of an hour was exceedingly pressed by the great superiority of the enemy. The *Barfleur*, Sir Samuel Hood's own ship, had at one time seven, and generally three ships firing upon her, and none of the division escaped the encounter of a very disproportionate force. At length, the leading ships of the centre were gradually enabled to come up to the assistance of the van, and these were soon followed by Sir George Rodney in the *Formidable*, with his two seconds, the *Namus* and *Duke*, all of ninety guns, who maintained a most tremendous fire. The gallantry of a French captain of a seventy-four in the rear, who, having backed as main-topsail, readily received and bravely returned the fire of these three great ships in succession, without in the least flinching from his station, excited the highest admiration and applause of his enemies. The coming up of the admiral, with part of the centre division, rendered the fight less unequal; and De Grasse, to prevent its now becoming decisive, availed himself of his command of the wind, and the connected state of his fleet, to keep such a cautious distance during the remainder of the engagement as he thought would enable him to do much execution without any considerable hazard on his own side. This sort of firing, which was extremely well supported on both sides, was continued for an hour and three quarters longer; during all which time the rest of the fleet was held back by the calms and baffling winds under Dominica. About twelve o'clock the remaining ships of the centre came up, and the rest was closing the line; upon which De Grasse withdrew his fleet, and evaded all the efforts of the English commander for its renewal. The enemy failed entirely in his object; for his ships received much more damage than they produced to their opponents, and two of them were so much disabled that they were obliged to quit the fleet and put into Guadaloupe. Some of the British ships suffered greatly, but still kept the line. Captain Bayne, of the *Alfred*, gallantly fell in this action.

On the 11th the enemy had gained such a distance that the body of their fleet could only be descried from the mast-head of the British centre, where two of their damaged ships were perceived, about noon, to fall off from the rest to leeward. The pursuit now became so vigorous that they would necessarily have been cut off, had not De Grasse borne down with his whole fleet to their rescue; and the result was to bring on that general engagement which had been the object of the British commander. The hostile fleets met upon opposite tacks, and, in the course of the battle, which commenced about seven in the morning of the 12th, and was continued with unremitting fury till sunset, Sir George Rodney first practised the manœuvre, since attended with such

signal success, of breaking the enemy's line. In the early part of the engagement Admiral Drake, whose division led to action, gained the highest honour by the gallantry with which he received, and the effect with which he returned, the fire of the whole French line. His leading ship, the Marlborough, Captain Penny, was peculiarly distinguished. She received and returned, at the nearest distances, the first fire of twenty-three French ships of war, and had the fortune only to have three men killed and sixteen wounded: one proof, among a hundred others, of the ineffectual force of the French system of firing. The signal for close fighting had from the first been thrown out, and was, without a single exception, punctually observed. The line was formed at only a cable's length distance. The British ships, as they came up, ranged slowly along the enemy's line and close under their lee, where they gave and received a most tremendous fire. They were so near that every shot took effect, and the French ships being overcrowded with troops, the carnage in them was prodigious. Some opinion may be formed of the havoc made from the circumstance of the *Formidable*, Sir George Rodney's ship, having fired nearly fourscore broadsides; and it may be believed that she was not singular. The French stood and returned this fire with equal bravery, and both sides fought as if the fate and honour of their respective countries had been staked upon the issue of that single day. About noon Sir George Rodney made the movement already alluded to, and, supported by three other ships, broke through the enemy's line, about three ships short of the centre, where De Grasse commanded in the *Ville de Paris* of 112 guns. Being followed and supported by the ships astern of his division, he wore round upon his keel, and, completing their separation, threw them into inextricable confusion. This masterly push decided the fortune of the day; although the French continued to fight with great bravery till the darkness, which in those latitudes almost immediately succeeds the setting of the sun, obliged both parties to desist.

The broken state of the French fleet naturally exposed, in some instances, a few ships to the attack of a greater number; and the extent of the action, with the darkness and uncertainty occasioned by the smoke, afforded opportunities which might have been less expected for single combat. The *Canada* of seventy-four guns, Captain Cornwallis, took the French *Hector*, of the same force, singly. Captain Inglefield, in the *Centaur* of seventy-four guns, also came up from the rear to the attack of the *Cæsar* of seventy-four. Both ships were yet fresh and had received no injury, and a most gallant action took place; but though the French captain had evidently the disadvantage, he still disdained to yield. Three other ships came up successively. His courage was inflexible; he is said to have nailed his colours to the masts, and the contest terminated only with his death. When she struck, her masts went overboard, and she had not a foot of canvass without a shot-hole. The *Glorieux* also fought nobly, and did not strike till her masts, bowsprit, and ensign, were shot away. The English ship *Ardent* of sixty-four guns, which had been taken by the enemy in the beginning of the war, was now retaken by the *Belliqueux* or the *Bedford*. The *Diadem*, a French seventy-four, went down by a single broadside in an exertion to save her admiral. The count de Grasse was nobly sup-

ported, even after the line was broken, and till the disorder and confusion became unavoidable. His two seconds, the *Languedoc* and *Coronne*, were particularly distinguished, and the former narrowly escaped being taken in her last efforts to extricate the admiral. The *Ville de Paris*, after being much battered, was closely attacked by the *Canada*; and, in a desperate action of nearly two hours, was reduced almost to a wreck. Captain Cornwallis was so eager in his design upon the French admiral that, without taking possession of the *Hector*, he left her to be picked up by a frigate, while he proceeded to the *Ville de Paris*. It seemed as if the count was determined to sink rather than strike to any other than the admiral: though he perhaps also considered the fatal effects which the striking of his flag might produce on his fleet. At length Sir Samuel Hood came up in the *Barfleur*, almost at sunset, and poured in a most tremendous fire, which is said to have killed sixty men; but the count de Grasse, wishing to signalise as much as possible the loss of so fine and favourite a ship, endured the repetitions of this fire for about a quarter of an hour longer. He then struck his flag and surrendered himself to Sir Samuel Hood. With the *Ville de Paris* were taken four others of the line, one of which, the *Cæsar*, afterwards blew up, with a lieutenant and fifty British seamen aboard, and about 400 prisoners; and another was sunk by a single broadside during the engagement. Not a ship was lost in the British fleet, and its whole loss of men was computed to be less than that on board the *Ville de Paris* alone. A barony and a pension of 2000*l.* per annum were the rewards which were bestowed on him by his country for services of such importance, and at his death, which took place in 1792, a monument was voted to his memory at the national expense, which was subsequently placed in the north transept of St. Paul's cathedral. A view of this monument is given in the subjoined engraving.

RODOLPH I., emperor of Germany and founder of the imperial house of Austria, was born in 1218,

being the eldest son of Albert IV., count of Hapsburg, and landgrave of Alsace. He was brought up in the court and camp of the emperor Frederic II., and, on the death of his father, succeeded to territories of a very moderate extent, which, in the spirit of the times, he sought to augment by military enterprises. In 1245 he married a daughter of the count of Homburg, by whom he acquired an accession of territory, and some years after served under Ottocar, king of Bohemia, against the pagan Prussians. Several years of active warfare ensued, in which he much distinguished himself by his prudence, valour, and the spirit of justice with which he protected the inhabitants of the towns from their baronial oppressors. In 1273, as he was encamped before the walls of Basle, he received the unexpected intelligence that he was elected king of the Romans, and emperor, in preference to Alphonso, king of Castile, and Ottocar, king of Bohemia. Rodolph, then in his fifty-fifth year, willingly accepted the proffered elevation, and being crowned at Aix-la-Chapelle, immediately strengthened himself by marrying two of his daughters to the count palatine of Bavaria and the duke of Saxony. He also took measures to ingratiate himself with Pope Gregory X., who induced the king of Castile to withdraw his pretensions. The king of Bohemia, however, at that time one of the most powerful princes in Europe, persisted in his opposition, and a war ensued, in which he was defeated and compelled to sue for peace and agree to pay homage. Stung by this disgrace the Bohemian king broke the treaty in 1277, and the following year Ottocar was again defeated and slain. By the treaty with his successor, which followed, Rodolph was to hold Moravia for five years, and retain the Austrian provinces which had been previously yielded by Ottocar, and the securing of which to his family was henceforward his primary object. After some abortive attempts to restore the influence of the empire in Tuscany, he contented himself with drawing large sums from Lucca and other cities for the confirmation and extension of their privileges. No foreign foe remaining, he assiduously employed himself to restore peace and order to Germany, and wisely put down the private fortresses, which served as a retreat to banditti and to ferocious nobles. For these and other eminent services in the same spirit he obtained the title of "a living law," and was regarded as a second founder of the German empire.

He subsequently engaged in war with the counts of Savoy and of Burgundy, and delivered the young king of Bohemia from the captivity to which he had been subjected by the regent Otho, and married him to one of his daughters. The final object of the emperor was to secure the imperial succession to his son Albert; but the electors, jealous of the rapid rise of the family, could not be made to concur, and Rodolph felt the disappointment severely. He had, however, laid a permanent foundation for the prosperity of his race; and after a reign of nineteen years, expired in July, 1291, in the seventy-third year of his age. There is scarcely an excellency, either of body or mind, which the biographers of the house of Austria have not attributed to its founder; and he appears to have merited no small portion of their panegyric. Few princes have surpassed him in energy of character and in civil and military talents. He was personally brave, almost to rashness, indefatigable, simple and unaffected in his manners, affable,

and magnanimous. In the beginning of his career he seems to have shared in the usual license of the period in pursuit of aggrandizement; but, as an emperor, he has been considered, for the most part, as equitable and just as he was brave and intelligent.

RÖDERER, PIERRE LOUIS, COUNT, was born at Metz in 1754. He became counsellor of the parliament of Metz before the revolution; and in 1789 he was chosen deputy to the constituent assembly. A high reputation for talents preceded him, which was justified by the eloquence of his speeches on the most important questions. He was a constitutional royalist, yet made such frequent concessions to the republican party that they reckoned him among their number. He was appointed a member of the committee of finance, of which he became the usual reporter, or chairman. In the manner in which M. Röderer developed his system of finances, and the ability with which he defended his reports, his talent was especially displayed. When the schism arose in the jacobin club, M. Röderer joined the *feuillants*, but speedily returned to the former. After the close of the session of the constituent assembly, he was appointed *procureur-syndic* of the department of the Seine. On the morning of the 10th of August, accompanied by the directory of the department, he repaired to the palace, and represented to the king and queen that the danger was far beyond any thing they had conceived, and that the royal family incurred the danger of being destroyed within the palace if the king did not repair to the national assembly for protection. Soon after the events of that day, he was accused by the revolutionists, and seals were put upon his papers. He withdrew himself from danger and did not re-appear till after the 9th of Thermidor. In 1799, when Bonaparte returned from Egypt, M. Röderer succeeded in forming political ties between him and Sieyès; and he was also among those who most aided in preparing the revolution of the 18th of Brumaire. Called to the senate at its first formation, he declined to take a seat there, but was made counsellor of state. There he occupied himself with the framing of a number of laws which he presented to the legislative assembly, and he was principally charged with the establishment of the prefectures. He was the chief instrument of concluding the treaty which put an end to the misunderstandings between France and the United States. In 1802 he presented to the legislative assembly the project of the order of the legion of honour, of which he was named commandant. In 1803 he took a seat in the senate, and was one of the members appointed to confer with the Swiss deputies assembled at Paris upon the means of giving a new constitution to their country. Shortly after he was made count. He took a large share in the whole organization of the kingdom of Naples under Joseph Bonaparte. On the return of the Bourbons, M. Röderer disappeared from the political world. He was the author of several historical works of much value.

ROE, SIR THOMAS, an able statesman, who was born at Low Leyton, in Essex, about 1580, and admitted into Magdalen college, Oxford, in 1593. He was taken from the university in a year or two; and, after spending some time in one of the inns of court, and in France, was made esquire of the body to Queen Elizabeth. In 1604 he was knighted by King James, and soon after sent by Henry, prince of Wales, to make discoveries in America. In 1614 he was sent

ambassador to the Great Mogul, at whose court he continued till 1618. During his residence there he employed himself in the service of the East India company. In 1620 he was elected a Burgess for Cirencester in Gloucestershire; and, the year following, sent ambassador to the grand seignior, in which station he continued under the sultans Osman, Mustapha, and Amurath IV. In his passage to Constantinople he wrote a letter to Villiers, duke of Buckingham, then lord high admiral, complaining of the great increase of pirates in the Mediterranean sea; and, during his embassy, sent "A True and Faithful Relation to his Majesty and the Prince of what hath lately happened in Constantinople, concerning the Death of Sultan Osman, and the Setting Up of Mustapha his Uncle," which was printed at London in 1622. He kept a very curious account of his negotiations at the Porte, which remained in manuscript till 1740, when it was published under the title of "The Negotiations of Sir Thomas Roe, in his Embassy to the Ottoman Porte, from the year 1621 to 1628 inclusive; containing a great variety of curious and important matters, relating not only to the affairs of the Turkish empire, but also to those of the other states of Europe in that period: his correspondence with the most illustrious persons, for dignity or character, as with the queen of Bohemia, Bethlem Gabor prince of Transylvania, and other potentates of different nations, &c., and many useful and instructive particulars, as well in relation to trade and commerce, as to subjects of literature; as ancient manuscripts, coins, inscriptions, and other antiquities." During his residence in the East he made a large collection of valuable manuscripts in the Greek and oriental languages, which in 1628 he presented to the Bodleian library. He also brought over the fine Alexandrian manuscript of the Greek Bible, sent as a present to Charles I. by Cyril, patriarch of Constantinople, which was afterwards transcribed and published by Dr. Grabe. In 1629 he was sent ambassador to mediate a peace between the kings of Poland and Sweden. He succeeded in his negotiation, and so much pleased the great Gustavus Adolphus [of Sweden that, after gaining the victory of Leipsic, he sent Sir Thomas a present of 2000*l.*, and in his letter calls him his *strenuum consultorem*, he being the first who had advised him to commence the war. In 1640 he was chosen member of parliament for the university of Oxford. The year after he was sent ambassador to the diet of Ratisbon, in order to mediate respecting the restoration of the king of Bohemia's son to the palatinate; and, upon his return, was made chancellor of the Garter and one of the privy council. The calamities of the nation, in which he could not avoid having a share, not only embittered his life, but contributed to shorten it, for he died in November 1644. He left a great number of manuscripts behind him, and in 1730 proposals were published for printing by subscription, in five volumes, folio, "The Negotiations and Embassies of Sir Thomas Roe from 1620 to 1644;" but the publishers not meeting with sufficient encouragement, the design was dropped, and only the volume mentioned above was published in 1740 by Mr. Richardson.

ROEBUCK, JOHN, an eminent physician and philosopher, who was born in Yorkshire, and studied at Edinburgh and Leyden. He commenced practice at Birmingham, and subsequently engaged in several

very profitable speculations, among which was the establishing of the iron foundry of Carron, all of which he carried on with great success. But he lost his property in an unsuccessful attempt to work mines of coal and salt at Borrowstowness on the estate of the duke of Hamilton. He passed the last twenty years of his life in great indigence, and died in July 1794.

ROEMER, OLAUS, a Danish astronomer and mathematician, who was born at Arhusen, in Jutland, in 1644, and studied at the university of Copenhagen. He applied himself to the study of mathematics and astronomy and became so great an adept in those sciences that when Picard was sent by Louis XIV., in 1671, to make observations in the north, he engaged him to return with him to France, and presented him to the king, who ordered him to teach the dauphin mathematics, and settled a pension upon him. During the ten years he resided at Paris he gained great reputation by his scientific discoveries. In 1681 Christian V., king of Denmark, called him back to his own country, and made him professor of astronomy at Copenhagen. He employed him also in reforming the coin and the architecture, in regulating the weights and measures, and in measuring the roads, throughout the kingdom. Frederic IV., the successor of Christian, showed the same favour to Roemer, and conferred new dignities on him. Roemer died in 1710. Some of his observations were published in 1753, under the title of "Basis Astronomiæ," by his scholar, Peter Horrebow, then professor of astronomy at Copenhagen. Newton, after laying down this proposition, "Light is propagated from luminous bodies, and spends about seven or eight minutes of an hour in passing from the sun to the earth," proceeds to say, that "this was first observed by Roemer, and then by others, by means of the satellites of Jupiter. For these eclipses, when the earth is between the sun and Jupiter, happen about seven or eight minutes sooner than they ought to do by the tables; and when the earth is beyond the sun they happen about seven or eight minutes later than they ought to do; the reason being that the light of the satellites has farther to go in the latter case than in the former by the diameter of the earth's orbit."

ROGER, or ROGIER, VAN DER VELDE, one of the most eminent painters of the Old Netherlandish school, who was born at Brussels, and died in 1529. In the hall of his native city are four allegorical pictures by him. A celebrated Descent from the Cross, executed by him, was sent to Spain; another is in Aix-la-Chapelle. Roger was also distinguished as a painter on glass.

ROGERS, WOODS, an English circumnavigator, who belonged to the royal navy in 1708, when he was invited by the merchants of Bristol to take the command of an expedition to the South Sea. He set sail with two vessels, the Duke and the Duchess, taking out Dampier as a pilot. Passing to the south of Terra del Fuego, in January 1709, they entered the Pacific Ocean, and, February 1, arrived at the isle of Juan Fernandez, where they found Alexander Selkirk, and, having visited the coast of California, crossed the Pacific, and returned to England in October 1711. Captain Rogers was afterwards employed with a squadron to extirpate the pirates who infested the West Indies. He died in 1732.

ROGERS, BENJAMIN.—This eminent composer was the son of Peter Rogers, a gentleman of

the chapel of St. George, at Windsor. He was first a chorister under the tuition of Dr. Nathaniel Giles, and then a clerk or singer in the chapel. Afterwards he was appointed organist of Christchurch, Dublin, where he continued until the breaking out of the rebellion in 1641, when he returned to Windsor, and again became a clerk in the chapter. The troubles during the rebellion soon deprived him also of this situation; and, aided by a small annual allowance which was paid him in compensation for his losses, he was compelled to earn a subsistence by teaching music at Windsor. In 1653 he composed "A Set of Airs in Four Parts for Violins," which were presented to the archduke Leopold, afterwards emperor of Germany, and were often played before him. Through the interest of Dr. Ingels, chaplain to the lord commissioner Whitelocke, Rogers was recommended to the university of Cambridge, and having received from Cromwell a mandate for that purpose, was admitted in 1658 to the degree of bachelor of music. In the year 1662 he was again appointed a clerk of St. George's chapel at Windsor, with some addition of salary, and was also elected organist of Eton college. Both these places he held until a vacancy occurring in Magdalen college, Oxford, he was chosen organist there. In 1669, upon the opening of the new theatre at Oxford, he took the degree of doctor of music. He continued in his latter station of organist until the year 1685, when he was ejected by order of King James I. The college allowed him a small pension, on which he lived, in the outskirts of the city, to old age, entirely neglected.

His works are not numerous. There are some of his detached compositions in a collection entitled "Court Ayres, consisting of Pavans, Almagnes, Corants, and Sarabands, of Two Parts," published by Playford in 1655; some hymns and anthems for two voices, in a collection entitled "Cantica Sacra," and others in the psalms and hymns, in four parts, published by Playford. His services and anthems are the most celebrated of his works. They contain great sweetness of melody and correctness of harmony.

ROGERS, DANIEL, a diplomatist and writer, who was born in Warwickshire about 1540, and was early sent to Germany to be educated in the reformed religion. However, on the accession of Elizabeth to the English throne, he returned to his native country. He was employed by the queen in several important negotiations with foreign powers, in all of which he appears to have given his royal mistress satisfaction. Among his works we may mention his "Collection of Odes, Epigrams, and Panegyrics in praise of Bishop Jewell," and his "Epistle to George Buchanan." His death took place in 1590.

ROGERS, ROBERT, a celebrated musician, who was born in 1787 at South Anston, a village in the West Riding of the county of York, received his education principally in a small town in the vicinity, where, under the care of two successive masters, he studied mathematics, the Latin classics, and the French language, and, having at an early age a propensity for the sea, also learned navigation and astronomy. At the age of eight years Rogers was placed under the tuition of a musician in the village, and spent every leisure hour in the practice of the violin. Circumstances, however, which cannot be accounted for, completely foiled the schemes he had laid of one

day having the honour to belong to the British navy. At the age of fourteen his father, who was a farmer and tenant to the duke of Leeds, placed him with a respectable attorney at Sheffield; but, not finding this profession suitable to his inclinations, any scheme that could be thought of was devised to relieve the tediousness of a lawyer's office; for this purpose, at the age of sixteen, he entered the volunteers, and was considered the best shot at ball practice in his company; and the medal which he won at a trial of skill, before he was seventeen years of age, is still preserved, if not as a trophy of his valour, yet as a mark of his unwearied assiduity. After this, while he was engaged in the office of one of the most eminent lawyers in Sheffield for three years, his strong propensity for music not having abated, he continued to devote seven hours out of the twenty-four in every day to the practice of the piano-forte and violin, and "while one half of the world was buried in sleep," the works of Haydn, Mozart, Beethoven, Pleyel, Cramer, Steibelt, and Dussek were his favourite companions. On leaving the office of this gentleman Rogers felt, for the first time in his life, a real pang; though he hated the law he could not forget the kindness of his master; and as he was, in all probability, in a likely way to try whether his passion for music would furnish him with any thing more substantial than air, he felt himself placed in an unpleasant predicament. However, he was soon relieved from this by procuring a situation at Manchester in the band of the theatre, under the management of Mr. Macready, the father of the tragedian of that name, and in this situation he had ample time and opportunity for studying music. Finding, however, travelling about the country with a company of comedians was too unsettled an occupation, he determined to seek some fixed residence. Sheffield was the place he returned to, where he was engaged as an organist and piano-forte teacher for many years with great success. The only work he published was "A Selection of Sacred Music," dedicated to the earl of Scarborough, which not only did him credit, but was of pecuniary advantage.

ROGERS, DR. JOHN, an English divine, was born, in 1679, at Ensham, in Oxfordshire, where his father was vicar. He studied at New college, Oxford, and, in 1693, was elected scholar of Corpus Christi college; after which he took his degree, and entered into orders. In 1710 he took a bachelor of divinity's degree; and, two years after, came to London as lecturer of St. Clement Danes. He afterwards became lecturer of the united parishes of Christchurch, and St. Leonard's, Foster Lane. In 1716 he was presented to the rectory of Wrington, in Somersetshire, and, the same year, resigning his fellowship, was married to the hon. Mrs. Lydia Hare, sister to the lord Colerane, who was his pupil in the university. Some time after he was elected canon residentiary of the church of Wells, in which he also had the office of sub-dean. In 1719 he engaged in the Bangorian controversy, and published upon that occasion "A Discourse of the Visible and Invisible Church of Christ; in which it is shown that the Powers claimed by the Officers of the Visible Church are not inconsistent with the Supremacy of Christ as Head, or with the Rights and Liberties of Christians as Members of the Invisible Church," octavo. The Rev. Dr. Sykes having published an answer to this discourse, Dr. Rogers replied in "A

Review of the Discourse of the Visible and Invisible Church of Christ." The university of Oxford made a public acknowledgment of their opinion of his merit by conferring on him, in 1721, without his knowledge, the degree of D.D. In 1726 he was made chaplain to the prince of Wales; and about the same time appeared in defence of Christianity against the attacks of Collins in his "Scheme of Literal Prophecy." Dr. Rogers did not at first professedly write against the Scheme; but publishing, in 1727, a volume of sermons, entitled "The Necessity of Divine Revelation, and the Truth of the Christian Religion Asserted," he prefixed to them a preface, with remarks on the scheme of literal prophecy. This preface, however, seemed liable to exception, or at least to demand a more full and distinct explication; and he received a letter upon it the same year from Dr. Marshall. He endeavoured to give satisfaction to all; and, therefore, Collins having written "A Letter to the Rev. Dr. Rogers on Occasion of his Eight Sermons concerning the Necessity of Divine Revelation, and the Preface affixed to them," Dr. Rogers published "A Vindication of the Civil Establishment of Religion, wherein Some Positions of Mr. Chandler, the author of the 'Literal Scheme,' &c., and an Anonymous Letter on that Subject are occasionally considered; with an Appendix, containing a Letter from the Rev. Dr. Marshall, and an Answer to the same." 1728.

The same year, Dr. Rogers having resigned his lecture of St. Clement Danes, retired from London, with an intention to spend the remainder of his life at Wrington; but he had not been there long when he received an offer, from the dean and chapter of St. Paul's, of the vicarage of St. Giles's, Cripplegate. He accepted it, but did not enjoy his new preferment above six months, for he died on the 1st of May, 1729. He was buried in the church of Ensham. After his death some volumes of his sermons were published, and two tracts, viz.—"Reasons against Conversion to the Church of Rome," and "A Persuasive to Conformity addressed to Dissenters."

ROHAN, LOUIS RENE EDOUARD, PRINCE DE, cardinal-bishop of Strasburg.—This nobleman, who was born in 1734, was at first known under the title of Prince Louis. The dissipation in which the young ecclesiastic indulged did not prevent him from attending to study, nor from forming ambitious projects. In 1772 he went as ambassador to the court of Vienna. He derives his notoriety, however, chiefly from the affair of the necklace. He was then grand almoner of France, and, being thrown into the Bastille, continued in prison more than a year, when he was acquitted and released by the parliament of Paris, in August 1786. He was afterwards a member of the constituent assembly, but on account of his opposition to the revolutionary principles was obliged to retire to Germany, where he died in 1803.

ROHAULT, JAMES, a French philosopher, who was born at Amiens in 1620. He cultivated the languages and belles lettres in his native city, and was then sent to Paris to study philosophy. He became a zealous follower of Des Cartes, and drew up an abridgment and explanation of his philosophy with great clearness and method. In the preface to his work entitled "Physics," he says, that "the abilities and accomplishments of this philosopher must oblige the whole world to confess that France is at least as capable of producing and raising men versed in all

arts and branches of knowledge as ancient Greece." Rohault's "Physics" were written in French, but afterwards translated into Latin by Dr. Samuel Clarke, with notes, in which the Cartesian errors are corrected upon the Newtonian system. He wrote also "Elemens de Mathematiques," "Traité de Mechanique," and "Entretiens sur la Philosophie." Rohault died in 1675, and left behind him the character of an amiable as well as a learned and philosophic man.

ROLAND, JEAN MARIE BAPTISTE DE LA PLATIERE, was born in 1734, and previous to the revolution engaged in manufactures. Being sent to Paris by the city of Lyons on official business before the national assembly in 1791, he became connected with Brissot and other popular leaders, through whose influence he was appointed minister of the interior in 1792. His principles, however, were so far from being agreeable to the king that he was dismissed after a few months; but after the 10th of August he was recalled to the ministry, and continued to hold his place until the proscription of the Girondists compelled him to leave Paris. On receiving at Rouen the news of the death of his wife, he killed himself with a sword cane. Roland was the author of the "Dictionary of Manufactures," forming part of Panckoucke's "Encyclopédie Méthodique," and of several other works.

His wife, Manon Jeanne Roland, was born at Paris in 1754, and was the daughter of an engraver. She was remarkable for her beauty, and received an excellent education. The study of Greek and Roman history early inflamed her imagination, and gave her a tendency to republican sentiments. After her marriage, in 1779, Madame Roland took part in the studies and tasks of her husband, and accompanied him to Switzerland and England. The revolution found in her a ready convert to its principles; and on the appointment of her husband to the ministry, she participated in his official duties, writing and preparing many papers, and taking a share in the political councils of the leaders of the Girondist party. On the fall of her husband, she was arrested. She conducted herself with great firmness during the trial, and at the time of her execution. "O Liberty, what crimes are committed in thy name!" was her exclamation when she arrived at the scaffold, on the 8th of November, 1793. Madame Roland had laid aside the modesty and softness of her sex, and had adopted deistical notions in religion. While in prison she wrote memoirs of her life, which have since been published, with her other writings relating to the events of the revolution. The most complete edition is that forming part of the memoirs relating to the French revolution, under the title "Mémoires de Madame Roland, avec une Notice sur sa Vie," with notes.

ROLT, RICHARD.—This gentleman was principally known as the compiler of several useful publications. He was born in 1724, and held an office in the customs for some years; however, when Charles James Stuart came over he joined his standard, and was consequently deprived of his post. He afterwards supported himself by writing; among his works we may mention his "Dictionary of Trade and Commerce," and his "History of England." He died in 1770.

ROLLIN, CHARLES, a learned French historian, who was born at Paris in 1661. His father was a

cutler, who intended him for the same business; but his talents obtained the notice of a learned Benedictine, who procured him a place in the college of Du Plessis, by which he was enabled to gratify his inclination for learning. After going through a course of theology at the Sorbonne, he received the tonsure. In 1688 he obtained the chair of eloquence in the royal college, of which he became rector in 1694; reformed the academical course in many particulars, and revived the study of the Greek language. In 1698 he was chosen coadjutor or head of the college of Beauvais, which was also much benefited by his attention. In 1720 he was again chosen rector of the university at Paris; but was displaced in consequence of his connexion with the Jansenists. His productions are, "*Traité des Etudes*," "*Histoire Ancienne*," and a Roman history to the war against the Cimbri. He died in 1741. Rollin's writings are distinguished for purity and elegance of style, but they are diffuse and prolix, and his historical works are deficient in critical sagacity.

ROMANA, MARQUIS DE LA, a celebrated general in the war of the Spaniards against Napoleon. Preparatory to his plans against the Bourbons in Spain, the French emperor had drawn to Germany, in 1807, a body of from 10,000 to 12,000 Spanish troops, at the head of which was General Romana, who, taking advantage of his station on the island of Funen, entered into a secret correspondence with the commander of the English fleet established there, obtained English transports, and with all his forces, excepting a few divisions who could not be brought up quick enough, embarked between the 17th and 20th of August, 1808, at Nyborg and Svenborg, and arrived at Corunna. From this time Romana was incessantly employed in exciting the Spaniards. He was the first to suggest the idea of arming the peasantry and forming the Guerillas. In this way, as well as by his personal services in the field, Romana had an important part in maintaining the independence of Spain. He died in 1811.

ROMAINE, WILLIAM, a very distinguished clergyman of the church of England, who was born at Hartlepool in 1714. He was first sent to the grammar school at Houghton le Spring, and in 1730 en-

tered as a student at Oxford. He resided principally at his college, till he took his degree of master of arts, which he did on the 15th day of October, 1737,

having been ordained a deacon at Hereford a year before, by the then bishop of that see, Dr. Henry Egerton; whether by a nomination to a cure in his diocese, or by letters dimissory from some other bishop, is not certain. His first engagement, after he was in orders, was the curacy of Loe Trenchard, near Lidford in Devonshire. He went there upon a visit with one of his contemporaries at Oxford, whose father lived at Lidford; and upon the express condition that his friend would find him employment in the way of his profession. This employment was accordingly found for him in the church aforementioned, which he served for six months, most probably, of the year in which he took his master's degree. In the year following he was resident at Epsom, in Surrey, as appears by a letter dated from that place, October 4th, 1738, and written to Mr. Warburton, upon the publication of his first volume of "*The Divine Legation of Moses*;" and on the 15th day of December, in the same year, he was ordained a priest by Dr. Hoadly. His title for orders was most probably a nomination to the church of Banstead, which he served for some years, together with that of Horton, in Middlesex, being curate to Mr. Edwards, who had both these livings.

Mr. Romaine early engaged in preparing for the press a new edition of "*The Hebrew Concordance and Lexicon of Marius de Calasio*," a work which employed him seven years, and the first volume of it was published in the year 1747. Whilst he is justly celebrated as the editor of Calasio, he is perhaps no less justly censured for having omitted his author's account of the word which is usually rendered God, and having substituted his own in the body of the work. But he thought himself excusable, and made his own apology in an address to the reader, which he prefixed to the work. His words are these:—"I have endeavoured to perform the office of a faithful editor; you have Marius himself not in the least diminished or added to, excepting only one place, and that of such great consequence that I should have thought it a crime if I had neglected to amend it. This I have done with the best intention, and only this once; I hope therefore that it may be pardoned." To which he adds, that he has marked this place with inverted commas, as he has many of his additions under the particles.

It was certainly Mr. Romaine's plan, after he had finished his edition of "*The Concordance and Lexicon of Marius de Calasio*," to have returned into his native county; and he had actually packed up his trunk, and fixed it on shipboard with that view. But as he was going to the water-side, in order to secure his own passage, he was met by a gentleman, a total stranger to him, who asked him if his name was not Romaine. He replied that it was. The gentleman had formerly been acquainted with his father, and observing a strong resemblance to him in his son, was induced to make the inquiry. After some apologies for this abrupt address, and some little conversation concerning his family and himself, the gentleman told him that the lectureship for the united parishes of St. George's, Botolph Lane, and St. Botolph's, Billingsgate, was then vacant; and that, having some interest in those parishes, he would exert it in his behalf, if he would become a candidate for the lectureship. Mr. Romaine consented, provided he should not be obliged to canvass in person,—a custom which he always thought inconsistent with the character of a

clergyman, and against which he openly protested many years afterwards, when he was candidate for the living of Blackfriars: so that his objection to canvass was not a hasty impression taken up in his youth, but a settled persuasion that continued with him: and, as he was never backward to acknowledge the obligation when received, so (as Mr. Goode justly observes in his funeral sermon) it "was not pride, but principle."

It was in the year 1748 that he was chosen lecturer of St. Botolph's, and it has been thought (and inferred from some expressions of his own in one of his letters published since his death) that his determination to leave London was the result of disappointment and disgust,—that he had come to the metropolis "strongly intrenched in notions of his own exalted abilities, and flattering himself that he required no other recommendation to rapid preferment, where talent was always admired and justly estimated." He is supposed to have alluded to some circumstances of this kind in a letter to an intimate friend, in which he speaks of "having known a very vain proud young man, who knew almost every thing but himself, and was therefore very fond of himself; who met with many disappointments to his pride, which only made him prouder, till the Lord was pleased to let him see and feel the plague of his own heart. That, upon the discovery of this he tried every method that can be tried to give peace, but found none. In despair of all things else, he betook himself to Jesus, and was most kindly received. He trusted to the word of promise, and experienced the sweetness of promise. After this he went through various frames and trials of faith, too many to mention."

In the year following he was chosen lecturer of St. Dunstan's in the West. In the person of his predecessor two lectureships were united,—the one endowed, and founded by Dr. White for the use of the benchers of the Temple; the other a common parish lectureship, supported by voluntary contributions. Mr. Romaine was elected to both, and continued some years in the quiet exercise of his office, till the faithful discharge of it raised violent clamours and opposition against him. The rector then thought fit to dispute his right to the pulpit, and occupied it himself during the time of prayers in order to exclude him from it. Mr. Romaine appeared constantly in his place, to assert his claim to the lectureship, as well as his readiness to perform the office. The affair was at length carried into the court of king's bench; the decision of which deprived Mr. Romaine of the parish lectureship, but confirmed him in that founded by Dr. White, and endowed with a salary of 18*l.* a year. Lest this should be removed from the parish, the use of the church was granted him: but as Lord Mansfield's decision was, that seven o'clock in the evening was a convenient time to preach the lecture, the churchwardens refused to open the church till that hour, and to light it when there was occasion; so that Mr. Romaine frequently read prayers and preached by the light of a single candle, which he held in his own hand. The church doors being shut until the precise moment fixed for preaching the lecture, the congregation was usually assembled in the street, and there waiting for admission. The consequence was a concourse of people collected indeed without noise and tumult, but not without great inconvenience to those who passed that way, among whom happened to be one

evening the then bishop of London, Dr. Terrick, who had been Mr. Romaine's predecessor in the lectureship. Observing the crowd, he inquired into the cause of it; and being told that it was Mr. Romaine's audience in these circumstances, he interfered with the rector and churchwardens in their behalf, expressed great respect for Mr. Romaine, and obtained for him and his hearers that the service of the church should begin at six o'clock, that the doors should be opened in proper time, and that lights should be provided for the winter season.

In the year 1750 Mr. Romaine was appointed assistant morning preacher in the parish of St. George, Hanover Square. He entered upon this office on the 1st of April, and retired from it on the 28th day of September, 1755, during which time he preached occasionally at Bow church, in exchange with Dr. Newton (afterwards bishop of Bristol), then rector of that parish, and lecturer of St. George's, Hanover Square, and also at Curzon chapel, then called St. George's chapel, Mayfair, in exchange with Dr. Trebeck himself, who was morning preacher there. The times in which he was called to the exercise of his ministry in the west end of the metropolis were distinguished by some signal judgments of Almighty God: such particularly as were the earthquakes by which Lisbon was destroyed and London threatened; two shocks having been felt in it, and a third expected. Mr. Romaine was not wanting upon the present occasion, as appears from two sermons in print, entitled "An Alarm to a Careless World," and "The Duty of Watchfulness Enforced,"—sermons which are not exceeded in any of his writings. In both, and particularly in the preface to the former, there are some valuable antidotes against the prevailing philosophy of the day, which ascribed every thing to second causes, and almost denied the existence of the first, excluding the God of nature from the works of nature, and refusing to acknowledge him as the author of judgments, and sin committed against his divine Majesty as the cause of them. This, as he tells us in the preface before mentioned, was the philosophy of the year 1750, when the "learned accounted for earthquakes by changing their name into airquakes, and then they were explained philosophically." It was in this period of his life that Mr. Romaine was called to the professorship of astronomy in Gresham college. He had not the highest opinion of the religion, morals, or wisdom of the age; and in the discharge of his duty in this new office he pursued a plan which ran counter to them all. He attempted to prove that God was best acquainted with his own works, and had given the best account of them in his own words.

Mr. Romaine, having left the cure of St. Olave's, was morning preacher for near two years at St. Bartholomew the Great, near West Smithfield, and removed from thence to Westminster chapel, where he had the same office for six months, till the dean and chapter withdrew their patronage and protection from it, and refused him their nomination for a license to preach there. The place then fell into other hands, and Mr. Romaine, who was immovably attached to the established church, resigned that situation. Nor had he any stated employment in the church, excepting the lectureship of St. Dunstan's in the West, till he was chosen to the rectory of Blackfriars in 1764, to which, owing to a dispute about the election that was settled in the court of chancery, he was not ad-

mitted till the year 1766. During the time in which he had no settled employment in the morning, he preached charity sermons in many churches in London — sermons which were the means not only of spreading the gospel, but of proving its efficacy. He preached often likewise at the Lock Hospital upon the first institution of that charity, and the building of the chapel. Being honoured also at Lambeth with the acquaintance of Archbishop Secker, he generally assisted in the parish church upon the first day of the month, it being the custom of that venerable prelate constantly to attend and to administer the sacrament of the Lord's supper.

In speaking of him as a preacher, we ought not to omit his frequent appearances in that character before the university of Oxford. He printed some of his discourses delivered there, such as those on "The Divine Legation of Moses," upon "Jephthah's Vow," upon "The Sure Foundation," and upon "The Lord our Righteousness." This latter he sent to the press, as being the last which he was permitted to preach, the pulpit being refused him in consequence of it, and he published it with the following dedication to the vice-chancellor:—"When I delivered these discourses, I had no design to make them public; but I have been since compelled to it. I understand they gave great offence, especially to you, and I was in consequence thereof refused the university pulpit. In justice, not to myself, for I desire to be out of the question, but to the great doctrine here treated of, namely, the righteousness of the Lord Jesus as the only ground of our acceptance and justification before God the Father, I have sent to the press what was delivered from the pulpit. I leave the friends of our church to judge whether there be any thing herein advanced contrary to the Scriptures, and to the doctrines of the reformation. If not, I am safe. If there be, you are bound to make it appear. You have a good pen, and you have great leisure; make use of them; and I hope and pray you may make use of them for your good and mine."

As a proof of his unalterable regard for the church and nation, he first printed in 1757, the year of his dismission from the university pulpit, "An Earnest Invitation to the Friends of the Established Church to join with several of their Brethren, Clergy and Laity, in London, in setting apart one hour of every week for Prayer and Supplication during these Troublesome Times." After having mentioned the motives and calls to prayer, he proceeds to the matter of it, and invites us to "pray for the peace of our established church, and for all orders and degrees of its ministers, beseeching God to give them his grace and heavenly benediction, that both by their life and doctrine they may set forth his glory, and set forward the salvation of all men. And to the end there may never be wanting such persons in the church, let us pray for all seminaries of Christian education, especially for the two universities," &c. As a proof of his good wishes to all Christian people, he adds, "May the God of love dispose us also to pray fervently for all the protestant dissenting congregations which love the Lord Jesus in sincerity. May he shed that love abroad in all our souls, which alone can effectually free us from party spirit," &c. This same tract he reprinted in the year 1779, and again in 1795, a few months before his death.

Mr. Romaine's last preferment was the rectory of St. Andrew Wardrobe, and St. Ann's, Blackfriars.

The living is vested in the crown and in the parishioners alternately. Mr. Romaine's predecessor was Mr. Henley, a nephew of the then lord chancellor Henley. He enjoyed this preferment only about six years and a half, and died young, of a putrid fever, in consequence of visiting one of his parishioners in that disorder. Mr. Romaine's friends, when they first started the idea of nominating him as a candidate for the living, entertained little or no hopes of success; but, upon sounding their fellow parishioners, they found that at least two-thirds of them were in his favour. In order to check their progress, a rumour was spread that he was above soliciting their votes and interest. But upon the day being fixed for each candidate to preach his probationary sermon, Mr. Romaine was apprized of it, came immediately to London, and made his appearance among them. The day appointed for his preaching was the 30th of September, 1764, upon which occasion many absented themselves who had been in the habit of hearing him, lest they should crowd the church and occupy the seats of the inhabitants, and, by giving them offence, throw obstacles in the way of his election. He thought fit to assign his reasons in the sermon for not having behaved towards them in the common way of soliciting their favour. "Some have insinuated that it was from pride that I would not go about the parish from house to house canvassing for votes; but truly it was another motive; I could not see how this could promote the glory of God. How can it be for the honour of Jesus that his ministers, who have renounced fame, riches, and ease, should be most anxious and earnest in the pursuit of those very things which they have renounced? Surely this would be getting into a worldly spirit as much as the spirit of parliamenteering. And as this method of canvassing cannot be for Jesus' sake, so neither is it for our honour: it is far beneath our function: nor is it for your profit. What good is it to your souls? What compliment to your understandings? What advantage to you in any shape, to be directed and applied to by every person with whom you have any connexion, or on whom you have any dependence? Is not this depriving you of the freedom of your choice? Determined by these motives, when my friends of their own accord put me up as a candidate, to whom I have to this hour made no application directly or indirectly, I left you to yourselves. If you choose me, I desire to be your servant for Jesus' sake; and if you do not, the will of the Lord be done." This sermon operated greatly in his favour; it was well received by the parishioners, and published at their request.

There were two candidates for the living besides himself, and a scrutiny was demanded in favour of each at the close of the first day's poll. This scrutiny was entered into, but produced no decision, the proper qualifications not being settled which entitled an inhabitant to vote at the election of a rector. A second election was agreed upon by the friends of the several candidates, which ended in favour of Mr. Romaine, who had a great majority of votes, and was declared duly elected. But this did not satisfy the other candidates; each put in his claim, and the business was transferred into the court of chancery. It continued there for more than a year, and in the end of January, or the beginning of February, 1766, a decree was given by Lord Chancellor Henley in favour of Mr. Romaine. He was instituted and inducted accordingly, but was observed to tremble much during the

whole ceremony of his admission. His feelings have been expressed by himself in a letter which he wrote upon the decision in chancery:—"My friends are rejoicing all around me, and wishing me that joy which I cannot take. It is my Master's will, and I submit. He knows what is best both for his own glory and his people's good; and I am certain he makes no mistakes in either of these points; but my head hangs down upon the occasion, through the awful apprehensions which I ever had of the care of souls. I am frightened to think of watching over two or three thousand when it is work enough to watch over one. The plague of my own heart almost wearies me to death; what can I do with so vast a number?" Mr. Romaine's usefulness as a minister continued till the close of his life, which lasted to a protracted period, and he died on the 25th of July.

This eminent clergyman is best known as an author by his "Walk of Faith" and his sermons; of the latter we give a brief specimen taken from his "Twelve Discourses on the Law and the Gospel:"—

"Divine teaching consists in opening the eyes of the understanding to perceive spiritual and divine objects, and to see their value and importance in disposing the will to choose them and the heart to love them. The divine teacher is the Holy Spirit. He prepares the mind to receive his instruction, and then fills it with the knowledge of his will in all wisdom and spiritual understanding. The necessity of his doing this is founded in the present state and circumstances of fallen men: for through sin all the faculties of the soul were lost, and the understanding, which is the eye of the soul, was left in the same condition as the bodily eyes would be if they had no light.

Hence the psalmist declares, that there is none who understandeth the things of God; and he represents God as looking down from heaven to see if there were any who did understand and seek after God; but he found none, no not one. They all had their understanding darkened, being alienated from the life of God through the ignorance that is in them, because of the blindness of their heart. The prophets give us the same character and speak of men as if they were all blind, and describe the Messiah to be the sun of righteousness; the light who was to arise to lighten the Gentiles, and was to be the glory of his people Israel. Thus Jehovah says of his beloved Son, 'I, the Lord, will give thee for a covenant of the people, for a light of the Gentiles, to open the blind eyes.' And again—'I will also give thee for a light to the Gentiles, that thou mayst be my salvation unto the ends of the earth,' Isa. xlix. 6. How did our Lord fulfil these prophecies? He did not, while he was upon earth, open the bodily eye of any blind person among the Gentiles, but he has fulfilled them, and, glory be to his great name! he is daily fulfilling them in the Gentile world, by opening the blind eyes of our understandings to see and to discern the things of God. In this sense the Psalmist, speaking both of Jews and Gentiles, says, Psalm cxlvi. 8. 'The Lord openeth the eye of the blind,' that is the Lord Christ: for we read, Isaiah xxxv. 4, 5. 'Say unto them that are of a fearful heart, Be strong, fear not; your God will come and save you. Then the eyes of the blind shall be opened: for in that day (Isa. xxix. 18,) shall the deaf hear the words of the book, and the eyes of the blind see out of obscurity, and out of darkness.' All these scriptures had their happy accomplishment, when God, who was to come and save us, spake with his own mouth, and said, 'I am come a light into the world, that whosoever believeth on me should not abide in darkness.' From these authorities it is certain that fallen man is in darkness, and cannot see the things of God. The eyes of his understanding are in the same condition as his bodily eyes would be without light. He cannot see any spiritual objects; and how then, can he come to the knowledge of them, unless he be taught them of God? By what other way or means can he discern them? Has he any powers or faculties of his own, which can help to enlighten him? No, he has none: for since the eyes of his understanding are in darkness, all his endeavours to enlighten them, without divine teaching, will be like those of a blind man, who only makes his blindness more manifest the more he labours and strives to give an account of those objects which he never saw nor felt.

"But cannot the arts and sciences enlighten his blind eyes? No. They cannot help him to discover one single spiritual idea. The arts and sciences treat of the objects of sense: to these they are confined, and cannot get beyond the bounds of nature; for it is a certain truth, and indeed it is at present a received opinion, that all our ideas come from sense. We are not able to form an idea of any thing, unless it fall under the observation of some of our senses. If any one of the senses be destroyed, the man is not able to form an idea of any object peculiar to that sense. A man born deaf has no idea of sounds, nor a blind man of colours. Since then, the arts and sciences treat entirely of the objects of sense, how can they give us any ideas of those things which are not objects of sense? for was it ever known that the stream rose higher

than the fountain head? From hence it appears, that if the understanding be ever so greatly refined and enlarged with the knowledge of arts and sciences, yet it stands in as much need of divine teaching as the most ignorant peasant does; because the things of God are not discoverable by the arts and sciences. Let matter of fact speak to this point. Has there not been a total ignorance of divine things whenever the light of revelation has been extinguished? Look into the learned ages of Greece, and you find the several sects of philosophers enquiring, What is the chief good of men? and none of them could discover what it was, and disputing about the origin of evil, and never coming near the truth. Look into the times when Rome was raised to its highest glory, and was as famous for its learning as for its conquests, and you will not find one learned Roman who can tell you what God is. Tully has written a book upon the nature of the gods, and it is one of the most valuable of his writings; for therein he gives us the opinions of the philosophers upon this subject, and shows his own and their exceeding great ignorance of it. \* \* \* \* \*

We know, from the experience of the Greeks and Romans, that arts and sciences never did lead them to the knowledge of any spiritual and divine objects; and we are assured, from the testimony of God's word, that they never can. Man, in his natural state, blinded by sin and under the power of it, cannot attain to any such knowledge. The apostle has decided this point for us. Speaking of the politest classical age of Rome, he says of her great philosophers and celebrated authors, that they were without understanding; that they became vain in their imaginations; and their foolish hearts were darkened. What! was Tully without understanding? Was the imagination of Virgil vain, and the heart of Seneca foolish? Yes, in the things of God; 'for the natural man receiveth not the things of the Spirit of God; for they are foolishness unto him: neither can he know them, because they are spiritually discerned.' 1 Cor. ii. 14. While he remains a natural man, it is absolutely impossible that he should know them; 'neither can he know them,' because he has no spiritual discernment, by which alone spiritual objects can be discovered; and therefore he must remain for ever ignorant of them, unless God should open the eyes of his understanding, and bring him out of darkness into his marvellous light."

"This is a very humbling, but it is a real view of human nature, and I need not to have gone to distant ages and countries for proof. We have it near enough at home, if men's pride would but let them see it; but their pride arises chiefly from their ignorance of it, and helps to keep them ignorant. If they had but a little humility, they would discover how imperfect their knowledge is, even of the things about them, and they would therefore see the necessity of being taught of God in these things, which were out of the reach of their senses: such are all spiritual and divine things; and in these they want divine teaching, and the promise is, concerning these; 'All thy children shall be taught of God.' Now, God never acts in vain. Unless his children wanted teaching, he need not be their teacher: but in what belongs to the spiritual world they are entirely ignorant, and they have no means of discovering, unless they be taught of God, what state they are in by nature, and if it be a state of guilt and misery, how are they to be deli-

vered from it? God has revealed in his holy word the knowledge of what belongs to these two states; but sin has so blinded men's understandings, and depraved their judgments, that they will not assent to what is revealed, nor be determined by it, until the Holy Spirit convince them what they are by nature, and what they may be by grace. Accordingly, the Scripture declares, that the Holy Spirit is the inspirer of every good thought, and word and work. He enlightens the children of God with saving truth, and subdues the opposition which was in their wills to it, and that enmity which was in their hearts. From the first moment he awakens them, and opens the eyes of their understanding; until he bring them safe to glory; he is their teacher. He teaches them to look upon sin, as it is in itself exceeding sinful; he alarms the conscience, and makes it feel the guilt and danger of sin; he leads the humble and convinced sinner to Christ for pardon; he gives him faith, and hope, and love; and by grafting him, like a living branch, into the true vine, enables him to bear much fruit to the glory of God. And since every thing good in him comes from divine teaching, is it not absolutely necessary that he should be taught of God?"

ROMANZOFF, PETER ALEXANDROWITZ, a celebrated Russian field-marshal, who was born in 1730. He was descended from an illustrious family, and having entered the army, his rank and courage soon procured him promotion. Catherine II. made him commander-in-chief of the Russian army in 1770, and in 1774 he compelled the grand vizier, who then commanded the Turkish troops, to enter into a treaty highly advantageous to the Russians. Catherine magnificently rewarded Romanzoff, and he retained her favour till his death, which took place in December 1796.

*Romanzoff*

ROMILLY, SIR SAMUEL, an eminent English lawyer who was the son of a jeweller, who for many years carried on business in Frith Street, Soho. Young Romilly was born on the 1st of March, 1757, and having completed his education, was placed in the office of a solicitor, which he quitted to study for the bar, to which he was called in 1783. He first distinguished himself by his accuracy and precision as an equity draughtsman; but he soon aspired to the highest branches of the profession, and succeeded in no common degree. The court of chancery was the arena in which he was to combat, and a Scott and a Mitford were the legal gladiators with whom he was destined to contend in presence of a Thurlow. These were great names, and they have left few equals behind them.

At length one of these succeeded to the woolack in England; while another became lord chancellor of Ireland. Mr. Romilly became a leader, and was retained in almost every cause. His indefatigable industry, his unwearied patience, his comprehensive acuteness, his deep knowledge of the law, his correct notions of the practice of the court, were all calculated to give due weight to arguments selected with skill, propounded with modesty, and enforced by a chastened eloquence. He now began to feel himself raised to independence; but his efforts did not relax by prosperity; and fortune, as well as honour, attended

his career. In the profession he had chosen, the best portion of life has often passed away before this degree of success is attained; and even the subject of this memoir had reached the age of forty before he had formed a domestic establishment. At length, in the year 1798, he married a lady, with whom for many years he enjoyed great domestic happiness. Become a husband and a father, he applied to business with additional eagerness and industry; and when Mr. Fox and Lord Grenville assumed the reins of government in 1806, he was nominated solicitor-general, and received the honour of knighthood. It was at first uncertain what office he should hold during that administration; for it had been proposed at one time to reward such distinguished merit by entrusting the great seal to his custody: but this pre-eminence was reserved for another. It is much to the credit of Sir Samuel, as well as of his colleague, that the press, during their time, in the language of the great Lord Chatham, became "a chartered libertine." Party contention was at that moment at its height; and political disputes were carried still higher than before. Yet, whatever provocations might have been given to the administration of that day, no prosecution for libel ensued. Sir Samuel had long determined to commence a reform of English jurisprudence, by altering, amending, or repealing certain laws which still continued to disgrace our statute-book. He commenced his career by an anomalous case arising out of the rigours of the feudal system, and which, when applied to modern times, was productive of fraud, injustice, and even of murder. Accordingly, in 1807, he obtained leave to bring in a bill "for making the freehold estates of persons liable to the bankrupt laws, who might die indebted, assets for the payment of their simple contract debts." Notwithstanding this bill was lost on a division, yet the effect produced by it did not prove wholly useless, for the legislature soon after granted its sanction to an amended act, by means of which the debts of traders have been more effectually secured for the benefit of the public. Nearly at the same time he assisted as a manager at the trial of the late Viscount Melville, who, after being treasurer of the navy, had presided for some years over the affairs of the admiralty. On this occasion the whole arrangement of the evidence and documentary papers was entrusted to his charge; and he summed up the proofs in a speech of considerable length. After animadverting with much severity "on the suspicious fact of burning the vouchers," he dwelt on the circumstance of "two 10,000*l.* bank-notes having been traced to the private use of the noble defendant;" and the refusal "to account for the sum of 10,000*l.* which he confessed to have misapplied." Sir Samuel concluded thus: "The crime, my lords, with which the noble viscount stands accused, is that of a wilful violation of the law in the breach of an act of parliament and the appropriation of money to his own purposes; both of which are, in fact, resolved into one and the same crime:—The managers for the house of commons charge him with the misapplication of 10,000*l.*, the manner of employing which he has left no means of tracing. The accused has no possible excuse for his conduct; for when the law ordained that he should not apply the public money but for public purposes, he received an additional salary in compensation for not doing so; and to wind up the climax of his criminality,

this very law, which he had violated, was one of his own production."

A reply having been made by Sir Thomas Plumer, after some previous deliberation, it was declared "that a majority of the lords had acquitted Henry Viscount Melville of the high crimes and misdemeanours charged upon him by the impeachment of the commons of England, and all things contained therein." On the dismissal of the new ministers, after an administration of only one year's duration, Sir Samuel defended their conduct, and graced their retreat, in an oration worthy of his acknowledged talents and intrepidity. He alluded, with an honest pride, to the abolition of the slave trade, so often promised, so often delayed, so often eluded by their predecessors. Their conduct in respect to the emancipation of Ireland had his most hearty concurrence; and he justified the refusal to give the king a pledge not to renew the Roman catholic question on constitutional principles. He concluded by a powerful appeal to the house in respect to the recent impeachment; and he deprecated the return of Lord Melville to office, notwithstanding his acquittal, as no one had hitherto presumed to move for rescinding the vote against him. In this last proposition he was fully gratified, as the viscount was never after employed. One other great object, nearly at the same period, occupied the attention, and afforded scope to the labours, of the subject of this memoir. Considering the present as an enlightened age, he deemed this a proper time to attempt a reform of our criminal code. The ex-solicitor-general wished for the repeal of certain laws, equally cruel in their provisions and ineffectual in respect to their execution. Accordingly on the 18th of May, 1808, he moved for leave to bring in a bill for that purpose; and in this was introduced a most provident and humane clause for affording compensation to such as were unjustly accused and tried.

Sir Samuel soon after published a pamphlet, to justify his conduct and explain his views; he also introduced some new arguments, and enlarged those already adduced in refutation of the theory of Dr. Paley. In this little work he animadverted on the barbarous act of Queen Elizabeth, which rendered it a capital offence "for any person above the age of fourteen to be found associating for a month with persons calling themselves Egyptians," and he quoted the respectable authority of Lord Hale to prove that thirteen persons, coming under its provisions, had been executed upon it at one single assize. Who would have thought that, until recently, it was a capital offence for soldiers and "mariners to wander and beg without a pass?" And yet this law continued in full force until two years after the epoch of which we here treat.

"Let it be remembered, as is now universally admitted," observes this judicious writer, "that the certainty of punishment is much more efficacious than any severity of example for the prevention of crimes. So evident is the truth of this maxim, that if it were possible that punishment, as the consequence of guilt, could be reduced to an absolute certainty, a very slight penalty would be sufficient to prevent almost every species of crime, except those which arise from sudden gusts of ungovernable passion. If the restoration of the property stolen, and only a few weeks', or even but a few days', imprisonment, were the unavoidable consequence of theft, no theft would ever be committed.

"No man would steal what he was sure he could not keep; no man, by a voluntary act, would deprive himself of his liberty but for a few days; no man would expose himself to certain disgrace and infamy without the possibility of gain. It is the desire of a supposed good which is the incentive to every crime: no crime, therefore, could exist, if it were infallibly certain that not good, but evil, must follow as an unavoidable consequence to the person who committed it.

"This absolute certainty, it is true, can never be attained where facts are to be ascertained by human testimony, and questions are to be decided by human judgments. But the impossibility of arriving at complete certainty ought not to deter us from endeavouring to approach it as nearly as human imperfection will admit; and the only means of accomplishing this are, a vigilant and enlightened police, rational rules of evidence, clear and unambiguous laws, and punishment proportioned to the offender's guilt."

It has already been stated that Sir Samuel distinguished himself greatly in the important debate which was a prelude to the "Abolition Bill;" and when the house of commons in 1814 took into consideration that article in the treaty of peace which allows of the prosecution of the slave trade for a period of five years, his indignation was aroused, to find that the ministers of this country had acceded to any convention in which this was a prominent stipulation.

The next great public occasion in which we find the subject of the present memoir engaged, respected the court in which he daily practised. In order to facilitate public business, and ease the indefatigable labours of the lord chancellor, a new judge was proposed to be appointed and a new tribunal to be instituted. This was objected to in the house of commons by Sir Samuel, as an innovation without being an improvement; and he prognosticated that neither the great officer who presided in the court of equity, nor the suitors of that court, nor the public in general, would profit by the change. How far his prescience extended on this occasion may be gathered from the result of two or three years' experience. While that project was but as yet in embryo, he published a pamphlet, containing his opinions on this subject; the general result of which was, that the new division of chancery into two courts, and the creation of an intermediate court of appeal between it and the house of lords, would tend greatly to enhance the expense of suits "already grievously and oppressively high," to multiply the business of the court, and to protract the final decision of causes.

"The remedy, my lord, which I have to propose, is a very simple one, but I am much afraid, considering the force of several expressions which I find scattered in your lordship's pamphlet, that you will think me disrespectful even in mentioning it. You have, however," adds he, "really left me no choice. You have imposed upon me the necessity of being deficient in what you will think due respect, in order to avoid the reproach of being deficient in what you have made my duty. The remedy then, my lord, seems to be "that the house of lords, like all inferior tribunals, should, when they are pressed with an unusual quantity of business, sit on a greater number of days and at unusual hours in order to despatch it."

His last, and according to some his best, speech,

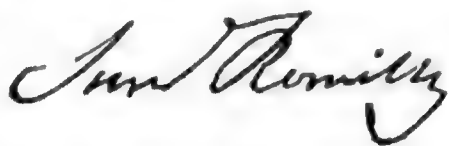

was delivered against the alien bill, at the close of the late parliament, and so powerful were his arguments, that the amendments introduced by the lords were on his suggestion thrown out.

"I do not know," said Sir Samuel, "what course the house is about to take on this subject, although I cannot help suspecting what that course will be—a course utterly unwarrantable to the individuals more immediately concerned, and utterly repugnant to the spirit of all parliamentary proceeding. Deeply involved as our privileges are in this question, yet as this parliament will in all probability be dissolved in a very short period, I fear its last act will be an act of signal injustice. Such, Sir, will be a fit close for the greater part of our proceedings. Apprehending that we are within a very few hours of the termination of our political existence, before the moment of dissolution arrives, let us recollect for what deeds we have to account. Let us recollect that we are the parliament which, for the first time in the history of this country, twice suspended the Habeas Corpus act in a period of profound peace. Let us recollect that we are the confiding parliament which entrusted his majesty's ministers with the authority emanating from that suspension, in expectation that, when it was no longer wanted, they would call parliament together to surrender it into their hands—which those ministers did not do, although they subsequently acknowledged that the necessity for retaining that power had long ceased to exist. Let us recollect that we are the same parliament which consented to indemnify his majesty's ministers for the abuses and violations of the law of which they had been guilty in the exercise of the authority vested in them. Let us recollect that we are the same parliament which refused to enquire into the grievances stated in the numerous petitions and memorials with which our table groaned—that we turned a deaf ear to the complaints of the oppressed—that we even amuse ourselves with their sufferings. Let us recollect that we are the same parliament which sanctioned the use of spies and informers by the British government—debasating that government, once so celebrated for good faith and honour, into a condition lower in character than that of the ancient French police. Let us recollect that we are the same parliament which sanctioned the issuing of a circular letter to the magistracy of the country, by a secretary of state, urging them to hold persons to bail for libel before an indictment was found. Let us recollect that we are the same parliament which sanctioned the sending out of the opinion of the king's attorney-general and the king's solicitor-general as the law of the land. Let us recollect that we are the same parliament which sanctioned the shutting of the ports of this once hospitable nation to unfortunate foreigners flying from persecution in their own country. That, Sir, is what we have done; and we are about to crown all by the present most violent and most unjustifiable act. Who our successors may be I know not; but God grant that this country may never see another parliament so regardless of the liberties and rights of the people, and of the principles of general justice, as this parliament has been."

In the midst of these active and popular pursuits, Lady Romilly was attacked by illness. During their residence at their country house at Tanhurst in Surrey, in the month of August 1818, she had a long interval of comparative health, and hope again established itself in the bosom of her family. In the expectation

that the mild air of the Isle of Wight, the charms of a beautiful scenery, and the recreation of agreeable society would tend to confirm her convalescence, they went to East Cowes. Lady Romilly, while there, had a fresh attack of illness, of a nature still more serious and distressing than any she had yet experienced; and Dr. Roget, the nephew of Sir Samuel, was immediately sent for to her assistance. The continual fluctuations of her disorder sometimes affording gleams of hope, at other periods indicating urgent danger, kept Sir Samuel for a long time in a state of the most fearful suspense. He was a daily witness to her sufferings, and, with an imagination which always entered deeply into the distresses of others, while he was proportionably regardless of his own, his sympathy was on this occasion more than ordinarily acute. He now became alarmed about himself, and was anxious to obtain relief. A variety of medicines were administered with a view to procure rest, and allay his nervous feelings; but under the unfavourable circumstances in which they were given, their efficacy was inconsiderable, and their operation transient. He frequently expressed his surprise that his want of sleep did not interfere with his bodily health, that his appetite and digestion continued in full vigour, that no indication of fever existed, and that he felt no uneasy sensation in his head. In conversing with Dr. Roget and Dr. Dumont he dwelt much on this apparent anomaly, and drew from it the most ominous presage as to the probability of its ending in insanity, an apprehension which unfortunately took deep root in his mind. Lady Romilly died of dropsy in the chest, in the night of the 29th of October, 1818. Sir Samuel was informed of the event the next morning by Dr. Roget; he received the intelligence with calmness and resignation, and without any effusion of grief. In the course of the day it was proposed to him to quit the scene of his sorrows, and return by easy journeys to London; he immediately and without hesitation agreed to the plan, and directed the arrangements necessary on the occasion. On his arrival at Murrel Green, the following day, he declared that he was so much exhausted that he could proceed no farther that day, which accordingly was passed at the inn: and towards the evening he became composed. Dr. Roget, who constantly passed the night in his room, observed that, although in general restless, he yet, at intervals, enjoyed tranquil sleep. At no period did he betray the smallest sign of impatience or irritability. The next day he resumed his journey, but as he approached London, his agitation increased, and he once complained to his daughter that his head was disturbed. In the evening of his arrival at his house in town, after having eaten his dinner with his usual appetite, he expressed a desire to see Dr. Marcet, but did not assign any particular reason for this wish. It has been erroneously reported that he at that time felt a distressing sense of burning heat in his head. It is, however, certain that except in the instance above alluded to, which occurred in the Isle of Wight, he never, at any period of his illness, complained of any feeling of this kind. Dr. Marcet directed his inquiries very particularly to the state of the head: and the constant answer of Sir Samuel was, that he had no head-ache, nor any uneasy sensation whatever in his head. The symptoms present were those of a high degree of nervous irritation, unaccompanied by fever or any inflammatory action; but they were of a nature to excite consider-

able alarm as to the state of his mind. Though he refrained from giving vent to his feelings, it was evident from his manner, and from the expressions which dropped from him, that he despaired of his recovery, in spite of every endeavour to inspire him with hope and comfort. Various steps were recommended with a view to allay his extreme irritation, but he objected to all of them in succession, and insisted upon being allowed to go to bed without making any attempt to procure relief, on the ground that he felt he must necessarily pass a wretched night, and that if he were to use any medical prescriptions it would only have the effect of taking away all his confidence in the powers of medicine. During the greater part of the night, Dr. Roget, who lay on a bed in the same room, observed that he was perfectly tranquil, and apparently asleep, although, when this was mentioned to him the next day by Dr. Roget, he assured him that he was mistaken, and that although quiet, he had never, for an instant, dropped asleep. The next morning he was worse; the restlessness had returned, unaccompanied with symptoms of fever. A consultation was immediately held, in which the propriety of drawing blood from the head and of applying ice, was fully discussed; it was decided, upon mature deliberation, that the adoption of these measures, under the actual circumstances, would not be expedient: other remedies of an active nature were prescribed; the physicians agreed to meet again at five o'clock in the afternoon, and injunctions were given that any change in the symptoms of his disorder should in the mean while be attentively watched. He took the medicines that had been ordered, without the least reluctance, and continued tranquil, and apparently asleep, till about two o'clock. His daughter was then by his bed side; on his awaking, she observed him becoming restless and agitated. To her first enquiry whether she should go and call Dr. Roget, who was in an adjoining room, he answered in the negative; and to her second, he gave a faint assent. Dr. Roget hastened to obey the summons, but in the short interval of Miss Romilly's absence, a sudden paroxysm had seized him, he had hurried from his bed, and had armed his hand against his own life. The razor, with which he had inflicted the fatal wound, was yet in his hand, when Dr. Roget entered his apartment. Before he expired, he made signs that he wished to write, but though supplied with pen and ink, nothing intelligible could be collected from his attempts. He then desisted from making them, and, joining his hands, appeared, from the movements of his lips and eyes, to be absorbed in fervent prayer. It is hardly necessary to state that the jury summoned on the coroner's inquest brought in a verdict, that the deceased had destroyed himself while in a state of temporary mental derangement. This event took place on the 2nd of November, 1818. United in death, as in life, Sir Samuel and his lady were interred at the same time, and in the same grave, at Knill, the seat of Lady Romilly's ancestors, in Herefordshire.

ROMNEY, GEORGE, an eminent English portrait painter, who was a native of Dalton in Lancashire, where he was born in 1734. After several

attempts on the part of his father to settle him in trade, he consented to his becoming an artist, and

placed him with Mr. Steele for instruction. In 1762 he came to London, where he met with great encouragement, and in 1765 he gained a prize from the society for the encouragement of arts and sciences, for an historical picture of the Death of King Edmund. In 1773 he went to Italy, where he staid two years, and on his return to England enjoyed the most uninterrupted success in his profession for more than twenty years. After that period he retired in the possession of a handsome fortune. Many of his designs are in the illustrations of Boydell's Shakespeare, and he painted several pictures for the prince of Wales. He died in his native county in November 1802.

**RONSARD, PIERRE DE**, an early French poet, who contributed to the improvement of the language and literature of his country. He was born of a noble family of Vendome in 1524. Having finished his education, he resided some time at the court of James V. of Scotland, and, on his return from his travels, was employed in a diplomatic capacity in Germany. At the Floral games at Toulouse he triumphed over his competitors, and received a silver statue of Minerva, which he presented to Henry II. He was greatly esteemed by that prince and by his successors Francis II. and Charles IX. He distinguished himself in the wars against the Huguenots, obtained the abbey of Bellocane, and was also prior of St. Cosme near Tours, where he died in 1585. His writings, consisting of sonnets, madrigals, eclogues, lyric pieces, elegies and satires, and an epic poem, "La Franciade," are of little merit.

**ROOKE, SIR GEORGE**, an English admiral, who was descended of an ancient family in the county of Kent, and born in June 1650. His strong predilection for a seafaring life induced him to enter the royal navy at an early age, in which he rose to the highest situations. His conduct in several naval expeditions under King William and Queen Anne placed his name high in his profession; especially by the gallantry which he displayed in the destruction of the French and Spanish fleets in Vigo Bay, 1702, and the capture of Gibraltar in 1704. Sir George occupied a

seat during several parliaments for Portsmouth, and another at the council board of the lord high admiral, Prince George of Denmark. His votes on several occasions, particularly one in favour of Harley as speaker of the house of commons in 1701, obscured his merits in the eyes of the court party; the value of his services was depreciated, and his good fortune ascribed to accident. He at length retired in disgust from the service to his family seat in Kent, where he died in 1709.

**ROSA, SALVATOR**, a celebrated painter, distinguished likewise as a musician and a poet. He was the son of an architect and surveyor, and was born at the village of Renella, in the kingdom of Naples, in 1615. He was intended for the church; but leaving, of his own accord, the seminary in which he had been placed for education at the age of sixteen, he devoted himself to the study of music, and with such success that he became a skilful composer. His eldest sister having married Francesco Francanzani, a painter of considerable talent, Salvator, from frequenting his work-room, acquired a predilection for the art, in which he afterwards excelled. He at first amused himself with copying whatever pleased his fancy in the paintings of his brother-in-law; and his latent genius being thus awakened, his sketches were so much admired that he was easily persuaded to adopt painting as a profession. But his taste was formed more from the study of nature among the wilds of the Appennines than from the lessons of other artists, and he delighted in delineating scenes of gloomy grandeur and terrible magnificence, to which the boldness of his conceptions, and the fidelity of his representations, communicate a peculiar degree of interest.

He worked for some time at Naples in obscurity, till one of his pictures being observed by the famous painter Lanfranco, he generously recommended Salvator to notice, and procured him effectual patronage and support. He removed to Rome, where he established his reputation, and raised himself to celebrity and independence. He afterwards went to Florence, where he was patronised and employed by the grand duke and other members of the family of Medici. At length returning to Rome, he painted many pictures for the churches in that city, where he died in 1673. His satires and other poetical productions have been often printed under the title of "Rime di Salvator Rosa, Pittore e Poeta Napolitano." On account of his caustic wit he was excluded from the Roman academy. Some time after, the academy having refused admission to another artist, who practised surgery as well as painting, Salvator Rosa observed that it was very injudicious in them, as the academy greatly needed a surgeon to replace the legs and arms that the members daily dislocated.

**ROSE, RIGHT HONOURABLE GEORGE**—This statesman commenced his career in humble life, and his first office of importance was that of superintendent to the "Record" office. In 1767 a new field opened for the display of his unwearied and indefatigable industry. He was at that period appointed to superintend a work of no common magnitude, the completion of the journals of the house of lords, in thirty-one folio volumes! From this period Mr. Rose was constantly employed by nearly all succeeding ministers, with the exception of Mr. Fox, and at length rose so high in the favour of his sovereign, after becoming a senator, as to have obtained the invidious appellation of "one of the king's friends."

It ought not to be here forgotten, that when the earl of Shelburne, at the conclusion of the American war, became premier, he found Mr. Rose a very useful assistant in a subordinate capacity. Soon after his retreat the administration, of which Mr. Pitt was the head, no longer considered him as a clerk, but as a coadjutor. Although both he and his countryman, Mr. Dundas, were doubtless of different political sentiments from those at first professed by this young, able, and ambitious minister, yet they soon perceived that his talents and his eloquence, superadded to the name and exploits of his father, were calculated to produce no small degree of effect in the councils, as well as fortunes, of the nation which had given him birth. The rise of Mr. Rose was now equally rapid and secure. On the disgrace of the coalition administration he had readily obtained a seat in parliament; while his appointment to the important office of joint secretary to the treasury in 1784, rendered him acquainted with all the affairs of the state. Mr. Rose now turned his thoughts to the melioration of the finances. His early knowledge of a sea-faring life, his occasional residence on the shores of the British Channel, and, above all, his habits and his researches, had rendered him familiar with the severe but very inadequate fiscal regulations then in force. Accordingly it was he who first conceived the idea of putting down smuggling, and improving the income of the state by decreasing the amount of duties exacted at the custom-house. By means of this and other financial measures, in all of which Mr. Rose participated and assisted, the revenue was increased; while trade, which had been greatly depressed by the American war, assumed a more flourishing aspect. His love of order, his attention to details, his regularity and sober habits, extended from the treasury to the long room; and all the public boards were kept on the alert by his vigilance and industry.

In 1792 Mr. Rose was fated to encounter a charge of malversation in his capacity as secretary of the treasury. This accusation was founded on a trial in the court of king's bench, arising out of the many incidents of the Westminster election, with which he had connected himself as a friend to Lord Hood, and consequently a foe to Mr. Fox. One Smith, a publican at Whitehall, was the plaintiff; and, according to his statement, having been convicted by the board of excise in a penalty of 50*l.*, he had applied to Mr. Rose, through the medium of General Gascoigne, for a remission of the fine.

A promise to this purpose was stated to have been obtained, and the dealer in beer, to show his gratitude, immediately commenced a very active scrutiny to detect the bad votes polled for Lord John Townshend. But on learning soon after that he was still liable to a moiety of the fine, and that it was actually about to be levied, he presented a bill of 110*l.* to Mr. Rose, and on his refusal to pay the same, soon after commenced an action in Westminster Hall, where he recovered, by the verdict of a jury, the full amount of his supposed services. On Tuesday, March 13th, Mr. Thomson, then M. P. for Evesham, introduced the charge in the house of commons, and concluded a long speech by moving for a committee of inquiry on the ground of public rumour. He was seconded by Mr. Lambton, who mentioned a new case of corruption in the person of one Hoskins, connected with the lottery department.

Mr. Rose strongly animadverted on "the extraor-

dinary ground of authority which the honourable mover had taken his information from, viz. public rumour, and entered into an analysis of that undefinable personage called the public, who was not to be met any where, and yet was in every person's mouth. Possibly the honourable gentleman found the public in newspaper paragraphs and libellous pamphlets: he would not go the length of saying, that what the honourable gentleman had advanced was his own invention; but he could not avoid expressing his astonishment at the honourable gentleman's credulity, in venturing to bring before the house, in the serious and solemn manner that he had done, charges which if he did not, before he sat down, prove to the satisfaction of the house, not only that every part of them was not true, but that they had not in them the smallest degree of truth, nor any shadow or trace of truth whatever, he should be more mistaken than ever he had been in his life."

Mr. Rose having said this, proceeded to state the whole of the transactions of every kind that had taken place between Mr. Smith and himself; and the greater part of what he said he supported by written documents. He began with explaining, that Mr. Smith had kept a livery-stable, and that he had been in the habit of hiring horses of him to go the first stage out of town; that he had not seen the man to his knowledge, nor should he have known him if he had met him, before he sent him a petition enclosed in a letter, in 1789, both of which he would read to the house. "The petition stated that Smith, having had an information lodged against him for brewing beer at home, had been convicted in a penalty of 50*l.*; that the beer was small beer for the use of his own family; that he was a poor man, altogether ignorant that it was contrary to law to brew small beer for the use of his own family, and that he had no intention to commit any offence whatever against the laws of his country. The petition farther stated, that one-third of the penalty went to the poor of the parish, one-third to the informer, and the other to the king. The letter stated that the vestry of St. Martin's (or St. Margaret's) were willing to give up their third of the penalty, provided he (Mr. Rose) would procure the remission of the king's other two-thirds. Thus, Mr. Rose said, the member of parliament through whose medium, according to the honourable gentleman, Mr. Smith had been introduced to him, was no other than the vestry of St. Martin's. With the petition, Mr. Rose said, he did exactly what, in the ordinary course of business, he ever did whenever petitions were sent to him, viz. referred it to the board to whose cognizance the subject-matter belonged. Mr. Smith's petition he enclosed to Mr. Cholmondeley, the chairman of the excise board; and afterwards, upon another application, understanding that Mr. Cholmondeley was out of town and the petition with him, he wrote to the secretary to beg him to get the board to suspend deciding upon Mr. Smith's case till Mr. Cholmondeley came to town, and on no other account than merely because Mr. Cholmondeley had the petition with him. But to show the house of what little avail his interference had proved, the petition was rejected by the board of excise, and Mr. Rose read the secretary's answer, with the decision of the board, in which the secretary declared, 'that all the allegations were untrue; that Mr. Smith was not a poor man; that the beer brewed was strong, and not small beer; that he well knew what he had done

was illegal; that he contrived to get the malt into his house so privately that even his brewer (who was the person that had informed against him) did not know when or whence it came; that he had long been in the habit of brewing and conveying it into his own cellars for sale; and that if the penalty had been 500*l.* instead of 50*l.* it would not have been adequate to the beer he had brewed.' Here, therefore, Mr. Rose observed, was a clear proof that he had not influenced the board in their decision. Half the penalty had actually been levied, and the other half was to be paid by instalments. This, he solemnly said, was the whole of the transaction between Mr. Smith and him, as far as regarded the penalty of 50*l.* During the time of the election for Westminster, Smith came to him as he was going out, and made a proposition for opening his house. Mr. Rose said, Smith declared in his entry that he could detect a great number of bad votes that had been given for Lord John Townshend; when he answered, 'Do so, if you can; it will be doing a right thing;' but as to any proposition on the subject of the election, he must go to Lord Hood's committee. He did so, found the bad votes he said he could find, and at length applied to him (Mr. Rose) to be paid. The answer Mr. Rose gave him he declared was, 'Return to Lord Hood's committee, they'll pay you.' Smith afterwards again demanded payment of him, and commenced an action which was tried in the court of king's bench. He would not, Mr. Rose declared, impeach the justice of the court, nor the integrity of the jury; such a case was certainly made out as to induce them to give a verdict for Smith. These were the facts; but did any man in his senses suppose that he (Mr. Rose), if he had felt the least consciousness of being really indebted to Smith, that he would suffer the cause to have gone into a court of justice? Most certainly he would not. He never had sent a man who had a demand upon him twice from his door in the whole course of his life. But he must still think that Smith had not a right to call on him for payment."

On every subject connected with our commercial relations, Mr. Rose was constantly consulted. He had rendered himself familiar with all questions relative to our commercial intercourse with other nations; and no one was ever better acquainted than himself with the maritime claims, rights, and interests of Great Britain. After filling a variety of high, honourable, and lucrative situations, he retired with his patron Mr. Pitt, on the elevation of Lord Sidmouth to the premiership, and under his banners became an active member of opposition. On the return of his friend once more to power, new honours and new employments awaited him. Having been admitted into the privy council, Mr. Rose now of course became entitled to the usual prefix of right honourable; he was also nominated, first, vice-president, and afterwards president of the board of trade, the business of which was familiar to him; he also at the same time enjoyed the office of treasurer of the navy, with a residence, &c., in Somerset House, in addition to a salary of 4000*l.* per annum. As to the last of these appointments, it had been long considered by others as a sinecure, managed wholly by a deputy who superintends the heads of offices; but it only opened a new field for his exertions.

In 1812, on the motion for printing the comparative statement of the population of Great Britain in the years 1801 and 1811, Mr. Rose congratulated

the house and the country at large on an increase of no less than one million and a half of inhabitants within the short space of ten years. "In England," he observed, "the increase appeared to be in a ratio of fourteen per centum, in Wales of twelve, and in Scotland of thirteen. This increase in the amount of the population exhibited an extent and duration unexampled in the history of this country; and what rendered it still more surprising was, that the increase of the males was as great as that of the females. The total population of England, Scotland, and Wales, in 1801, was 10,472,048; at present it amounted to 11,911,644, making an increase of 1,439,596 persons actually resident in the country; which, added to 170,000 comprised in our army and navy abroad, made a total amount of 1,609,596. Much had been said as to the means of supplying such an immense multitude; and it would appear that the imports of grain and the prices of the same had greatly increased between the years 1775 and 1810, having risen in average quantity from 564,413 to 1,471,005 quarters, and in average price from 30*s.* to 60*s.* During the last year not less than 4,271,000*l.* went out of the country for the sustenance of the inhabitants. To meet the growing wants of an increasing population without having recourse to foreign countries was a most important object; and he was firmly persuaded that no such effectual mode existed as encouraging and extending the cultivation of potatoes, which would grow in those soils that were unfit for the cultivation of grain. There is also another source of supply," added he; "I mean the fisheries. It is strange that in a maritime country like this, fish is rarely to be seen but at the tables of the rich; for the poor received little or no benefit from that nutritious description of aliment. There might be some prejudices existing against the use of fish; but the exertions of gentlemen in the different parts of the country, if rightly directed, would do them away. He himself had been enabled, at a time when the quarter loaf was extremely dear, to supply the poor in his immediate neighbourhood, with twenty-two pounds of good potatoes and nine herrings for fifteen pence. If the hints he had now thrown out were acted upon, it would tend to introduce a variety of nutritious food amongst the lower orders of society, save a sum of 3,500,000*l.* annually in the country, increase the agriculture of the kingdom, and, by extending the fisheries, employ 100,000 persons in the way which, more than any other, was calculated to uphold the naval greatness of the empire."

The next important subject in which we find Mr. Rose engaged was the defence of himself and ministers, in consequence of a motion made on the part of Mr. Brougham, "that a select committee might be appointed for the purpose of taking into consideration the present state of the commerce and manufactures of the country, and particularly with reference to the orders in council and license trade." On this occasion he entered into a variety of interesting details; but as the projects in question were afterwards abandoned for a time, it would be unnecessary to mention them in this place.

On the defalcation and evasion of Mr. Chinnery, the treasurer of the navy in a very manly manner exculpated himself from all blame relative to that public officer. Having been recommended to his notice by Lord Thurlow, whose private secretary he was while lord chancellor, Mr. Rose took an oppor-

tunity of introducing him to office. He acquitted himself for some time with great propriety; but after the expiration of four or five years, got into a very expensive mode of living. On this he remonstrated with him on account of his extravagance, and even wrote to him on the same subject, telling him freely "he had always found when a man exceeded his income, there was but little security for his honour." He never went to any of his private concerts, lest he should be supposed to countenance them: and the only time he was in his house was when he stood god-father for his son.

To enumerate all the speeches made, and mention the part taken in the course of so many sessions by the right honourable gentleman, would be to detail all the important occurrences in parliament for nearly forty years. It may be proper, however, to observe, that he was a great encourager of friendly societies, for the purpose of supporting poor tradesmen, manufacturers, labourers, and others, during sickness and old age, by means of weekly or monthly assessments obtained from their earnings. He actually brought in a bill to protect their property, which was before liable to depredation; and, by his means, frauds of the kind alluded to were very properly rendered felonies by an act of the legislature. To him also the public is indebted for an extension of this plan to associations of a similar nature.

In 1817 he moved for "leave to bring in a bill for the protection and encouragement of provident institutions or banks for savings." He was of opinion "that when these institutions were once properly understood, they would gradually do away the evils of the whole system of poor-laws. When it was considered that no less a sum than 7,000,000*l.* was annually raised at present for the benefit of the poor, and yet that complete relief was not afforded to them, it must be allowed that any measure which tended to alleviate the pressure of the poor-rates, and to meliorate the condition of the lower orders of society, was of the utmost importance, and deserved in the greatest degree the protection and encouragement of the legislature. This bill," he added, "was exactly the same as that brought in last session; and although neither had been solicited by the parties, yet it would be recollected that the excellent act which passed both houses of parliament in 1795, and had done so much good, was precisely in the same predicament.

"Not only would there arise from this parliamentary interposition a protection and security for the poor man's savings, but, what was better, habits of industry, honesty, and sobriety, would be duly encouraged and matured among the lower orders; while one leading evil of inferior life would be checked, if not prevented—the contracting of early and improvident marriages."

As an author, Mr. Rose was certainly a voluminous writer, and would have been still more so had he not been prevented by the pressure of public business. The following is a passage from one of his numerous works:—"Vertot's 'Account of the Revolutions of Rome' has been found very useful by persons who have read the Roman history; but the best model that I have met with for such a work as appears to me to be much wanted, is a short history of Poland, which I translated near forty years ago, but did not publish; the manuscript of which his majesty at the time did me the honour to accept, and it probably is still in his majesty's library. I then thought of at-

tempting a history on the same plan for this country; but I gave up the intention, more from a sense of my incompetency than from the close employment, which occupied nearly my whole time. I heartily wish some one more equal in all respects to the task may embark in it and execute it usefully." In 1767, when the house of lords passed a vote for publishing a superb engraved edition of "Doomsday Book," Mr. Rose was appointed to superintend this grand national work. We have been told that it cost an immense sum, and it has always been allowed that the editorship was conducted with due care and undeviating fidelity.

In 1799 Mr. Rose published a work on the finances, which made some noise. It was entitled "A Brief Examination of the Revenue, Commerce, and Manufactures of Great Britain, from 1792 to 1799." On this occasion his view of our situation was favourable in the extreme; and it would almost appear evident from his statement, that the pressure of taxation and the continuance of war were evils too light in themselves to be put in competition with our increasing prosperity and our brilliant prospects. To this work a table is annexed by way of appendix, and for the convenience of reference, which is said to have been the result of an elaborate investigation, by some gentleman connected with the administration, and well qualified for the task. It would appear from this publication, that in 1793, the first year of the war with France, our imports were 19,256,000*l.*, our foreign and colonial produce 5,784,000*l.*, the export of British manufactures 18,892,000*l.*, and the total 19,676,000*l.*: with the exception of the year 1797, the progress had been gradual but certain; and in 1798 our imports amounted to 27,857,000*l.*; while our foreign and colonial produce had risen to 10,617,000*l.*; our British manufactures exported were estimated so high as 19,672,000*l.*; the grand total amounted to 30,289,000*l.*, producing an average total for seven years of upwards of twenty-five millions and a half pounds sterling.

In 1809 Mr. Rose printed a pamphlet with his name annexed, in which he broached the singular political paradox, that no increase of the influence of the royal prerogative had occurred since Mr. Dunning's famous motion. This produced many replies, particularly one from Mr. Martin, a member of the finance committee, who entered into a comparative estimate of the army, ordnance, number of generals, amount of public debt, &c. &c., in 1782 and 1810, whence he deduced a far different result, and appealed to the candour of his right honourable opponent for the truth of his positions; but Mr. Rose remained inflexible, and supported his former position by means of new arguments. In 1809 also appeared "Observations on the Historical Work of the late Right Hon. Charles James Fox; by the Right Hon. George Rose. With a Narrative of the Events which occurred in the Enterprise of the Earl of Argyle, in 1685; by Sir Patrick Hume."

Mr. Rose died at Cuffnells, near Lyndhurst, on the 13th January, 1818, after a short illness, without a struggle, and amidst great serenity both of mind and countenance. He had attained the seventy-fifth year of his age, although in point of appearance and activity he might have passed for a much younger man: thus, a long life solely dedicated to business, appears to have made but little impression either on his bodily or vital powers. In person he was of the

middle size, and of that shape and form which bespeak longevity. To this, perhaps, he contributed not a little by temperance, early rising, and constant but regular exercise.

**ROSCOE, WILLIAM.**—The parents of this eminent scholar were in very humble circumstances, and Mr. Roscoe was born at Liverpool in 1752. After receiving the rudiments of his education at a small school, he was articled to an attorney at sixteen years of age. While engaged in the duties of his office he was stimulated to undertake the study of the Latin language by one of his companions, who boasted that he had read Cicero "*De Amicitia*," and spoke in high terms of the eloquence of the style and nobleness of the sentiments of that celebrated composition. Young Roscoe immediately commenced the work; and, smothering his difficulties by perpetual reference to his grammar as well as to his dictionary, he laboured through the task which the spirit of emulation had excited him to undertake. The success experienced in his first attempt prompted him to proceed; he stopped not in his career till he had read the most distinguished of the Roman classics. Having thus made considerable progress in the Latin language, he—still without the assistance of a master—applied to the study of the French and Italian: the best authors in each of those tongues soon became familiar to him; and it is believed that few of his countrymen ever acquired so general, so extensive, and so recondite a knowledge of Italian literature as did Mr. Roscoe. At a later period of his life he added Greek to his other attainments.

After the expiration of his articles he entered into partnership with Mr. Aspinall; when the entire management of an office, extensive in practice and high in reputation, devolved on him alone. About this time he formed an intimacy with Dr. Enfield, the tutor of the academy at Warrington, to whom, on the publication of the second volume of that popular work, "*The Speaker*," he contributed an elegy to Pity, and an ode to Education: Mr. Roscoe also became acquainted with Dr. Aikin, then practising as a surgeon at Warrington; and these gentlemen were not less admirers of his refined and elegant style as a writer than of his chaste and classical taste in painting and sculpture. In 1788 Mr. Roscoe published

a work upon the slave trade entitled, "*A Scriptural Refutation of a Pamphlet lately published by the Rev. Raymond Harris*;" and shortly afterwards his principal poem, "*The Wrongs of Africa*." Incited by the enthusiasm of the same train of feeling, he composed, soon after the commencement of the French revolution, two ballads, "*The Vine-covered Hills*," and "*Millions, be free!*" which were equally popular in France and England; and he also sang the praises of liberty in a translation of one of Petrarch's odes, which was inserted in the "*Mercurio Italico*."

The great work on which Mr. Roscoe's fame chiefly rests, his "*Life of Lorenzo de' Medici*," was commenced in 1790, and completed in 1796. During the period of its compilation, the author lived at the distance of two miles from Liverpool, whither he daily repaired to attend the business of his office. His evenings alone could be dedicated to the work. The rare books which he had occasion to consult were mostly procured from London, although it was a considerable advantage to him that his friend Mr. Clarke, the banker, had spent a winter at Florence. The work was printed at Liverpool under his own superintendence.

In 1805 appeared Mr. Roscoe's second great work "*The Life and Pontificate of Leo the Tenth*," the son of Lorenzo de' Medici, in four volumes, quarto. The octavo edition in six volumes did not appear till 1806. In the preface to this elaborate performance the author observes:—"For almost three centuries the curiosity of mankind has been directed towards the age of Leo X. The history of that period has not, however, been attempted in a manner in any degree equal to the grandeur and variety of the subject. Nor is this difficult to be accounted for. As attractive as such an undertaking may at first appear, it will be found, on a nearer inspection, to be surrounded with many difficulties. The magnitude of such a task; the trouble of collecting the materials necessary to its proper execution; the long devotion of time and of labour which it must unavoidably require; and, above all, the apprehensions of not fulfilling the high expectations which have been formed of it; are some of those circumstances which have, perhaps, prevented the accomplishment of a work which has often been suggested, sometimes closely contemplated, but hitherto cautiously declined. The same considerations which have deterred others from engaging in so laborious and hazardous an attempt would, in all probability, have produced a similar effect on myself, had I not been led by imperceptible degrees to a situation in which I could scarcely, with either propriety or credit, have declined the task. The history of the "*Life of Lorenzo de' Medici*," the father of Leo X., had opened the way to a variety of researches, not less connected with the events of the ensuing period than with those of the times for which they were immediately intended; and even that work was considered by many, perhaps not unjustly, as only the vestibule to a more spacious building, which it would be incumbent on the author at some future period to complete. Since that publication, the friendship and liberality of several distinguished characters, both at home and abroad, have supplied me with many valuable communications and original documents, which, without their countenance and favour, it would not have been in my power to have obtained. To have withheld these

materials from the public, would have defeated the purpose for which they were communicated; and to have shrunk from the task under such circumstances would have given occasion for a construction almost as unfavourable to myself as the failure of success. These reflections have induced me, amidst the constant engagements of an active life, to persevere in an undertaking which has occasionally called for exertions beyond what my time, my talents, or my health, could always supply; and I now submit to the public the result of the labour of many years, in the best form in which, under all circumstances, it has been in my power to offer it to their acceptance."

Mr. Roscoe proceeds to describe the principles on which he has proceeded in the execution of his undertaking, to advert to the literary historians whose volumes he has consulted, to describe the various original documents to which he has had access, and to acknowledge the assistance which he has derived from numerous friendly sources. In conclusion, he says:—"I cannot deliver this work to the public without a most painful conviction that, notwithstanding my utmost endeavours, and the most sedulous attention which it has been in my power to bestow upon it, many defects will still be discoverable, not only from the omission of much important information which may not have occurred to my enquiries, but from an erroneous or imperfect use of such as I may have had the good fortune to obtain. Yet I trust that, when the extent of the work, and the great variety of subjects which it comprehends, are considered, the candid and judicious will make due allowance for those inaccuracies against which no vigilance can at all times effectually guard. With this publication, I finally relinquish all intention of prosecuting, with a view to the public, my researches into the history and literature of Italy. That I have devoted to its completion a considerable portion of time and of labour will sufficiently appear from the perusal of the following pages, and it may therefore be presumed that I cannot be indifferent to its success. But, whatever inducements I may have found in the hope of conciliating the indulgence or the favour of the public, I must finally be permitted to avow, that motives of a different, and perhaps of a more laudable nature, have occasionally concurred to induce me to persevere in the present undertaking. Among these, is an earnest desire to exhibit to the present times an illustrious period of society; to recal the public attention to those standards of excellence to which Europe has been indebted for no inconsiderable portion of her subsequent improvement; to unfold the ever active effect of moral causes on the acquirements and the happiness of a people; and to raise a barrier, as far as such efforts can avail, against that torrent of a corrupt and vitiated taste, which, if not continually opposed, may once more overwhelm the cultivated nations of Europe in barbarism and degradation. To these great and desirable aims I could wish to add others, yet more exalted and commendable; to demonstrate the fatal consequences of an ill-directed ambition, and to deduce, from the unperverted pages of history, those maxims of true humanity, sound wisdom, and political fidelity, which have been too much neglected in all ages, but which are the only solid foundations of the repose, the dignity, and the happiness of mankind."

After the publication of his first historical work, Mr. Roscoe had retired from his practice as a soli-

citor, and had entered himself at Gray's Inn, with the intention of practising at the bar. In 1805, however, he was induced to join the banking-house of his friends Messrs. Clarke; and in the following year he received a strong public testimonial to his talents, by being elected one of the members for his native town in parliament. His senatorial career was brief; but during its continuance he distinguished himself as a steadfast advocate of the principles he had always professed, and as a warm partisan of the cause of emancipation throughout the debates upon the slave trade. After the dissolution in 1807, distrusting the power of his friends to secure his re-election, he declined entering upon a new contest; and from that time interfered with politics only by means of occasional pamphlets.

In 1817 Mr. Roscoe published a discourse he delivered on the opening of the Liverpool royal institution, on the "Origin and Vicissitude of Literature, Science, and Arts." In 1824 he edited a new edition of the works of Pope, to which he prefixed a life of the author. The last work he was occupied in publishing was a botanical one, on a portion of the class Monandria. To the science of botany he had previously evinced his attachment by "An Address delivered before the Proprietors of the Botanic Garden at Liverpool, previously to opening the Garden, May 3, 1802."

While Mr. Roscoe's mind was chiefly occupied with his literary and political studies, a series of unforeseen circumstances, particularly several other failures, obliged the banking-house in which he was engaged to suspend payment. The creditors, however, had so much confidence in Mr. Roscoe's integrity that time was given for the firm to recover from its embarrassments; and Mr. Roscoe, on first entering the bank after this accommodation, was loudly greeted by the populace. The difficulties, however, in which the bank was placed rendered it impossible for the proprietors to make good their engagements. Mr. Roscoe did all that could be expected from an honest man; he gave up the whole of his property to satisfy his creditors. His library, which was very extensive, and consisted principally of Italian works, was the greatest sacrifice; the books were sold for 5150*l.*, the prints for 1880*l.*, and the drawings for 738*l.* A portrait of Leo X. was purchased for 500*l.* by Mr. Coke, of Holkham. Yet, upon the whole, Mr. Roscoe can scarcely be termed unfortunate. Distinguished through life by the friendship of the gifted and noble, his days were passed in a free intercourse with kindred minds, and his declining years were solaced by the affectionate attentions of justly and sincerely attached relations. He was regarded as the head of the literary and scientific circles of his native town; and much of his time was spent in the promotion of many noble public institutions which he had contributed to establish. The reflection that by his means no citizen of Athens had ever assumed a mourning garment, afforded satisfaction to the dying moments of the statesman of old: as concise a comment has been supplied on the tenour of Mr. Roscoe's life, in the assertion that he has not left behind him a single enemy. "Such," it has been observed, "was the charm of his manner—of his unaffected cheerfulness—of his conciliating disposition—of his playful humour—of his natural eloquence—of his open and candid dealing—of his evident and unceasing kindness of heart and universal benevolence—

such his domestic virtues, and such his various and brilliant talents—that he was every where, at home and abroad, loved and admired; and he died, as he lived, without an enemy.” The death of this amiable and highly gifted man took place, in the eightieth year of his age, at Toxteth Park, Liverpool, on the 30th of June, 1831, after a short illness, partaking somewhat of the nature of cholera.

**ROSCOMMON, WENTWORTH DILLON**, EARL OF, a nobleman who was born in Ireland in 1633, and educated at Caen, in Normandy. Returning to England on the restoration, he plunged into the dissipation of the dissolute court, ruined his estate by gaming, became involved in quarrels, and found it necessary to go to Ireland. Here he pursued nearly the same course, and soon after returned to England. From this time he began to act with more discretion, and became distinguished among the wits of the day. On the accession of James II. he went to Italy, and died at Rome in 1684. His principal production is the poetical essay on translated verse. Johnson calls him the most correct writer of English verse before Dryden.

**ROSENMULLER, JOHN GEORGE**, a celebrated German theologian, who was born in 1736, and was professor of theology at Erlangen and Leipsic, where he distinguished himself as a preacher and by his activity in the cause of education. Of his numerous works we shall mention only his “*Scholia in N. Testament.*,” and his “*Hist. Interpretationis Librorum Sacrorum.*” He died in 1815. His son Ernest Frederic Charles, a distinguished orientalist, who was born in 1768, was educated at Leipsic, where he heard the lectures of Morus, Platner, Beck, &c. In 1795 he was extraordinary professor of Arabic, and in 1813 ordinary professor of oriental literature. Among his works are his valuable “*Scholia in Vet. Testamentum.*,” “*Scholia in Nov. Testamentum.*,” “*The East in Ancient and Modern Times.*,” “*Manual of Biblical Antiquities.*,” and “*Manual of Biblical Criticism and Exegesis.*” These works contain a great mass of valuable matter, critical, exegetical, geographical, and historical. Rosenmüller has also rendered important services to oriental literature by his “*Institutiones Linguae Arabicæ.*,” “*Arabum Adagia.*,” and “*Analecta Arabica.*” A second son, John Christopher, was an eminent anatomist, and professor of anatomy and surgery at Leipsic. Besides some writings on subjects of natural history, he was the author of “*Anatomico-Surgical Delineations.*,” “*Manual of Anatomy.*,” and of several articles in Pierer’s medical dictionary, and other periodicals, and of various other literary works.

**ROSS, ALEXANDER**, a writer of considerable talent, whose numerous works display much industry and learning. He was a native of Scotland, and having been ordained, he became master of a free grammar school in Southampton, where he died in 1654. Among his publications we may mention his “*Continuation of Sir Walter Raleigh’s History of the World.*,” and “*A View of Different Religions.*,” the latter went through several editions.

**ROSS, GEORGE**, a celebrated American, who was born in 1730 at Newcastle, Delaware, where his father was the pastor of the episcopal church. He commenced the study of the law at Philadelphia, at the age of eighteen, and, when admitted to the bar, established himself in Lancaster, Pennsylvania. In 1768 Mr. Ross was chosen a representative in the assembly of Pennsylvania, and retained his seat in that

body until 1774, when he was elected one of the delegates to the first general congress at Philadelphia. At the time of his election he was also appointed to report to the assembly of the province a set of instructions to regulate the conduct of himself and his associates. In 1777 indisposition caused Mr. Ross to resign his place in congress; on which occasion the inhabitants of Lancaster voted him a piece of plate, to be paid for out of the county stock. Mr. Ross, however, thought it his duty to decline the present. On the dissolution of the proprietary government in Pennsylvania, a general convention was assembled, in which Mr. Ross was appointed to assist in preparing a declaration of rights on behalf of the state, in forming rules of order for the convention, and in defining and settling what should be considered high treason and misprision of treason against the state, and what punishment should be inflicted for those offences. In April 1779 Mr. Ross was appointed a judge of the court of admiralty for the state of Pennsylvania; but in the ensuing July a sudden and violent attack of the gout terminated his life in the fiftieth year of his age.

**ROSS, JOHN**, a learned English prelate, who was born in Herefordshire, and educated at St. John’s college, Cambridge, where he took his doctor’s degree in 1756. Having entered holy orders, he became vicar of Frome, in Somersetshire, and was subsequently made bishop of Exeter, where he died in 1792. This prelate published an edition of the “*Epistolæ Familiares.*,” besides several other works.

**ROSSINI, GIOACHIMO**, a popular musical composer, whose works have been received with equal applause in every part of Europe. In his seventeenth year, according to an Italian journal, Rossini began to unfold his musical talents, and in his thirtieth year he had already numbered above thirty brilliant triumphs. The annals of music hardly contain another such instance of rapid success. Rossini was born at Pesaro, a small town of Romagna in 1792; his father was a strolling musician, his mother an under singer at the inferior theatres. While a child, he sang on the stage at Bologna with his mother, but received no regular musical education, relying principally upon his acquaintance with the works of recent composers, Haydn, Mozart, Cherubini, Spontini, and his own talents for singing. He began to compose at an early age, wrote an overture and a cantata in 1808, and became the director of a musical society. In 1812 his first opera was performed at the theatre Della Valle in Rome. His next productions were the following, written in the order in which they are given:—“*L’Inganno Felice.*,” “*Ciro in Babilonia.*,” an oratorio; “*La Pietra di Paragone.*,” a buffa with which he made his debut in Milan; and “*Ciampiale.*” His “*Tancredi.*,” which was brought forward at Venice in 1813 with brilliant success, attracted the greatest attention. From that time his works were called for by all the Italian theatres; and by his rapidity of execution he contrived, though often to the injury of his reputation, to answer all the demands made upon him. It is well known that the same overture sometimes serves for several operas, both comic and tragic. His next works were, “*Aureliano in Palmiro.*,” the buffa piece, “*Il Turco in Italia.*,” “*Elizabetta.*,” “*Il Barbiere di Seviglia.*,” “*Otello.*,” “*Cenerentola.*,” “*La Gazza ladra.*,” “*Armida.*,” “*Moise.*,” “*Riccardo e Zoraida.*,” “*Odoardo e Cristina.*,” “*La Donna del Lago.*,” “*Bi-*

anco e Falliero," "Matilda di Chabran, or Corradino," "Zelmira," and "Semiramide."

**ROTHSCHILD.**—This celebrated European house has raised itself from an humble sphere to an unexampled degree of wealth and importance by judicious enterprise, a sagacious and systematic series of operations, which thousands of others had the same opportunities to take advantage of, a reputation for fair dealing, and a correct estimate of men and events. The father of the brothers now carrying on the business, Mayer Anselm, was born at Frankfort on the Maine, in 1743, and died in 1812. His parents died when he was but eleven years old, and he was, as is common with poor Jews in Germany, educated for a teacher. This occupation not suiting his taste, Rothschild engaged in trading in a small way, and was not long after employed in a banking house in Hanover; and in a few years his industry and frugality made him master of a small capital. Returning to Frankfort, he married, and established the banking house which is still in existence. His activity, intelligence, and integrity in a short time procured him a continually increasing credit, particularly after his nomination as agent to the landgrave of Hesse in 1801. In 1802, 1803, and 1804, his affairs continued to prosper so much that at this period he was able to contract for a Danish loan of four million dollars. In 1813 occurred those political events which raised the house of Rothschild to the position it has since occupied in the commercial and financial concerns of the world. In a period of twelve years about five hundred million dollars were raised by the house for different powers, by way of loan or subsidy, which were distributed in nearly the following proportion; for England two hundred millions, for Austria fifty millions, for Prussia forty millions, for France eighty millions, for Naples fifty millions, for Russia twenty-five millions, for several German courts four millions, for Brazil twelve millions, exclusive of various other large sums. The remarkable success of the Rothschilds, setting aside the great opportunities which they have enjoyed from favourable circumstances, may be attributed to their strict adherence to two fundamental maxims. The first of these, in compliance with the dying injunctions of their father, is their conducting all their operations entirely in common. Every proposition of magnitude made to one of them is submitted to the deliberations of all; no project is adopted until thus fully discussed, and it is then executed by united efforts. A second principle is, not to aim at exorbitant profits, to set definite limits to every operation, and, so far as human prudence and foresight can do, to render it independent of accidental influences: in this maxim lies one of the main secrets of their strength. The reasonableness of their terms, the punctuality with which they execute their contracts, the simplicity and clearness of their plans, and their judicious manner of carrying them into effect, fortify their credit. A constant exchange of couriers is kept up between them, who are frequently in advance of those of the government. Several princes have publicly acknowledged their obligations by conferring nobility and other honours upon the different members of the family, one of whom died lately.

**ROTROU, JEAN**, a French tragic poet, born at Dreux in 1609, and was the most distinguished dramatic writer among the predecessors of Corneille. Of his thirty-six tragedies, tragi-comedies, and comedies, only one—the tragedy of "Venceslas" (as revised

by Marmontel) keeps the stage; the plot of this piece is borrowed from the Spanish of Roxas. Rotrou endeavoured to elevate the tone of the drama by giving it a moral purpose, and his heroes and heroines are made to utter Christian sentiments. Richelieu, who granted him a pension, could not prevail upon him to assist in decrying the Cid of Corneille. In 1650 Rotrou fell a victim to a pestilential disease, to which he nobly exposed himself in the discharge of his official duties, as one of the principal magistrates of his native place. His "Œuvres" appeared at Paris in 1820.

**ROTTECK, CHARLES VON**, a distinguished German historian, who was born at Freiburg in 1775. In 1798 he was appointed professor of universal history. In 1818 he exchanged the chair of history for that of natural law and politics. He was a member of the academy of sciences in Munich. Rotteck was distinguished from almost all other German historians by the circumstance that his works, in addition to deep research and critical acuteness, display a civic spirit, if we may call it so. Though born in a country where civil liberty was so little understood at the time of his education, he nevertheless learned to understand it, and to trace its development in history. His chief work is his "Universal History." As a recommendation of this work, we would mention that the subscription for an abridgment of it was prohibited in Prussia in 1831. His work on standing armies and a national militia was translated into English and French, and Benjamin Constant translated his "Ideas on Representative Estates." Rotteck was likewise active as a representative in the chamber of Baden. Besides his more extended works, he has written several important articles in periodicals and encyclopedias, and "A Manual of Natural Law and Politics." He would have found a noble field had he been born in a country where the activities of men were unchecked by arbitrary institutions, or at a time of a warm struggle for freedom in his own country.

**ROUBILLIAC, LOUIS FRANCIS**, a celebrated sculptor, was a native of Lyons, in France, who settled in England in the reign of George I.; and, in

the absolute dearth of native talent which prevailed at that period, he long stood at the head of his profession. He executed a statue of Handel for Vauxhall gardens, and another of Sir Isaac Newton, erected

at Trinity college, Cambridge; but was chiefly employed on sepulchral monuments. He wrote satires in his native language, and died in London, in 1762.

**ROUSSEAU, JEAN JACQUES.**—This celebrated and highly gifted writer, who has justly been described as one of the "illustrious," was born at Geneva in 1711. He was the son of a person of but little note, who, however, gave him a good education. When speaking of his early life, Rousseau describes himself as possessing a warm temperament, and as being replete with mental and corporeal susceptibility. The works that Rousseau produced, and the extravagances both of thought and conduct into which he plunged, may doubtless be traced to one or two obvious singularities in his condition, which have not been sufficiently observed upon either by his latest biographer or by any of the preceding writers, whether friends or foes, who have laboured to explain or to expose the character of this extraordinary man. The most striking of these peculiarities was the utter want of coincidence between his theoretic maxims and his temperament and habits. His education was irregular, and in his youth he was turned adrift upon the world, with no other guides than the passions of his age, and the licentious examples that surrounded him. For many years he continued a vagabond and an adventurer, sometimes so needy as to pass the night without house or food; inevitably contracting the vices of each successive mode of life upon which he chanced to be flung, but ever, as he has stated it himself, finding consolation, under the severest privations, in the ideal anticipations of a sensual imagination. Before his twentieth year he had been successively "apprenti greffier, graveur, laquais, valet de chambre, séminariste, interprète d'un archimandrite, secrétaire du cadastre, maître de musique." At that age he found a resting-place; but, as if it were fated that his morals were to be benefited by no change of fortune, the residence of his protectress became the scene where the last remnant of virtuous restraint that had survived his wanderings was to be sacrificed to her example and deliberate invitation. Such was the commencement and consummation of Rousseau's moral education; and it is little to be wondered at if, in the result, he became, to every practical purpose, irretrievably enervated by the corrupt manners and habits amidst which his youth was passed. But his intellectual character was not so quickly decided. The growth of his faculties, it appears, was unusually slow; up to the age of thirty-nine his talents were unknown to his friends, and almost to himself. He had previously, it is true, obscure intimations of his strength from visitations of ambitious reveries—the inquietude of genius was about him; but up to the very moment of the explosion of his mind, neither Rousseau himself, nor any who had known him, ever anticipated the career that was before him. At last he became an author, being now on the verge of forty. By this time his experience of life in all its forms had been great. He had been an acute, though a silent observer of the varied scenes he had witnessed. He had, for the last ten years, been initiated in the mysteries of Parisian society, then at its most profligate period; and his quick and comprehensive understanding had seized the complicated system of vices, in all their disastrous consequences, with which it teemed. He saw that system in all its deformity.

But Rousseau's aversion to the disorders that he afterwards signalized himself in denouncing, had this singularity, that it appears in the first instance to have been almost entirely an intellectual repugnance.

Perhaps to assert that it was not a moral sentiment, may seem either a perversion of language, or at best a pedantic distinction; but when we remember the history and the habits, both previous and subsequent, of the man, it appears clearly to have belonged rather to that class of moral sentiments which result from the conclusions of a vigorous understanding (or, more correctly speaking, perhaps, may be called those conclusions themselves), than to the instinctive movements of an habitually virtuous mind. Thus by the time that Rousseau's philosophical opinions were formed his personal morals were gone; and it was his fate to commence his public career inveterately attached, by taste and temperament, to many of the licentious indulgences against which he vehemently, and, we do think, very sincerely inveighed. This view, we imagine, will go pretty far towards explaining several of the singularities in his works and his demeanour. The first question upon which he employed his powers was the moral effects of refinement upon society. Struck by the universal profligacy that surrounded him in a nation claiming to be the most refined, and very probably attracted by the novelty of his own speculations, he composed his celebrated discourse on the arts and sciences. His final conclusions are unquestionably wrong, but great truths are dispersed throughout it; and though neither this nor his subsequent writings will in themselves form a wise man, a wise man who consults them will find abundance of matter to suggest the profoundest meditations upon things the most important to human happiness. But, whatever may be thought of his general views, Rousseau had the merit—and it required no ordinary courage—of "speaking out." He levelled his opinions at the corruptions and frivolities of the age in language of unprecedented boldness. In the midst of a luxurious capital, to which he emigrated in search of bread, and in defiance of philosophers, academies, theatres, saloons, and all that Paris held most dear, this daring innovator ventured to question the institutions upon which all their pretensions rested, and to eulogize, in terms that his bitterest enemies admitted to belong to the highest order of eloquence, a system of morals and manners which both he and they were too degenerate to adopt.

The success of his first work, and the immediate celebrity that it brought him, proved the crisis of his fate. Had it been allowed to pass off as a clever treatise, abounding with glowing passages and home-truths, but, as far as the main argument was concerned, demanding no serious refutation, Jean Jacques might have gone on to live like ordinary men. But the cry was raised through France that a watch-maker's son from Geneva was meditating no less than a subversion of that venerable system which kept up a continual demand for courts and courtiers: for tragedies, opera-dancers, bon-mots, made-dishes, academical discourses; for the Pompadours, Du Def-fands, Sophie Arnoulds, and the other legitimate necessities of life; and forthwith the vindication of those sacred superfluities was gravely undertaken by nine stout literati (as if each Muse had sent her champion), having in their ranks the anointed ma-

jesty of Poland to throw in a stately syllogism for the endangered rights of his well-beloved cousins, and his priest of the chamber, the godly Pere Menou, to pledge the blessings of the church upon his gracious logic. Jean-Jacques intrepidly went forth to meet the embodied deputies from the fine arts, the king, and the Jesuit, and he beat them all. But the victory, if not the very contest, turned his brain. He not only contracted an affection for doctrines that procured him so much renown, but he took it into his head that (the eyes of Europe being now upon him) it was incumbent on him, as their author, to demonstrate by his conduct a capacity of practising those habits of simplicity, independence, and self-privation, which he had been fearless enough to extol. Accordingly he assumed the stoic; he simplified his costume, contracted his expenditure, retired from the saloons, renounced civil speeches, and became a "citizen of Geneva," and a copier of music. In all this there may have been (what his rivals and enemies insisted upon to be the ruling passion of his life) an affectation of singularity; but when we consider the whole of his extraordinary character, we incline to the opinion that there was a considerable mixture of sincerity, and that his motives were pretty much what he has explained them to have been in his "Confessions." However, from whatever motive he acted, he was not to be diverted from prosecuting his plan; and neither the entreaties of his friends, nor the allurements of female admirers, nor the mockeries of Baron D'Holbach's corps of sneerers, could tear the irrevocable Jean Jacques from his self-inflicted exile. He buried himself in his hermitage; yet, though he had withdrawn his person from the world, his heart and imagination still lingered amidst its scenes. To give up, on a sudden, the habits and indulgences of forty years, proved a sacrifice beyond his strength; and if left to the reaction of his own feelings, or if temperately managed by his advisers, he would probably have seized the first plausible pretext of abandoning his scheme of absurd and unnecessary self-denial. But nothing could have been more inconsiderate than the means adopted by his friends. At one time they implored him to return to the world, as if human affairs could not go on without him; at another they assailed him with predictions of the precise day upon which his new-fangled stoicism was to die a natural death. They tormented or flattered him by weekly reports of what all Paris was saying in wonder at his unnatural desertion; and they secretly carried on consultations and intrigues with the woman to whom, in every vicissitude of his fortune and humour, he seems to have clung with fidelity, in order to secure her co-operation, and, it is also said, to make her the instrument of a plan of domestic annoyances that might the sooner disgust him with his retirement. These methods were little calculated to succeed with such a being as Rousseau—proud, vain, irritable, and suspicious. They only riveted him in his absurdities. He was determined to let all Paris and all Europe see that he possessed more force of character than was allowed him; while the discovery that a secret committee was sitting upon him gave his sensitive imagination the alarm; and in the well-meaning, though imprudent importunities of his friends, or, at the worst, in their impertinent interference, he caught the first germ of a notion which, fostered by his jealous fancies, and afterwards con-

firmed by real calumny and persecution, became matured into the conviction that there existed a dark and extended conspiracy against his fame.

Such appears to us to be the fair explanation of Rousseau's feelings and situation at the outset of his public career; and such the origin of those contradictions in his character, in which partly the shame of retracting, and partly the undue importance annexed to them by others, impelled him to persevere. Thus he was for ever at variance with himself. His theories and his habits never coalesced. He had been spoiled by the world before he comprehended its vices, and undertook to decry them. He attempted or affected to renounce them himself, but it was too late. His reformation was not only incomplete, but ridiculous. The philosophic citizen of Geneva and the effeminate Frenchman could never assimilate. In the one character he accommodated his outward garb and manners to the severity of his theoretic views; in the other he dispensed his senses and imagination from joining in the sacrifice. He fled from the corruptions and frivolities of polished life, and he took his mistress with him. The same inconsistency pervades his writings. His intellect, having attained its growth, was manly and comprehensive, but by this time his fancy and moral taste were depraved; and hence we find bold truths and virtuous lessons incessantly counteracted by sensual illustrations. As a moral teacher this was his great intellectual failing, that he could never divest his imagination of the licentious associations of his youth. To them, with all his speculative austerities, he clung to the last—at once a stoic and a voluptuary; in the same breath licentious and sublime, he declaims against the passions in language that inflames them. In his most animated praises of virtue he seems inspired by the intoxications of vice.

These observations, if well founded, will answer one of the most popular charges against the memory of Rousseau,—that the object of his writings, more especially of his celebrated romance, was to corrupt his readers,—the object in the "*Nouvelle Heloise*" was to move his readers by pictures of ideal virtue, and by impassioned descriptions of feelings and situations analogous to those through which he had passed himself; but that, in the progress of the work, becoming involved in new feelings and situations incompatible with his original design, he could not refrain from embodying them in it; and feeling bound to justify what he did, he resorted to paradoxes, and spoiled the whole. Or perhaps it would be more correct to say, that with his paradoxes and the inveterate habits of his imagination on the one hand, and his more matured and legitimate powers on the other, he produced a questionable work of fascination, of which the inexperienced should beware, but from which a discerning mind may collect many a profound reflection, and many an eloquent and elaborate analysis of human passion. This last remark will apply, but with several favourable qualifications, to his greatest production, the "*Emile*." The unconquerable predilections of the writer often break out in the indelicacy of his details, but both the object and the tendency are unquestionably moral. He exhorted mothers not to put away their children, and, with respect to them, had the honour of bringing nature into fashion; and for the first stages of human life he zealously pointed out a mode of treatment which, though the objects might not

ultimately survive to reap the benefits of it, would still ensure to parents the consolation of reflecting that the days of their children, however few, had been passed in happiness. These and the other writings of Rousseau would demand a more extended notice, but our space does not allow it. In spite of their defects, and of the predictions in his own day that they could not last, they have stood their ground. With many, and these not the least valuable depositaries, his fame is as fresh as ever. His genius has annexed to abstract questions a popular charm unknown before him; while his particular descriptions of the scenery of Switzerland, and of the romantic beings whom his fancy placed there, enter largely into the associations that daily attract the traveller to that interesting region.

Rousseau had a long controversy and quarrel with Hume: the main point on which they quarrelled was that Hume, before setting out for England with Jean Jacques, had supplied a passage to Horace Walpole's pretended letter from the king of Prussia, then under composition in the Parisian circles, and that Rousseau was soon made acquainted with the fact of his friend and protector having co-operated in the sneer. That Hume did so is admitted by himself, but with this single exception his conduct, in the first instance, was in the highest degree generous and considerate. He brought Rousseau to England, where he supplied him with friends, had him comfortably settled, and procured him a pension from the crown—services which might surely have cancelled a single and momentary indiscretion. But in the progress of the quarrel the historian acted below himself—he lost his temper. In his letters to Paris he heaped the most abusive epithets upon his protégé, and finally had the extraordinary weakness to publish a statement of his wrongs, written with so much vehemence that Messieurs D'Alembert and Suard, who translated it into French and superintended the publication, found it prudent to soften some of the expressions—an act of friendship for which Hume, in his cooler moments, thanked them. In reading the details of this affair we have been particularly struck by one curious little coincidence. The great charge against Rousseau was, that his extravagant conduct and suspicions originated in the vaguest rumours and surmises. Yet the grave and philosophic David Hume appears to have been instigated on no better grounds than a supposition that the "Confessions," which were commenced during this quarrel, were expressly directed against him; and he determined to anticipate his calumniator.

Now the "Confessions" break off precisely at the point of time preceding the transaction, which it was presumed was to have been a leading topic. Instead of venting his feelings upon recent occurrences Jean Jacques was at that moment taking refuge from them in the remembrance of more pleasurable scenes—in recalling the adventures, and once more reanimating the buried hopes of his younger and better days, associated as they were with his boyish frolics, his glorious illusions, his rambles amidst the hills and lakes of his country, and with the still glowing images of the fair beings for whom his heart first sighed—in his vivid recollections of all which he has contrived to throw so inexpressible a charm round his romantic story.

We cannot, however, suppress one remark respecting the insinuation that Rousseau either had

not suffered persecution, or, if he had, that he had provoked that he might glory in it. This charge, which is more roundly asserted by Grimm and others, is utterly unfounded. Jean Jacques was a real and unwilling victim of his opinions. Instead of inviting persecution for his "Emile," (the first occasion upon which the vengeance of authority was levelled at him), he had taken the most scrupulous precautions to avert it. The lady of Marshal Luxembourg undertook to dispose of the manuscript, but the author, contrary to her earnest solicitations, insisted that it should not be printed in France. It was sent to Holland. A copy was soon after transmitted to Paris, to be there printed and published under the eye of the censor. The reasons for this do not appear: all that we can collect is that there was in the whole affair a singular mixture of trick and mystery, but there is abundant evidence that Rousseau was not a party to it. When informed of it by M. de Malesherbes, the magistrate under whose authority the French edition was preparing, he instantly disavowed and protested against the proceeding. These facts, which had originally rested on Rousseau's statement, are verified by the certificate of M. de Malesherbes; yet, in disregard of all this, the prerogatives of despotism were put in force against Rousseau—a warrant to imprison him issued. He was roused from his bed at midnight by a timely warning of his danger, and, to escape a gaol, precipitately fled from France. He was refused an asylum in his own country, where his book was excommunicated before a copy had been received. Wherever he went the same fate attended the work and the author. He was successively hunted and pelted through Switzerland from one miserable canton to another, till, Frederick of Prussia compassionating him, he at length found a temporary shelter in the territories of a tolerant despot. All this might seem a very laughable affair for the heartless coteries of Paris, but those who have any feeling for the privileges of the human mind must pronounce it to have been unequivocal persecution.

After Rousseau's return from England he repaired to the Chateau de Trie, where the prince of Conti afforded him an asylum. Here he for a while assumed the name of Renau, and announced "that he was dead to literature, and should never more read upon any subject that could re-excite his extinguished ideas." In an interesting private letter of the same period, since published, he expresses a similar determination, and speaks of his indifference to "cette aere fumée de gloire qui fait pleurer." Botany, and the composition of his "Confessions," were his only serious occupations. He soon left Trie—the reason does not appear—and successively resided at Lyons, Chambery, and Bourgoin, till 1770, when he finally returned to Paris, where the authorities connived at his presence, on the condition that he should publish nothing more. He continued in Paris till 1778, living in a small apartment in the Rue Platrière, upon a small annuity derived from the profits of his works, and his earnings as a music-copier, and manfully rejecting to the last all offers of loans or presents. About the middle of 1778 he yielded to the importunities of M. Girardin, and went to Ermenonville to superintend the education of his son. His death took place six weeks after.

The end of Rousseau, with some eccentricity, had much in it of the sublime. He is represented to

have addressed his wife, a few minutes before his death, in these words:—"Be so good as to open the windows, that I may have the pleasure of seeing once more the verdure of that field. How beautiful it is! how pure the air! how serene the sky! what grandeur and magnificence in the aspect of nature! Look at the sun, whose smiling aspect seems to call me hence! There is my God—God himself, who opens to me the bosom of his paternal goodness, and invites me to taste and enjoy at last that eternal tranquillity which I have so long and so ardently panted after!"

He was buried in the Isle of Poplars, and the monumental tribute depicted in the above engraving was erected to his memory by his friend the marquis de Girardin. The ceremony is thus described by a person who was present. He says, with true French sentiment, "The interment took place that very evening, during the brightest moonlight and the calmest weather. The reader may imagine what were my feelings as I proceeded to the Isle with the body—the place, the moonlight, the serenity of the evening, the man, the recollection of the incidents of his life, his extraordinary destiny, and the common end which awaits us all; but the circumstance on which my thoughts dwelt longest, and with most satisfaction, was that at length the unfortunate Rousseau enjoyed repose, well merited it is true, but which it was impossible he could have hoped for while he lived."

We cannot conclude the life of Rousseau, who was certainly one of the first writers and thinkers of his day, without furnishing the reader with a specimen of his style as an author. The following is one of his "Walks," which form an appendix to his "Confessions." It relates to the art of learning how to grow old. He says, "Adversity is, doubtless, a great master, but a master whose lessons are dearly purchased, and sometimes not worth the price we give for them. Besides, before we have obtained sufficient knowledge from such tardy studies, the season to profit by it is over. Youth is the proper time to acquire wisdom; age is the period when we should practise it. I confess that experience ever improves, but can only be of service for the future. Is it not too late to learn how we ought to live at the very moment we are about to die? Of what utility are the informations so lately and sorrowfully acquired on my own fate, and the contrivances of

those who have been the instruments of it? I have only learned to know mankind that I might feel more acutely the miseries into which they have plunged me; this knowledge only discovering their snares, without enabling me to avoid them. Why did I not always remain in that thoughtless, but pleasing confidence, which rendered me for so many years the scorn and plaything of my pretended friends? So far from guarding against their contrivances, I had not the least suspicion of them. I was their dupe and victim, it is true, but I thought myself beloved, and my heart enjoyed the sweets of that friendship with which they had inspired me, while I attributed to them an equal portion of it. These pleasing illusions are destroyed, and melancholy truth, which time and reason have unveiled, in making me feel my misfortunes, has also shown me they are without remedy; that resignation is my only resource; that all the experience of age, in my situation, is without present utility, and utterly unprofitable for the future. At our birth we begin that race whose goal is death; of what utility would it be to learn to conduct the chariot with skill at the very end of our journey? To think of quitting it gracefully is all that is then necessary. The only proper study for an old man, if any remains for him, is to learn to die,—a business least attended to in an advanced age, every thing but that being thought of. Old people hold more to life than children, and leave it with more reluctance than young ones; because, their cares having been all for this world, they find on quitting it that they have lost their labour. All their hopes, all their wealth, the fruit of so many laborious watchings, must then be relinquished, having thought of gaining nothing during life which they cannot carry with them.

I began this study in good time, and if I did not profit by my reflections, it was not for want of having made or well considered the weight of them. Thrown at an early age into the storms of life, I learned by experience that I was not formed for this world, and should never attain that condition which my heart felt the necessity of. Despairing, therefore, to find happiness among mankind, my ardent imagination leaped over that space of my existence which I had yet scarcely entered on, as over a strange, inhospitable soil, wishing to fix my abode in a more tranquil asylum.

This sentiment, nurtured by education from infancy, and strengthened during my whole life by that inexhaustible train of sorrows and misfortunes which have accompanied it, has called me at all times to the consideration of the nature and destination of my being with more attention and care than I have observed in any other person. I have seen many who philosophize more learnedly than myself, but their philosophy (to use the expression) is foreign to themselves. Wishing to appear wiser than others, they examine the arrangement of the world as they would study some complicated machine, through mere curiosity, contemplating human nature that they may speak of it learnedly, but without any thought of self-improvement, still labouring to instruct others without enlightening themselves. Some of these determine to write a book, no matter what, provided it is well received. When wrote and published, its contents interest the author no longer, except by a wish to have others adopt the opinions it inculcates, and a resolution to defend them in case of an attack;

but he entertains no idea of using it for his own improvement, or embarrassing himself whether these opinions are true or false, provided no one refutes them. On the contrary, whatever I desired to learn was for my own information, and not to instruct others. I have ever been persuaded that before we set up for teachers, we should acquire a competent knowledge of ourselves; and of all the studies I have pursued, while surrounded by the bustle of the world, there is none I should not equally have applied to, had I been confined to a desert isle for the rest of my days. What we ought to do depends greatly on what we ought to believe, and in all that does not relate to the immediate calls of nature our opinions are the rule of our actions. Governed by these principles, which were ever mine, I long and repeatedly sought to regulate the enjoyment of my life, to discover its real allotment, and was at length consoled for my want of aptitude in conducting myself skilfully in this world, on feeling it is a science we should not endeavour to attain.

Born in a family where morality and piety were conspicuous, afterwards brought up by a minister remarkable for wisdom and religion, I imbibed principles, maxims, some will say prejudices, which have never forsaken me. Given up to my own government while yet a child, allured by caresses, and constrained by necessity, I became a catholic, but still remained a Christian. Confirmed in time by habit, my heart was sincerely attached to my new religion: the instructions and example of Madame de Warrens gave stability to this attachment, the rural solitude in which I passed the flower of my youth, the study of good books to which I applied myself, strengthened these natural propensities and affectionate dispositions, rendering me religious almost after the manner of Fenelon. Placed in a calm retreat, meditation, the study of nature, the contemplation of the universe, incessantly carries the thoughts of a recluse towards the Author of all these objects, prompting him to search with pleasing inquietude the final destination of what he sees, and the source of his feelings. Afterwards, when my destiny again threw me in the torrent of the world, I recognised nothing that could delight my heart for a single moment. The regret of my peaceful leisure continually pursued me, and mingled indifference and disgust with every pleasure that was within my reach, and with every pursuit that could conduct me to riches or honour. Irresolute in my unsatisfactory wishes, I hoped little, obtained less, and felt, in the allurements of prosperity, that, even should I obtain all I believed myself in search of, I should not find that happiness my heart so ardently sought after without entertaining any precise idea of its object. Thus every thing contributed to detach my affections from this world even before misfortunes had entirely estranged me from it. To the age of forty I continued floating between indigence and riches, wisdom and folly, full of habitual failings, without any vicious inclinations; living at hazard without being guided by principles or regulated by reason; wavering in my duties without despising them, but frequently without comprehending their tendency.

From my youth I had fixed on the age of forty as the period of my efforts and pretensions of every kind, fully resolved that when I should attain that age, in whatever situation I might find myself, I would contentedly remain there for the rest of my

life, living from day to day without care for my future subsistence. When that period arrived I executed my resolution with regret; and though my fortune seemed inclined to take a more favourable turn, relinquished it, not only without pain, but even with a sensible satisfaction. In renouncing every false hope and allurements I delivered myself up to that calm repose which was ever my predominant taste, the most durable of my inclinations. I gave up the world and its vanities, and renounced all superfluous ornaments, no longer wore a sword, watch, white stockings, or lace, confining myself to a good cloth suit, with a plain wig, and, what was still better, rooted from my heart those covetings and desires which stamped a value on those objects. I gave up the situation I then occupied, for which I felt that nature had not designed me, and set about copying music at so much a page, an employment I always had a decided inclination for.

I did not confine my reform to exteriors. I was sensible that these privations required others more difficult, doubtless, but far more necessary, and, resolving not to do my work by halves, undertook to submit my interior to a strict examination, which might reduce it to that state I should wish to find it in at my death.

A remarkable revolution which had lately taken place in me, a new moral world which began to present itself, the unreasonable judgment of mankind, which (without foreseeing how much I should become its victim) I began to feel the absurdity of; the increasing necessity of a more substantial good than literary fame, which inclination had securely reached me before I felt myself disgusted with it; the desire to pursue, for the remainder of my life, a more salutary course than that which had employed the most valuable part of it; in a word, every consideration tended to point out the immediate necessity of reform, which I had long felt the want of. I undertook it, therefore, and spared nothing that depended on me to render the execution of my enterprise effectual.

It is from this epocha that I may date an entire renunciation of the world, and an increased desire for solitude, which has never since forsaken me. The work I had resolved on could not be accomplished without an absolute retreat; it required long and uninterrupted meditations, which the tumult of society would not admit. This forced me to adopt, for some time, a different manner of life, and presently I so well relished its enjoyments that I never discontinued it since, except at intervals, and by constraint, ever returning to it again, when opportunity offered, with redoubled affection; and in the sequel, when mankind had rendered this sequestration necessary, I found that what they supposed would have rendered me miserable, turned out my greatest happiness, which I could not otherwise have procured myself.

I entered on the work I had resolved to undertake with a zeal proportioned to its importance, and the necessity I felt to perfect it. At that time I lived among modern philosophers, who bear little resemblance to the ancients. These, instead of removing doubts, or fixing resolutions, presently staggered all those certitudes which I thought it necessary to obtain confirmation of; for your ardent missionaries of atheism, and furious dogmatists, cannot endure those who differ from themselves in the most trifling particular. I frequently defended my opinions weakly.

partly from a dislike to disputes, and partly for want of talents to maintain them; but I never adopted their distressing doctrines; and this resistance to intolerant minds, who, besides, had private views to answer, was not one of the least causes of their animosity.

They had not prevailed on me to adopt their sentiments, but they had rendered me uneasy in my own; their arguments had staggered, but not convinced me; I could not think of any pertinent answers, but I felt their objections were not unanswerable; I accused myself less of error than inaptitude, and my feelings disputed much better than my reason.

At length I said, Shall I for ever suffer myself to be tossed about by the sophism of these plausible reasoners, when I am not even certain that they believe what they preach to others with so much earnestness? Those passions which govern their opinions, self-interest, which demands you should believe this or that, render it impossible to penetrate their true sentiments. Should we seek for the simplicity of truth in the leaders of a party? Their philosophy is designed for others, I must have one of my own: let me seek it diligently while it is yet time, that I may possess a fixed rule for the conduct of my latter days. I am now in a mature age, possessed of all the powers of my understanding, already I approach the decline. If I wait longer my intellectual faculties will have lost their activity, and my tardy deliberations may be less useful than they promise to be at this time; I will, therefore, seize the present moment; it is the epocha of my external and mental reform; let me ultimately fix my opinions and principles, remaining for the residue of my life what mature deliberation shall convince me I ought to be.

I executed this project slowly, and at different times, but with as much application and care as I was capable of employing, being fully persuaded that the repose of my life and future happiness depended on it. At first I found myself in such a labyrinth of embarrassments, difficulties, objections, and obscurity, that I was tempted twenty times over to abandon all, to renounce my vain researches, and level my deliberations to the rules of common prudence, without searching farther into those principles it was so much labour to develope; but this prudence was foreign to my disposition, and I felt myself no more able to adopt it than I should have been to profit by its admonitions; labouring to acquire it, therefore, was sailing over a stormy sea without rudder or compass in search of a lighthouse, which, when found, directed to no port.

I persisted notwithstanding every discouragement. For the first time in my life I possessed courage, and to that I am indebted for having been able to sustain the horrible destiny which from that period began to envelope me, without my entertaining the least idea of its approach. After the most ardent and sincere researches that were ever undertaken, perhaps, by one mortal, I determined on those sentiments for the residue of my life which appeared reasonable and necessary, and, if I have been mistaken in the result, have, at least, the consolation of knowing that my errors cannot be imputed to me as a crime, since I used my utmost efforts to guard against mistakes. I make no doubt but the prejudices of childhood, and the secret wishes of my heart, may have inclined the

balance to the side which procured me most consolation; for it is difficult to defend our belief from what we ardently desire. Who can doubt but being interested to admit or reject particular notions of a future state determines the belief of the major part of mankind through the medium of their hopes and fears? These, I allow, might fascinate my judgment, but not render my faith less sincere, for I examined cautiously, and feared to be mistaken in every particular. If our whole term of existence is confined to this life, it was expedient for me to know this, that I might take my measures accordingly, while some part of my being remained, and before I was so completely duped; but what I had most to fear in my present undertaking was, venturing the everlasting state of my soul for the sake of temporal enjoyments, which, in my opinion, were never very desirable.

I confess that I did not answer to my own satisfaction all the difficulties that had embarrassed me, and which our philosophers had so often thundered in my ears; but being determined to decide on points which human understanding has so little direction to, and finding on all hands impenetrable mysteries and unanswerable objections, I adopted in each question such sentiments as appeared to me best established and most conformable to reason, without stopping at those objections which I could not resolve, and which I knew were opposed by others not less powerful in the opposite system. A dogmatical method of treating these subjects is only conformable to a spirit of imposition; mean time it is necessary to have a belief of one's own, and to select it with all possible maturity of judgment. If, in spite of these precautions, we yet fall into error, we cannot in justice be pronounced culpable, since we have not erred either wilfully or carelessly. This was the immovable principle which I established as the basis of my security.

The result of my wearisome researches were nearly those opinions which I have since put together in the confession of faith of my 'Savoyard Vicar'—a work that has been unworthily profaned by the present generation, but which may one day cause a revolution in the opinions of mankind, if good sense and truth should ever revive among them.

From this time, easy in the principles I had adopted after such long and painful meditation, I have made them the fixed rule of my conduct and belief without perplexing myself either with those objections I cannot resolve or those I could not foresee, and which, presenting themselves from time to time, have sometimes staggered, but never overthrown me. I have ever said—these are but metaphysical subtleties, arguments which should have no weight against sound principles adopted by reason, confirmed by the feelings of my heart, and bearing the seal of inward approbation by the silence and subjection of the passions. In these concerns, so superior to human understanding, shall one objection, which I cannot resolve, overthrow a body of doctrine so well constructed, so firmly connected, composed with so much meditation and care, so well appropriated to my understanding, my heart, my whole being, and reinforced by that internal satisfaction which I feel wanting in all others? No vain delusive arguments shall ever destroy that affinity which I perceive between my immortal nature and the construction of this world with the exact order which reigns therein. I find in the correspondent and moral order of things, from whence the system I have adopted results, those

very resources which I stand in need of to support the miseries of life. In any other system I should live without comfort and die without hope, being the most miserable of all creatures; let me then adhere to that opinion which is alone sufficient to make me happy in spite of fortune or mankind.

This deliberation, and the conclusion I drew from it, seemed dictated by reason itself, as a preparation for the destiny that was approaching, which might enable me to sustain it. What would have been my fate, or what would yet become of me, among the dreadful trials with which I have been surrounded, and in the incredible situation to which I am reduced for the rest of my life, if, without asylum from my implacable persecutors, indemnification for the scandals which have been heaped on me by the world, or hope of ever obtaining that justice I feel due to me, I saw myself given up, without future hope, to the most horrible fate a mortal can possibly experience? While tranquil in my innocence I pictured nothing but affection and benevolence among mankind; my believing, confident heart was laid open to them as to friends and brothers; meanwhile, the traitors silently entangled me in nets forged at the bottom of hell. Surprised by the most unforeseen of all misfortunes, the most terrible for a feeling, haughty soul, dragged into the snare without knowing why, or to what end, I plunged into an abyss of ignominy, surrounded by fearful obscurity, through which I could discover nothing but distressing objects. On the first surprise I was overwhelmed, and should never have recovered from the fit of horror those unforeseen misfortunes plunged me into had I not already laid up a magazine of strength, which served to raise me from my fall.

It was not until after years of agitation that, recovering my spirits, and beginning to return to myself, I felt the full value of those resources I had procured for my moments of adversity; when deciding on all those things which I saw it necessary to form a judgment of, I saw, in comparing my maxims with my situation, that I gave infinitely more importance to the opinions of men, and the little wants of this transitory existence, than they deserved; since this life, being but a state of probation, it is immaterial what kind of trials we experience in it, provided they produce the designed effect; consequently, the greater and more multiplied our afflictions are, the more meritorious it is to sustain them properly. The most acute troubles lose their edge with those who consider the great and sure reward that attends them; and the certainty of obtaining this recompence was the principal fruit I had gathered from my former meditation.

It is true, that in the midst of those numberless outrages and unbounded indignities, which overwhelmed me from all parts, some intervals of uneasiness and doubt from time to time shook my hopes, and disturbed my tranquillity. The powerful objections which I could not resolve during these moments of despondency, presented themselves to my mind with redoubled strength, and added to the hopelessness of my situation, when, weighed down with my destiny, I was ready to give up all for lost. Frequently new arguments which I heard took hold of my thoughts, and strengthened those that already tormented me.—“Alas!” said I, my heart overwhelmed with grief, “what shall save me from utter despair, if, in the darkness of my fate, I contemplate

only as chimeras those consolations which my reason had collected? If, destroying thus its own work, it strikes away the prop of hope and confidence it had procured me in adversity, what support have I but those illusions which amuse myself alone? The whole present generation, viewing only errors and prejudices in what I singly adopt, finding truth and evidence in a contrary system, and appearing scarce able to believe that I am sincere in my profession of them; while giving in to these opinions with my utmost belief, I find insurmountable difficulties, which yet do not prevent me from persisting in them. Am I, then, alone wise and enlightened among mankind? To be persuaded that things are thus, is it sufficient that they accord with my ideas, and that I find the order of them convenient? Can I derive a firm confidence from appearances which have no solidity for the rest of mankind, and which would appear delusive even to myself if my heart did not support my reason? Ought I not rather to have fought my persecutors with equal weapons, by adopting their maxims, than to depend on delusions of my own, and become a prey to their attempts without a single effort to replace them? I think myself prudent, while, perhaps, I am but the dupe, victim, and martyr of a vain error.

How many times in these moments of doubt and uncertainty, have I been ready to abandon myself to despair! and had I ever passed a month in that state, it would have been all over with me in this world; but their attacks, though frequent, were short; and though even yet I am not entirely delivered from them, they have become so scarce and momentary that they have not even strength to interrupt my felicity, being light inquietudes, which no longer affect my soul, any more than the falling of a feather into a river can affect its course.

I am convinced that re-considering those points which I had formerly concluded on, is supposing myself to possess more information, more discernment, or a greater degree of zeal, than I employed at the time these decisions were made; but I am persuaded this is not the case, and no substantial reason can induce me to prefer those opinions which, when overwhelmed with despair, served only to augment my misery, to sentiments adopted in the vigour of my age, in the full maturity of my understanding, after the most serious examination, and at a period when the serenity of my life left no predominant interest but the investigation of truth. Now that my heart is wrung with distress, my soul weighed down by cares, my imagination bewildered, my brain perplexed by the multitude of distressing mysteries which surround me; now, when all my faculties, enfeebled by age and sufferings, have lost their vigour, shall I foolishly cast away those resources I had so carefully procured, giving more confidence to the declining state of my intellects, in order to render myself unavailing miserable, than to my reason, when, possessing all its vigour, it endeavoured to guard me against the anguish of unmerited misfortunes? No; I am neither wiser, better instructed, nor more sincere than when I decided these important questions. I was not then unconscious of those difficulties which now perplex me, they were then surmounted, and if at present some new ones start up, which I was not then aware of, they are the sophisms of subtle metaphysicians, which should not be permitted to invalidate those eternal truths

which have been admitted at all times, and by all the sages, which are acknowledged by all nations, and are engraven on the human heart in characters indelible. I knew when meditating on these subjects that human reason, circumscribed by the senses, could not comprehend them in their full extent; I contented myself, therefore, with that evidence that was within my reach, without attempting what was beyond it: this conclusion was reasonable, and I adhered to it with the full approbation of my heart and reason. On what evidence should I renounce it, which might not be combated by still more forcible arguments to continue firm in my attachment? What dangers do I find in this adherence? What advantages would accrue from a change? That morality without root or produce which they pompously display in some of their writings, or theatrical representations, without an idea of its producing any effect on the heart or understanding; or rather that secret and cruel morality, the interior doctrine of all their adherents, to which the former serves as a mask, which they only follow in their outward conduct, and have so dexterously made use of with regard to myself; this hostile morality is of no use for defence, being good for nothing but attack. Of what use, then, would it be to me in the condition I am reduced to? Innocence is the only support I depend on in my sufferings; how much more wretched then should I make myself, if, relinquishing this last, this powerful resource, I substituted wickedness in its place? Could I hope to rival them in the art of mischief? And even could I attain to it, what consolation should I derive from the retribution I might deal them? I should forfeit my own esteem, and gain nothing in return.

Reasoning thus with myself, I so far established my principles as to have them shaken no longer by captious arguments or unanswerable objections, by difficulties beyond my reach, and perhaps beyond the reach of human reason. Resting my belief on the most solid basis I could possibly establish for it, I accustomed myself to repose so securely under the shadow of my conscience that no contradictory arguments, either ancient or modern, could have power for a single instant to shake or trouble my repose. Declined into a languor and inactivity of understanding, I have even forgot the evidences and maxims on which my belief was founded, but I shall never forget the conclusions which, with the approbation of my reason and conscience, I drew from them, and to this point I will adhere. Let all the philosophers of the universe unite to explode these principles, I will continue firm for the rest of my life, in every particular, to the decisions of that time when I was more able than I now am of choosing wisely.

Tranquil in these dispositions, together with self-approbation, I find them supply that hope and those consolations I stand so much in need of in my present situation. It is impossible that a solitude so complete, permanent, and distressing in itself, the perpetually active animosity of the whole present generation, and the indignities it is perpetually loading me with, should not sometimes depress my spirits, that my hope should not be shaken, and that discouraging doubts should not arise at times to trouble my soul and fill it with distress; but it is then, when incapable of those exertions which would be necessary to give me assurance that I recall my former resolutions; it is then that the care, atten-

tion, and sincerity of heart with which I formed them return to my remembrance and bring back my fleeting hopes.

Thus confined to the contracted sphere of my former acquisitions, I have not, like Solon, the happiness of gaining some piece of information every day of my old age, since I find it necessary to guard against the dangerous pride of endeavouring to acquire that knowledge I formerly found beyond my comprehension; but though there remain few acquisitions to hope for on the side of useful knowledge, many important ones remain on the side of those virtues necessary in my situation. This is the proper season to enrich and ornament my soul with those acquirements she may carry with her when delivered from this mortal body, which clouds every object, and viewing the truth without a veil, she will perceive the poverty and insufficiency of all that knowledge which our learned pedants are so vain of, and will lament those moments as lost in this life when she endeavoured to obtain it; but patience, gentleness, resignation, and impartial justice, are possessions she will carry with her; with these we may enrich ourselves incessantly, without fearing that death should rob us of our acquisitions or diminish their value. It is to this invaluable study alone that I will consecrate the remainder of my old age; happy, if by the knowledge of myself I can attain to leave life, not better, for that is impossible, but more virtuous that I entered it."

ROUSSEAU, SAMUEL.—This meritorious but unfortunate retainer of literature was a native of London, and served his apprenticeship in the printing office of Mr. Nichols, by whom he was frequently employed in collecting epitaphs and other remains of antiquity. He was a singular instance of patient perseverance in the acquirement of the ancient languages. Whilst working as an apprentice and journeyman, he taught himself Latin, Greek, Hebrew, Syriac, Persian, and Arabic. To these acquirements he added a knowledge of the French, and some of the modern tongues. He was, for a short time, master of Joy's charity-school in Blackfriars. A few years after the expiration of his apprenticeship, he commenced printing, on his own account, in Leather Lane, Holborn, and afterwards removed to Wood Street, Clerkenwell, where he carried on business for some time, but with little advantage to himself and family; having, from unforeseen circumstances and losses in trade, been obliged to relinquish his business. During the time he was a printer he taught the Persian language, and compiled and published several oriental works:—"Flowers of Persian Literature;" "Dictionary of Mohammedan Law, Bengal Revenue Terms, Shanscrit, Hindoo, and other Words used in the East Indies;" "Persian and English Vocabulary;" "Richardson's Specimens of Persian Poetry, or, Odes of Hafiz, with an English Translation and Paraphrase;" "Balfour's Forms of Herkern, corrected from a Variety of Manuscripts, translated into English, with an Index of Arabic Words Explained, and Arranged under their Proper Roots;" "The Book of Knowledge; or, A Grammar of the Persian Language;" also, "A Persian Copy Book," containing a great variety of copies, in imitation of the Nustaleck hand. After he relinquished the printing business, he edited a variety of works for the booksellers; but, as a creditable support for himself and family was his aim, and not literary reputation, most of his works have appeared under fictitious

names:—"An Essay on Punctuation," "Annals of Health and Long Life," "Principles of Punctuation or, The Art of Pointing Familiarized," "Principles of Elocution," and many others, as dictionaries, biography, geography, &c. &c. They have, however, generally proved successful to the publishers, as their objects were useful, and nothing ever appeared in them contrary to good morals or the established religion and government. Mr. Rousseau died in great distress in 1820.

ROUSSEAU, JEAN BAPTISTE, an eminent French lyric poet, born at Paris in 1671. He was the son of a shoemaker, but received a good education, and, at an early period, displayed a strong taste for poetry. In 1688 he obtained a situation in the service of the French ambassador at Copenhagen, and subsequently accompanied Marshal Tallard to England as his secretary. He wrote several plays for the theatre, on the success of one of which, having, according to the Parisian custom, appeared on the stage to receive the congratulations of the audience, he is said to have had the ingratitude to disown his father, when the old man, rejoicing at his son's triumph, came forward to speak to him, before the friends who surrounded him. In 1701 he was admitted into the academy of inscriptions and belles-lettres, and his lyric compositions procured him high reputation among the French literati; but his turn for satire, and his quarrelsome temper, at length involved him in disgrace. Some abusive and indecent verses were circulated at Paris, which Rousseau was accused of having written, but which he disclaimed, and professed to have discovered the author in the person of his enemy, Saurin. To relieve himself from the obloquy under which he laboured, he commenced a prosecution of that academician, for composing the defamatory couplets in question, and, having failed in substantiating the allegation, he was exiled from France in 1712. He went to Switzerland, and afterwards resided at Vienna, under the patronage of Prince Eugene. The latter part of his life was spent in the Netherlands, where he obtained a pension from the duke of Aremberg, which he resigned on having forfeited the favour of that nobleman. His death took place at Brussels in 1741. An edition of his works was published under his own inspection, by Tonson; and since his death they have been often printed in various forms. The best edition is that of Amar, with a commentary and life of the author. The same editor has also published his "*Euvres Poétiques*," with a commentary. Rousseau's works are four books of Odes, the first book containing odes from the Psalms: purity and elegance of expression are here combined with beauty and dignity of versification; but the lyric enthusiasm is often wanting; cantatas, of which he was the creator, and in which he is very distinguished; epistles in verse, the least pleasing of his works, but highly popular in their day, on account of their satirical allusions; allegories, forced and monotonous; epigrams, which, next to his odes and cantatas, are the best of his works, and, with some exceptions, are witty, finely turned, and well expressed; four comedies in verse, and two in prose; his operas have no merit.

ROWE, NICHOLAS, a distinguished English dramatic poet, who was born in 1673. His education was commenced at Highgate, from whence he was removed to Westminster school, where he ac-

quired a good knowledge of the Greek and Roman classics. His father, who designed him for the law, took him from Westminster school when about sixteen years of age, and entered him as a student in the Middle Temple, whereof he himself was a member, that he might have him under his immediate care and instruction. Being called to the bar he had great prospects of advancement in that profession if the love of the belles lettres, and poetry in particular, had not stopped him in his career. To him there appeared more charms in Euripides, Sophocles, and Æschylus, than in all the records of antiquity; and when he came to discern the beauties of Shakespeare and Milton, he began to think with contempt of all other excellencies when put in the balance with the enchantments of poetry and dramatic genius.

Mr. Rowe had the best opportunity of rising to eminence in the law by means of the patronage of Sir George Treby, lord chief justice of the common pleas, who had it in his power to promote him. Dr. Welwood observes "that Sir George was one of the finest gentlemen, as well as one of the greatest lawyers, of that time, and it was to the genteel part of the study that Mr. Rowe chiefly applied himself."

"The Ambitious Stepmother," written in the twenty-fifth year of Mr. Rowe's age, was his first attempt in the drama. It was dedicated to the earl of Jersey. It is conducted with less judgment than any other of our author's tragedies; it has an infinite deal of fire in it; the business is precipitate, and the characters active; and, what is somewhat remarkable, Mr. Rowe never after wrote a play with so much elevation of spirit. "The purity of the language," says Mr. Welwood, "the justness of his characters, the noble elevation of the sentiments, were all of them admirably adapted to the plan of the play."

His next tragedy, "Tamerlane," appeared in 1704, was acted at the theatre in Lincoln's Inn Fields, and dedicated to the marquiss of Hartington. "This was the tragedy upon which Mr. Rowe valued himself most," says Mr. Welwood. "In it he aimed at a parallel between the late King William and Tamerlane, and also Bajazet and a monarch who is since dead. That glorious ambition in Tamerlane to break the chains of enslaved nations, and to set mankind free from the encroachments of lawless power, are

painted in the most lively as well as the most amiable colours."

In 1703 appeared "The Fair Penitent," Mr. Rowe's next tragedy. It was acted at the theatre in Lincoln's Inn Fields, and dedicated to the duchess of Ormond. This is one of the most finished of his performances, and one of the most pleasing tragedies on the stage, of which it still keeps, and probably will long keep, possession, the story being of a domestic nature, the fable interesting, and the language delightful. The character of Sciolto is strongly marked, Horatio is the most amiable of all characters, and is so sustained as to strike an audience very forcibly.

Mr. Rowe's next tragedy was "Ulysses," first acted, in 1706, at the Queen's theatre in the Haymarket, and dedicated to the earl of Godolphin. This play is not at present in possession of the stage, though it highly deserves to be so, as the character of Penelope is an excellent example of conjugal fidelity. This play has business, passion, and tragic propriety, to recommend it. In the same year Mr. Rowe wrote a comedy in three acts, called "The Biter;" it was performed at the theatre in Lincoln's Inn Fields, but without success, the author's genius not lying towards comedy. Notwithstanding its unfavourable reception by the audience, it is said Rowe himself was highly delighted with this play.

"The Royal Convert" was brought upon the stage in 1708, and was first acted at the Queen's theatre in the Haymarket, and dedicated to the earl of Halifax. The fable of this play is taken from dark and barbarous times, and the scene is laid among our ancestors. Rhodogune is a character highly tragical; vicious with a mind that must have been truly heroic if formed to virtue. In 1714 appeared "Jane Shore," written in imitation of Shakespeare's style, first acted at the theatre royal, Drury Lane, and dedicated to the duke of Queensberry and Dover. The conduct of the design is regular, and in that sense it partakes not of Shakespeare's wildness; the poetry is uniform, which marks it to be Rowe's; but in that it is very different from Shakespeare, whose excellency does not consist merely in the beauty of soft language or descriptions, but in the general power of his drama, the boldness of the images, and the force of his characters. As this play chiefly exhibits familiar scenes and private distress, it takes possession of the heart, and will probably long retain possession of the stage.

Mr. Rowe's last tragedy was "Lady Jane Grey," performed in 1715, and dedicated to the earl of Warwick. Mr. Edmund Smith, author of "Phædra and Hippolitus," designed writing a tragedy on this subject, and at his death left some loose hints and short sketches of scenes which were put into Mr. Rowe's hands, who acknowledges he borrowed part of one scene, and inserted it in his third act, viz. that between Guilford and Lady Jane. It is not much to be regretted that Mr. Smith did not finish this play, since it fell into the hands of one so much above him as a dramatist; for if we may judge of Mr. Smith's abilities of writing for the stage by his "Phædra and Hippolitus," it would not have been so well executed as by Rowe. "Phædra and Hippolitus" is a play without passion, though of inimitable versification; and in the words of a late poet we may say of it, that not the character but the poet speaks.

Mr. Rowe likewise published an edition of the works of Shakespeare, and prefixed the life of that great man from materials which he had been industrious

enough to collect in the county where Shakspeare was born. To this edition, published in 1709, he also added a preface. If this edition added not to Mr. Rowe's fame, it at least increased the popularity of his author. It would be injurious to the memory of Mr. Rowe to omit taking notice of his translation of Quillet's "Callipædia," and Lucan's "Pharsalia;" the versification in both is musical and well adapted to the subject. When the duke of Queensberry was promoted to the office of secretary of state, he appointed Mr. Rowe his under-secretary. He continued in this employment near three years, till the death of his patron, after which event all avenues were stopped to his preferment; and during the rest of Queen Anne's reign he passed his time in literary occupations. While Mr. Rowe was thus without a patron, he went one day to pay his court to the earl of Oxford, lord high treasurer of England, then at the head of the Tory faction, who asked him if he understood Spanish well? he answered, No; but imagining his lordship might intend to send him into Spain on some honourable commission, he added, "that in a short time he did not doubt but he should presently be able both to understand and speak it." The earl approving of what he said, Mr. Rowe took his leave, and immediately retired out of town to a private country farm, where within a few months he learned the Spanish tongue, and then waited again on the earl to give him an account of his diligence. His lordship now demanding if he was sure he understood it thoroughly, and being answered in the affirmative, merely exclaimed, "How happy are you, Mr. Rowe, that can enjoy the pleasure of reading and understanding 'Don Quixote' in the original!" This indifference was sufficiently recompensed by the regard which King George I. testified for Mr. Rowe's merit. Upon his accession to the crown he was made poet laureate, and one of the land surveyors of the customs in the port of London. The prince of Wales, afterwards George II., conferred on him the place of clerk of his council; and the lord chancellor, Parker, the day he received the seals, appointed him, unasked, secretary of the presentations.

Mr. Rowe was twice married, first to a daughter of Mr. Parsons, and afterwards to a daughter of Mr. Devenish, a gentleman of a good family in Dorsetshire. By his first wife he had a son, and by the second a daughter.

Mr. Rowe died the 6th of December, 1718, in the forty-fifth year of his age, and was interred on the 19th in Westminster Abbey, over against Chaucer, his body being attended by a vast number of friends. Dr. Atterbury, bishop of Rochester and dean of Westminster, out of a particular mark of esteem for him as a schoolfellow, honoured his ashes by performing the last offices himself. A sumptuous monument was afterwards erected to his memory by his wife, for which Mr. Pope wrote an epitaph, which we here insert:—

"Thy relics, Rowe! to this sad shrine we trust,  
And near thy Shakspeare place thy honour'd bust:  
Oh! next him skill'd to draw the tender tear,  
For never heart felt passion more sincere;  
To nobler sentiment to fire the brave,  
For never Briton more disdain'd a slave.  
Peace to thy gentle shade and endless rest!  
Blest in thy genius, in thy love too blest!  
And blest that timely from our scene remov'd  
Thy soul enjoys the liberty it lov'd.  
To these so mourn'd in death, so lov'd in life,  
The childless parent and the widow'd wife,  
With tears, inscribe this monumental stone  
That holds their ashes and expects her own."

Dr. Welwood has given us the following character of Mr. Rowe:—"As to his person it was graceful and well made, his face regular and of a manly beauty. As his soul was well lodged, so its rational and animal faculties excelled in a high degree. He had a quick and fruitful invention, a deep penetration, and a large compass of thought, with singular dexterity and easiness in making his thoughts to be understood. He was master of most parts of polite learning, especially the classical authors, both Greek and Latin; understood the French, Italian, and Spanish languages; and spoke the first fluently and the other tolerably well. He had likewise read most of the Greek and Roman histories in their original languages, and most that are wrote in English, French, Italian, and Spanish. He had a good taste in philosophy; and having a firm impression of religion upon his mind, he took great delight in divinity and ecclesiastical history, in both which he made great advances in the times he retired into the country, which were frequent. He expressed on all occasions his full persuasion of the truth of revealed religion: and being a sincere member of the established church himself, he pitied, but condemned not, those that dissented from it. He abhorred the principles of persecuting men upon the account of their opinions in religion; and, being strict in his own, he took it not upon him to censure those of another persuasion. His conversation was pleasant, witty, and learned, without the least tincture of affectation or pedantry; and his inimitable manner of diverting and enlivening the company, made it impossible for any one to be out of humour when he was in it. Envy and detraction seemed to be entirely foreign to his constitution, and whatever provocations he met with at any time he passed them over without the least thought of resentment or revenge. As Homer had a Zoilus, so Mr. Rowe had sometimes his; for there were not wanting malevolent people, and pretenders to poetry too, that would now and then bark at his best performances; but he was so much conscious of his own genius, and had so much good nature, as to forgive them; nor could he ever be tempted to return them an answer. The love of learning and poetry made him not the less fit for business, and nobody applied himself closer to it when it required his attendance. When he had just got to be easy in his fortune, and was in a fair way to make it better, death swept him away, and in him deprived the world of one of the best men, as well as one of the best geniuses of the age. He died, like a Christian and philosopher, in charity with all mankind, and with an absolute resignation to the will of God."

The dramas of Rowe are well known, we therefore take a classical imitation as a specimen of his style. It is from the third book of Horace, and exhibits considerable point and spirit.

"Hail, gentle Cask! whose venerable head,  
With hoary down and ancient dust o'erspread,  
Proclaims that since the vine first brought thee forth,  
Old age has added to thy worth.  
Whether the sprightly juice thou dost contain  
Thy votaries will to wit and love;  
Or senseless noise and lewdness move,  
Or sleep, the cure of these and ev'ry other pain.

Since to some day propitious and great,  
Justly at first thou wast design'd by fate:  
This day, the happiest of thy many years,  
With thee I will forget my cares;  
To my Corvinus' health thou shalt go round,  
(Since thou art ripen'd for to-day,  
And longer age would bring decay)  
Till ev'ry anxious thought in the rich stream be drown'd

To thee my friend his roughness shall submit,  
And Socrates himself a while forget.  
Thus, when old Cato would sometimes unbend  
The rugged stiffness of his mind,  
Stern and severe the Stoick quaff'd his bowl,  
His frozen virtue felt the charm,  
And soon grew pleas'd and soon grew warm,  
And bless'd the sprightly pow'r that cheer'd his gloomy

With kind constraint ill nature thou dost bend,  
And mould the snarling Cynic to a friend.  
The sage reserv'd, and fam'd for gravity,  
Finds all he knows summ'd up in thee,  
And by thy pow'r unlock'd grows easy, gay, and free.  
The swain who did some cred'ulous nymph persuade  
To grant him all, inspir'd by thee,  
Devotes her to his vanity,  
And to his fellow fops toasts the abandon'd maid.

The wretch who, press'd beneath a load of cares,  
And lab'ring with continual woes despairs,  
If thy kind warmth does his chill'd sense invade,  
From earth he rears his drooping head,  
Reviv'd by thee he ceases now to mourn;  
His flying cares give way to haste,  
And to the god resign his breast,  
Where hopes of better days and better things return.

The lab'ring hind who, with hard toil and pains,  
Amidst his wants a wretched life maintains,  
If thy rich juice his homely supper crown,  
Hot with thy fires and bolder grown,  
Of kings and other arbitrary pow'r,  
And how by impious arms they reign,  
Piercely he talks with rude disdain,  
And vows to be a slave, to be a wretch, no more.

Fair queen of Love, and thou great god of Wine!  
Hear ev'ry Grace and all ye Pow'rs divine,  
All that to mirth and friendship do incline!  
Crown this auspicious Cask and happy night  
With all things that can give delight:  
Be ev'ry care and anxious thought away!  
Ye Tapers! still be bright and clear,  
Rival the moon and each pale star,  
Your beams shall yield to none but his, who brings the day."

ROWE, ELIZABETH, a clever English writer, who was born at Ilchester in Somersetshire in 1674. She was early imbued with the truths of religion, and her biographer says that, when a child, "her strongest bent was to poetry and writing. Poetry indeed was her favourite employment, in youth her most distinguished excellence. So prevalent was her genius this way that her very prose hath all the charms of verse without the fetters; the same fire and elevation, the same bright images, bold figures, rich and flowing diction. She could hardly write a familiar letter, but it bore the stamp of the poet. One of her acquaintances remembers to have heard her say, she began to write verses at twelve years old, which was almost as soon as she could write at all. In the year 1696, the twenty-second of her age, a collection of her poems, on various occasions, was published, at the desire of two of her friends, which we may suppose did not contain all that she had by her, since the ingenious prefacer gives the reader reason to hope that the author might, in a little while, be prevailed with to oblige the world with a second part no way inferior to this former. The occasion of her poetical name, Philomela, which from this time she was known by to the world, whether she assumed it herself, or was complimented with it by her friends, I have not been able to learn: the latter is most probable: and that it was given her at the publication of these poems, before which, her modesty not consenting that her own name should appear, this was substituted in the room of it, as bearing a very easy allusion to it, and happily expressing the softness and harmony of her verses, not less soothing and melodious than the strains of the nightingale, when from some leafy shade she fills the woods with her melancholy plaints. Though many of these poems are of the religious kind, and all of them consistent with the strictest regard

to the rules of virtue, yet some things in them gave her no little uneasiness in advanced life. To a mind that had so entirely subdued its passions, or devoted them to the honour of its Maker, and endued with the tenderest moral sense, what she could not absolutely approve appeared unpardonable; and, not satisfied to have done nothing that injured the sacred cause of virtue, she was displeased with herself for having writ any thing that did not directly promote it."

After the death of her husband, Mrs. Rowe indulged her unconquerable inclination to solitude by retiring to Frome in Somersetshire, in the neighbourhood of which place the greater part of her estates lay. When she forsook the town, she determined to return to it no more, but to devote the remainder of her life to an absolute retirement; yet on some few occasions she thought it her duty to violate this resolution. In compliance with the request of the honourable Mrs. Thynne, she passed some months with her in London, after the death of her daughter the Lady Brooke; and on the decease of Mrs. Thynne herself, she was entreated by the countess of Hertford, to reside some time with her at Marlborough, to soften, by her conversation and friendship, the severe affliction of the loss of so excellent a mother. Yet, even on these occasions, she never quitted her retreat without very sincere regret, and always returned to it again as soon as ever she could with decency disengage herself from the importunity of her noble friends. 'Twas in this recess that she composed the most celebrated of her works, "Friendship in Death," and the several parts of the "Letters Moral and Entertaining." The drift of "The Letters from the Dead" is (as the ingenious author of the preface expresses it) to impress the notion of the soul's immortality, without which all virtue and religion, with their temporal and eternal good consequences, must fall to the ground; and to make the mind contract, as it were unawares, an habitual persuasion of our future existence, by writings built on that foundation, and addressed to the affections and imagination." It may also be added, that the design both of these, and "The Letters Moral and Entertaining," is by fictitious examples of heroic virtue, and the most generous benevolence, to allure the reader to the practice of every thing that ennobles human nature, and benefits the world; and by just and lively images of the remorse and misery attendant on vice, to warn the young and unthinking from being seduced to ruin by the enchanting name of pleasure.

Mrs. Rowe enjoyed an uncommon strength of constitution, and had passed a long series of years with scarce any indisposition severe enough to confine her to her bed. But about half a year before her decease, she was attacked by a distemper, which seemed to herself, as well as to others, attended with danger. Though this disorder, as she expressed herself to one of her most intimate friends, found her mind not quite so well prepared to meet death as usual; yet when, by devout contemplations on the atonement and mediation of her blessed Redeemer, she had fortified herself against that fear and diffidence from which the most exalted piety does not always secure us in such an awful hour, she experienced such divine satisfaction and transport that she said, with tears of joy, "She knew not that she had ever felt the like in all her life;" and she repeated on this occasion Mr. Pope's verses, entitled "The Dying

Christian to his Soul," with an air of such intense pleasure as evidenced she really felt all the elevated sentiments of pious ecstasy and triumph which breathe in that beautiful piece of sacred poetry. After this threatening illness, Mrs. Rowe recovered her usual good state of health; and though at the time of her decease she was somewhat advanced in life, yet her temperance, and the calmness of her mind, undisturbed with uneasy cares and passions, encouraged her friends to flatter themselves with a much longer enjoyment of so valuable a life than it pleased heaven to allow them. On the day in which she was seized with that distemper, which in a few hours proved mortal, she seemed to those about her to be in perfect health and vigour; and in the evening, about eight o'clock, she conversed with a friend, with all her wonted vivacity, and not without laughter, after which she retired to her chamber. At about ten, her servant, hearing some noise in her mistress's room, ran instantly into it, and found her fallen off the chair on the floor, speechless. She had the immediate assistance of a physician and surgeon, but all the means used were without success; and after having given one groan, she expired, a few minutes before two o'clock, on Sunday morning, February 20th, 1737.

We have space but for a single letter of this clever authoress. It forms part of her imaginary correspondence between the dead and living:—"This will find you, my lord, confirmed in your infidelity, by your late disappointment. It was not in my power to give you the evidence of a future state, which you desired, and I had rashly promised; but since this engagement was a secret to every mortal but ourselves, you must be assured that this comes from your deceased friend, whose friendship, you see, has reached beyond the grave. In my last sickness, we fixed on the time and place of my appearance. You was punctual to the appointment: for though I was not permitted to make myself visible, I had the curiosity to know if you had the resolution to attend the solemnity of a visit from the dead. The hour was come; the clock from a neighbouring steeple struck one; no human voice was heard to break the awful silence; the moon and stars shone clear in their midnight splendour, and glimmered through the trees, which, in lofty rows, led to the centre of a grove, where I was engaged to meet you. I saw you enter the walks, with a careless incredulous air; not the least concern or expectation appeared in your looks; as if you came there only in regard to your own word, and a sort of respect to my memory. However, the calmness of the night induced you to walk till the morning began to break; when you retired, singing an idle song you had got out of 'The Fairy Tales.' By the gaiety of your temper you seemed pleased, my lord, with a new proof against a future life, and happy to find yourself (as you concluded) on a level with the beasts that perish—A glorious advantage! and worthy of your triumph!"

"But we have so often discoursed on this subject that I would not tire you with the repetition of any thing past; only, once more to make way to your reason by moving your passions, in recollecting the manner of your brother's death, which was all a demonstration of the immortality of the soul, and to what heights of fortitude that prospect could raise the heart of man, at the hour of terror, and in the jaws of death. With what a steady composure did he en-

dure the violence of his distemper! with what conviction and full assurance expect the reward of his piety! with what a graceful resignation did he receive the sentence of death, when, at his importunity, the physicians told him there were no hopes of his recovery! 'Then I have but a few weary steps,' he replied, 'and the journey of life will be finished.' This was not a time for affectation. All was open undissembled goodness, and true greatness of mind. Nothing else could have supported him, when every circumstance of life conspired to allure him back to life, to deepen the shadows of the grave, and make the king of terrors more terrible.

"There was not, my lord, among the race of men, a more lovely and agreeable person than your brother. His marriage was just concluded with the charming Cleora; he had just finished a noble seat and fine gardens to receive her. When he was near death, she came at his request to take a last and sad farewell. Angels might have sorrowed to see tears in the brightest eyes on earth; while her tenderness for him would have disguised her anguish. This, with the sight of a fond young sister, fainting in her woman's arms; your aged father sitting near, silent and stupid with his grief; what could support the mind of man in such complicated distress! The accomplished youth, who had all that was gentle and humane in his disposition, must have betrayed some weakness if he had not been assisted by a power superior to nature. But how equal, how steady was his mind! how becoming, how graceful his whole behaviour! Never was the last, the closing part of life performed with more decency and grandeur. His reason was clear and elevated, and his words were the very language of immortality, and excited at the same time both pity and envy in those that were near him. When the cold sweats hung on his brows, and his breath and speech failed, joy struggled through the decay of nature, and a heavenly smile sat on his face; a smile that at once compelled our tears, and accused us of weakness in them. You, my lord, attended him to the last moment of life; and when I pressed this as an argument of a future state, you confessed, that though you thought religion a delusion, it was the most agreeable delusion in the world; and that men who flattered themselves with those gay visions, had much the advantage of those that saw nothing before them but a gloomy uncertainty or the dreadful hope of annihilation. From this uncertainty I was very solicitous to draw you, while I was in a mortal state; but I have now a more ardent desire to convince you, though I cannot obtain the permission to give you that evidence you requested. However, this letter may satisfy you that I am in a state of existence; nor is an apparition from the dead a greater miracle than a variety of objects that daily surround you, and owe the loss of their effect to your familiarity with them. Happy minds in this superior state are still concerned for the welfare of mortals, and make a thousand kind visits to their friends; to whom, if the laws of the immaterial world did not forbid, it would be easy to make themselves visible, by the splendour of their own vehicles, and the command they have on the powers of material things and the organs of sight. It often seems a miracle to us that you do not perceive us; for we are not separate from you by places, but by the different conditions of the states we are in."

ROWLANDS, HENRY, an antiquary of con-

siderable research, who was a native of the Isle of Anglesey, and, being a member of the clerical profession, obtained the living of Sianfadden in his native island. He devoted all his leisure to his favourite pursuit, of which he published an account under the title of "*Mona Antiqua Restaurata, an Archæological Discourse on the Antiquities of the Isle of Anglesey.*" He died in 1722.

ROWLANDSON, THOMAS.—This talented English artist was born in London in July 1756, and educated at a then celebrated school in Soho Square. Richard Burke, son of the celebrated Edmund Burke, was his schoolfellow. Mr. Holman, the tragedian, was also educated there. At a very early period of his childhood, Rowlandson gave presage of his future talent, and he drew humorous characters of his master and many of his scholars before he was ten years old. The margins of his school books were covered with these his handyworks. In his sixteenth year he was sent to Paris, and was entered a student in one of the drawing academies there, where he made rapid advances in the study of the human figure; and during his residence, which was nearly two years, he occasionally indulged his satirical talent in portraying the characteristics of the French people. On his return to London, he resumed his studies at the royal academy, then held in some apartments at Old Somerset House. He had been admitted on the list of students before his visit to Paris. The celebrated Mr. Bannister, who had evinced an equal predilection for the graphic art, was at this time a fellow-student; and it was here that that friendship commenced between them which continued through life. The elder Rowlandson, who was of a speculative turn, lost considerable sums in experimenting upon various branches of manufactures, which were tried on too large a scale for his means; hence his affairs became embarrassed, and his son, before he had attained his manhood, was obliged to support himself. He, however, derived that assistance from an aunt which his father's reverse of fortune had withheld. This lady was a Mademoiselle Chatterlier, married to Thomas Rowlandson, his uncle. She amply supplied him with money; and to this indulgence, perhaps, may be traced those careless habits which attended his early career, and for which he was remarkable through life. At her decease, she left him 7000*l.* much plate, trinkets, and other valuable property. He then indulged his predilection for a joyous life, and mixed himself with the gayest of the gay. Whilst at Paris, being of a social spirit, he sought the company of dashing young men; and, among other evils, imbibed a love for play. He was known in London at many of the fashionable gaming houses, alternately won and lost without emotion, till at length he was minus several thousand pounds. He thus dissipated the amount of more than one valuable legacy. It was said to his honour, however, that he always played with the feelings of a gentleman, and his word passed current, even when with an empty purse. This uncontrollable passion for gaming, strange to say, subverted not his principles. He was scrupulously upright in all his pecuniary transactions, and ever avoided getting into debt. He has been known, after having lost all he possessed, to return home to his professional studies, sit down coolly to fabricate a series of new designs, and to exclaim, with stoical philosophy, "I have

played the fool, but (holding up his pencils) here is my resource." It is not generally known, that, however coarse and slight may be the generality of his humorous and political etchings, many of which were the careless effusions of a few hours, his early works were wrought with care; and his studies from the human figure, at the royal academy, were scarcely inferior to those of the justly-admired Mortimer. From the versatility of his talent, the fecundity of his imagination, the grace and elegance with which he could design his groups, added to the almost miraculous despatch with which he supplied his employers with compositions upon every subject, it has been the theme of regret amongst his friends that he was not more careful of his reputation. His style, which was purely his own, was most original. He drew a bold outline with the reed-pen, in a tint composed of vermilion and Indian ink, washed in the general effect in chiaro-scuro, and tinted the whole with the proper colours. This manner, though slight, in many instances was most effective; and it is known, on indubitable authority, that the late Sir Joshua Reynolds and his successor to the chair of the royal academy, have each declared that some of his drawings would have done honour to the greatest masters of design of the old schools. For many years, for he was too idle to seek new employment, his kind friend and best adviser, Mr. Ackerman, supplied him with ample subject for the exercise of his talents. The many works which his pencil illustrated are existing evidences of this. Many successions of plates for new editions of those popular volumes, "Dr. Syntax in Search of the Picturesque," "The Dance of Death," "The Dance of Life," and other well known productions of the versatile pen of the late Mr. Coomb, will long be regarded as mementos of his graphic humour. It should be repeated, that his reputation has not been justly appreciated. No artist of the past or present school, perhaps, ever expressed so much as Rowlandson, with so little effort, or with so small and evident an appearance of the absence of labour. The death of this artist took place in 1827.

**ROWLEY, WILLIAM**, a dramatic writer in the reign of James I., who was one of the company of players under the protection of the prince of Wales. He was a comic actor, but is now only known from his writings, which were very popular; amongst these we many mention his play entitled "A New Wonder, a Woman Never Vext," and the "The Witch of Edmonton." He was also engaged in the composition of plays for other dramatists.

**ROXBURGH, WILLIAM**, an eminent English physician and naturalist who for many years exercised his profession in India, and was also superintendent of the splendid botanic garden in Calcutta. On his return to Europe he settled at Edinburgh, where he died in 1815. He was the author of "An Account of the Plants on the Coast of Coromandel," "A Botanical Description of a New Species of Swietenia or Mahogany," "Essay on the Natural Order of the Scitamineæ," &c.

**ROXBURGH, DUKE OF**.—This nobleman was a celebrated bibliomanist. His library of 9353 works, which was particularly rich in old romances of chivalry and in early English poetry, was sold by public auction in London in 1812. The prices paid for some works were enormous. A folio copy of the first edition of "Boccaccio" dated Venice, 1471,

was bought by the marquis of Blandford, now duke of Marlborough, for 2260*l.* sterling; a copy of the first work printed by Caxton, dated 1471, "Recuyell of the Historyes of Troye," was sold for 1000 guineas; and a copy of the first edition of "Shakespeare" for 100 guineas. The Roxburgh club, formed in commemoration of this triumph of bibliomany, celebrated its anniversary, on that of the sale of the "Boccaccio." Every year, one of the members was required to be at the expense of an impression of some rare book, of which only copies enough for the club were struck off.

**ROYER-COLLARD, PIERRE PAUL**, a French orator who was born in 1763 at Sompuis, near Vitry le Francois, and in 1789 was chosen advocate of the parliament of Paris. He was then elected a member of the common council of Paris, being considered a friend of legal freedom. With the 10th of August his membership ceased, and he passed safely through the bloody period of 1793 and 1794, and in May 1797 was chosen a member of the council of five hundred, from the department of Marne; but three months later he was expelled because he was opposed to the oath required of the clergy. He afterwards, together with the marquis of Clermont-Gallerande, the abbé Montesquiou, and M. Becquey, was one of the counsellors of the king of France, until Louis XVIII. fled to England, when this body was dissolved. Royer-Collard now lived devoted to the sciences, and in 1811 was made dean of the philosophical faculty and professor of the history of modern philosophy. Here, for two years, he displayed the talents of a Pascal; so profound was he in theory, so convincing was his logic, and so animated and eloquent his delivery. He likewise exhibited the rare talent of philosophical eloquence as a political orator in the chamber, where his calm and firm character gave something of the sublime to his independent thought. Royer-Collard adhered, as appears from his "Discourses," printed in December, 1813, to the Scotch school of philosophy. In 1814 Louis XVIII. appointed him director-general of the press and the book trade, and afterwards state counsellor and knight of the legion of honour. When Napoleon returned, in 1815, he resigned all his political offices and remained only a professor. After the second restoration he was again called into the council of state, and appointed president of the department of education. Here he effected much good, especially in the normal school, which is now abolished; he likewise defended all he could against the effects of party hatred. In the session of the chamber, in 1815, he voted with the minority for the charter and for the constitutional mode of election. In the following sessions he maintained that the chamber of deputies is not bound by the opinions of its constituents, being merely an elective, and not a representative body, and was often proposed as a candidate for the presidency. In the session of 1817 he was considered as the head of the few deputies who were called doctrinaires. After 1819 he was no longer at the head of the department of public education, probably because his views did not coincide with those of the ministry; for he opposed with all his ability the laws of exception; the new mode of election; the grant of the 100,000,000 francs for the Spanish war, and similar measures, until the dissolution of the chamber; and being again elected from the department of Marne, he voted against septen-

nial elections, and against the laws respecting sacrilege. In 1827 he was chosen a member of the French academy in place of La Place.

**RUBENS, PETER PAUL.**—This eminent painter of the Flemish school was the son of a doctor of laws and a sheriff of Antwerp, who, during the troubles of the Low Countries, retired to Cologne, where his celebrated son was born in 1577. The family subsequently returned to Antwerp, where the subject of this article received a literary education, and early displayed a talent for design, which induced his mother, then a widow, to place him with the painter Van Oort, whom he left for the school of

Otto Venius. His talents having made him known to the archduke Albert, governor of the Netherlands, that prince employed him on several pictures, and recommended him to the duke of Mantua, at whose court he remained six years, studying the works of Giulio Romano, and other great artists, and paying particular attention to the colouring of the Venetian school. In the interval he also visited Madrid on a commission for the duke, where he saw some of the finest works of Titian and other masters. On leaving Mantua, he visited Rome and other cities of Italy, copying some of the best pictures and perfecting himself in every branch of his profession. After a residence of seven years in Italy, he returned to Antwerp, being recalled by the illness of his mother, who died before his arrival. This event induced him to retire to the abbey of St. Michael, where he gave himself up for a time to solitary study. His reputation now stood so high that he was called to the court of the archduke, and pensioned; soon after which he married his first wife, and lived in a style of great magnificence, which excited much envy among inferior artists, who sought to lower his reputation by attributing the best parts of his pictures to his numerous pupils. These calumnies he treated with disregard, and, aware of the source of much of the ill-will, relieved the necessities of some of his principal decriers. For the cathedral at Antwerp he painted that great masterpiece, the Descent from the Cross; for the Jacobites, the Four Evangelists; and he continued to execute many great works with surprising facility, until, in

1620, he was employed by Mary de' Medici to adorn the gallery of the Luxembourg, for which he painted a well-known series of magnificent pictures, allegorically exhibiting the principal events in the life of that princess.

Such was the opinion of his general talents that he was chosen, at the recommendation of the archduchess Isabella, to be the private negotiator of a peace between Spain and England; for which purpose he visited Madrid in 1628, where he was treated with great distinction. He painted for Philip IV., and his minister Olivarez, twelve or fourteen of his most celebrated pictures, in the short space of nine months; and in 1629 he returned to Flanders with a secret commission, and proceeded to England. Although not received openly as a minister, Charles I., who was both a patron and judge of the fine arts, was much gratified by his visit; and, during his stay in England, where he succeeded in his negotiation, he was engaged to paint the ceiling of the banqueting-house at Whitehall. He also executed several other pictures for the English nobility, some of which are to be found at Blenheim, Wilton, Easton, &c. He remained in England about a year, during which time he received the honour of knighthood, and then returned to Flanders, where he married the beautiful Helen Formann, his second wife, and was nominated secretary to the council for the Low Countries. He maintained a highly dignified station through the rest of his life, which was one of continued prosperity, until his death at Antwerp in 1640, in the sixty-third year of his age.

Rubens, beyond all comparison, was the most rapid of the great masters; and so many pictures bear his name, it is impossible not to credit a part of what was asserted in his own days, that the greater portion of many of them was performed by his pupils. His great characteristics are freedom, animation, and striking brilliancy and disposition of colouring, the favourite tone of which is that of a gay magnificence, from which, whatever the subject, he never deviated. Besides the excellence of his general powers, he saw all the objects of nature with a painter's eye, and instantly caught the predominating feature by which the object is known and distinguished; and, as soon as seen, he executed it with a facility that was astonishing. According to Sir Joshua Reynolds, he was the greatest master of the mechanical part of his art that ever existed. His chief defects consist in inelegance and incorrectness of form, a want of grace in his female figures, and in the representation of youth in general, and an almost total absence of sublime or poetical conception of character. The works of Rubens are found in churches, palaces, and galleries throughout Europe; for every branch of the art was cultivated by him,—history, landscape, portrait, and even common life. His celebrated Rape of the Sabines is in the national gallery. The number of engravings from the designs of Rubens exceed three hundred. This great painter, who was no mean scholar, wrote some treatises on his art in very good Latin.

**RUDDIMAN, THOMAS**, an eminent grammarian who was born in October 1674, at Ragget, in the county of Banff, Scotland. He was taught the Latin grammar at the parish school of Boyndie, and at the age of sixteen he was anxious to go to the university, and when his father opposed this inclination, he set out without his knowledge to King's

college, Aberdeen, and obtained, by his skill in Latin, the first exhibition of that year. After studying at this college for four years he obtained the degree of master of arts. Though he was only twenty years of age when he left Aberdeen, it appears from a work entitled "*Rhetoricorum Libri Tres*," composed before this period, but never published, that he had then read the Roman classics not only with attention but advantage. He was soon after engaged as a tutor, which situation he quitted in about a year for that of schoolmaster in the parish of Lawrence Kirk. After passing three years in this employment, he had a favourable opportunity of removing to advantage, owing to an accidental introduction to the celebrated Dr. Pitcairne. Ruddiman accordingly quitted Lawrence Kirk, and soon after his arrival at Edinburgh was appointed assistant-keeper of the advocate's library. The emoluments of this place were trifling, but it made him known and made him learned; and after the regular hours of attendance at the library, he occupied his leisure hours as a private tutor in the Latin language. As he became better known his assistance was procured by those who were engaged in literary publications. His first employment of this kind was as editor to Sir Robert Sibbald's "*Introductio ad Historiam Rerum a Romanis gestarum in ea Borealis Britanniae parte quae ultra murum Picticum est*," and he likewise contributed his aid to Sir Robert Spottiswood's "*Practiques of the Laws of Scotland*." In 1707 he commenced auctioneer. The same year he published an edition of "*Voluseni de Animi Tranquillitate Dialogus*," to which he prefixed a life of Volusenus, or Wilson, a learned countryman, who had been patronized by Cardinal Wolsey. In 1709 he published "*Johnstoni Cantici Solomonis Paraphrasis Poetica*," and "*Johnstoni Cantica*," with notes. He was next employed by Freebairne, the bookseller, on a new edition of Gawin Douglas's "*Virgil's Aeneid*," which he corrected, and added the glossary. Shortly after he was invited by the magistrates of Dundee to be rector of the grammar school there, but, his salary as librarian having been increased to 30*l.* 6*s.* 8*d.*, he was induced to decline the offer. In 1714 he published his "*Rudiments of the Latin Tongue*," which soon superseded all other books of the kind, and he lived to see fifteen editions of it sold. His next publication was the works of Buchanan, in two volumes. His account of his life, and opinion of that history, so different from that entertained by his countrymen, drew on him many enemies. After having been so long accustomed to superintend the press, Ruddiman was led to form the plan of erecting a printing office himself. Accordingly, in 1715 he commenced printer, in partnership with his brother; and some years after he was appointed printer to the university in conjunction with James Davidson, a bookseller. In 1718 he became one of the founders of the first literary society in Scotland, and soon after he published the first part of his "*Grammaticae Latinae Institutiones*." He also wrote a third part on prosody, which is said to be more copious and correct than any other publication on the subject, but for want of encouragement he published only an abridgment of it. He next engaged in the management of a newspaper, "*The Caledonian Mercury*." After the death of the principal keeper of the advocate's library, Mr. Ruddiman was appointed his successor, but without an increase of salary. In 1739 he published what is

known by the name of Anderson's "*Diplomata Scotiae*," from having been begun by Anderson, but was finished by Ruddiman, who wrote the admirable preface, which displays a greater extent of knowledge than any of his other productions. During the rebellion in 1745, although Ruddiman was firmly attached to the house of Stuart, he took no active part, but employed himself in writing critical observations on Burman's commentary on Lucan. During the last fourteen years of his life he was almost incessantly engaged in controversy, first, with Auditor Benson, on the comparative merit of Buchanan and Johnston as poets. His next antagonist was Logan, one of the ministers of Edinburgh. The subject of Ruddiman's controversy with Logan was, whether the crown of Scotland was strictly hereditary, and whether the birth of Robert III. was legitimate? Ruddiman maintained the affirmative in both points. He was soon after called upon to repel the attacks of Mr. Love, a schoolmaster at Dalkeith, who wrote in defence of Buchanan's character. About this time he gave his assistance to Mr. Ames in his typographical researches. In 1751 he lost his eye-sight. Yet this misfortune, that to a scholar cannot easily be supplied, did not prevent him from continuing his correspondence with his friends, nor from pursuing his studies, and producing his edition of Livy in four volumes. Glasgow had to boast of the spotless perfection of her Horace, and Edinburgh had reason to triumph in the purity of Ruddiman's Livy in 1751. Ruddiman resigned his place of keeper to the advocate's library, in a letter on the subject, and died at Edinburgh on the 19th of January, 1757, in the eighty-third year of his age.

RUFFHEAD, OWEN, a writer of some note, who was born about 1723, and educated for the law. He became a member of the Middle Temple, and was in due time called to the bar. He did not rise to eminence in his profession, but attained celebrity as a writer. His principal work was an edition of the "*Statutes at Large*." He also carried on a periodical entitled "*The Contest*," which was a political work of considerable merit. He died in 1769.

RUGGLE, GEORGE, a celebrated dramatic writer, who was born at Lavenham in Suffolk in 1575, and received the rudiments of his education in his native town, after which he continued his studies at St. John's college, Cambridge. In consequence of a legal dispute carried on between the university, and the mayor and corporation of Cambridge, Ruggle, who was one of the taxers of the university, wrote his celebrated comedy entitled "*Ignoramus*," which was a satire on the lawyers engaged in the contest. He subsequently wrote several other dramas, and died in 1626.

RUGENDAS, GEORGE PHILIP, a celebrated battle painter, who was born at Augsburg in 1666. After six years' study, his right hand became disabled by a fistula, but he continued to work with the left. His pictures are full of spirit and ease; there is an endless variety in the attitudes of his horses. Among his engravings (all laboured with uncommon care) are distinguished six large ones, representing the Siege of Augsburg, of which he was a witness. He died at that city in 1742. His sons, George Philip and Christian, are also known as engravers.

RUHNKENIUS, DAVID, a learned professor of history and eloquence in the university of Leyden, and one of the most celebrated classical scholars of

his time, was born in 1723 at Stolpe in Pomerania. His opulent parents designed him for study, and sent him at first to Königsberg, where he made himself acquainted with classic authors of antiquity, and also practised music and other of the fine arts. In his eighteenth year he went to Wittenberg, and studied with eagerness the philosophy of Wolf. Two years after he went to Leyden to enjoy the instructions of the celebrated Hemsterhuys in the Greek language. There he spent six years, and devoted himself to the whole circle of scholastic studies under the guidance of his great teacher. The first fruits of his application were two "*Epistolæ Criticæ*," the subject of the first of which was the hymns of Homer, Hesiod, and the Greek Anthology; of the second, Callimachus, Apollonius and Orpheus. It was now his wish to obtain a philosophical professorship in some Dutch university; but, having no prospect of such an appointment, he resumed, at Hemsterhuys' advice, the study of the Roman law, which he had begun in Wittenberg. But without being diverted from Greek literature, he undertook an edition of Plato. For this purpose he procured from the library of Sangermann, at Paris, a transcript of the only existing copy of Timæus's "*Lexicon of Plato*," and published it with a commentary. So much critical and grammatical erudition can rarely be found condensed into so narrow a space. This work was sufficient to give Ruhnken a rank among the first philologists of his times. As he had become fond of his easy life in Holland, he declined several honourable offers of professorships in foreign countries and devoted his leisure to a literary tour, with the intention of consulting the principal libraries of Europe. For a year he laboured amid the treasures of the royal library of Paris, where, with unwearied industry, he transcribed and collated manuscripts, and made excerpts from them. Hemsterhuys had meanwhile found opportunity, as he was now oppressed with age and sickness, to get Ruhnken appointed assistant lecturer on the Greek language; and, on the death of Oudendorp, he was appointed professor of history and eloquence. Of his numerous works, among which are his "*Memoir of Hemsterhuys*," his edition of "*Muretus*," the most distinguished is his "*Velleius Paterculus*"—a true model for the treatment of Latin classics. In 1780 he published a hymn of Homer to Ceres, which Mathäi had discovered in Moscow, and communicated to him in a letter. In his intended edition of Plato he had only finished the Scholia, when death put an end to his activity in 1798.

RUE, CHARLES DE LA, a French orator and poet, who was born at Paris in 1643, and educated by the Jesuits. He distinguished himself early by fine parts in polite literature; and a Latin poem, which he composed in 1667 upon the conquests of Louis XIV., was thought so excellent that Corneille translated it into French and presented it to the king; apologizing, at the same time, for not being able to convey to his majesty the beauties of the original. He was one of those who had the care of the editions of the classics for the use of the dauphin; and Virgil was allotted to him, which he published with notes, and an exact life of the author, in 1675. He published panegyrics, funeral orations, and sermons. His masterpiece is a funeral oration for the prince of Luxembourg. There are also tragedies of his writing in Latin and French, which had the appro-

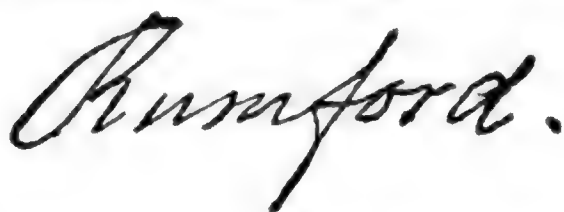

bation of Corneille, and therefore must have made him pass for no ordinary poet. He died in 1725.

There was another Charles de la Rue, a Benedictine monk, who was born in 1685, and became so deeply learned in the Greek and Hebrew languages, and in divinity, that Montfaucon made him an associate with him in his studies. Montfaucon had published, in 1713, the remains of Origen's "*Hexapla*," and was very desirous that an exact and complete edition should be published of the works of the writer. His own engagements not permitting him, he prevailed with De la Rue to undertake it; and accordingly two volumes were published by him, in 1733, with notes. A third volume was just ready for the press, when De la Rue died in 1739; and though it was published afterwards, yet the edition of Origen was not quite completed.

RUINART, THIERRY, a French theologian, who was born at Rheims in 1657, and became a Benedictine monk in 1674. He studied the scriptures, the fathers, and ecclesiastic writers so closely, that Mabillon chose him for a companion in his literary labours. He published, in 1689, "*Acta Primæ Martirum Sincera*." In a preface to this work he endeavours to refute an opinion which Dodwell had advanced in a work entitled, "*De Paucitate Martirum*," inserted among his "*Dissertationes Cyrenicæ*." A new edition of this work, with alterations and additions, was printed in 1713. Ruinart published other learned works and assisted Mabillon, whom he survived, and whose life he wrote, in the publication of the acts of the saints and annals of their order. He published also an edition of the works of "*Gregory of Tours*." When Mabillon died in 1707 he was appointed to continue the work he had jointly laboured with him, but died before it was completed, in 1709.

RUMFORD, COUNT.—He was by birth an American, and received the title of count from the elector of Bavaria. He was born in Woburn, New England, in 1752, and his name was Benjamin Thompson. He acquired, when young, a knowledge of natural philosophy by the aid of the professor of that science in the college of Cambridge, and then employed himself as a teacher till he was raised to independence by an advantageous marriage, when he became a major in the militia of his native province; and when the war took place between Great Britain and her colonies, his local knowledge enabled him to render services of importance to the English commanders. He came to England, and, as the reward of his services, obtained a situation in the foreign office under Lord George Germaine. Towards the close of the war he was sent to New York, where he raised a regiment of dragoons, of which he was appointed colonel, and thus became entitled to half-pay. Returning to England in 1784 he received the honour of knighthood, and was for some time one of the under-secretaries of state. Soon after he went to the continent, and, through the recommendation of the prince of Deux Ponts, afterwards king of Bavaria, entered into the service of the reigning elector-palatine and duke of Bavaria, when he effected many important and useful reforms in both the civil and military departments of the state. Among these was a scheme for the suppression of mendicancy, which he carried into execution at Munich and other parts of the Bavarian territories, providing labour for able-bodied paupers, and exciting a spirit of industry among the lower

orders of the people in general. As the reward of his success in this and other undertakings, he received from the sovereign of Bavaria various orders of knighthood, was made a lieutenant-general, and created Count Rumford. He left Bavaria in 1799 and returned to England, where he employed himself in making experiments on the nature and application of heat, and on other subjects of economical and philosophical research. He likewise suggested the plan, and assisted in the foundation, of the royal institution, which led to other establishments of a similar description. In 1802 he removed to Paris, where he took up his residence; and, his wife being dead, he married the widow of the celebrated Lavoisier; but the union proved unfortunate, and a separation ere long took place. Count Rumford then retired to a country-house at Auteuil, about four miles from Paris, and there devoted his time to the embellishment of his domain and to the cultivation of chemistry and experimental philosophy. Though he disliked both the character and the politics of the French, he preferred the climate of their country to every other; and he therefore procured permission from the king of Bavaria to continue in France and retain the pension of 1200*l.* a year, granted him by that prince. He died in August 1814, leaving by his first wife a daughter, who resided at Boston in the United States. Count Rumford was by no means a man of learning, his literary acquirements being confined to the English, French, and German languages; but he was familiar with the discoveries and improvements of modern science, and the industry and perseverance with which he pursued his enquiries, enabled him to make some considerable additions to our knowledge of chemistry and practical philosophy. Besides a great number of papers in various scientific journals, he published four volumes of essays, experimental, political, economical, and philosophical. We subjoin his autograph.

**RUMJANZOFF, NICHOLAS PETROWITSCH**, count chancellor of the Russian empire. This nobleman was the son of the field-marshal Peter Rumjanzoff, or Romanzoff, distinguished in the reign of Catherine by his victories over the Turks. He began his career about 1785, as Russian ambassador at Frankfort on the Maine. He was afterwards minister of commerce, and did much to promote the internal and foreign trade of Russia. In 1807 he became minister of foreign affairs, and soon after chancellor of the empire. He accompanied the emperor in 1808 to Erfurt, and in 1809 concluded peace with Sweden. During the campaign of 1813 he remained in Petersburg at the head of the department of foreign affairs, which, however, were directed in the imperial camp, by the emperor himself. After the return of the emperor he resigned the portfolio to Count Nesselrode. From this time Count Rumjanzoff, who had almost totally lost his hearing, lived retired from public affairs, and devoted his great riches to patriotic and scientific undertakings. He promoted greatly the

introduction of the system of mutual instruction: Kotzebue's voyage round the world was executed, and the description of it printed at his expense, and the Russian "Codex Diplomaticus" has been printed at his expense at Moscow. For Professor Hase of Paris he defrayed the expenses of an edition of "Leo Diaconus," and to the imperial academy of science he gave 25,000 roubles, to be spent in printing old Russian annals and chronicles. He also caused a monument, of much importance, as connected with the history of art in the middle ages, the Chersonese gates of the cathedral of Novogorod, to be described by Adelung, and the work to be printed at his expense. In 1820 he established on his domains (containing one town, ninety villages, and 30,000 souls), at Homel, a charitable school. He collected from sixty to two hundred of the vagrant and mendicant children of bond-peasants in a wing of his castle, where they were clothed, fed, taught on the system of mutual instruction, and exercised in some trade. To Rumjanzoff, also, we are indebted for the first edition in the Tartar language of Abulgasi's "History of the Mongols and Tartars." The count died at St. Petersburg in January 1826, in the seventy-third year of his age, without children. Among other things, he left a valuable collection of Oriental coins.

**RUNNINGTON, CHARLES**, an English lawyer who was born in Hertfordshire in 1751, and after having completed his education he commenced practising his profession. In 1778 he obtained the rank of serjeant-at-law, after which event he was frequently applied to, to officiate as judge on the home circuit, for the late Justice Gould, Justice Buller, Baron Hotham, Justice Heath, the late Lord Chief Baron Macdonald, and Lord Kenyon; the duties of which substitution he discharged to the satisfaction of the suitors, the profession, and the public. But this official aid was so repeatedly solicited that he was at length compelled to retire from the circuit. In 1782 his first lady died, and in 1783 he married Mrs. Wetherell, the widow of Charles Wetherell, Esq., of Jamaica. In Hilary Term, 1791, he argued the great case, in the court of king's bench, of the corporation of Lynn against the city of London, in error, and succeeded in reversing the judgment of the court of common pleas. He was counsel, together with Sir Samuel Shepherd, the late Mr. Clifford, and other gentlemen, in the actions which Sir Francis Burdett brought against the speaker of the house of commons, Mr. Colman, and Earl Moira; upon the judgment of the first cause, a writ of error was brought in the exchequer chamber, which was argued by Mr. Clifford on the part of Sir Francis Burdett, in the most luminous and impressive manner. The substance of that argument was said to have been communicated by Mr. Serjeant Runnington to Mr. Clifford.

In 1813 Mr. Pooley resigned the office of recorder of Colchester, upon which the corporation solicited the serjeant to accept that office; this, he agreed to do, thinking that the appointment was in the select body of the corporation only; but being in the free burgesses at large, he was opposed by Mr. Harvey, and after a hard contest of several days, was, on the 17th July, 1813, chosen by a considerable majority; but as the mayor who swore him in that office was not mayor *de jure*, an information in nature of *quo warranto* was afterwards filed against the serjeant; in consequence of which he was obliged to disclaim

the office. The residence of the serjeant was principally at Brighton, where, in 1812, he took a most active part as a magistrate for the county of Sussex. His firm, prompt, and impartial manner of administering the duties of that office was certainly of the highest benefit and importance to that place. On the 19th of April, 1815, on the death of the late Mr. Serjeant Palmer, Mr. Runnington was appointed his majesty's commissioner for the relief of insolvent debtors in England, which he resigned in 1819. Serjeant Runnington published Sir Matthew Hale's "History of the Common Law," a new edition, with considerable additions; Gilbert's "Law of Ejectments;" Ruffhead's "Statutes at Large, from Magna Charta to the 25th George III.;" "The History, Principles, and Practice of the Legal Remedy by Ejectment, and the Resulting Action for Mesne Process."

#### RUPERT, or ROBERT OF BAVARIA, PRINCE.

—This brave nobleman was the third son of Frederic V., elector palatine and titular king of Bohemia, by the princess Elizabeth of England, daughter of James I., and was born in 1619. Becoming an exile through the misfortunes of his father, at the commencement of the civil war in England, he offered his services to his uncle, Charles I., and had the command of a corps of cavalry, at the head of which he distinguished himself at the battle of Edgehill in 1642, and at Chalgrave Field in 1643. Soon after he took Bristol, and obliged the enemy to raise the sieges of Newark and of York. He displayed his courage at Marston Moor and at Naseby; but his impetuosity and imprudence contributed to the disastrous result of those engagements. He afterwards shut himself up in Bristol; but having surrendered that place, after a short siege, to Fairfax, his conduct so much displeased the king that he dismissed the prince from his service. He then went abroad, and after the death of Charles I. he was made commander of that part of the fleet which adhered to Charles II. in 1648. Prince Rupert for some time carried on a predatory warfare against the English, and at length sailed to France, and joined Charles II. at the court of Versailles. His time was chiefly devoted to scientific studies till the restoration, when he returned to England. In 1666 he was appointed, in conjunction with Monk, to the command of a fleet against the Dutch; and in the next war with Holland, in 1673, was made admiral of the fleet. In 1679 he was nominated a member of the new privy council; but from that period he interfered but little in public affairs, leading a retired life, and spent much of his time at Windsor castle, of which he was governor. Many useful inventions resulted from his studies, among which are the invention of prince's metal, and the discovery of the method of engraving in mezzo-tinto. The prince died in London in 1682.

RUSH, BENJAMIN.—This distinguished American was born on the 24th of December, 1745, near Philadelphia, and in 1759 entered the college of Princeton, where he graduated in 1760, before he had completed his fifteenth year. The next six years of his life were devoted to the study of medicine. During his noviciate he translated the aphorisms of Hippocrates into English, and also began to keep a notebook of remarkable occurrences, which he continued through life. From a part of this record, written in the seventeenth year of the author's age, we derive the only account of the yellow fever of 1762 in Phi-

ladelphia. In 1766 he went to Edinburgh to study at the university in that city, and took his degree of M.D. there in 1768. The next winter he spent in London, in the spring he went to France, in the autumn he returned to Philadelphia, and commenced the practice of his profession. In 1769 he was elected professor of chemistry in the college of Philadelphia, and when in 1791 the college was merged in the university of Pennsylvania, he was appointed professor of the institutes and practice of medicine, and of clinical practice. In the previous year he had begun to publish his new principles of medicine, depending chiefly for the cure of diseases upon bleeding and cathartics; and these were more or less developed by him in his successive annual courses of lectures for the subsequent twenty-three years of his life.

In the year 1793, when Philadelphia was desolated by the yellow fever to an extent almost equal to that of the ravages of the plague in the old world, the theories and the active strength of Dr. Rush's genius were put to the test. All the physicians, for some time after the commencement of this disease, were unsuccessful in its treatment. Dr. Rush adopted a new mode of treatment, to which he was led by a manuscript of Dr. Mitchell, of Virginia, respecting the yellow fever which prevailed there in 1741. His success was great, and naturally brought him a great increase of practice. He had scarcely a moment of repose. Whilst at his meals his house was filled with persons, chiefly the poor, waiting for his advice; every day he was obliged to refuse numerous applications, and in riding through the streets he was often forced to tear himself away from persons who attempted to stop him, and to drive his chair as speedily as possible out of the reach of their cries. His incessant labours of body and mind, by night and day, nearly cost him his life; but by timely and proper treatment he was rescued from the grave. This was the most eventful year of his life, and in it he laid the foundation of a reputation inferior to few in the annals of medicine. Dr. Rush did not confine his attention exclusively to the practice of his profession, but took an active and zealous part in political affairs. He was an ardent friend of liberty, and was one of the signers of the declaration of independence. In 1777 he was appointed physician-general of the military hospital in the middle department, some time after which he published his observations on hospitals, army diseases, and the effects of the revolution on the army and people. In 1787 he was a member of the convention of Pennsylvania for the adoption of the federal constitution, which received his warmest approbation. During the last fourteen years of his life he was treasurer of the United States mint. Dr. Rush took a deep interest also in the many private associations for the advancement of human happiness with which Pennsylvania abounded. He was an honorary member of many of the literary institutions, both of America and of Europe. In 1805 he received a medal from the king of Prussia for his replies to certain questions respecting the yellow fever; and on a similar account he was presented with a gold medal, in 1807, from the queen of Etruria; and in 1811 the emperor of Russia sent him a diamond ring, as a testimony of his respect for his medical character. The life of this great and good man was terminated on the 19th of April, 1813, in the sixty-eighth year of his age. Notwithstanding his great labours as a lecturer and practitioner,

he was a voluminous writer, having during forty-nine years, from the nineteenth year of his age to within a short period of his death, been constant in the employment of the pen. His printed works consist of seven volumes, six of which treat of medical subjects, and the other is a collection of essays, literary, moral, and philosophical. He also wrote various political essays, which were published in the papers of the time. From the result of his individual experience and observation, he established more principles, and added more facts, to the science of medicine than all who had preceded him in his native country.

**RUSHWORTH, JOHN**, an industrious collector of historical matter, who was born in 1607, and was for some time a student at Oxford, which he quitted for Lincoln's Inn, where he remained until he was called to the bar. He was, however, more attached to politics than to law, and made it his business to attend parliament, the star-chamber, and other courts, when important business was transacting, in order to take notes of what he saw and heard. In 1600 he was assistant clerk of the house of commons; and when Sir Thomas Fairfax became general of the parliamentary forces, he was appointed his secretary. He was a member of parliament in 1658, and in 1660 he was re-elected for Berwick in the healing parliament. In 1667 he was made secretary to Sir Orlando Bridges, keeper of the great seal, but after the decease of that lawyer, was arrested for debt, and committed to the king's bench prison, where he died in 1690. His historical collection of "Private Passages in State, Weighty Matters in Law, and Remarkable Proceedings in Parliament," was published at different times, in folio, until it amounted to eight volumes, including the trial of the earl of Strafford, published in 1686. The first seven volumes of these were reprinted uniformly in 1721.

**RUSSELL, LORD WILLIAM**.—This distinguished martyr in the cause of civil and religious liberty was born in 1641, and educated in the principles of constitutional freedom espoused by his father. He appears to have yielded to the vortex of dissipation introduced by the restoration, but on his marriage with Rachel, daughter of the earl of Southampton, his conduct entirely changed, and he immediately directed his talents into their proper channel. The family of this nobleman was both ancient and honourable.

They were in possession of landed property in Dorsetshire, and as early as 1221 we find John Russell constable of Corfe castle. William, in 1284, obtained a charter for a market at his manor of Kingston Russell; and in the first of Edward II. he was returned to parliament one of the knights for the county of Southampton. Sir John Russell, the lineal descendant of William, was speaker of the house of commons in the second and tenth year of the reign of Henry VI. His son, John Russell, lived at Barwick. A fortunate occurrence some years after opened the way to wealth and honour. In the twenty-first year of the reign of Henry VII., Philip, archduke of Austria, and in right of his wife, king of Castile, having encountered a violent storm in his passage from Flanders to Spain, was obliged to put into Weymouth. Sir Thomas Trenchard, who lived near the port, entertained him in the best manner he was able, till he could acquaint the king with his arrival. In the mean time he sent for Mr. Russell,

who had travelled abroad and was acquainted with foreign languages. The archduke was so much pleased with Mr. Russell that he took him with him to court, and recommended him warmly to the king. He was immediately made one of the gentlemen of the privy chamber. He afterwards attended Henry VIII. in his expedition to France, and was present at the taking of Therouenne and Tournay. When the latter place was afterwards given up, the orders from the king to deliver it into the hands of the French were directed to him. In 1522 he was knighted by the earl of Surrey for his services at the taking of Morlaix, in Bretagne, and was created Lord Russell in 1539. For the eminent services of this nobleman in France, where the vanguard was entrusted to his command, he was rewarded with many honours and appointments; and all these were crowned in 1540, when, on the dissolution of the monasteries, he obtained a grant of the rectory of Tavistock. Francis, the second earl of Bedford, was present at the battle of St Quintin, and held many high offices under Queen Elizabeth. His grandson, Edward, having died without issue in 1627, the title passed to the issue of Sir William Russell, the first son of Francis. Francis, earl of Bedford, engaged in the great work of draining the fens; he was also a great leader of the county party in the house of peers, and it was the wish of Charles I. to have made him lord high treasurer of England. William, the father of Lord Russell, having succeeded to the earldom, was partly instrumental in gaining the battle of Edgehill; but he afterwards joined the king at Oxford. His second son was William Lord Russell, the subject of this memoir. The period to which the active life of Lord

Russell belongs, is one of great importance. From the year 1670 to 1683 may be styled the middle of the great contest, which, beginning in 1641 and ending in 1688, has been very properly called a revolution of half a century. The sons of Charles I. had confident expectations of establishing an arbitrary monarchy in England; and on the other side there were many real patriots, determined to surrender their liberties only with their lives. At this period

a struggle took place between the crown and parliament, which ended in the complete victory of the former; and, had not James attacked the church as well as the constitution, would probably have led the way to despotism. The triumph of Charles II. over his parliament was scarcely less signal than that of the triumph of the parliament over his father, and, like it, sealed with blood. But it differs in one particular; although Charles II. was finally successful, the laws enacted during the contest were in favour of the conquered party. While this struggle was going on, Lord Russell was universally considered as the head of the popular party. The king had prorogued the parliament for many months, but was at last obliged to again convoke it. Immediately after it met, Lord Russell accused the earl of Darnley, one of the cabinet ministers, of mismanagement at the treasury, and of having said at the council-board that a new proclamation was better than an old law. He concluded his speech by moving an address to exclude this obnoxious nobleman from the king's presence and councils for ever; and that articles of impeachment should be drawn up against him. These articles were accordingly delivered next day at the bar of the house by Sir Samuel Barnardiston; but, on a division, they were all rejected. After the restoration the house of commons had been modelled to the purposes of the court. Not less than a third of the members were placemen or pensioners. Lord Clifford had introduced, or more probably extended, the practice of buying, downright, one man after another. Many of the more indigent class trafficked their votes for a dinner at Whitehall, and a gratuity on extraordinary occasions. Others had the expenses of their election defrayed from the treasury; and it was common for those who had been chosen on popular grounds, after a few violent speeches, to sell themselves to the court. Placed beyond the fear of the people by the long continuance of parliament, they were encouraged in the hope of riches and promotion by the increasing corruption of government. The king, on his side, endeavoured to dispense with parliaments altogether. He made a new treaty with the king of France, which contained the usual stipulations of neutrality on one hand and pension on the other. At this time he was so utterly abandoned by his subjects that he did not dare to trust even his ministers with his engagements. He wrote the treaty with his own hand, and confided himself entirely to none but Lauderdale. The French minister wrote to his master, that in all England there were but the king and the duke of York who embraced his interest with affection; and that the king himself, without this new treaty, might have been drawn into the sentiments of his people. In this state of affairs, after the meeting of parliament, Lord Russell contended strongly for a war with France, and at the same time expressed his fears arising from catholicism and a standing army. On the meeting of a new parliament, Lord Russell found himself returned a knight of the shire for two counties, Bedford and Herts, and made his election for the former. He was a firm believer in the existence of the "popish plot," which occurred about this period; and so apprehensive was he of the accession of James II. that he moved for leave to bring in a bill "to secure our religion and properties in case of a popish successor." His lordship afterwards seconded a motion for bringing in the exclusion-bill, and, when passed by the commons, carried it up to the

house of lords, where it was thrown out. A severe vengeance was speedily enacted for such determined measures of hostility against the duke of York. So sensible, indeed, was Lord Russell of his danger, that he expressed himself to a friend, that he was well assured of falling a sacrifice, "for arbitrary government could not be set up in England without wading through his blood."

Lord Russell was accused of participating in the Rye House plot, and after his examination before the privy council, at which Charles presided, "he looked upon himself as a dying man, and turned his thoughts wholly to another world. He read much in the Scriptures, particularly the Psalms; but whilst he behaved with the serenity of a man prepared for death, his friends exhibited an honourable anxiety to preserve his life. Lord Essex would not leave his house, lest his absconding might incline a jury to give more credit to the evidence against Lord Russell. The duke of Monmouth sent to let him know he would come in and run fortunes with him, if he thought it could do him any service. He answered it would be of no advantage to him to have his friends die with him."

The interval between his imprisonment and his trial was anxiously spent by Lady Russell in preparations for his defence; and it must be allowed, that on this critical occasion, his faithful consort displayed an heroic constancy and attachment, almost unexampled in modern times. This unfortunate nobleman was brought to trial on the charge of treason on the 13th of July, 1683. The principal evidence against him was Lord Howard, and some notion of the value of the testimony of this witness may be gathered from the following report:—

"My Lord, I appear with some confusion. Let no man wonder that it is troublesome to me. My lord, as to the question Mr. Attorney puts to me, this is the account I have to give. It is very well known to every one, how great a ferment was made in the city upon occasion of the long dispute about the election of sheriffs: and this soon produced a greater freedom and liberty of speech, one with another, than perhaps had been used formerly, though not without some previous preparations and dispositions made to the same thing. Upon this occasion, among others, I was acquainted with Captain Wale, a person that had been some months in England, being returned out of Ireland, and who indeed I had not seen for eleven years before. But he came to me as soon as he came out of Ireland; and when these unhappy divisions came, he made very frequent applications to me; and though he was unknown himself, yet being brought by me, he soon gained a confidence with my Lord Shaftesbury, and from him derived it to others, when this unhappy rent and division of mind was, he, having before got himself acquainted with many persons of the city, had entered into such counsels with them as afterward had the effect which, in the ensuing narrative, I shall relate to your lordship. He came to me, and did acquaint me that the people were now so sensible that all their interest was going, by that violence offered to the city in their elections, that they were resolved to take some course to put a stop to it, if it were possible: he told me there were several consultations and meetings of persons about it, and several persons had begun to put themselves into a disposition and preparation to act; that some had furnished them-

selves with very good horses, and kept them in the most secret and blind stables they could; that divers had intended it, and for his own part, he was resolved to embark himself in it. And having an estate in Ireland, he thought to despatch his son thither, (for he had a good real estate, and a great stock; how he disposed of his real estate I know not); but he ordered his son to turn his stock into money to furnish him for the occasion: this I take to be about August. His son was sent away. Soon after this, the son not being yet returned, and I having several accounts from him wherein I found the fermentation grew higher and higher, and every day a nearer approach to action, I told him I had a necessity to go into Essex to attend the concerns of my own estate, but told him how he might, by another name, convey letters to me, and gave him a little cant, by which he might blind and disguise the matter he wrote about when I was in the country. I received two or three letters from him that gave me an account, in that disguised state, but such as I understood, that the negotiation which he had with my correspondents was going on, and in good condition; and it was earnestly desired I should come to town: this was the middle of September. I, notwithstanding, was willing to see the result of that great affair, upon which all men's eyes were fixed, which was the determination of the shrievalty about that time. So I ordered it to fall into town, and went to my house on Saturday night, which was Michaelmas-day. On Sunday he came to me and dined with me, and told me (after a general account given me of the affairs of the times) that my Lord Shaftesbury was secreted, and withdrawn from his own house in Aldersgate Street; and that though he had a family settled, and had absconded himself from them, and divers others of his friends and confidants, yet he did desire to speak to me, and for that purpose sent him to show me the way to his lodging: he brought me to a house at the lower end of Wood Street, one Watson's house, and there my lord was alone. He told me he could not but be sensible, how innocent soever he was, both he and all honest men were unsafe so long as the administration of justice was in such hands as would accommodate all things to the humour of the court. That in the sense of this he thought it but reasonable to provide for his own safety by withdrawing himself from his own house into that retirement. That now he had ripened affairs into that head, and had things in that preparation, he did not doubt but he should be able, by those men that would be in readiness in London, to turn the tide, and put a stop to the torrent that was ready to overflow. But he did complain to me, that his design, and the design of the public, was very much obstructed by the unhandsome deportment of the duke of Monmouth and my Lord Russell, who had withdrawn themselves, not only from his assistance, but from their own engagements and appointments. For when he had got such a formed force as he had in London, and expected to have it answered by them in the country, they did recede from it, and told him they were not in a condition, or preparation in the country, to be concurrent with him at that time. This he looked upon but as an artificial excuse, and as an instance of their intentions wholly to desert him; but notwithstanding there was such preparations made in London, that if they were willing to lose the honour of being concurrent with them, he

was able to do it himself, and did intend speedily to put into execution. I asked him what forces he had; he said, 'Enough.' Says I, 'What are you assured of?' Says he, 'There is above ten thousand brisk boys are ready to follow me, whenever I hold up my finger.' Says I, 'How have you methoded this, that they shall not be crushed? for there will be a great force to oppose you.' 'Yes,' he answered, 'but they would possess themselves of the gates; and these ten thousand men, in twenty-four hours, would be multiplied into five times the number, and be able to make a sally out, and possess themselves of Whitehall by beating the guards.' I told him this was a fair story, and I had reason to think a man of his figure would not undertake a thing that might prove so fatal unless it were laid on a foundation that might give a prudent man ground to hope it would be successful. He said he was certain of it, but confessed it was a great disappointment that these lords had failed him: I told him, I was not provided with an answer at that time; that he well knew me, and knew the general frame and bent of my spirit. But I told him I looked upon it as dangerous, and ought to be laid deep, and to be very well weighed and considered of; and did not think it a fit thing to be entered upon without the concurrence of those lords; and therefore desired, before I discovered my own inclination, to discourse with those lords. He did consent, with much ado. 'But,' says he, 'you will find they will wave it, and give doubtful and deferring answers, but you will find this a truth.' I went to Moor Park the next day, where the duke of Monmouth was, and told him the great complaint my Lord Shaftesbury had made, that he failed him. Says he, 'I think he is mad!' I was so far from giving him any encouragement, that I did tell him from the beginning, and so did my Lord Russell, there was nothing to be done by us in the country at that time. I did not then own I had seen my lord, but spoke as if this were brought me by a third person, because he had not given me liberty to tell them where his lodging was. Says I, 'My lord, I shall be able to give a better account of this in a day or two: shall I convey it to my lord, that you are willing to give a meeting?' 'Yes,' says he, with all my heart: this was the 2nd, 3rd, or 4th of October: I came to town on Saturday, and was carried to him on Monday; and I suppose this was Tuesday, the 2nd of October: on Wednesday I think I went to him again (but it is not very material), and told him I had been with the duke of Monmouth, and gave him a punctual account of what I had from him; and the duke did absolutely disown any such thing; and told me he never did give him any encouragement to proceed that way, because the countries were not in a disposition for action, nor could be put in readiness at that time: says my Lord Shaftesbury, 'It is false; they are afraid to own it; and,' says he, 'I have reason to believe there is some artificial bargain between his father and him, to save one another; for when I have brought him to action, I could never get him to put on, and therefore I suspect him; and,' says he 'several honest men in the city have puzzled me in asking how the duke of Monmouth lived: says he, 'they puzzled me,' and I could not answer the questions; for I know he must have his living from the king; and,' says he, 'we have different prospects; we are for a commonwealth, and he had no other design but his own personal interest, and that will not go

down with my people now (so he called them), they are all for a commonwealth: and then,' says he, 'it is to no purpose for me to see him; it will but widen the breach, and I dare not trust him to come hither.' Says I 'My Lord, that is a good one indeed—dare not you trust him, and yet do you send me to him on this errand?' 'Nay,' says he, 'it is because we have had some misunderstanding of late; but I believe he is true enough to the interest.' Says I, 'It is a great unhappiness to take this time to fall out; and I think it is so great a design that it ought to be undertaken with the greatest strength and coalition in the kingdom.' Says he, 'My friends are now gone so far that they cannot pull their foot back again without going further; for,' says he, 'it hath been communicated to so many that it is impossible to keep it from taking air, and it must go on.' Says he, 'We are not so unprovided as you think for; there are so many men that you will find as brisk men as any in England. Besides, we are to have 1000 or 1500 horse, that are to be drawn by insensible parties into town, that when the insurrection is, shall be able to scour the streets, and hinder them from forming their forces against us.' My lord, after great enlargement upon this head, and heads of the like nature, I told him I would not leave him thus, and that nothing should satisfy me, but an interview between him and the lord: no, I could not obtain it; but if I would go and tell them what a forwardness he was in, and that, if they would do themselves right, by putting themselves upon correspondent action in their respective places, and where their interest lay, well; otherwise he would go away without them: so I went again to the duke of Monmouth. I spake to him only (I never spake to my Lord Russell then, only we were together; but I had never come to any close conjunction of counsels in my life with him at that time). Says I to the duke, 'This man is mad, and his madness will prove fatal to us all; he hath been in a fright by being in the Tower, and carries those fears about him that cloud his understanding: I think his judgment hath deserted him, when he goes about with those strange sanguine hopes, that I cannot see what should support him in the ground of them. Therefore,' says I 'pray will you give him a meeting?' 'God-so, says the duke, 'with all my heart, and I desire nothing more.' Now, I told him, I had been with my Lord Shaftesbury, with other enlargements that I need not trouble your lordship with. 'Well,' says he, 'pray go to him, and try if possible to get a meeting.' So I went to him, and told him:—Says I, 'This is a great unhappiness, and it seems to be a great absurdity that you are so forward to act alone in such a thing as this.' 'Pray,' says I, 'without any more to do, since you have this confidence to send for me, let me prevail with you to meet them, and give them an interview, or else you and I must break. I will no longer hold any correspondence, unless it be so.' Says he, 'I tell you they will betray me.' In short, he did, with much importunity, yield, that he would come out the next night in a disguise. By this time it was Saturday; I take it to be the 6th of October; an almanack will settle that: so the next night, being Sunday, and the shops shut, he would come out in a concealment, be carried in a coach, and brought to his own house, which he thought then was safest. I came and gave the duke of Monmouth an account of it; the duke, I suppose, conveyed the same understanding to my Lord Russell; and I sup-

posed both would have been there accordingly, to have given the meeting; but next morning I found Colonel Rumsey had left a note at my house, that the meeting could not be that day. Then I went to the duke of Monmouth, and he had had the account before, that my Lord Shaftesbury did apprehend himself to be in some danger in that house, and that the apprehension had occasioned him to remove; but we should be sure to hear from him in two or three days. We took it as a waver, and thought he did from thence intend to abscond himself from us, and it proved so to me, for from that time I never saw him. But Captain Walcot came to me, and told me that he was withdrawn, but it was for fear his lodging might be discovered, but he did not doubt but in a week he would let me know where his lodging was: but told me within such a time, which I think was eight or ten days, there would be a rising; and I told the duke of Monmouth, and I believe he told my Lord Russell; and we believed his frenzy was now grown to that height that he would rise immediately and put his design in execution; so we endeavoured to prevent it. Upon which my Lord Russell (I was told) and the duke of Monmouth, did force their way to my Lord Shaftesbury's, and did persuade him to put off the day of rendezvous. I had not this from my Lord Russell, for I had not spoke a word to him; but the duke told me my Lord Russell had been with him (I had indeed an intimation that he had been with him,) but the duke told me, says he, 'I have not been with him, but my Lord Russell was, having been conveyed by Colonel Rumsey.' After this day was put off, it seems it was put off with this condition, that those lords, and divers others, should be in readiness to raise the country about that day fortnight, or thereabouts; for there was not a fortnight's time given: 'and,' says the duke of Monmouth, 'we have put it off; but now we must be in action, for there is no holding it off any longer. And,' says he, 'I have been at Wapping all night, and I never saw a company of bolder and brisker fellows in my life; and,' says he, 'I have been round the Tower, and seen the avenues of it; and I do not think it will be hard, in a little time, to possess ourselves of it; but,' says he, 'they are in the wrong way yet, we are engaged to be ready for them in a fortnight, and therefore,' says he, 'now we must apply ourselves to it as well as we can.' And thereupon I believe they did send into the country; and the duke of Monmouth told me, he spake to Mr. Trenchard, who was to take particular care of Somersetshire, with this circumstance; says he, 'I thought Mr. Trenchard had been a brisker fellow; for when I had told him of it, he looked so pale, I thought he would have swooned, when I brought him to the brink of action: 'and,' said I, 'Pray go and do what you can among your acquaintances; and truly, I thought it would have come then to action. But I went the next day to him, and he said it was impossible; they could not get the gentlemen of the country to stir yet.'

"This is just in the order it was done. When this was put off, then they were in a great hurry; and Captain Walcot had been several times with me, and discoursed of it. But upon this disappointment, they said it should be to the dishonour of the lords, that they were backward to perform their parts; still they were resolved to go on. And this had carried it to the latter end of October. About the 17th or 18th, Captain Walcot came to me, and told me, now they

were resolved positively to rise, and did believe that a smart party might perhaps meet with some great men. Thereupon I told the duke of it; I met him in the street, and went out of my own coach into his, and told him that there was some dark intimation as if there might be some attempt upon the king's person: with that he struck his breast with great emotion of spirit, and said, 'God-so, kill the king! I will never suffer that.' Then he went to the play-house to find Sir Thomas Armstrong, and send him up and down the city to put it off, as they did formerly; and it was done with that success that we were all quieted in our minds, that at that time nothing would be done: but upon the day the king came from Newmarket, we dined together: the duke of Monmouth was one; and there we had a notion conveyed among us, that some bold action should be done that day; which, comparing it with the king's coming, we concluded it was designed upon the king. And I remember my Lord Grey, says he, 'By God, if they do attempt any such thing, it cannot fail.' We were in great anxiety of mind till we heard the king's coach was coming, and Sir Thomas Armstrong not being there, we apprehended that he was to be one of the party, for he was not there. This failing, it was then next determined (which was the last alarm and news I had of it) to be done upon the 17th of November, the anniversary of Queen Elizabeth: and I remember it by this remark I made myself, that I feared it had been discovered, because I saw a proclamation a little before, forbidding public bonfires without leave of my lord mayor. It made some impressions upon me, that I thought they had got an intimation of our intention, and had therefore forbid that meeting. This, therefore, of the 17th of November being also disappointed, and my Lord Shaftesbury, being told things were not ripe in the country, took shipping and got away; and from that time I heard no more of him, till I heard he was dead. Now, Sir, after this we all began to lie under the same sense and apprehensions that my Lord Shaftesbury did, that we had gone so far, and communicated it to so many, that it was unsafe to make a retreat; and this being considered, it was also considered that so great an affair as that was, consisting of such infinite particulars, to be managed with so much fineness, and to have so many parts, it would be necessary that there should be some general council, that should take upon them the care of the whole. Upon these thoughts we resolved to erect a little cabal among ourselves, which did consist of six persons; and the persons were, the duke of Monmouth, my lord of Essex, my Lord Russell, Mr. Hampden, jun., Algernon Sidney, and myself."

On this hearsay evidence was Lord Russell condemned to death; and after the verdict had been pronounced the king was strongly solicited in his behalf. But Charles was inexorable; he dreaded the principles and popularity of Lord Russell; he deeply represented that eagerness and perseverance with which he had opposed him in the late parliaments. Lord Russell then resigned himself to his fate with admirable fortitude. His lady, that he might not be shocked in his last moments, summoned up the resolution of an heroine, and parted from him without shedding a tear. He behaved with surprising serenity of temper: immediately before he was conveyed to the scaffold he wound up his watch, saying, with a smile,—“Now I have done with time, and must henceforth

think solely of eternity.” The scaffold was erected in Lincoln's Inn Fields, that the triumph of the court might appear the more conspicuous, from his being conveyed through the whole city of London; even the populace wept as he passed along in the coach with Tillotson and Burnet. Dr. Burnet preached two sermons in Newgate to Lord Russell the day before he suffered, which were published by the author in 1713. In the preface he says, “I had been with the Lord Russell, in Newgate, four whole afternoons before that; for he desired to be alone till twelve of the clock. He did all that while possess his soul with so clear a serenity, in such a calm and Christian manner, that I still reckon it a particular happiness, as well as an honour, that I attended then upon him. Before I preached these sermons he received the sacrament from Dr. Tillotson's hands. When the office was ended he showed us the paper he had prepared for his last words. We had some discourse with him about the lawfulness of consultations in order to resistance in the state in which things were then. He thought the violence used in the matter of the sheriffs of London showed a design to destroy such men as the court thought stood in their way, of which he was among the first; he prayed God he might be the last. We thought that was indeed an unjustifiable account; till a total subversion came we still thought it was unlawful to resist. He said, it would be then too late; he had all along had other notions of the English government, but he would not then enter upon farther debates in these matters. He spent the rest of the day till towards evening in devotion; then his children and friends came to him. He spoke to his children in a way suited to their age, with a good measure of cheerfulness, and took leave of his friends in so calm a manner as surprised them all. The parting with his lady was not so easy to him: she stayed with him all the day and till eleven at night; then they parted in a solemn, grave silence. Upon which, when she was gone, he said to me—‘The bitterness of death is now past.’”

The execution was performed not on Tower Hill, the common place of execution for men of high rank, but in Lincoln's Inn Fields, in order that the citizens might be humbled by the spectacle of their once triumphant leader carried in his coach to death through the city, a device, which, like most others of the kind, produced an effect contrary to what was intended. In passing, he looked towards Southampton House; the tear started in his eye, but he instantly wiped it away. He prayed for the king; but, with a prescience of what afterwards happened, he foretold, “that although a cloud now hung over the nation, his death would do more service than his life could have done.”

Our space will now only permit us to notice Lord Russell's speech to the sheriffs, on delivering them the subjoined paper upon the scaffold just before his execution:—“I expected the noise would be such that I could not be very well heard. I was never very fond of much speaking, much less now; therefore I have set down in this paper all that I think fit to leave behind me. God knows how far I was always from designs against the king's person, or of altering the government; and I still pray for the preservation of both, and of the protestant religion.

“I am told that Capt. Walcot has said something concerning my knowledge of the plot. I know not whether the report be true or no, but I hope it is not; for to my knowledge I never saw him, to speak to him,

in my whole life; and in the words of a dying man, I know of no plot either against the king's life or the government. But I have now done with this world; I am going to a better. I forgive all the world, and I thank God, I die in charity with all men; and I wish all sincere protestants may love one another, and not make room for popery by their animosities."

The following is the substance of the paper delivered by Lord Russell to the sheriffs:—"I thank God I find myself so composed and prepared for death, and my thoughts so fixed on another world, that I hope in God I am quiet from setting my heart on this; yet I cannot forbear now the setting down in writing a further account of my condition to be left behind me, than I will venture to say at the place of execution, in the noise and clatter that is like to be there. I bless God heartily for those many blessings, which He in his infinite mercy hath bestowed upon me through the whole course of my life; that I was born of worthy and good parents, and had the advantage of a religious education, which are invaluable blessings; for even when I minded it least, it still hung about me and gave me checks; and has now for many years so influenced and possessed me, that I feel the happy effects of it in this my extremity, in which I have been so wonderfully (I thank God) supported, that neither my imprisonment nor fear of death have been able to discompose me in any degree; but, on the contrary, I have found the assurances of the love and mercy of God in and through my blessed Redeemer, in whom only I trust; and I do not question but I am going to partake of that fulness of joy which is in his presence. These hopes, therefore, do so wonderfully delight me that I think this is the happiest time of my life, though others may look upon it as the saddest.

"I have lived, and now am, of the reformed religion, a true and sincere protestant, and in the communion of the church of England; though I could never yet comply with, or rise up to, all the heights of many people. I wish with all my soul all our differences were removed; and that all sincere protestants would so far consider the danger of popery as to lay aside their heats and agree against the common enemy, and that the churchmen would be less severe, and the dissenters less scrupulous; for I think bitterness and persecution are at all times bad, but much more now.

"For popery, I look on it as an idolatrous and bloody religion, and therefore thought myself bound, in my station, to do all I could against it; and by that I foresaw I should procure such great enemies to myself, and so powerful ones, that I have been now for some time expecting the worst; and, blessed be God! I fall by the axe, and not by the fiery trial! yet, whatever apprehensions I had of popery, and of my own severe and heavy share I was like to have under it, when it should prevail, I never had a thought of doing any thing against it basely or inhumanly, but what would consist with the Christian religion, and the laws and liberties of this kingdom. And, I thank God, I have examined all my actions in that matter with so great care that I can appeal to God Almighty, who knows my heart, that I went on sincerely, without being moved either by passions, by-ends, or ill designs. I have always loved my country much more than my life, and never had any design of changing the government, which I value, and look upon as one of the best governments in the

world, and would always have been ready to venture my life for the preserving it; and would suffer any extremity rather than have consented to any design of taking away the king's life; neither had any man the impudence to propose so base and barbarous a thing to me; and I look upon it as a very unhappy and uneasy part of my present condition, that there should be so much as mention made of so vile a fact, though nothing in the least was said to prove any such matter, but the contrary by my Lord Howard; neither does any body, I am confident, believe the least of it; so that I need not, I think, say more.

"For the king, I do sincerely pray for him, and wish well to him and the nation, that they may be happy in one another; that he may be, indeed, the defender of the faith; that the protestant religion, and the peace and safety of the kingdom may be preserved and flourish under his government; and that himself, in his person, may be happy both here and hereafter. As for the share I had in the prosecution of the popish plot, I take God to witness, that I proceeded in it in the sincerity of my heart, being then really convinced (as I am still) that there was a conspiracy against the king, the nation, and the protestant religion; and I likewise profess, that I never knew any thing, directly or indirectly, of any practices with the witnesses, which I look upon as so horrid a thing that I never could have endured it. For, thank God, falsehood and cruelty were never in my nature, but always the farthest from it imaginable. I did believe, and do still, that popery is breaking in upon this nation, and that those that advance it, will stop at nothing to carry on their design. I am heartily sorry that so many protestants give their helping hand to it; but I hope God will preserve the protestant religion, and this nation, though I am afraid it will fall under very great trials, and very sharp sufferings; and, indeed, the impiety and profaneness that abounds, and appears so scandalously bare-faced everywhere, gives too just occasion to fear the worst thing that can befall a people. I pray God prevent it, and give those who have showed a concern for the public good, and have appeared hearty for the true interest of the nation, and the protestant religion, grace to live so, that they may not cast a reproach on that which they endeavoured to advance, which (God knows) has often given me sad thoughts; and I hope such of my friends as may think they are touched by this, will not take what I say in ill part, but will endeavour to amend their ways, and live suitable to the rules of the true reformed religion, which is the only thing that can administer true comfort at the latter end, and relieve a man when he comes to die. As for my present condition, I bless God I have no repining in my heart at it. I know, for my sins, I have deserved much worse at the hands of God; so that I cheerfully submit to so small a punishment as the being taken off a few years sooner, and the being made a spectacle to the world. I do freely forgive all the world, particularly those concerned in taking away my life; and I desire and conjure all my friends to think of no revenge, but to submit to the holy will of God, into whose hands I resign myself entirely. But to look back a little; I cannot but give some touch about the bill of exclusion, and show the reason of my appearing in that business, which, in short, is this—that I thought the nation in such

danger of popery, and that the expectations of a popish successor (as I have said in parliament) put the king's life likewise in much danger, that I saw no way so effectual to secure both as such a bill. As to the limitations that were proposed, if they were sincerely offered, and had passed into a law, the duke then should have been excluded from the power of a king, and the government quite altered, and little more than the name of a king left; so I could not see either sin or fault in the one, when all the people were willing to admit of the other; but thought it better to have a king with his prerogative, and the nation easy and safe under him, than a king without it, which would breed perpetual jealousies and a continual struggle. All this I say only to justify myself, not to inflame others, though I cannot but think my earnestness in that matter has had no small influence in my present sufferings. But I have now done with this world, and am going to a kingdom which cannot be moved. And as to the conspiring to seize the guards, which is the crime for which I am condemned, and which is made a constructive reason, for taking away the king's life, to bring it within the statute of Edward III., I shall give this true and clear account:—I never was at Mr. Shephard's with that company but once, and there was no undertaking then of securing or seizing the guards, nor any appointed to view or examine them. Some discourse there was of the feasibility of it; and several times by accident, in general discourse elsewhere, I have heard it mentioned as a thing which might easily be done, but never consented to as a thing fit to be done. And I remember particularly, at my Lord Shaftesbury's, there being some general discourse of this kind, I immediately flew out and exclaimed against it; and asked, if the thing succeeded, what must be done next, but mastering the guards and killing them in cold blood? which I looked upon as a detestable thing, and so like a popish practice, that I could not but abhor it. And at the same time, the duke of Monmouth took me by the hand, and told me very kindly—'My Lord, I see you and I are of a temper; did you ever hear so horrid a thing?' And I must needs do him justice to declare, that I ever observed in him an abhorrence of all base things. As to my going to Mr. Shephard's, I went with an intention to taste sherry; for he had promised to reserve for me the next very good piece he met with when I went out of town; and if he recollects himself, he may remember I asked him about it, and he went and fetched a bottle; but when I tasted it, I said it was hot in the mouth, and desired that whenever he met with a choice piece, he would keep it for me, which he promised. I enlarge the more upon this, because Sir George Jefferies insinuated to the jury, as if I had made a story about going thither; but I never said that was the only reason. I will now truly and plainly add the rest. I was, the day before this meeting, come to town for two or three days, as I had done once or twice before, having a very near and dear relation lying in a languishing and desperate condition; and the duke of Monmouth came to me, and told me, he was extremely glad I was come to town, for my Lord Shaftesbury and some hot men would undo us all. 'How so, my Lord?' I said—'Why (answered he) they will certainly do some disorderly thing or other, if great care be not taken; and therefore, for God's sake, use your endeavour with your friends to prevent any

thing of this kind.' He told me that there would be company at Mr. Shephard's that night, and desired me to be at home in the evening, and he would call on me, which he did. And when I came into the room, I saw Mr. Rumsey by the chimney, though he swears he came in afterward; and there were things said by some, with much more heat than judgment, which I did sufficiently disapprove: and yet for these things I stand condemned; but, I thank God, my part was sincere and well meant. It is, I know, inferred from hence, and pressed to me, that I was acquainted with these heats and ill designs, and did not discover them. But this could be but misprision of treason at most; so I die innocent of the crime I stand condemned for. I hope nobody will imagine that so mean a thought should enter into me as to go about to save myself by accusing others; the part that some have acted lately of that kind has not been such as to invite me to love life at such a rate. As for the sentence of death passed upon me, I cannot but think it a very hard one; for nothing was sworn against me (whether true or false I will not now examine) but some discourses about making some stir; and this is not levying war against the king, which is treason by the statute of Edward III., not the consulting and discoursing about it; which was all that is witnessed against me; but, by a strange fetch, the design of seizing the guards was construed a design of killing the king; and so I was in that cast.

"And now I have truly and sincerely told what my part was in that which cannot be more than a bare misprision; and yet I am condemned as guilty of a design of killing the king. I pray God, lay not this to the charge, neither of the king, council, nor judges, nor sheriffs, nor jury; and for the witnesses, I pity them, and wish them well. I shall not reckon up the particulars wherein they did me wrong; I had rather their own conscience would do that; to which, and the mercies of God, I leave them; only I shall aver, that what I said of my not hearing Colonel Rumsey deliver any message from my Lord Shaftesbury was true; for I always detested lying, though never so much to my advantage. I hope none will be so unjust and uncharitable as to think I would venture on it in these my last words, for which I am soon to give an account to the great God, the searcher of hearts and judge of all things. From the time of choosing sheriffs, I concluded the heat in that matter would produce something of this kind; and I am not much surprised to find it fall upon me; and I wish what is done to me may put a stop, and satiate some people's revenge, and that no more innocent blood be shed; for I must, and do still look upon mine to be such, since I know I was guilty of no treason; and therefore would not betray my innocence by flight (though much pressed to it), of which I do not, I thank God, yet repent, how fatal soever it may have seemed to have proved to me; for I looked upon my death in this manner (I thank God) with other eyes than the world does. I know I said but little at the trial, and I suppose it looks more like innocence than guilt. I was also advised not to confess matter of fact plainly, since that certainly must have brought me within the guilt of misprision; and thus, being restrained from dealing frankly and openly, I chose rather to say little than to depart from that ingenuity that, by the grace of God, I had carried along with me in the former part of my life; and so

could easier be silent, and leave the whole matter to the consciences of the jury, than to make the last and solemnest part of my life so different from the course of it, as the using little tricks and evasions must have been; nor did I ever pretend to any great readiness in speaking. I wish those gentlemen of the law, who have it, would make more conscience in the use of it, and not run men down, and, by strains and fetches, impose on easy and willing juries, to the ruin of innocent men; for to kill by forms and subtleties of the law, is the worst sort of murder. But I wish the rage of hot men, and the partiality of juries, may be stopped with my blood, which I would offer up with so much the more joy if I thought I should be the last that were to suffer in such a way. Since my sentence I have had few thoughts but preparatory ones for death; yet the importunity of my friends, and particularly the best and dearest wife in the world, prevailed with me to sign petitions, and make an address for my life, to which I was ever averse; for (I thank God) though in all respects I have lived the happiest and contentedst man in the world (for now very near fourteen years), yet I am so willing to leave all, that it was not without difficulty that I did any thing for the saving of my life, that was begging; but I was willing to let my friends see what power they had over me, and that I was not obstinate nor sullen, but would do any thing that an honest man could do for their satisfaction, which was the only motive that swayed or had any weight with me. And now, to sum up all, as I had not any design against the king's life, or the life of any man whatsoever, so I never was in any contrivance of altering the government. What the heats, passions, and vanities of other men have occasioned, I ought not to be responsible for, nor could I help them, though I now suffer for them. But the will of the Lord be done, into whose hands I commend my spirit! and trust that 'Thou, O most merciful Father, hast forgiven all my transgressions, the sins of my youth, and all the errors of my past life, and that thou wilt not lay my secret sins and ignorances to my charge, but wilt graciously support me during that small time of life now before me, and assist me in my last moments, and not leave me then to be disordered by fear, or any other temptations, but make the light of thy countenance to shine upon me. Thou art my sun and my shield, and as thou supportest me by thy grace, so I hope thou wilt hereafter crown me with glory, and receive me into the fellowship of angels and saints, in that blessed inheritance purchased for me by my most merciful Redeemer, who is, I trust, at thy right hand, preparing a place for me, and is ready to receive me; into whose hands I commend my spirit!'" Lord Russell died as he lived: to the last the friend of truth, protestantism, and the liberties of his country.

**RUSSELL, LADY RACHEL.**—This distinguished lady was the wife of the above nobleman, and as celebrated for her devotion to her husband as she was for her literary eminence. She was born in 1636, married to Lord Russell in 1667, and survived him about forty years. But few particulars of Lady Russell's life have been preserved, but her "Letters" have been often reprinted, one of which we take as a specimen. It was written to the celebrated Dr. Fitzwilliam:—

"I have received, good Doctor, your friendly letter and excellent prayers, indeed, very excellent

ones; and although neither could have come too soon, yet I could not wonder they staid so long. The rigour of the season has been as extreme as ever was known in England, or in these parts of the world; but a little time of patience has carried us through all the inconveniencies and hardship of it, yet not without very great and very sharp sufferings to numbers of the poorer sort; the consideration of which is a most fit contemplation for my sad thoughts,

whose sufferings of another nature will have a like period; and, by faith and trust in God, a happy one. when I shall for ever (as is my hope my loved lord is now) be enabled to perform the everlasting race of obedience, which here, by reason of those strong impressions things in this life of sense make upon us, is much weakened. But I am much encouraged by your allowing that I have a just sense of sorrow, and that you saw not my mourning so much to be condemned as you apprehended they were; it excites me better to struggle for my duty, than, when doing all I can, to think I do so ill, that I may have reason to be amazed, and fear a punishment in both states: but my merciful Father truly knows the sharpness of my sorrows, and the weakness of my person, not fitted to stand out against such storms; but with his help we can do all things. As to the two points your letter, Doctor, insists upon, I will first say for myself. I am very confident I shall ever so take either the reproof, caution, or advice of a friend in such a manner, as I shall never lose a friend for acting the part of one to me, who shall make at least this advantage by finding such, that I shall be subject to the fewer deliberate follies; by sudden acts, I expect to be guilty of many, left to the trouble and distraction of choice alone as I must now be. Therefore, good Doctor, let me engage you to continue the same way of proceeding, though I may not always comply with what you offer to me, yet that may be the best for me, if I could discern it so. Now for the first particular concerning a chaplain, I shall not be untractable. I told you I could not live under my distresses without one: for the delay I touched upon, the distance of time now before I shall be settled, so as to require the use of one, will much take off my former objections; and

as to the definition of a prudent person, you and I shall reconcile it to the same thing. I approve with you the church of England the best church, the best offices and services in it, upon the face of the earth, that we know of; but, Sir, I shall covet one so moderate as not to be impatient and passionate against all such as cannot think so too; but of such a temper as to be able to converse peaceably with such as may have freedom in my family, though not of it, without giving offence, and I take it the best way of gaining good people to our opinions.

"As to your kind offer of assistance, whenever cause for it, I shall ever use a freedom with you, Sir; but, as a fit return, remember an old proverb, not to spur a free horse too fast. Sir, your circumstances, and my heavy ones, may most likely render that unfit; but I shall not in appearance be soon in want, seeing my removes next summer will probably be very short. For, having an eye upon any particular person, I must approve, and thank you for your kindness in it; but if you have, let it be so; the person may not know it, for this reason; several that had opportunities of seeing me often in my first extremities, urged my doing what you have since done; and to them I answered as I have to you."

RUSSELL, ALEXANDER, an eminent physician, who was a native of Edinburgh, in which city he received his education, and having taken his degree of M.D., he came to London, but afterwards sailed to Aleppo, where he was appointed physician to the English factory there. While there he employed all his leisure in the collection of information relative to the natural productions of that part of the world. The result of these inquiries appeared in 1756, in a work entitled "The Natural History of Aleppo and the Parts Adjacent." Three years after Dr. Russell returned to England, and was appointed one of the physicians to St. Thomas's hospital, which office he held till his death, which took place in 1770.

RUSSELL, WILLIAM, a bachelor of music, who was born in London in the year 1777. At the age of eight he was placed under the tuition of Cope, organist of the church of St. Saviour, Southwark, but his father being partial to cathedral music, engaged also Shrubsole, the organist of Spa Fields chapel, who had formerly been in the cathedral of Canterbury, and the organist at Bangor, to instruct his son in cathedral service. An ardent desire to attain eminence in his profession first led Russell to examine the writings of Haydn and Mozart; and it was, perhaps, in a great measure, from an attentive study of their scores, that he might date his great knowledge and excellence in the art, both as a performer and composer. In the year 1789 his father appointed him his deputy, as organist of St. Mary's, Aldermanbury, and he continued to officiate there till the autumn of 1793, when he was appointed organist of Queen Street chapel, in Lincoln's Inn Fields. At the time that he was engaged in this chapel, a cathedral service was performed there by a small but very respectable choir. Russell continued in this engagement till the middle of 1798. He then returned, for about three months, to St. Mary's, Aldermanbury, till September of the same year, when he was elected organist of St. Ann's, Limehouse. In 1801 he was unanimously elected organist of the Foundling chapel. In the year 1798 he had been a candidate with six others for this situation, at the resignation of Grenville; but, owing to the powerful interest that had been made for the per-

son who succeeded, his wishes were at that time frustrated. With respect to his theatrical engagements, Russell's *entre* was as piano-forte player and composer at Sadler's Wells in the year 1800. He continued to hold these situations for four seasons, till a change of proprietors took place, and Reeve purchased an eighth in the concern, after which his services, of course, were no longer wanted. In 1801 the managers of Covent Garden theatre engaged him to preside at the piano-forte there, for the express purpose, as they stated to him, of accompanying Messrs. Billington, Storace, and Braham. Russell's theatrical compositions are numerous, but consist chiefly of dramatic spectacles and pantomimes. They amount, in the whole, to about twenty, and were principally written for Covent Garden, Sadler's Wells, and the Circus. He composed also two oratorios, "The Redemption of Israel," and "Job," and four odes, one on music, another to the genius of Handel, a third on St. Cecilia's day, and a fourth to harmony, besides several voluntaries, glees, and single songs. As a composer, Russell had great excellence, and as a performer on the piano-forte and organ, he had few equals. He died in the year 1813, aged thirty-six.

RUSSELL, WILLIAM, an historical writer of eminence, who was born in Mid-Lothian in 1746, and having received his education, he was apprenticed to a bookseller and printer. After he had completed his time he published "A Collection of Modern Poems." He then removed to London and commenced business as a printer, and also as a writer for the press. He was the author of "A History of America, from its Discovery by Columbus, to the Conclusion of the Late War," a "History of Modern Europe, with an Account of the Decline and Fall of the Roman Empire," and several other works of a similar description. He obtained the diploma of LL. D. from a Scottish university, after which he commenced "A History of Ancient Europe," but died suddenly in 1793.

RUTLEDGE, EDWARD, an American leader who was one of the signers of the declaration of independence. He was born of a respectable family at Charleston, South Carolina, in November 1749. After a proper education, he was placed in the office of his elder brother, to prepare himself for the practice of the law. In 1769 he was sent to England to complete his legal studies, where he was entered at the Temple. On his return home in 1773, Mr. Rutledge commenced the practice of his profession, and was rising to eminence as a lawyer, when he was elected to a seat in the first continental congress assembled at Philadelphia in 1774. His having been chosen at his age to so dignified a post, shows the high esteem with which he was thus early regarded by his countrymen. Owing to the strict secrecy which was preserved concerning the transactions of the congress at that time, nothing is known of his course in this new situation. He continued a member till 1777, and took an active part in the debates preceding the declaration of independence. When that decisive measure was adopted, and the political horizon of the United States had become darkened by the misfortune of Long Island, with other embarrassing circumstances, the British renewed their negotiations for a reconciliation. Dr. Franklin, John Adams, and Mr. Rutledge, were deputed by congress to confer with Lord Howe on the subject. This conference accordingly took place, but resulted in nothing of importance.

to either party. Mr. Rutledge used afterwards to relate an anecdote of Dr. Franklin to this effect: When the commissioners took leave of Lord Howe, his lordship had them conveyed to New York in his own barge. As they approached the wharf, the doctor began to jingle some gold and silver coin in his pocket. Upon their arrival at the wharf, he offered a handful of the money to the sailors who had rowed the boat; but the commanding officer not permitting them to receive it, he replaced it in his pocket, and afterwards explained this conduct to his associates by saying, "As these people are under the impression that we have not a farthing of hard money in the country, I thought I would convince them of their mistake."

In 1779 Mr. Rutledge was again appointed to congress, but indisposition obliged him to return home before he had taken his seat. His native state had now become the theatre of war, the scantiness of its population offering a comparatively easy conquest to the British arms. Mr. Rutledge commanded a company in a battalion of artillery, and was engaged in dislodging a party of regular troops from Port Royal island, and notwithstanding their superior discipline and their advantages of position, the troops were compelled to retreat. Whilst Charleston was closely beleaguered, Mr. Rutledge endeavoured to elude the vigilance of the British, in order to accelerate the advance of troops to its relief. In this attempt he was taken prisoner and sent to St. Augustine, where he remained near twelve months before he was exchanged. He afterwards resided some time in the vicinity of Philadelphia, but, as soon as possible, proceeded to the south, and, on the re-establishment of civil government in Carolina, after the successes of the Americans there, in 1782, was one of the representatives who were convened at the village of Jacksonborough. Though he assented, as a member of this assembly, to the adoption of a bill of pains and penalties, he was inclined to excuse such as were compelled, by unavoidable circumstances, to keep aloof from the standard of freedom. This intemperate convention adjourned a little previous to the evacuation of Charleston by the British, in December 1782, when Mr. Rutledge returned home, and soon after resumed the practice of his profession. He was a conspicuous member of the state legislature, in which body he was opposed to any further increase of African slavery in the Southern States, and, afterwards, an unwearied advocate of the federal constitution. Mr. Rutledge was subsequently elected colonel of an artillery regiment, and supplied the place of General Pinkney in the senate, upon that gentleman's leaving his seat. He quitted the profession of the law in the year 1798, when he was elected governor of the state; but lived to complete only half the term. His weak constitution had become considerably broken by hereditary gout, which did not, however, make him relax in the execution of his official duties. While attending a session of the legislature at Columbia, his sickness increased so much as to render him desirous of returning to Charleston; but, in compliance with the requisitions of the state constitution, he remained at the seat of government until the legislature had adjourned, and, while on his return home, encountered heavy rains and cold. Soon after his arrival at Charleston, he was confined to his bed, and expired on the 23rd of January, 1800.

RUTHERFORD, DANIEL, was born in Edinburgh on the 3rd of November, 1749, and after receiving the rudiments of his education, he went to the university of Edinburgh for further improvement. After finishing a regular course under the professors of that foundation he entered upon his medical studies. He attended the lectures on chemistry, first as given by Dr. Cullen, and afterwards by Dr. Black, who succeeded Dr. Cullen as professor of chemistry in the year 1766. He was a pupil at the botanical lectures of Dr. Hope, and at those on the *materiæ medicæ* by Dr. Home. He attended the lectures, not only on the theory, but also on the practice of medicine, as delivered both by Dr. Cullen and by Dr. John Gregory; for at that time the professorships of the theory and practice of physic were conjoined, and these branches of medical science were taught in alternate years by the conjunct professors; a mode of teaching which was attended with many great advantages. By means such as these, the attentive student had not only an opportunity of hearing the sentiments of different eminent teachers, on those subjects most immediately connected with the successful cure of diseases, but of hearing the philosophy of the human body, and the principles upon which its diseases are to be removed, illustrated, and explained by two different professors, in one connected chain of reasoning. But if Dr. Rutherford enjoyed peculiar advantages from the plan on which the lectures on the theory and practice of medicine were then conducted, he was no less fortunate in the study of his profession at Edinburgh, from having an opportunity of witnessing actual practice, directed by eminent men, in an extensive and well-regulated hospital. From the commencement of his medical studies at Edinburgh, he became a pupil at the royal infirmary. There he had an opportunity of following several surgeons of great eminence, particularly Messrs. Alexander Wood, William Chalmers, and James Rae, men deservedly eminent in their profession, and who, as successful operators, have certainly not been since excelled in Edinburgh. He followed also, with great industry, the career of the ordinary physicians of the infirmary, which was at that time under the charge of Drs. Clerk, Drummond, Hope, and Stedman, all of whom were just and universally esteemed judicious practitioners and learned men. But as an observer of actual practice he paid particular attention to the clinical wards of the infirmary, where that practice was then conducted, and the lectures delivered by Drs. Cullen and John Gregory, at the time conjunct clinical lecturers, as well as the conjunct professors of the theory and practice.

Dr. Rutherford's attendance on medical lectures at Edinburgh was concluded by his obtaining the degree of doctor of medicine from the university. That event took place at the public graduation in 1772; when, after finishing all the stated trials, with great approbation, he was, with fourteen others, promoted to the highest academical honours in medicine. His inaugural dissertation, which, according to the stated rules of the university, must be published, did him great honour, both at home and abroad. He had also a strong predilection for chemistry, and he selected a chemical subject. The subject of this dissertation was *De aëre fixo*. It was subjected to the examination of the then eminent professor of chemistry, Dr. Black, who, in the public hall, and in the

presence of the assembled university, bestowed upon it very high encomiums. It is indeed true that, of late years, very great, unexpected, and important discoveries, have taken place in chemical philosophy. We cannot, therefore, expect to find in Dr. Rutherford's dissertation on fixed air the name given by Hales, Black, Priestley, and every other eminent philosopher, to what is now called carbonic acid gas, all that is at present known respecting that singular combination of carbon and oxygen. His dissertation, however, contained many important observations respecting that fluid. But it was still more distinguished by another particular; it evidently demonstrated that Dr. Rutherford had discovered a new gaseous fluid, respecting which much has, of late, been said by the most eminent modern philosophers, and which some of them have distinguished by the name of *azote*, and others of *nitrogen*. From these circumstances it is not wonderful that Dr. Rutherford's inaugural dissertation obtained great approbation from the most eminent chemists, not only in Edinburgh, but also in London and Paris.

After completing his academical course at Edinburgh, Dr. Rutherford prosecuted his studies for some time at other distinguished seminaries for medical education. He went first to London, afterwards to France, and then to Italy. In these countries he contemplated and cultivated with attention, not foreign amusements or luxuries, but the philosophy and medicine of enlightened men and enlightened nations. After passing about three years abroad he returned to Great Britain, and immediately entered upon the practice of medicine in the city of Edinburgh. He first became a licentiate of the royal college of physicians there, in the year 1776; and after the lapse of one year, the term of noviciate required by the laws of the college, to give a fair opportunity for estimating character, he was by that learned body unanimously raised to the rank of a fellow, on the 6th of May, 1777.

From his father's celebrity, as well as his own character, his practice was soon as extensive as could reasonably be expected by a young man. But medical practice by no means occupied his whole time or attention. Soon after settling in Edinburgh he was elected a member of the philosophical society, as it was then denominated, but which has been since incorporated by a charter from the crown, under the name of the royal society of Edinburgh.

In the philosophical society, which was then presided over by the venerable Lord Kaimes, and which consisted of but a small select number, it was the practice for each of the members to furnish papers in rotation. When it came to Dr. Rutherford's turn, probably from his predilection for chemistry, he presented a dissertation on a saline body, which had at that time obtained particular notice—nitre, as it was then denominated, or, as it was afterwards styled, nitrate of potass. The experiments of Dr. Priestley had pointed out this saline body to philosophers, as furnishing a large portion of what, at that time, was termed vital air, from its being thought essential to the support of life, but which is now denominated oxygene gas, from its containing, in a gaseous form, what is, perhaps, an essential constituent of every acid. In that paper, which was read before the philosophical society of Edinburgh, in the winter of 1778, long prior to any proper account of the discoveries of the illustrious Lavoisier having reached the country, Dr.

Rutherford at least suggested to his fellow-members what the great French philosopher afterwards demonstrated.

After Dr. Rutherford had continued to practice medicine, and to cultivate philosophy, in Edinburgh for about ten years, he was on the 1st of December, 1786, on the death of Dr. John Hope, admitted into the university, as professor of botany, by commissioners both from the crown and from the town-council. He was at the same time appointed king's botanist for Scotland; and, in consequence of that appointment, was entrusted with the charge of the royal botanical garden at Edinburgh.

By his commission from the town-council he was nominated, as his predecessor had been, a member of the faculty of medicine in the university. By that nomination he became connected with the royal infirmary, as one of the clinical physicians; and, besides his botanical lectures, he took regularly a share in the lectures on the cases of patients in the clinical wards, selected from the whole that are admitted into the hospital, as being most instructive to the attentive observer. A few years after Dr. Rutherford's admission into the university, he became still more intimately connected with the royal infirmary; for, on the death of Dr. Henry Cullen, in 1791, he was elected one of the physicians in ordinary to that extensive establishment. To these important offices, a large portion of his time was necessarily dedicated. It is not, therefore, wonderful that at this period he was under the necessity of, in some degree, deserting his favourite study, chemical philosophy. But a regular and due attention to every duty, both public and private, did not prevent him from continuing to be an active member and regular attendant, not only on the royal society and on the royal college of physicians, but also on societies of a more private nature, which have been accompanied with the most happy effects at Edinburgh, both in promoting social intercourse among medical practitioners, and in improving their knowledge of the profession.

Soon after Dr. Rutherford's admission into the university of Edinburgh, a change took place in his domestic life. On the 13th of December, 1786, he was married to Miss Harriet Mitchelson, youngest daughter of John Mitchelson, Esq., of Middleton. By that marriage he had several children.

Dr. Rutherford, during the course of a long life, enjoyed tolerable, but by no means uninterrupted good health. For as early as the tenth year of his age, when it is not reasonable to suppose that luxurious living could have any influence in inducing disease, he was attacked with distinctly marked symptoms of gout, a disease which he probably derived from inheritance, for both his father and grandfather had been subject to it at very early periods of life. Although he had but little reason to complain of other diseases, yet this can never be said to have left him, and he afterwards suffered from it severely. With the view of combating this distressing complaint, he gave a fair trial, for the space of about two years, to the most abstemious diet, and to a total abstinence from every species of drink stronger than pure water. But during that period his gout became more severe than it had ever been before. And, as he found that this mode of living impaired his strength, both of mind and body, he prudently deserted it, deriving his principal

relief from patience, flannel, and the attention of friends.

He thought, however, that he in general passed the winter more easily when he could conveniently dedicate a few weeks in the autumn to relaxation from business and to the warm baths at Buxton. But, notwithstanding this, the gout still continued frequently to visit, and in all probability at last proved fatal to him; for he died suddenly, on the 15th November, 1819, in the seventy-first year of his age.

**RUTTY, JOHN**, a medical practitioner and writer, who was born in 1698, and educated partly at Dublin and partly in London. He then went to Holland, where he took his doctor's degree, and then settled in Dublin. He was the author of several works which display considerable ability and much eccentricity of character. The principal of them are his "History of the Quakers," "An Essay on Women Preaching," "A Synopsis of Mineral Waters," and "An Essay towards a Natural History of the Vicinity of Dublin." His death took place in 1775.

**RUYSCH, RACHEL**, one of the most celebrated painters of fruit and flowers. She was born at Amsterdam in 1664, and died in 1750. Her pictures are distinguished for truth and splendour of colouring, united with great finish.

**RUYSDAEL, or RUYSDAAL, JAMES**, a celebrated landscape painter, who was born in 1635 at Harlem. His brother Solomon, who was born in 1616, and known for the beauty of his representation of marbles, &c., seems to have been his teacher. James Ruysdael died in his native city in 1681. His aim appears to have been a faithful but poetical conception of gloomy, and sometimes wild nature. Landscapes with dark clouds hanging over them, churchyards, or thick woods after a thunder-storm, cascades between thick foliage, lakes and rivulets surrounded by overhanging trees, &c., are his subjects, and are represented admirably. The figures in his paintings were executed by others.

**RUYTER, MICHAEL FITZ ADRIAN**, a celebrated Dutch admiral, who was born at Flushing in 1607. He entered young into the naval service of his country, and rose from the situation of cabin-boy to that of captain in 1635. He was sent in 1641 to the assistance of the Portuguese, who had thrown off the yoke of Spain, on which occasion he was appointed rear-admiral, and two years after he was employed against the Barbary corsairs. In the war between the Dutch and English, which commenced in 1652, Ruyter repeatedly distinguished himself, especially in the terrible battle fought in February 1653, near the mouth of the channel, when Blake commanded the English, and Tromp and Ruyter the Dutch. He afterwards served against the Portuguese, the Swedes, and the Algerines, previously to the naval warfare between England and Holland in the reign of Charles II. He commanded in the great battle fought in the Downs in June 1666, against Prince Rupert and the duke of Alhmarle; and in the following year he insulted the English by his memorable expedition up the Thames, when he destroyed Upnor castle, and burned some ships at Chatham. He was admiral of the Dutch fleet at the battle of Solebay in 1672, and signalized his skill and courage on several other occasions. He died in the port of Syracuse on the 29th of April, 1676, in consequence of a wound received in an en-

gagement with the French, a few days before, off Messina. His body was carried to Amsterdam, where the states-general erected a monument to his memory.

**RYAN, LACY**.—This gentleman, though generally considered a native of Ireland, was born in the parish of St Margaret, Westminster, about 1694. He was the son of Daniel Ryan, a tailor, and was educated at St. Paul's school. He had some thoughts of going to the East Indies with his brother, but a stronger propensity for the stage prevailing, by the friendship of Sir Richard Steele, he was introduced into the Haymarket company in 1710, and played with considerable success in the part of Marcus in "Cato," during the first run of that play in 1712, though then but eighteen years of age. From that time he rose in his profession, and constantly sustained important parts, both in tragedy and comedy. In his person he was well made; his judgment was critical and correct, his understanding accurately just, and his emphasis was perfect even to a musical exactness.

The friendship subsisting between Ryan and his great theatrical contemporary, Quin, is well known to have been inviolable, and reflects honour to them both. That valuable and justly admired veteran of the English stage, even when he had quitted it on his own account, yet for some years afterwards made an annual appearance in his favourite character of Sir John Falstaff, for the benefit of Mr. Ryan; and when, at last, he prudently declined hazarding any longer that reputation which he had so nobly purchased, by venturing into the field under the disadvantages of age and infirmity, yet even then, in the service of that friend, he continued to exert himself; and when his person could no longer avail him, he, to speak in Falstaff's language, "used his credit; yea, and so used it,"—that he has been known, by his interest, to have sold in the rooms of Bath, among persons who could very few of them be present at the play, as many tickets for Mr. Ryan's benefit as have amounted to one hundred guineas. Mr. Ryan is known to have been a great walker; and when he meditated a sally of unusual length, as often as he could he would prevail on the late Mr. Gibbon of Covent Garden theatre, to be his companion. But much exercise not suiting the habits of this gentleman, he was rarely to be tempted farther than the outskirts of London. Mr. Ryan, at length, in the sixty-eighth year of life, fifty years of which he spent in the service and entertainment of the public, paid the great debt of nature at Bath, to which place he had retired for his health, the 15th of August, 1760.

**RYER, PETER DU**, a French writer, who was born at Paris in 1605, and, being liberally educated, made great progress in literature. He was made secretary to the king in 1626; but marrying early, was obliged to sell his place in 1633. He subsequently became secretary to the duke of Vendome. His writings gained him a place in the French academy in 1646, and he was afterwards made historiographer of France with a pension. He is the author of nineteen dramas, and thirteen translations, which, says Voltaire, "were all well received in his time; yet necessity, as may easily be imagined, would not permit him to give that perfection to his works as was requisite to make their merit lasting. He died in 1658."

**RYMER, THOMAS**, was born in the north of

England, and educated at the grammar school of Northallerton, after which he was admitted a scholar at Cambridge. On quitting the university he became a member of Gray's Inn, and in 1662 succeeded Mr. Shadwell as historiographer to King William III. His valuable collection of "The Fœdera," continued from his death by Mr. Sanderson, extends to twenty volumes; and was abridged by M. Rapin in French, in Le Clerc's "Bibliothèque." Mr. Rymer was also the author of "A View of the Tragedies of the Last Age," which occasioned those admirable remarks preserved in the preface to Colman's edition of "Beaumont and Fletcher," and since by Dr. Johnson in his "Life of Dryden." The strong language which he employed in his "View of the Tragedies of the Last Age," against the inimitable Shakspeare, are scarcely to be forgiven, and must surely be considered as a kind of sacrilege committed on the *Sanctum Sanctorum* of the Muses. He wrote "Edgar, a Tragedy," in 1678, and he was a very excellent antiquary and historian. Some of his works relating to our constitution are remarkably good, and his well-known work, "The Fœdera" will stand an everlasting monument of his worth, his indefatigable assiduity, and clearness of judgment as an historical compiler. This work has been since published with considerable additions by the committee of public records. He died in 1713.

SAAVEDRA, FAXARDO DIEGO DE, a learned Spanish writer, who was born at Algezares in May 1584, and educated at Salamanca. In 1606 he went to Rome as secretary to the cardinal Gaspar de Borja, who was appointed Spanish ambassador to the pope, and assisted in the conclaves held for the election of the popes Gregory XV. and Urban VIII. For these services Saavedra was rewarded with a canonry in the church of St. James, although he had never taken orders. Some time after he was appointed agent from the court of Spain at Rome. In 1636 he assisted at the electoral congress held there, in which Ferdinand III. was chosen king of the Romans. After being employed in many other diplomatic affairs of importance, he returned to Madrid in 1646, and was appointed master of ceremonies in the introduction of ambassadors; but he did not enjoy this honour long, as he died in 1648. In his public character he rendered the state very important services, and, as a writer, is ranked among those who have contributed to polish and enrich the Spanish language. The Spanish critics, who place him among their classics, say he wrote Spanish as Tacitus wrote Latin. He has long been known, even in this country, by his "Emblems." These were first printed in 1640 under the title of "Idea de un Principe Politico Christiano Representada en cien Empresas," and reprinted at Milan in 1642; they were afterwards translated into Latin, and published under the title of "Symbola Christiano-Politica." He wrote also "Corona Gotica, Castellana, y Austriaca Politicamente Illustrada," and "Respublica Literaria."

SABATIER, ANTOINE, a learned French writer, who was born in 1741. Having completed his studies, he assumed the clerical tonsure, and the title of abbé; but at the same time he devoted himself to literature. He was at first connected with the philosophical party of the French literati, whose society, however, he left, and afterwards displayed his enmity to them on every possible occasion. His most celebrated work is entitled, "Les Trois Siecles de la Litterature Francais, ou Tableau de l'Esprit de

nos Ecrivains depuis Francois I. Jusqu'en 1772." This work procured him many enemies, but brought him into notice. M. Sabatier now assumed the character of an ardent defender of religion and morality. He left France during the revolution, and did not return till after the restoration of the Bourbons, and died in one of the hospitals of the Charitable Sisters at Paris, on the 15th of June, 1817. His works are very numerous: one of the principal, besides that already mentioned, was entitled "Les Siecles Païens, ou Dictionnaire Mythologique, Heroique, Politique, Litteraire et Geographique de l'Antiquite Païenne."

SABATIER, PETER, a learned French writer who was born at Poitiers in 1682, and died at Rheims in March 1742. He spent twenty years of his life in preparing for the press a valuable edition of all the Latin versions of the Scriptures, collected together, and united in one point of view. It consists of three volumes folio; but he lived only to print one volume; the others were completed by La Rue. The title is "Bibliorum Sacrorum Latinæ Versiones Antiquæ seu Vetus Italica, et Ceteræ quæcunque in Codicibus MSS. et Antiquorum Libris reperiri potuerunt."

SABATIER, RAPHAEL BIENVENU, an eminent French surgeon who was born at Paris in October 1732, and after studying there acquired the first rank in his profession. He became censor-royal of the academy of sciences, professor and demonstrator of the surgical schools, secretary of correspondence, surgeon-major of the hospital of invalids, and a member of the institute. His education had been more liberal and comprehensive than usual. He not only was an excellent Greek and Latin scholar, but was well acquainted with the English, Italian, and German languages. In his latter days Bonaparte appointed him one of his consulting surgeons, and he was one of the first on whom he bestowed the cross of the legion of honour. Sabatier died at Paris in July 1811. He retained his faculties to the last, but we are told became ashamed of his bodily weakness. "Hide me," he said to his wife and son, "from the world, that you may be the only witnesses of this decay to which I must submit." A little before his death he said to his son, "Contemplate the state into which I am fallen, and learn to die." His works are, "Theses Anatomico-chirurgicæ," "De Variis Cataractam extrahendi Modis;" An edition of Verdier's "Abregé d'Anatomie;" an edition of La Motte's "Traité Complet de Chirurgie," which was followed by his own, "Traité Complet d'Anatomie," 1775, of this a third edition, with many improvements, appeared in 1791; "De la Medicine Expectative," "De la Medicine Operatoire, ou Des Operations de Chirurgie qui se pratiquent le plus frequemment."

SABBATHIER, FRANCIS, a learned French writer who was born at Condom in 1735, and after studying among the fathers of the oratory in that city, went to Orleans, where he was employed as a private tutor. In 1762 he was invited to the college of Chalons-sur-Marne, where he taught the third and fourth classes for sixteen years, which gave him a title to the pension of an *emeritus*. His literary reputation took its rise principally from his essay on the temporal power of the popes, which gained the prize of the academy of Prussia. He was then about twenty-eight years old; but had before this addressed a curious paper on the limits of the empire of Charlemagne to the academy of belles lettres at Paris. He was the principal means of founding the academy of

Chalons, procured a charter for it, and acted as secretary for thirty years. Such was his reputation that he had the honour to correspond with some of the royal personages of Europe, and in particular with the kings of Prussia and Sweden; nor was he less in favour with Choiseul, the French minister, who encouraged his taste for study. It does not appear, however, that his wealth increased with his reputation, and this occasioned his projecting a paper-manufactory in Holland, which ended like some of the schemes of ingenious men; Sabbathier was ruined and his successors made a fortune. He died in a village near Chalons, in March 1807, in his seventy-second year. He published "*Essai Historique-critique sur l'Origine de la Puissance Temporelle des Papes*;" "*Le Manuel des Enfants*," a collection of maxims from Plutarch's Lives; "*Recueil de Dissertations sur Divers Sujets de l'Histoire de France*;" "*Les Mœurs, Coutumes et Usages des Anciens Peuples, pour Servir à l'Education de la jeunesse*;" "*Dictionnaire Pour l'Intelligence des Auteurs Classiques Grecs et Latins, tant Sacrés que Profanes, contenant la Géographie, l'Histoire, la Fable, et les Antiquités*."

SABBATINI, ANDREA, a Neapolitan artist who is supposed to have been born about 1480. He was so pleased with the style of Pietro Perugino, who had painted an Assumption of the Virgin in the dome of Naples, that he set out for Perugia to become his pupil; but hearing the works of Raphael in the Vatican spoken highly of, he altered his mind, went to Rome, and entered that master's school. His stay there was short, for the death of his father compelled him to return home again in 1513. It is said that he painted with Raphael at the Palace and in the Vatican, and that he copied his pictures well: he certainly emulated his manner with success. Compared with his fellow-scholars, if he falls short of Julio, he soars above Raphael del Colle. He had correctness in his attitude and features, depth of shade, perhaps too much sharpness in the marking of the muscles, a broad style of folding in his draperies, and a colour which even now maintains its freshness. Of his numerous works at Naples, the altar-pieces at St. Maria delle Grazie is considered the best. This distinguished artist died in 1545.

SACCHINI, ANTONIO MARIA GASPARO.—This celebrated Italian composer was born at Naples in 1735. In early youth he studied, during several years, under Durante, at the conservatory of St. Onofrio, at Naples, where Piccini, Traetta, and Guglielmi, were his fellow-students. He there prosecuted his studies on the violin with particular care; and the dexterity which he acquired on this instrument gave him that facility of throwing a certain elegance, and *éclat* in his accompaniments which was afterwards so conspicuous in his compositions. After quitting this school he was not long in making himself known by his works, the celebrity of which procured him, in 1762, an engagement as composer to the principal theatre at Rome, where he resided seven or eight years; making, however, occasional excursions to the principal towns of Italy for the purpose of bringing out his works. The Italian connoisseurs seemed now to agree, that if Piccini had the advantage of Sacchini in the buffo style, the latter certainly excelled in the serious opera. In 1769 he was chosen successor to Galuppi, in the direction of the conservatory of L'Ospedaletto at Venice. This institution was entirely for females, and the girls, who were severely

disciplined in regard to morals, generally remained there till they married. It was an object of curiosity to strangers who attended their concerts, not only to hear all kinds of female voices, but also all sorts of instruments played by females, without the exception even of the double bass, horn, or bassoon. During the time that Sacchini was director of this institution, he formed a great number of good singers in it; among whom may be distinguished Gabrielli, Canti, and Pasquali. In October 1767 the King's theatre in London was opened with a new serious opera, by different composers, called "*Tigrane*," in which an admirable cantabile air, "*Care Luci*," composed by Sacchini, was sung in an exquisite manner by Guarducci. This air was the first of Sacchini's compositions ever performed on our stage. Five years after this, namely, in 1772, Sacchini himself arrived in England. In this country he not only supported the high reputation he had acquired on the continent, but vanquished the natural enemies of his talents in England. His operas of "*The Cid*" and "*Tamerlano*," were equal, if not superior, to most of the musical dramas performed in any part of Europe—indeed each of these dramas was so entire, so masterly, and yet so new and natural, that there was nothing left for criticism to censure, though innumerable beauties to point out and admire. It is evident that this composer had a taste so exquisite and so totally free from pedantry, that he was frequently new without effort; never thinking of himself or his fame for any particular excellence, but totally occupied with the ideas of the poet, and the propriety, consistency, and effect of the whole drama. His accompaniments, though always rich and ingenious, never call off attention from the voice, but the principal melody is invariably rendered distinguishable through all the contrivance of imitative and picturesque design in the instruments. His dramatic works, in the year 1778, amounted to seventy-eight in number; and by the many masses and motets which he composed while he remained at Venice, in the character of Maestro dell'Ospedaletto to Conservatorio, he manifested himself to be able to write for the church as well as for the stage.

He remained too long in England for his fame and fortune. The first was injured by cabals, and by what ought to have increased it, the number of his works; and the second by inactivity and want of economy. "Upon a difference with Rauzzini," says Dr. Burney, "this singer, from a friend became his foe: declaring himself to be the author of the principal songs in all the late operas to which Sacchini had set his name, and threatened to make affidavit of it before a magistrate." The utmost of this accusation that can be looked upon as true, may have been, that during Sacchini's severe fit of the gout, when he was called upon for his operas before they were ready, he employed Rauzzini, as he and others had done Anfossi in Italy, to fill up the parts, set some of the recitatives, and perhaps compose a few of the airs for the under singers. In the summer of 1781 Sacchini went to Paris. After increasing his reputation there by new productions, he returned in the following year to London, where he only augmented his debts and embarrassments; so that in 1784 he took a final leave of this country, and settled at Paris, where he not only obtained a pension from the queen of France, but the theatrical pension, in consequence of three successful pieces. The last of Sacchini's works was the opera of "*Evelina*," founded on an interesting

event in the history of the ancient princes of Wales. This graceful and elegant composer died, however, before it could be performed, at Paris in 1786. He was honoured with a public funeral, and with every mark of respect and distinction which sensibility and gratitude could bestow on a person who had contributed so largely to the public pleasures.

SACHEVERELL, HENRY, D.D., an English divine of the establishment, who was exalted into temporary importance by the spirit of party politics. In 1705 he was appointed preacher of St. Saviour's, Southwark, and while in this station he preached his two sermons, the object of which was to rouse apprehensions for the safety of the church, and to excite hostility against the dissenters. Being impeached in the house of commons, he was brought to trial in February 1710, and sentenced to be suspended from preaching for three years. This prosecution, however, excited such a spirit in the high church party, that it ultimately overthrew the ministry, and established the fortune, of Dr. Sacheverell, who, during his suspension, made a sort of triumphal progress through the kingdom. The same month that his suspension terminated, he was appointed to the valuable rectory of St. Andrew, Holborn, by Queen Anne; and such was his reputation, that the copy-right of the first sermon which he afterwards was allowed to preach sold for 100*l*. He had also sufficient interest with the new ministry to provide handsomely for a brother. Little was heard of him after this party ebullition subsided, except by his numerous squabbles with his parishioners. His abilities, even according to writers on his own side, were contemptible; and, if we may credit Dr. Swift, he was despised by the ministry whom his notoriety so much contributed to support. He died in 1724.

SACHS, HANS, the most distinguished master-singer of Germany in the sixteenth century. He was born at Nuremberg in 1494, and was by trade a shoemaker. He followed his business and made verses with equal assiduity. He became a protestant, and died on the 19th of January, 1576. His complete works appeared in 1570, in five folio volumes, in Nuremberg; also in 1588; and at Kempton, in five quarto volumes. Busching published a selection of them in 1828. He possessed a fruitful genius, and, notwithstanding the rudeness of his language, his poems are distinguished for *naïveté*, feeling, invention, wit, and striking description.

SACKVILLE, THOMAS, Lord Buckhurst and earl of Dorset, an accomplished statesman and poet, who was the son of Sir Richard Sackville, of Buckhurst, in the parish of Witham, in Sussex, where he was born about 1527. He was first a member of the university of Oxford, but removed to Cambridge, and afterwards became a student of the Inner Temple. At both universities he was distinguished for his performances in Latin and English poetry, and in the Temple he wrote his tragedy of "Gorboduc." Of a poem intended to comprehend a view of the illustrious but unfortunate characters in English history, entitled "The Mirror of Magistrates," he finished only a poetical preface, and one legend on the life of the duke of Buckingham. He was member in the two first parliaments of Elizabeth, after which he travelled. On the death of his father, in 1566, he succeeded to a large inheritance, and was soon after raised to the peerage by the title of Baron Buckhurst. He was then imprisoned owing to the influence of

the favourite, Leicester, in consequence of a report in disfavour of the latter, when sent on an embassy of inquiry into his conduct in Holland. In 1598 he was joined with Burleigh in negotiations for peace with Spain, and signed the treaty which followed with the states-general. On the death of that minister he succeeded him as lord high treasurer. In this situation he was instrumental in discovering the dangerous projects of the earl of Essex, at whose trial he presided as high steward, in which office he conducted himself with great prudence and humanity. On the accession of James I. his post of treasurer was confirmed to him, and in 1604 he was created earl of Dorset. He died suddenly at the council table in April 1608, at an advanced age. This statesman ranks among the most prudent and able of the ministers of Elizabeth, and was a good speaker, and a still better writer. As a poet he was the first who approached to perfection in the English heroic stanza, and gave the first example of a regular tragedy in blank verse. His tragedy of "Gorboduc," or, as entitled when printed in 1671, "The Tragedie of Ferrex and Porrex," is a sanguinary story from early British history, composed with little pathos or attention to dramatic rules, but with considerable force of poetical conception and moral sentiment.

SACKVILLE, CHARLES, sixth earl of Dorset and Middlesex, was born on the 24th of January, 1637. He received his education under a private tutor, and, after making the tour of Italy, was chosen member of the first parliament which assembled after the restoration. He ranked high as a speaker, but declined all public employment, being wholly engrossed with gallantry and pleasure. He, however, served as a volunteer in the first Dutch war in 1665, and, the night before the engagement, composed his celebrated song of "To all you ladies now at land," which is esteemed one of the happiest of his productions. He succeeded to the estate of his uncle, James Cranfield, earl of Middlesex, in 1674, and, in 1675, to his title by creation. In 1677, on the death of his father, he also succeeded him in his estate and the title of Dorset. He utterly disliked and discountenanced the violent measures of James II., and early engaged for the prince of Orange, who made him lord chamberlain of the household. In 1698, on the decline of his health, he retired from public affairs, and died on the 19th of January, 1705, leaving a son and daughter, the first of whom was created duke of Dorset in 1720. Lord Dorset wrote several small poems, which are included in Chalmers' collection, but they are not numerous enough to make a volume of themselves. He was still more celebrated as a patron of poets and of men of wit, who, in their turn, have been very copious in their panegyric; and Prior, Dryden, Congreve, and Addison, all bear testimony to his merit. He was a very able critic, and Butler owed it to him that the court relished his "Hudibras."

SACKVILLE, GEORGE, VISCOUNT SACKVILLE, was the third son of the first duke of Dorset, and was born in 1716. He was educated at Trinity college, Dublin, served with reputation at the battles of Fontenoy and Dettingen, and in 1758 had attained the rank of lieutenant-general. The following year he commanded the British cavalry at the battle of Minden, under Prince Ferdinand of Brunswick, whose orders to advance with his troops during the engagement he disobeyed either from cow-

ardice or misapprehension. His behaviour was generally attributed at home to the former cause, and he was tried by a court-martial, convicted of dereliction of duty, and sentenced to be dismissed from the service. Under the administration of Lord Bute he was restored to favour. In 1775 he was appointed colonial secretary of state, and held that office during the progress of the war with America. On relinquishing his post in 1782 he was created viscount. For a considerable part of his life he was called Lord George Germaine, having taken that name on succeeding to an estate left him by Lady Elizabeth Germaine, who died in 1769.

SACY, BARON ANTOINE ISAAC SILVESTRE DE, a distinguished orientalist, who was born in September 1758 at Paris, where he early lost his father. In 1781 he was appointed counsellor of the court of the mint, and entered in 1785, as an *associé libre*, the academy of inscriptions, of which he subsequently became a regular member. In 1791 the king made him one of the commissaries-general of the mint; and on the establishment of the national institute he was elected a member, but did not join it, as he was unwilling to take the oath of hatred against royalty. He refused to take this oath, also, as a professor in the special school of living oriental languages; but he was suffered to retain this office, as it was almost impossible to find a man qualified to fill his place. His uninterrupted occupation in scientific pursuits preserved him during the reign of terror. When Napoleon gave a new organization to the institute, Sacy became a member of the department of ancient literature and history. In 1808 he received the newly established professorship of the Persian language in the collège de France, and was also chosen a member of the legislative body for the department of the Seine. In 1814 he declared himself in favour of the deposition of Napoleon, and took an active part in the discussions of the different bills which occupied the chamber during the session. The king in consequence appointed him censor, rector of the university of Paris, and soon after a member of the commission for public instruction. He was also chosen member of many academies and learned societies. The most important writings of this oriental scholar are his Arabic Grammar and Anthology, published together in 1810 and 1816, which excel all similar works; his translation of "Abdollarif," which is invaluable on account of the subjoined annotations; his "Mémoires sur Diverses Antiquités de la Perse," in which the ancient historical monuments are explained, with a deep knowledge of the language, and the whole subject; his "Mémoires d'Histoire et de Littérature Orientale," his general grammar, his work on carrier-pigeons, his "Chrestomathie Arabe," and many others. The "Mémoires de l'Académie," and the "Notices et Extraits," of which latter work a number of volumes were wholly, or almost wholly, composed by him, moreover testify as much in favour of his diligence as his comprehensive knowledge. As a teacher Sacy has done much for the diffusion of a thorough knowledge of the Arabic and Persian in Europe, and has moreover educated excellent scholars. With strict integrity he united the most pleasing and open character, and was always ready to promote the labours and studies of others.

SADI, or SAADI, SHEIK MOSLEHEDIN SADI EL SHIRARI, of Shiraz, one of the most cele-

brated lyric and moral poets of Persia, who was born at Shiraz in 1175, and died in the 116th year of his age, 1292. As his parents were poor he was educated at the court of Abubeker, and received great favours from different monarchs of Persia. He spent thirty years in travelling, and is said not to have commenced writing until his ninetieth year. He completed his works, which are extensive, in the last twelve years of his life. The Persians esteem him exceedingly on account of his golden maxims, which they consider as a treasure of true wisdom, and also on account of his pure, elegant, and simple style. Of his works we possess a collection, or divan, of lyric poems in the Arabic and Persian languages, consisting partly of amatory poems, and partly of exhortations to partake in the joys of life intermingled with serious reflections; a moral work under the title of "Gulistan," or "The Garden of Roses," composed both of prose and verse, in eight books, with the following titles:—"On the maxims and morals of kings;" "On the minds and morals of dervises;" "On the quiet and happiness of contentment;" "On the importance of silence;" "On love and youth;" "On weakness and old age;" "On the education of children and good morals;" and lastly, "On the art of associating with men;" also a work in verse, called "Bostan," "The Orchard," containing a collection of histories, fables, and moral instructions; and, lastly, a collection of moral sentences, also in verse, under the title of "Pendnamah," or "Molamaat." The complete works of Sacy have been published in Persian at Calcutta, in two quarto volumes. Gentius has also published "Gulistan," the finest of his poems, in Persian and Latin, and Dumoulin the same poem in Persian and English. Dr. Bernard Dorn has translated "Three Pleasant Walks from Saadi's 'Garden of Roses.'" The "Pendnamah" has been published separately in the East Indies and England, in the Persian and English languages. There are also translations of many of his lyric poems by Ouseley and others, and the "Bostan" and "Gulistan" have been translated into a variety of languages.

SADLER, WILLIAM WINDHAM.—This celebrated aeronaut, and ingenious natural philosopher, was killed by an accident in the descent of his balloon on the 30th of September, 1824. The balloon drove against a chimney, and Mr. Sadler was thrown out of the car when at the height of about thirty yards. His skull was fractured, and several of his ribs were broken. Mr. Sadler was named Windham from his godfather, the celebrated statesman, who once ascended with his father in a balloon. He had made thirty successful ascents, and was particularly distinguished by his daring intrepidity in crossing the Irish channel. On that occasion he ascended from Dublin, and alighted on the coast of Wales. A chemist and civil engineer Mr. Sadler possessed talents of no ordinary cast, and he was employed by the first gas company which was established in Liverpool, and contributed to the advancement of that establishment when in its infancy. On leaving that service Mr. Sadler, from his enterprising spirit and his uniform success in many perilous aerial voyages, was induced to devote himself more closely to the hazardous pursuit of aerostation, gratifying the inhabitants of Liverpool and neighbourhood by his frequent, bold, and well-managed ascents. Of his talents and presence of mind, under circumstances not

threatening to human life, thousands have borne testimony, as well as the intrepid adventurers who have been the companions of his excursions. He almost uniformly alighted without sustaining the slightest personal injury, after voyages of the most astonishing rapidity and altitude, and the same balloon from which he met his death had, uninjured, borne him aloft for several years. He had acquired, indeed, facilities in managing the unwieldy bulk of his floating carriage, which even inspired the otherwise timid to adventure their lives under his pilotage. The fatal catastrophe, therefore, which terminated his existence can be deemed only one of those accidents which sometimes defy the foresight of the most skilful and wary. It had been Mr. Sadler's constant practice to address a letter to Mrs. Sadler on the eve of his departure on any voyage, and to carry the letter with him. He sometimes wrote to her during the period of his ascent. Upon this occasion a letter was found upon his person, which was immediately despatched to Mrs. Sadler. On receiving it she suspected some accident, and immediately set out, accompanied by Mr. Armstrong, the companion of Mr. Sadler, from Wigan. When they arrived at Blackburn Mr. Armstrong learned the dreadful result, and with a due regard to the situation of Mrs. Sadler, gradually prepared her for the fatal intelligence. On the melancholy fact being disclosed she determined to post on, and take a last look of the disfigured remains of her husband. The scene was awfully distressing. The body was removed to Liverpool at an early hour on Saturday morning, Mrs. Sadler accompanying the hearse a considerable part of the way. It passed through Bolton at the request of the committee, who had superintended the preparations for the ascent, and was attended by a large procession, following the chaise, in which were Mr. Armstrong and Mrs. Sadler. At Wigan similar marks of respect were shown to the corpse. At the funeral there were present upwards of 4000 individuals, who testified their respect to the memory of their unfortunate townsman by accompanying his remains to the grave.

SADLER, JOHN, an English writer, descended of an ancient family in Shropshire, who was born in 1615, and educated at Emanuel college, Cambridge, where he became eminent for his knowledge in the Hebrew and oriental languages. After having taken his degree, and been some years fellow of his college, he removed to Lincoln's Inn, where he made a considerable progress in the study of the law, and became in 1644 a master in chancery. In 1649 he was chosen town clerk of London, and published in the same year a book with this title,—“Rights of the Kingdom; or, Customs of our Ancestors; touching the duty, power, election, or succession of our kings and parliaments, our true liberty, due allegiance, three estates, their legislative power, original, judicial, and executive, with the militia; freely discussed through the British, Saxon, Norman laws and histories.” It was reprinted in 1682, and has always been much valued by lawyers. In August 1650 he was made master of Magdalen college, Cambridge, upon the removal of Dr. Rainowe, who again succeeded Sadler after the restoration. In 1635 he was chosen member of parliament for Cambridge; and in 1655, by warrant of Cromwell, pursuant to an ordinance for better regulating and limiting the jurisdiction of the high court of chancery,

he was continued a master in chancery when their number was reduced to six only. It was by his interest that the Jews obtained the privilege of building for themselves a synagogue in London. In 1658 he was chosen member of parliament for Yarmouth, and the year following appointed first commissioner under the great seal, with Taylor, Whitelock, and others, for the probate of wills. In 1660 he published “*Olbia: The New Island lately discovered; with its religion, rites of worship, laws, customs, government, characters, and language; with education of their children in their sciences, arts, and manufactures; with other things remarkable; by a Christian pilgrim driven by tempest from Civita Vecchia, or some other parts about Rome, through the straits into the Atlantic Ocean. The first part.*”

Soon after the restoration he lost all his employments, by virtue of an act of parliament of Charles II., “for the well-governing and regulating of corporations.” His conscience would not permit him to take the oath and declaration required, in which it was declared that “it was not lawful, upon any pretence whatever, to take arms against the king;” an obedience so absolute that he thought it not due to any earthly power, though he had never engaged or in any manner acted against the king. In the fire of London 1666 he lost several houses of value, and soon after his mansion house in Shropshire had the same fate. After these misfortunes he retired to his manor and seat of Warmwell in Dorsetshire, where he died in April 1674.

SADOLET, JAMES, a learned Italian writer, who was born at Modena in 1477, and was the son of an eminent civilian, who afterwards became a professor at Ferrara. He acquired a masterly knowledge in the Latin and Greek, and then commenced the study of philosophy and eloquence. He also cultivated Latin poetry. On going to Rome under the pontificate of Alexander VI. he was taken into the family of Cardinal Caraffe; and, upon the death of this cardinal, passed into that of Frederic Fregosa, archbishop of Salerno, where he found Peter Bembus, and contracted an intimacy with him. When Leo X. ascended the papal throne in 1513, he chose Bembus and Sadolet for his secretaries; men well qualified for the office, as both wrote with elegance and facility; and soon after made M. Sadolet bishop of Carpentras near Avignon. Upon the death of Leo in 1521 he went to his diocese, and resided there during the pontificate of Adrian VI., but Clement VII. was no sooner seated in the papal chair in 1523 than he recalled him to Rome. Sadolet submitted to his holiness, but on condition that he should return to his diocese at the end of three years, which he did; and it was fortunate he did so, for, about a fortnight after his departure from Rome, the city was taken and pillaged by the army of Charles V. Paul III., who succeeded Clement VII., recalled him to Rome again, made him a cardinal, and employed him in many important embassies and negotiations. Sadolet at length settled at Rome, and spent the remainder of his days there in repose and study. He died in 1547, as was supposed, from poison.

SAINTE-ALDEGONDE, PHILIP DE MAR-NIX LORD DU MONT.—This learned scholar and politician, who was born at Brussels in 1538, and afterwards, when the Low Countries were at war with the Spaniards, retired to Germany, where he received the post of counsellor in the ecclesiastical

council at Heidelberg. He suffered great hardships before he withdrew. "I was forced," says he, "to endure proscriptions, banishments, loss of estate, and the hatred and reproaches of all my friends and relations, and at last was imprisoned for a year under the duke of Alva and the commander Requezens, during which time I recommended myself to God, for at least three months, every night, as if that would be my last, knowing that the duke of Alva had twice ordered me to be put to death in prison. 'Tantum religio potuit suadere malorum.'" In 1572 he returned to his own country, in order to employ his talents in the support of liberty, and to the advantage of the reformed religion. He stood high in the opinion of the prince of Orange, and did him great services, not by arms, but by words; for he knew how to write and to speak well. In 1575 he was one of the deputies sent by the states to England to desire the protection of Queen Elizabeth. Three years after he was sent by the archduke Matthias to the diet of Worms, where he made an excellent speech to the electors and princes of the empire then present, in which, according to Thuanus, "having deplored the miserable state of the Low Countries, and sharply declaimed against the tyranny of the duke of Alva and Don John of Austria, he desired the assistance of the empire, since the empire was exposed to the same danger with the Low Countries; and he foretold that the flame of the war, if it were not stopped, would spread itself farther, and seize Cologne, Munster, Embden, and other neighbouring cities, which the Spaniards, by the advice of the duke of Alva, had long ago determined to subdue." He was one of the plenipotentiaries sent by the states into France in 1580, to offer the sovereignty of their provinces to the duke of Alençon, and in 1581 attended that prince to England, whence he wrote to the states the false news of his marriage with Queen Elizabeth. This fact Wicquefort sets before the eyes of ambassadors to make them cautious of the news they write. "Sometimes," says he, "one cannot believe even what one sees. The sieur de Sainte-Aldegonde, who managed the affairs of the states of the Low Countries at the court of London in 1581, being one evening in the queen's chamber, saw her in conversation with the duke of Alençon. The lords and ladies were at such a distance that they could have no share in it; but every body was witness of an action from which a great consequence might be drawn. The queen, taking off a ring from her finger, put it upon that of the duke, who immediately went away with an air of joy and satisfaction, as carrying with him the pledge and assurances of his marriage. Sainte-Aldegonde, thinking this action of the utmost importance to his masters, gave them advice of it by an express which he despatched the same night. The ringing of bells and firing of cannon, and other signs of rejoicing through all the Low Countries, proclaimed the satisfaction they received from this advice; but the queen reproached Sainte-Aldegonde for having precipitately given an advice, the falsity of which he might have known in a few hours." He was consul of Antwerp in 1584, when that city was besieged by the duke of Parma; in 1593 he conducted into the palatinate the princess Louisa Juliana, daughter of William I., prince of Orange, who had been betrothed to the elector Frederick IV., and in 1598 he died at Leyden in his sixtieth year.

**ST. GERMAN, CHRISTOPHER**, an English writer on jurisprudence, who was born at Shilton in Warwickshire, where his father, Sir William St. German, resided. He received his education at Oxford, from whence he removed to the Inner Temple, and was subsequently called to the bar. He became eminent for his knowledge of the laws, and also from his writings on that subject. His most celebrated work is entitled "The Doctor and Student, or Dialogue between a Doctor of Divinity and a Student, on the Laws of England." His death took place in 1540.

**ST. JOHN, JOHN**, a statistical writer, who was the nephew of the celebrated Lord Bolingbroke. He had a seat in the house of commons during three parliaments, and for many years was surveyor-general of the crown lands. He was the author of a valuable work entitled, "Observations on the Land Revenue of the Crown, containing the Origin and Sources of the Land Revenue of England." His death took place in November 1793.

**ST. JOHN.**—See **BOLINGBROKE**.

**SAINTE-MARTHE**, in Latin *Sammarthanus*, the name of a French family, which for more than a hundred years has been fruitful in men of letters. The first, Gaucher de Sainte-Marthe, had a son named Charles born in 1512, who became physician to Francis II., and was remarkable for his eloquence. Queen Margaret of Navarre and the duchess of Vendôme honoured him with their particular esteem, and conferred many favours upon him; and therefore, when those ladies died in 1550, he delivered a funeral oration upon each. He was the author of several poems in the Latin and French languages. He died in 1555.

Scevole, Sainte-Marthe, the nephew of Charles, was born at Loudon in 1536, and became very distinguished for learning. He learned the Latin, Greek, and Hebrew tongues, and became an orator, a lawyer, a poet, and an historian. The qualities of his heart are said to have answered those of his head; for he is represented as having been a good friend, zealous for his country, and of inviolable fidelity to his prince. He had in the reigns of Henry III. and Henry IV. several important employments: he was governor of Poitiers, and afterwards treasurer of France for that district. In 1593 and 1594 he exercised the office of intendant of the finances in the army of Bretagne, commanded by the duke de Montpensier; and, in the latter of these years, he reduced Poitiers to the subjection of Henry IV. He died in 1623. He was the author of "*La Louange de la Ville de Poitiers*;" "*Opera Poetica*," consisting of odes, elegies, epigrams, and sacred poems, in French and Latin; "*Gallorum Doctrina Illustrata Elogia*," 1598; but his chief work was his book called "*Pædotrophia, seu de Puerorum Educatione*," printed in 1584, and dedicated to Henry III. This poem went through ten editions in the author's lifetime, and hath gone through as many since.

**ST. PIERRE, JACQUES HENRY**, a celebrated author who was born at Havre de Grace on the 19th of January, 1737. He received his education at the college at Rouen, where he obtained the first mathematical prize in 1757. Having completed his studies he travelled through several parts of Europe, and then entered the corps of military engineers. He subsequently quitted that body and went to Russia, then joined the Poles, and two years after went

to Paris, where his restless disposition did not let him remain long, for in 1774 he returned to his na-

tive place. In 1784 he published his celebrated work entitled "The Studies of Nature," of which we can only give the following specimen:—

"Nature is infinitely extended and my powers are extremely limited. Not only the general history of nature, but even that of the smallest plant is far beyond my ability. Of this I was convinced by the following circumstance. One summer's day, being engaged in regulating some observations on the harmonies of the globe, I perceived on a strawberry plant, which happened to be placed in my window, some small flies of such beauty that I resolved to describe them. The following day I perceived another kind, which I likewise described. In the space of three weeks I observed thirty-seven different species; but, at length, they came in such numbers, and of such various kinds, that I desisted from this study, though very amusing, for want of leisure, and, to tell the truth, for want of expressions. The flies which I had observed were all distinguished from each other by their colours, their forms, and their manners. Some were of the colour of gold, others of silver, and others of bronze: these were spotted, those striped; some were blue, some green, some dull, and others shining. In some the head was rounded like a turban, in others lengthened into a point like a snail: in some it appeared dark like a spot of black velvet, in others it sparkled like a ruby. In their wings there was as great a variety. Some had long ones which glistened like mother of pearl; those of others were short and broad and resembled net work of the finest gauze. Each had a peculiar position and manner of employing them. Some carried them in a perpendicular, others in a horizontal attitude, and seemed to take a pleasure in extending them. These fluttered in the manner of butterflies; those raised themselves in the air against the wind by a mechanism nearly similar to that of paper kites, which, as they rise, form with the wind an angle of, I believe, twenty-two degrees and a half. Some settled on the plant to deposit their eggs, and others merely to take shelter from the sun; but most came for reasons that were wholly unknown to me. Some alighted and flew off again in a perpetual motion, while others

moved only the hinder part of their bodies. Many of them were motionless and perhaps engaged, like myself, in making observations. I alighted as sufficiently known all the other species of insects which resorted to my strawberry, such as the snails which fixed themselves beneath its leaves, the butterflies that hovered over it, the scarabei which burrowed about its roots, the minute worms which found a subsistence in the thickness of its leaf, the wasps and the bees which buzzed around its flowers, the grubs which devoured its stalks, the ants which destroyed the grubs, and lastly the spiders, which spread their nets to make a prey of all these different kinds of insects.

"Though these objects were so diminutive, yet they were not beneath my notice, since they had deserved the attention of Nature. I could not have refused them a place in the general history of her works, as she had given them one in the universe. Still more necessary would it have been, to take account of them, if I had written the history of my strawberry. The plants are the habitations of insects, and we seldom write the history of a town without treating of its inhabitants. Besides, my strawberry was not in its natural situation, on the border of a wood or the bank of a stream, where it would have been frequented by many other species of animals. It was in a flower-pot, in the midst of the smoke of Paris. I observed it only in moments of leisure. I knew not by what insects it might be visited in the course of the day, and still less those that might frequent it in the night, attracted merely by its exhalations, or perhaps by phosphoric lights that escape our observation. I was ignorant of those that might repair to it during the other seasons of the year, and of its other relations with reptiles, amphibious animals, fishes, birds, quadrupeds, and particularly with man, who disregards every thing that is not for his own use. But it was not sufficient for me to observe it, as it were, from the height of my greatness, for in that case my knowledge would not have equalled that of one of the flies by which it was inhabited. There was not one of them which, with its little spherical eyes, could not distinguish upon it a multitude of objects that I was unable to perceive except with the microscope, and with infinite trouble. Their eyes are even far superior to that instrument which only shows us the objects within its focus, that is, within the distance of a few lines; whereas, by a mechanism wholly unknown to us, they perceive both those that are near and at a distance. They are at one and the same time microscopes and telescopes. By their circular disposition round the head they see at once the whole expanse of heaven, of which those of an astronomer can embrace, at most, only one half. Thus these flies must have discovered at one view, in my strawberry, a distribution and combination of parts, which, with a microscope, I could observe only separately and in succession.

"In examining the leaves of this vegetable by means of a lens that magnified in a moderate degree, I found them divided by compartments covered with hair, separated by canals, and interspersed with glands. These compartments appeared like large verdant carpets, and their hairs seemed to resemble vegetables of a particular order, some of which were straight, others inclined, forked, and hollow like tubes, from the extremity of which issued drops of liquor; and their canals as well as their glands

seemed to be full of a sparkling fluid. In other species of plants these hairs and these canals exhibit different forms, colours, and fluids. There are even glands resembling basons of a circular, square, or radiated figure. Now Nature has made nothing in vain. When she forms a place fit to be inhabited she never fails to people it with animals. She is not confined by the smallness of the space: she has placed animals with fins in single drops of water, and in such numbers, that Lewenhoeck counted several thousands. Many others besides him, and among the rest Robert Hook, have seen in a drop of water, of the size of a grain of millet, ten, thirty, and even forty-five thousand. Those who are unacquainted with the extent of the patience and sagacity of an observer, might call in question the accuracy of these observations, had not Lyonnet, who relates them in Lesser's 'Theology of Insects,' demonstrated their possibility by a very simple process. We are at least certain of the existence of those animals whose figures we have designed. We find others with feet armed with claws, on the body of the fly, and even on that of the flea. We may therefore conclude, by analogy, that there are animals which feed on the leaves of plants, like the cattle in our meadows, which recline in the shade of hairs imperceptible to human eyes, and which drink from their glands, formed like suns, liquid gold and silver. Every part of a flower must present them with spectacles of which we have no idea. The yellow antheræ, suspended on whitethreads, appear to them like double bars of gold balanced on columns more beautiful than ivory; the corollæ, like vaults of rubies and topazes, of immeasurable extent; the nectaria like rivers of sugar; the other parts of the blossom like cups, urns, pavilions, and domes, which the architecture and workmanship of men have never imitated. This assertion is not founded only on conjecture; for, having one day examined some flowers of thyme with a microscope, I discovered, to my great surprise, superb long-necked flasks of a substance resembling amethysts, from the mouth of which seemed to bubble melted gold. I never examined the simple corolla of the smallest flower without finding that it was composed of an admirable substance, semi-transparent, interspersed with brilliant particles, and exhibiting the most lively colours. The animals which live beneath their rich reflections must have ideas very different from ours concerning light and the other phenomena of nature. A dew drop filtering through the capillary and transparent tubes of a plant, appears to them like a thousand fountains; collected into a globule at the extremity of one of its hairs, it is a boundless ocean, and, when evaporated in the atmosphere, an aerial sea. They must, therefore, be accustomed to behold fluids ascending instead of descending, assuming a round figure instead of presenting a level surface, and rising in the air instead of falling. Their ignorance must be as wonderful as their knowledge. As they can be thoroughly acquainted only with the harmony of the most minute objects, that of larger must totally escape them. They undoubtedly are ignorant that there exists men, and, among them, men of science who know and explain every thing, and who, transient beings like themselves, soar to an elevation which they can never attain, while they, by favour of their diminutive size, are acquainted with another world in the last division of matter and of time. Among these ephemeral creatures youth lasts but for

a morning, and decrepitude approaches with the night. If they have histories, they have months, and years, and ages, and epochs, proportionate to the duration of a flower. Their chronology is as different from ours, as their system of optics and hydraulics. Thus as man approaches the elements of nature, the principles of his knowledge vanish away.

"Such, then, must have been my plant and its native inhabitants in the eyes of those insects; but if, like them, I could have acquired an intimate knowledge of this new world, still I should not have possessed its history. It would have been necessary to study its relations with the rest of Nature, with the sun which makes it flourish, with the winds which propagate it by its seed, and the streams whose banks it secures and embellishes. It would have been necessary to discover how it is preserved a winter during cold that cleaves the very stones, and again recovers its verdure in spring, though no care is bestowed to protect it from the frost: how a feeble creeping plant can raise itself from the lowest depths of the valleys to the summit of the Alps, and spread over the globe from north to south, from mountain to mountain, forming on its way, with the plants of every climate, a thousand charming pieces of network of its white flowers and its rose-coloured fruits: how it could have extended from the mountains of Cashmir to Archangel, and from the rugged rocks of Norway to the extremity of Kamtschatka; how, finally, it should be found in the two portions of America, though an infinite number of animals make war upon it, and no gardener bestows any trouble on its propagation.

"With all this knowledge, I should still have possessed only the history of the genus and not that of the species. I should still have to examine the varieties, each of which is characterised by its flower, either single, or coupled, or disposed in bunches: by the colour, the smell, and the tastes of its fruit, by the size, the indentations, the smoothness, or the softness of its leaves. One of our most celebrated botanists, Sebastian Le Vaillant, discovered, in the environs of Paris only, five different species, of which three have flowers but bear no fruit. In our gardens are cultivated a dozen foreign kinds, as those of Chili, Peru, the Alps, and that of Sweden, which is green, &c. But how many varieties are unknown to us! Has not each degree of latitude one particular to itself? May we not presume that there are two which bear strawberries, as we know that there are others which produce pease and kidney-beans? May we not even consider as varieties of the strawberry the numerous species of raspberry, and of the bramble with which it has a striking analogy in the indentations of its leaves, in its tendrils which creep along the ground and replant themselves, in its rose-form flowers, in the figure of its fruits, whose seeds are on the outside? Has it not likewise an affinity with the sweetbriar and the wild rose by its flowers, with the mulberry-tree by its fruits and its leaves, and even with clover, of which one kind, in the vicinity of Paris, bears its seed in clusters, in the form of strawberries, whence it is denominated *trifolium fragiferum*? If we now reflect that all these species, varieties, analogies, and affinities, have, in every latitude, necessary relations with a multitude of animals, and that we are utter strangers to these relations, we shall be convinced that the complete history of the strawberry would furnish sufficient employment for

all the naturalists in the world. What a task would it then be to write, in the same manner, the history of all the species of vegetables scattered over the surface of the globe! The celebrated Linnæus reckoned from seven to eight thousand, but he had not travelled. Sherard is said to have been acquainted with sixteen thousand. A more modern botanist boasts of having himself made a collection of twenty-five thousand, and he estimates those which he had not seen at four or five times that number. We must be convinced, however, that all these calculations fall very short of the truth, when we reflect, according to the observation of the last-mentioned naturalist, that we know scarcely any thing of the interior of Africa, of the three Arabias, of the two continents of America; very little of New Guinea, New Holland, New Zealand, and the numerous islands of the South Sea, most of which are still unknown. Of the extensive islands of Ceylon and Madagascar, of the immense Archipelagoes, of the Philippines and Moluccas, and indeed of almost all the Asiatic islands, we know little more than a portion of the coasts. To the vast continent of Asia, excepting some great roads in the interior, and some of the coasts frequented by the Europeans for the purposes of trade, we may be said to be utter strangers."

The "Studies of Nature" obtained St. Pierre the post of intendant to the botanical gardens at Paris with a liberal salary. In 1789 appeared his beautiful tale of "Paul and Virginia," which was soon followed by the "Indian Cottage." The latter work is a masterpiece. St. Pierre lost his place of intendant by the storms of the revolution, and as he was married he suffered considerably from pecuniary embarrassments. He, however, retained a small patrimony, on which he lived till his death, which took place in 1814. He left a work entitled "The Harmonies of Nature," which, with the rest of his works, have been translated into our own language.

ST. PIERRE, CHARLES IRIENCE CASTEL DE, a moral French writer, who was born in 1658, and educated at the college of Caen. He was well known as a politician, and accompanied Cardinal de Polignac to the congress at Utrecht, where he proposed the establishment of a kind of European diet, in order to secure a perpetual diet, and as such a perpetual peace. The proposal was received with great good humour by the assembly, but it was attended with too many practical difficulties to be carried into effect. St. Pierre was the author of several political works, one of which, entitled "La Polysynodie," caused him to be expelled from the academy at Paris.

ST. REAL, CÉSAR VICHARD DE, an able writer, who was born at Chambery in 1639, and studied with the Jesuits at Paris, where his talents and learning gained him friends. He accompanied the duchess of Mazarin to England, and afterwards resided again in Paris, assuming the title of abbé, though without having any benefice. His writings involved him in a controversy with Arnaud, who accused him of Socinianism. He died in 1692. His principal works are his "Discours sur la Valeur," his "Sept Discours sur l'Usage de l'Histoire," and his "Histoire de la Conjuration des Espagnols contre la République de Venise," which partakes of the dramatic, and is by no means equal in point of style to his model Sallust. His "Don Carlos" is well written, but is likewise of a romantic character: his

translation of Cicero's letters to Atticus is of less merit. A complete edition of his works was edited by Perau in 1757.

SALAHEDDIN, YUSEPH BEN AYUB, usually called Saladin, a celebrated sultan of Egypt and Syria, who was born in the year 1137 in the castle of Tecnib, of which his father, a native of Curdistan, was governor. In 1168 he was chosen to succeed his uncle Siracouh in the command of the armies of the Fatimite caliph Adhed, or rather of the sultan Nouredin, his immediate superior. He terminated the dynasty of the Fatimite caliphs of Egypt in 1171, at the command of Nouredin, and subsequently endeavoured to supersede the minor son of Nouredin himself, but did not succeed until after his death, when he was recognised sultan of Syria and Egypt by the caliph of Bagdat. The great object both of his religion and his politics was now to expel the Christians from Palestine and to recover the city of Jerusalem. An atrocious massacre of Mohammedan pilgrims by the French lord du Chatillon added still more to his ardour; and his vow of revenge against the perpetrator he was enabled to make good by his celebrated victory on the plain of Tiberias in 1187, where he captured Guy de Lusignan with the chief-tain Chatillon, whom he cut down after the battle with his own scimitar, and many more. The fruits of this victory were the towns of Acre, Said, and Barout; after which he laid siege to Jerusalem, which yielded in 1187 in a capitulation, to the articles of which Saladin faithfully adhered. He then proceeded against Tyre, but failed in consequence of the destruction of his fleet by the Franks. The intelligence of the loss of Jerusalem reaching Europe, produced the crusade under the emperor Frederic Barbarossa, whose death inspired the Mussulman with hopes which were soon damped by the arrival of the forces of Richard Cœur-de-Lion of England, and of Philip Augustus of France. The recovery of Acre by the two kings took place in 1191, upon which event Philip returned to France, and Richard, after twice defeating the sultan, took Cæsarea and Jaffa, and spread alarm as far as Jerusalem. At length a truce was concluded between Richard and Saladin, by the terms of which the coast from Jaffa to Tyre was ceded to the Christians, whilst the rest of Palestine remained to the sultan. The departure of Richard freed Saladin from his most formidable foe. This active and able prince soon after died at Damascus, in the fifty-sixth year of his age. Though chargeable with unjustifiable means of acquiring power, Saladin employed it, when obtained, usefully for his subjects, whose burdens he lightened, whilst he benefited them by many useful works and establishments. Magnificent in his public undertakings, he was frugal in his personal expenses. In religion he was zealous for his creed almost to fanaticism, but faithful to his engagements. A lasting proof of the terror which his name inspired, was given by the Saladin tenth, imposed by the authority of Pope Innocent X. on clergy and laity for the support of the holy war. Saladin left a family of seventeen sons and one daughter, and was the founder of the dynasty of the Ayoubites.

SALE, GEORGE, a learned oriental scholar and writer, who was one of the principal compilers of the "General Dictionary" and "Universal History." His most celebrated performance, however, was a translation of the Koran into English from the original

Arabic, with copious notes from the most approved commentators. Little is known of his private life, except that he was one of the founders of a society for the encouragement of learning in 1736, which was the same year that Mr. Sale died.

SALE, JOHN, a celebrated musical professor, who was born in London in 1758, and admitted at an early age as chorister of the royal chapel at Windsor. He held this situation till 1775, and three years after he was appointed lay-vicar of the choirs of Windsor and Eton, which office he retained till Christmas 1796, being at that period a member of five choirs, namely, Windsor, Eton, his majesty's chapel royal, St. Paul's, and Westminster Abbey. In 1788 Mr. Sale succeeded Ladd as gentleman of his majesty's chapels royal, Soaper as vicar-choral of St. Paul's in 1794, and Hindle as lay-vicar of Westminster Abbey in 1796, and at Christmas in the latter year resigned Windsor and Eton. In 1800 he succeeded Bellamy senior as almoner and master of the choristers of St. Paul's, both of which he relinquished in 1812. In 1818 he became senior gentleman (or father) of his majesty's royal chapels; by which, according to custom from time immemorial, he is excused all duty or attendance. Mr. Sale was a principal bass singer at the king's concert of ancient music, academy of ancient music, ladies' concert, vocal and other concerts, oratorios, &c., in London as well as at Liverpool, Chester, Worcester, Birmingham, Hull, Norwich, Nottingham, Halifax, Yarmouth, Lincoln, Winchester, at various times for above thirty years, always acquitting himself with professional credit.

SALLUST, CAIUS CRISPUS, an ancient Roman historian, who was born at Amiternum, a municipal city in the territory of the Sabines, B. C. 86. His gay spirits and his fiery and restless disposition led him into many youthful excesses; yet it is not improbable that he was less corrupt than has been commonly represented. We ought also to take into consideration the prevailing state of morals at that time, when we sit in judgment on his faults. His faithful and vigorous descriptions of the moral depravity of the Romans plainly show that he was accurately acquainted with it. Through the favour of Cæsar he was appointed pretor and sent to Numidia, where he collected great treasures. When he returned to Rome, he played a conspicuous part, and in the latter part of his life appears to have reflected on the vices of his youth, and to have lived more moderately. His death took place B. C. 35. During the period of his retirement he made the history of his country his principal study. But, unfortunately, we have only a few fragments of the copious history which described the period from the death of Sylla to the conspiracy of Catiline. Two other historical writings of his have come down to us entire; one a description of the wars of the Romans against the crafty Jugurtha, the other of the conspiracy of Catiline. These are distinguished alike for their contents and their style. Sallust appears to have taken Thucydides as a model; but in the opinion of Quintilian he far surpasses him. The style of Sallust is vigorous, pure, and often very eloquent; his thoughts possess dignity, strength, truth, and clearness.

SALM-DYK, CONSTANTIA MARIA DE THEIS, PRINCESS OF.—This noble lady was born at Nantes, in 1767, of a noble Picard family. Her youth was devoted to study. In 1789 she was married to Pipelet, a surgeon, and went with him to Pa-

ris, where her "Sappho," a lyrical tragedy, in three acts, was performed more than one hundred nights with great applause. Her "Épître aux Femmes" was also received with the greatest favour. In 1801 Mad. Pipelet was married to the count of Salm-Dyck, who was afterwards created prince in 1816, and published several "Eloges," and "Discours Académiques." Her romance, "Vingtquatre Heures d'une Femme Sensible," displays great power of description. A collection of her poems, entitled "Poésies de la Princesse de Salm," appeared in 1817.

SALMASIUS, CLAUDIUS, the Latinized name of Claude de Saumaise, a French writer, distinguished for his profound and extensive learning, who was born at Sémur in Auxois, now the department of Cote d'Or, in 1588. His father, a respectable magistrate and a learned man, instructed him in the ancient languages, and then sent him to Paris to study philosophy. His edition of "Florus," which was published in 1609, and, according to his own assertion, had already been completed several years, is a remarkable proof of his early erudition. In 1608 he went to Heidelberg, to study law under the celebrated Gothofredus. The excellent university library there gave him an opportunity to gratify his literary curiosity and to extend his reputation by the publication of his learned labours. On his return to France in 1610 he began to practice his profession, but soon withdrew from it to devote his whole time to study, and the rest of his life was occupied with critical labours and learned controversies. His mother, a Calvinist, had educated him in protestant principles, and in 1623 he married the daughter of a respectable protestant. Several years later he passed some time at the country seat of his father-in-law, near Paris, where he completed his great labour on Pline le Vieux. In 1629 his father was desirous of transferring to him his place, and the parliament of Paris made no objection, although he openly professed Calvinism; but the keeper of the seals, Marillac, refused to sanction the step. The invitations of the universities of Padua and Bologna were declined by Salmasius; but in 1651 he accepted the offer of the professorship, which had been held by Joseph Scaliger at the university of Leyden. His friends made several attempts to induce him to return to France, and Cardinal Richelieu offered him a pension on condition of his writing a history of his ministry. But Salmasius declined all these offers. In 1649 Charles II. of England induced him to write a defence of his father; it was entitled "Defensio Regia pro Carolo primo, Anglico, Anglicano." The zeal with which Salmasius defended royalty in this work offended his republican patrons in Holland, and he therefore readily accepted the invitation of Queen Christina to visit Sweden. But the climate of Sweden was so unfavourable to his health that he returned to Holland the next year, and died in 1653, at Spa, where he had gone for his health. Although virulent in controversy, Salmasius was remarkably gentle and kind in private, and at home was entirely governed by his wife. The most important of his numerous works are his "Plinianæ Exercitationes in Solinum," an edition of the "Scriptores Historiæ Augustæ," "De Mutuo," "De Modo Usurarum," "De Famine Trapezetico," "De Re Militari Romanorum," "De Hellenistica," "Observationes in Jus Atticum et Romanum," &c. All his works display a wonderful

variety, extent and depth of erudition, but are less remarkable for taste or judgment. His learning was aided by a powerful memory. Besides the classical and many modern languages, he was acquainted with Hebrew, Chaldee, Arabic, Persian, Coptic, &c.

**SALT, HENRY.**—This celebrated scholar and traveller was born at Litchfield, and received his education in the grammar school of that town. He was subsequently sent to London, and placed under the tuition of an artist, but had not been long with him before Lord Valentia made him an offer to take him on his projected journey to India; and Mr. Salt accompanied him to India as his draftsman. During his travels in that country, and up the Red Sea, and through Abyssinia, back to England, they were gone four years; and on their return, Lord Valentia published his travels, in three volumes quarto, splendidly ornamented with plates, from the pencil of Mr. Salt. "The Account of Abyssinia" was written by Mr. Salt, who was employed to carry presents to the emperor of Abyssinia. Mr. Salt, on his return, published twenty-four views taken in India, the Red Sea, Abyssinia, &c.; and in 1814, "An Account of a Voyage to Abyssinia, and Travels in the Interior of that Country," quarto. This was the narrative of a second journey, which Mr. Salt made to that country, on his return from which he was appointed English consul-general in Egypt, where he engaged in active researches into the antiquities of that country. He died near Alexandria in 1827.

**SALZMANN, CHRISTIAN GOTTHILF**, a distinguished teacher at Schnepfenthal, who was born in 1744, in the territory of Erfurt, where his father was a protestant preacher. He himself was a clergyman in Erfurt, when the works of Rousseau and Basedow directed his attention more particularly to the education of his own children. In 1778 he published "Entertainments for Children, and Friends of Children," and in 1780 his excellent "Krebsbuchlein," in which he exposes, with keen irony, the prevalent mistakes in education. Basedow invited him, in 1781, to take part in his Philanthropin, an establishment for education, at Dessau, and he published his sermons, &c., at this institution, from 1781 to 1783. In the latter year he began, and in 1788 finished, his novel, "Karl von Karlsberg, or on Human Misery." In 1784 he established in Schnepfenthal, in Gotha, his own institution. His prudent management, and the zealous co-operation of able assistants, made it prosper. He began with his own children, and a few others: but pupils were soon sent him, not only from all parts of Germany, but also from many foreign countries, and some of these pupils of very high rank. In 1787 he published his "Heaven on Earth," which gained him the favour of many parents. In 1788 he began to publish "The Thuringian Messenger," a journal which was much read. A number of books on education by him and his associates contributed much to the changes which took place in education. His institution was distinguished, moreover, for the health of the pupils, and the development of their physical powers, which was owing to the salubrious situation, to the attention paid to diet, and to the gymnastics introduced there by Guts-Muths. Six of his associates became his sons-in-law, and two of his sons were among his associates. His daughters also taught. The wars in Europe, and the increasing number of similar institutions, reduced the number of his pupils, so that in 1807 he had but thirty-six child-

ren under his care. Salzmann died in 1811, having effected much good as an instructor and a popular author. Clearness and simplicity, piety and practical good sense, are the prominent features of his writings. He was distinguished for firmness, sagacity, and unceasing activity, and was honoured by thousands whom he had trained in the ways of virtue and wisdom. His institution continued under his son, Charles Salzmann.

**SALOMON, JOHANN PETER.**—This distinguished musical professor was born at Bonn, in the electorate of Cologne, in 1745, according to a baptismal certificate found amongst his papers. He was educated for the law, but his love for music predominating over every other inclination, he was at length allowed to devote himself to its study, and soon became celebrated in Germany and France, not only for his performance on the violin, but for his profound knowledge of the art generally. He came to England (about 1781; after which time this country proved the place of his constant residence. Salomon was one of those few whose right to contend for the honour of being the greatest performer on the violin in Europe was undisputed; "his taste, refinement, and enthusiasm," to use the words of Dr. Burney, "excited universal admiration, and caused his instruction to be eagerly sought for." Amongst his pupils, Pinto proved the extent of his master's skill, and his ability in communicating it. Unfortunately, this extraordinary young man, whose musical progress reflected so much honour upon his master, possessed qualities which are not unusually the concomitants of genius, and he perished just as he was ripening into unrivalled excellence. This country is indebted to the spirit and enterprise of Salomon for having brought into it, at a great pecuniary risk, the most original, brilliant, and fertile musical genius that has appeared in our days, the immortal Haydn! It was in this metropolis that he produced those great masterpieces, the twelve symphonies, written for Salomon's concerts, which are, and most probably will ever continue, the standard of perfection in this species of composition; indeed, they are acknowledged as such wherever modulated sounds are understood or felt. His judgment was not exercised in one department of music only; he brought out of obscurity, and placed in their proper sphere, the vocal powers of Braham, who avows the obligation, and is proud to boast of having possessed a friend whose unsolicited patronage was a recommendation of the most gratifying and valuable kind. Disinterested in his views, and anxious for the preservation and improvement of his favourite art, he was one of the early promoters and active assistants of the philharmonic society, the first concert of which he led with a zeal and ability which age had not abated; and the last business that occupied his attention was relative to the preparations for the ensuing season, in which he manifested a clear and unimpaired state of mind only four days previous to his death. Salomon had lived chiefly in the higher circles, where his good sense and polished manners ever rendered him acceptable; indeed, his education qualified him for any society. His classical attainments were considerable; and to these he added the more current and useful acquisition of four living languages, which he wrote and spoke with astonishing correctness and fluency. But the qualities of his heart are those which will

leave the most lasting impression on his friends. He was honourable, generous, and sincere; his talents were always to be gratuitously commanded if appealed to by distress; and his purse was so readily opened when his compassion was excited, that if a very faithful and vigilant servant, who lived with him twenty-eight years, had not been more cautious, his master would, in all probability, have offered his independence at the shrines of charity. He died in London, after a long illness, which originated in a fall from his horse. His remains were interred in the cloisters of Westminster Abbey.

**SAN MARTIN, JOSE DE.**—This distinguished South American leader was a native of the Missions, on the banks of the river Parana. He made his first campaigns in the service of Spain, in the peninsula, holding the rank of captain; but he left Spain in 1811, and returned to his own country, where he rapidly rose to distinction. He received from the revolutionary government of Buenos Ayres the command of a division of the patriot army, with the commission of colonel. His first object was to improve the organization and discipline of the cavalry, in which he succeeded so well as to gain a victory over a small detachment of royalist troops at San Lorenzo in 1813. This affair made him so conspicuous that he was appointed to the chief command in the province of Tucuman, in the hope that he might restore the patriot cause in that quarter, which was almost prostrated by the successive defeats of Belgrano. San Martin found only 570 men in Tucuman, the remnants of the patriot force. In the course of a few months he had contrived to raise an army of 4000 men from such slender beginnings. In 1814 he was obliged to resign his command on account of bad health. When he resumed active service, he obtained the command in the province of Cuyo, contiguous to Chile, and devoted himself to the task of recruiting and equipping an expeditionary army, called the "army of the Andes," having for its object the liberation of Chile from the Spanish authority. The plan of the expedition was arranged in concert with O'Higgins and other Chilean exile, who had taken refuge in Mendoza, the capital of Cuyo. Two years were consumed in the preparations necessary for this important movement. At length, at the very beginning of 1817, the patriot army of 4000 men broke up its cantonments at Mendoza, and entered the gorges of the Andes, to cross into Chile. San Martin effected the dangerous and difficult passage of the Andes in safety, and on the 12th February, encountering the Spanish forces posted at Chacabuco to resist his march, gained a complete and brilliant victory. Chile resumed its independence upon this event, O'Higgins becoming supreme director. Meanwhile it was known that the viceroy of Peru was fitting out an expedition against the Chilean patriots; and preparations were made to receive it. The opposing armies met at Mapu on the 5th of April, 1818, and again San Martin gained a complete victory, which finally accomplished the deliverance of Chile. Emboldened by these successes, he now conceived the plan of carrying his liberating arms into Peru itself, the only remaining possession of Spain in South America. Meanwhile the republic of Buenos Ayres was distracted by one of the numberless domestic *bouleversements* which have rendered its public administration a satire on the name of the government. The faction, which hap-

pened to possess an ephemeral ascendancy in the capital, called on San Martin to relinquish his splendid enterprise of liberating Peru, and to recross the Andes with his army, for the purpose of wasting his energies in the provincial broils of the republic. San Martin, and the other officers of the expeditionary army, unanimously refused obedience to the order; in consequence of which he was denounced by the government at Buenos Ayres. Upon which he resigned his commission into the hands of the officers, and was unanimously re-elected by them, thus holding his authority independent of the government. The liberating army sailed from Valparaiso on the 21st of August, 1820, the land forces under San Martin being supported by a squadron under Lord Cochrane. They landed at Pisco, and being sustained by the Peruvians, gained possession of Lima and of most of the country, a revolutionary government being installed in the capital, and San Martin declared protector of Peru, on the 3rd of August, 1821. Various measures were adopted under his auspices for giving firmness to the new order of things, although the royalists continued in force in the interior, and still held the castles of Callao. A congress was convened at Lima on the 20th of September, 1822, by virtue of the decrees of the protector; and he immediately resigned all his authority into their hands, accepting in return, only the honorary titles of generalissimo and founder of the liberty of Peru, with a pension. He withdrew from Peru, first to Chile, and afterwards to Europe, finding little inducement, it is to be presumed, to enter into public life in Buenos Ayres, and perhaps doubting of his personal security in that country. In leaving Peru, he gave evidence of the purity and disinterestedness of his purposes, and was certainly entitled to the praise of good intention, if not of brilliant ability.

**SANNAZARO, JACOPO**, a distinguished Italian poet, who was born at Naples in 1458. He received his education in the school of Giuniano Maggi and the academy of Pontanus, in which, according to the custom in the Italian academies, he adopted the name of Attius Sincerus. An early passion for Camosina Bonifacia, whose praises he sung under the names of Harnosina and Phillis, unfolded his poetical talents. In the hope of conquering his love by separation he went abroad, but, yielding to the impatience of his passion, returned to Naples, where he found his mistress dead. During his absence he wrote his "Arcadia," a series of idyls, which, although like his other Italian poems, the work of his youth, still retains its reputation. His poetry attracted the notice of King Ferdinand and his sons Alphonso and Frederic, who made him the companion of their journeys and campaigns. Frederic, who ascended the throne in 1496, gave him the delightful villa Mergellina, with a pension of 600 ducats. But in 1501, his benefactor was obliged to abdicate the throne, and flee to France; and Sannazaro was too faithful to desert him in his reverses. After the death of Frederic, he returned to Naples, and died there in 1533. He was buried in the church Santa Maria del Parto, which he had built at his villa. Sannazaro wrote sonnets and canzoni in Italian, several Latin poems, elegies, eclogues, epigrams, and a longer poem, "De Partu Virginis," in three books. His elegance of expression, no less than the poetical beauty of his thoughts, give him a distinguished place among the modern Latin poets.

SANTA ANA, ANTONIO LOPEZ DE, a Mexican general, of signal military abilities, and greatly distinguished in the political affairs of that republic. He first became known extensively at the time of the second revolution (so called), when Iturbide promulgated the plan of Iguala on the 24th of February, 1821. At the head of the desultory forces of the country, Santa Ana succeeded, by a coup-de-main, in driving the royalists out of Vera Cruz, and in obtaining possession of that city, of which Iturbide appointed him governor. The castle of San Juan de Ulua, which commanded the harbour of Vera Cruz, continued to be held by the Spaniards; and in November 1822 the emperor came to Xalapa, in the hope of effecting an accommodation with the Spanish governor of the castle. Meanwhile disputes had arisen between Santa Ana and General Echavarri, whom Iturbide had placed in command of the southern division, including Vera Cruz. The emperor summoned Santa Ana to Xalapa to answer to the complaints made against him; and he, confident in the supposed good-will of Iturbide, whose cause he had zealously maintained, readily obeyed the summons. On his arrival, to his great surprise, he was treated harshly by Iturbide, and deprived of his command. Enraged by this unexpected treatment, Santa Ana hurried back to Vera Cruz, riding day and night, so as to reach the city in anticipation of the tidings of his disgrace. Instantly assembling his own regiment, he exhorted them to take up arms against the odious usurpation of Iturbide, and found them all ripe for the project, they having, indeed, supported the emperor only out of attachment to their immediate chief. Santa Ana accordingly unfurled the standard of the republic at Vera Cruz, and commenced hostilities against the forces of Iturbide. In this state of things Guadalupe Vittoria left his hiding-place in the mountains to join Santa Ana, and, being declared commander in chief of the insurgents, soon drew to his standard the old republican champions of independence. The fall of Iturbide, and the adoption of the federal constitution, were the well-known consequences of this movement. In the political arrangements that ensued Santa Ana, not being duly considered, sailed from Vera Cruz with six hundred men, and landing at Tampico, advanced through the country to San Luis Potosi, where he took up his head quarters, and declared himself protector of the federal republic. But he failed to inspire the people with confidence in his intentions, and was compelled to submit to a force sent against him from the capital. He was discharged, however, and for several years took but little part in public affairs, living the chief part of the time in seclusion on his estate near Xalapa. In 1825 an expedition against Cuba was contemplated, to be conducted by him, but was never prosecuted. But in 1828 he again appeared on the stage, and with as decisive effects on the condition of public affairs as in 1822. When the news of Pedraza's election to the presidency, as the successor of Vittoria, reached Xalapa, Santa Ana raised his flag in favour of Guerrero; and such was his characteristic decision of purpose and execution, that the news of his rising, and of his investment and capture of the castle of Perote, reached the government almost simultaneously. Here he intrenched himself, and published a plan, having for its leading articles the annulment of the election of Pedraza, the declaring of Guerrero to be elected instead of him,

and the popular object of the expulsion of the Spaniards.

At length, however, Santa Ana was compelled to yield to the government troops, and fled for refuge into the mountains of Oaxaca, under sentence of outlawry, and apparently a broken and ruined man. But in the mean time the movement had been followed up in other parts of the republic with better success. Pedraza was compelled to flee his country, and Guerrero was recognised as president elect. Santa Ana was immediately appointed to the command of the very army sent against him, and to the government of Vera Cruz; and, on the inauguration of Guerrero into office, was made secretary of war, and commander in chief of the army. These political events a little preceded the foolish invasion of Mexico by the Spaniards, under Barradas, which afforded Santa Ana the opportunity of acquiring new laurels. Barradas landed near Tampico in July 1829, and took up a position at Tamaulipas, separated from Tampico only by the river of the same name. Here, or at Altamira, in the same neighbourhood, Barradas remained for about two months, when, after various engagements, he capitulated to the Mexicans under Santa Ana, who had assumed the command of the troops of the republic. Scarcely had Guerrero's administration time to enjoy this triumph, when the events of December 1829 occurred, in consequence of which Guerrero was driven from office, with his particular friends, and the vice-president. Bustamante assumed the direction of the government. Santa Ana was then consigned to comparative obscurity, but his military talents, his activity and enterprise, and his reputation for successful intrigue, rendered him a dangerous enemy to the government.

SANTANDER, FRANCISCO DE PAULA, was born at Rosario de Cucuta, in New Grenada, on the 2nd of April, 1792, and received the best education which his country afforded. He commenced his studies in the place of his birth, and completed them at the college of Bogota. During his course of study in philosophy and law he was distinguished for his application, industry, and aptness in acquiring whatever he undertook. He received his degree in 1809, the very time when the revolution began to agitate the country; and, like most other young men of spirit and talent, immediately embarked in the cause of independence. At first he was merely an ensign in the militia of New Grenada; was afterwards selected as an aide-de-camp by Manuel Castillo, military commandant and political chief of the province of Mariquita, and soon became attached, in the same capacity, to General Baraya. When Bolivar projected his first invasion of Venezuela, Castillo was employed to drive the Spaniards, under Correa, from the defiles of La Grita, and Santander, with two companies, was ordered to turn the defile by ascending the neighbouring heights. He was successful, and, in consequence, Correa was obliged to destroy his baggage and retreat in disorder. Santander was next commissioned to defend the valley of Cucuta. He had but 300 men. The Spaniards poured in a force ten times stronger than his own, and compelled him to evacuate Rosario, where they afterwards committed the most horrible atrocities, and succeeded in destroying Santander's little army. Mac Gregor was then sent to the succour of the province; and Santander commanded his vanguard. They recovered the province; and Santander, being made a colonel, was again charged with its

defence. He was attacked, but repulsed the assailants; and was subsequently appointed to the more important post of Ocana. Having scarcely 500 men under his command, he was about to be attacked by a greatly superior body of troops, but, by a bold and fortunate manœuvre, rejoined Urdaneta and Rovira, and the relics of the patriot divisions.

He was now made second in command under General Serviez, who was posted at Puente Real. But the force of Murillo was overwhelming; and New Grenada became the prey of the Spaniards. Santander retired into Venezuela, and prepared to second the efforts of Bolivar. He was employed to organize the militia of the province of Casanare. To prevent this, the viceroy Samano despatched a force, under Barreiro, of 2500 men, who were harassed by the few troops under Santander, until the latter was joined by Bolivar. An engagement at Bojaca terminated in the total defeat of Barreiro. This campaign restored Bogota to the patriots, and Santander was immediately appointed, by Bolivar, vice-president of Cundinamarca. He contributed more than any other person to the assembling of the congress of Cucuta, and that body elected him vice-president of Colombia. He took the oaths of office in December 1821. From that period he is to be considered as the actual head of the executive; because Bolivar, the titular president being engaged in prosecuting the war in Quito and Peru, left the administration of affairs entirely to the vice-president. Like Bolivar he was elected to a second term of office, to commence January 1, 1827. He seems to have acted, all things considered, with judgment, prudence, and ability, in the arduous task of balancing factions, giving effect to a new system, and healing the wounds of a country bleeding from a long war of the most terrible character. Until the insurrection of Paez in Venezuela, which broke out in May 1826, Santander's success corresponded to his patriotism. During the residue of that year he became extensively known as the great champion of that republican constitution which he was sworn to support, and, of course, became the object of unmitigated abuse from the disorganizers and insurrectionists of Venezuela. He ended actual hostilities with Paez, and left the insurrection to be quieted by Bolivar, to whom the disaffected appealed. In 1827 Santander entered upon his second term of office, and from that time was opposed to Bolivar, and was the rallying point of the constitutional and republican party. In September 1827 Bolivar entered upon the duties of the office of president, and of course the executive authority ceased to be vested in Santander, who was now regarded as the personal enemy of Bolivar; but in fact was hostile only to the design of the liberator to suspend or subvert the constitution, and he did not close his political career until he had exhibited several new proofs of his patriotism.

**SANCTORIUS**, a physician, celebrated for his writings on diet, and the preservation of health. He was born at Capo d'Istria in 1561, and studied successfully at Padua. He devoted much time to experimental investigations into the nature of insensible perspiration, on which he was engaged till the time of his death. His principal work was entitled "*Ars de Statica Medicini*."

**SANCROFT, WILLIAM**.—This eminent English ecclesiastic was born at Fresingfield in Suffolk, at the beginning of 1616. He was educated at Cam-

bridge, and became fellow of Emmanuel college in 1642. He was ejected in 1649, and left England till the return of Charles II. In 1664 he was promoted to the deanery of York, whence he was removed to the deanery of St. Paul's. On arriving in the metropolis, he set himself most diligently to repair the cathedral, which had suffered greatly from the zeal of the republicans in the civil wars, till the dreadful fire in 1666 suggested the rebuilding it. Towards this he gave 1400*l.*, besides what he procured by his interest and solicitations among his private friends, and in parliament, where he obtained the act for laying a duty on coals for the rebuilding of the cathedral. He also rebuilt the deanery, and improved the revenues of it.

In October 1668 he was admitted archdeacon of Canterbury, on the king's presentation, which he resigned in 1670. He was also prolocutor of the lower house of convocation; and was in that station when Charles II. in 1677 advanced him, contrary to his knowledge or inclination, to the archiepiscopal see of Canterbury. In 1678 he published some useful directions concerning letters testimonial to candidates for holy orders. He was himself very conscientious in the admission to orders or the disposal of livings, always preferring men of approved abilities, great learning, and exemplary life.

In 1686 Dr. Sancroft was named the first in James II.'s commission for ecclesiastical affairs; but he refused to act in it. About the same time he suspended Wood, bishop of Lichfield and Coventry, for residing out of and neglecting his diocese. As one of the governors of the Charter House, he refused to admit as pensioner in that hospital Andrew Popham, a Roman catholic, although he came with a nomination from the court. In June 1688 he joined with six of his brethren the bishops in the celebrated petition to King James, in which they gave their reasons why they could not cause his declaration for liberty of conscience to be read in churches. For this petition, which the court called a libel, they were committed to the Tower; and being tried for a misdemeanour on the 29th, were acquitted. This year the archbishop projected an union with the protestant

dissenters. We have the following account of this in the speech of Dr. W. Wake, bishop of Lincoln, in the house of lords, March 17, 1710, at the opening of the second article of the impeachment against Dr. Sacheverell. "The person," says he, "who first concerted this design, was the late most reverend Dr. Sancroft, then archbishop of Canterbury. The time was towards the end of that unhappy reign of King James II. Then when we were in the height of our labours, defending the church of England against the assaults of popery, and thought of nothing else, that wise prelate, foreseeing some such revolution as soon after was happily brought about, began to consider how utterly unprepared they had been at the restoration of King Charles II. to settle many things to the advantage of the church, and what a happy opportunity had been lost for want of such a previous care, as he was therefore desirous should now be taken, for the better and more perfect establishment of it. It was visible to all the nation, that the more moderate dissenters were generally so well satisfied with that stand which our divines had made against popery, and the many unanswerable treatises they had published in confutation of it, as to express an unusual readiness to come in to us. And it was therefore thoughtworth the while, when they were deliberating about those other matters, to consider at the same time what might be done to gain them without doing any prejudice to ourselves. The scheme was laid out, and the several parts of it were committed, not only with the approbation, but by the direction of that great prelate, to such of our divines as were thought the most proper to be entrusted with it. His grace took one part to himself; another was committed to a then pious and reverend dean, Dr. Patrick, afterwards a bishop of our church. The reviving of the daily service of our liturgy, and the communion book, was referred to a select number of excellent persons, two of which Archbishop Sharp and Dr. Moore, are at this time upon our bench, and I am sure will bear witness to the truth of my relation. The design was in short this; to improve, and, if possible, to enforce our discipline; to review and enlarge our liturgy, by correcting of some things, by adding of others; and if it should be thought advisable by authority, when this matter should come to be legally considered, first in convocation, then in parliament, by leaving out some few ceremonies, confessed to be indifferent in their nature as indifferent in their usage, so as not to be necessarily observed by those who made a scruple of them, till they should be able to overcome either their weaknesses or prejudices, and be willing to comply with them."

After William and Mary were settled on the throne, Dr. Sancroft and seven other bishops refused to own the established government, from a conscientious regard to the allegiance they had sworn to King James. Refusing likewise to take the oaths appointed by act of parliament, he and they were suspended August 1, 1689, and deprived the 1st of February, following. On the nomination of Dr. Tillotson to this see, April 23, 1691, the archbishop received an order from the then Queen Mary, May 20, to leave Lambeth House within ten days. But he resolving not to quit till ejected by law, was cited to appear before the barons of the exchequer on the first day of Trinity-term, June 12, 1691, to answer a writ of intrusion; when he appeared by his attorney; but avoiding to put in any plea, as the case stood, judgment passed against

him, in the form of law, June 23, and the same evening, went to a private house in Palsgrave Head Court, near the Temple. Thence, on August 5, 1691, he retired to Fresingfield, the place of his birth, and the estate and residence of his ancestors above 300 years, where he lived in a very private manner, till his death, which occurred in 1693.

**SANDBY, PAUL.**—This eminent artist was born at Nottingham in 1732. After receiving a good education, he commenced his career as an artist at a very early age. His sketches in the Highlands were taken in 1748, and shortly afterwards etched. At a later period, Paul Sandby was a competitor for higher pictorial honours. A member of the chartered society of painters, he became on its dismemberment a member of the royal academy, an ornament to society, and a credit to his profession; as from the suavity of his temper, his kindly disposition, his liberality, and social character, he became the centre of a circle, in which both rank and talent were included.

An act of kindness highly creditable to the subject of this brief sketch may here be mentioned. When Wilson, the pride of art, and father of British landscape-painting, was reduced to the necessity of selling his beautiful studies from nature to printsellers for a few shillings, Mr. Sandby requested he might have the refusal: and though by no means rich himself, he was happily able to give the artist gold, where silver only had previously been obtained. The consequence was, Mr. Sandby became possessed of the most choice of Wilson's drawings, which were afterwards purchased by Messrs. Hurst and Robinson at a price that would have rejoiced and cheered the heart of the neglected painter, circumstanced as he was in his day of necessity. Paul Sandby's legitimate department of art was landscape, both in water-colours and in oil. In the first he was considered as eminently skilful, as well in opaque as transparent colours, the latter of which was much practised at that time, introduced it is imagined by Marco Russ, and the style continued by Goupy, Barrett, and others; but by none was it brought to greater perfection than by Benwell, whose taste and character of subject resembled much the late lamented Harlowe,—like him, too, he met an early grave. Benwell was a pupil of Mr. Sanders, miniature-painter and draughtsman. The early style of Mr. Sandby's drawings was simple and chaste; at first carefully pencilled, and afterwards a wash of colour thrown over them; not richly as in the present day, but efficient in all that regarded light and shade, form and composition. From such drawings, a work was given to the public by a Mr. Watts: it contained views of different noblemen's and gentlemen's seats in different parts of the kingdom. These were engraved in the line manner by some of our best artists, including the names of Middiman, Byrne, Milton, &c. This work exhibits Mr. Sandby's talents to great advantage; and though his drawings do not reach the present style of execution, colour, or effect, what he produced in the early state of the art no doubt gave a tone to, and stimulated the efforts of Dayes, Girtin, Turner, and others, who have brought the art of drawing to a degree of excellence never then contemplated, and which can scarcely ever be surpassed.

To his other acquirements in art Mr. Sandby added etching and engraving, more especially in that style of engraving known by the name of aquatinta. In this way his works are so extensive and numerous

that it may well raise the wonder of all who are acquainted with them, how he could find time for their execution. Many of these must have been extremely popular at the time they were published,—such as the different encampments in the year 1780; these were the encampments in Hyde Park, St. James's Park, Blackheath, the Museum Gardens, Coxheath, and Warley Common, in which, beside the soldiers' tents, and the economy of a camp, many fashionable and well-known characters of the day are introduced. His talent for the delineation of character, bordering as it mostly does on caricature, led him (as it has done many others) beyond the limits of good sense or the graver character of art. On the appearance of Hogarth's "Analysis of Beauty," mixed up with some political and party feelings, Mr. Sandby produced a series of prints ridiculing the line of beauty, and exhibiting its application to the most absurd and ludicrous forms, as Hogarth had done to those of more elegant and legitimate objects. Nor did his satirical vein stop here; the measures of ministers and the politics of the time were also attacked by his graphic satire. That this exercise of wit and burlesque was not wholly congenial to the temper and disposition of Paul Sandby, may be inferred from the circumstance of his withdrawing these prints from the public eye on seeing the inimitable paintings by Hogarth of the Marriage A-la-mode. Such a man, he observed, should not be made the subject either of ridicule or burlesque. These plates, however, display great skill in their composition and execution, and much humour and wit in character and subject. His brother, Thomas Sandby, was also one of the first members of the royal academy, where he was appointed professor of architecture. He received the rudiments of education at the drawing-school in the Tower, and afterwards had apartments at Windsor Castle, where he was much noticed by the king and royal family. His lectures were not, however, distinguished for any peculiar ability or new criticisms on art.

*Paul Sandby*

**SANDEMAN, ROBERT**, the founder of a religious sect, who was born at Perth in 1723. He was educated at Edinburgh, and in his writings endeavours to prove that faith is neither more nor less than a simple assent to the divine testimony. In 1764 Mr. Sandeman went to America. He died at Danbury in 1771.

**SANDERS, ROBERT**, a very industrious compiler, who was born in Scotland about 1727. His "Complete English Traveller" had a very extensive sale, and the "Letters on Roman History" were well received. He died in 1783.

**SANDERSON, ROBERT**, an eminent English ecclesiastic, who was born at Rotherham in 1587. He was educated at Oxford, and his "Lectures on Logic," read in that university, were published in 1615. Dr. Sanderson was raised to the bishopric of Lincoln in 1660, which he held till his death in 1662.

Mr. Granger says that the moral character of this great and good man has lately been rashly and feebly attacked by the author of the "Confessional," and

as ably defended by the author of "A Dialogue between Isaac Walton and Homologites," 1766. Every enemy to church government has been, for the same reason, an enemy to Bishop Sanderson, and every other prelate; but the uprightness and integrity of his heart, as a casuist, was never before called in question by any man who was not an entire stranger to his character. He saw and deplored, and did his utmost, honestly and rationally, to remedy the complicated ills of anarchy in church and state, won "every man projected and reformed, and did what was right in his own eyes. No image can better express such a condition than that of a dead animal in a state of putrefaction, when, instead of one noble creature, as it was, when life held it together, there are ten thousand little nauseous reptiles growing out of it, every one crawling in a path of its own." In Sanderson published many theological works, but they are now but little read.

**SANDONI, FRANCESCA CUZZONI**.—This lady was a native of Parma, and received her vocal instructions from Lanzi. After singing at most of the great theatres in Italy, she was engaged for the opera in London, soon after the arrival of Senesino. Till the time of her arrival in England, Cuzzoni, a female singer, was in full possession of the public favour; she then, however, quarrelled with Handel, who patronised her rival Faustina, and the following year Cuzzoni quitted the kingdom. In 1746 she returned, but, being then advanced in years, gave little satisfaction. She died indigent, in her native country, in the year 1770. The following anecdote is related of Cuzzoni. Handel had composed for her the song of "Falsa Imagine," in "Otho," which occasioned so severe a dispute between them, on account of her refusing to sing it, that, at last, Handel threatened to throw the refractory signora out of the window; telling her, "that he always knew she was a very devil, but that he should now let her know, in her turn, that he was Beelzebub, the prince of devils." He then actually seized her by the waist and lifted up the sash. Alarmed at this fearful process, Cuzzoni now consented, and by the exquisite grace, and pathos, not less than by the beautiful ornaments, with which she executed the few simple notes that compose the air, she added more to her reputation than by any other performance.

**SANDFORD, FRANCIS**, a celebrated genealogist and herald, who was by birth an Irishman, and filled the office of pursuivant-at-arms in the Herald's college during the reign of Charles II. and his successor. He wrote an account of the ceremonies observed at the coronation of James II., and several other works of a similar character. The one best known is his "Genealogical History of the Kings of England and Monarchs of Great Britain." Mr. Sandford resigned his situation in 1688, and died a few years after.

**SANDRART, JOACHIM**, a German artist, who was born in 1606, and died in 1688. He is best known by his literary and critical works connected with the fine arts, which were published collectively by Volkmann in 1675.

**SANDYS**.—There are two members of this family who have distinguished themselves by their literary attainments. Edwin Sandys was born in 1519, and educated at Cambridge. He was elected master of St. Catherine's Hall in 1547, but in Mary's reign he was committed to prison. As he proceeded, the

people prayed that God would comfort him and strengthen him in the truth. Struck with these appearances of popularity, the keeper of the Marshalsea said, "These vain people would set you forward to the fire: but you are as vain as they, if you, being a young man, will prefer your own conceit before the judgment of so many worthy prelates and so many grave and learned men as are in this realm. If you persist, you shall find me as strict a keeper as one that utterly misliketh your religion." Dr. Sandys replied, "My years, indeed, are few, and my learning is small; but it is enough to know Christ crucified; and who seeth not the blasphemies of popery hath learned nothing. I have read in scripture of godly and courteous keepers, God make you like one of them; if not, I trust he will give me strength and patience to bear your hard dealing with me." The keeper then asked, "Are you resolved to stand to your religion?" "Yes," said Dr. Sandys, "by God's grace." "I love you the better, therefore," said the keeper, "I did but tempt you: every favour which I can show, you shall be sure of: nay, if you die at a stake, I shall be happy to die with you." And from that day such was the confidence which this good man reposed in Sandys, that many times he permitted him to walk alone in the fields; nor would he ever suffer him to be fettered, like the other prisoners. He lodged him also in the best chamber of the house, and often permitted his wife to visit him. After nine weeks' confinement in the Marshalsea he was set at liberty at the intercession of Sir Thomas Holcroft. This, however, was not accomplished without much difficulty, and so intent was Gardiner, bishop of Winchester, on bringing Sandys to the stake, that it required some management on the part of Sir Thomas before he could succeed; and no sooner was Sandys liberated than Gardiner, being told that he had set at liberty one of the greatest heretics in the kingdom, procured orders to be issued to all the constables of London to search for, and apprehend him. In Sandys' final escape, as related by his biographer, the hand of Providence was strikingly visible. On Sunday, May 6, he embarked in the same vessel with Dr. Cox, afterwards bishop of Ely, and the ship was yet in sight when two of the guard arrived on the shore to apprehend Dr. Sandys. But his danger was not entirely over, for, on his arrival at Antwerp, he received intelligence that King Philip of Spain had sent to apprehend him, on which he escaped to the territory of Cleve, from thence to Augsburg, where he remained fourteen days, and then removed to Strasburg. Here he took up his abode for the present, and here unquestionably spent the most gloomy portion of his life. His own health was at this time deeply injured; his only child died of the plague; and his beloved wife, who had found means to follow him about a year after his flight from England, expired, of a consumption, in his arms. In addition to his sorrows, the disputes concerning church discipline broke out among the English exiles, on which several of his friends left the place. After his wife's death he went to Zurich, where he was entertained by Peter Martyr; but, his biographer thinks, the time did not permit him to receive any deep tincture either as to doctrine or discipline from Geneva or its neighbours. Within five weeks the news of Queen Mary's death arrived, and he returned to Strasburg, where he preached; after which Grindal and he set out for their native country together,

and arrived in London on the day of Queen Elizabeth's coronation.

On the 21st of December, 1559, Dr. Sandys was consecrated, by Archbishop Parker, to the see of Worcester. Browne Willis has most unjustly accused our prelate of having enriched his family out of the lands of this see; on the contrary, he transmitted it to his successor exactly as he found it, that is, saddled with the conditions of an exchange which the crown had by statute a right to make. Dr. Sandys died at Southwell in 1588.

George Sandys, son of the preceding, is best known for his travels in the East, of which he published an account, as well as other works. He died in 1643.

SAPPHO, a distinguished Greek poetess, who was born at Mitylene, on the island of Lesbos, and flourished about 600 B. C. Alcæus, like her, a lyric poet, and a native of the same island, is said to have loved her; but his passion was not returned. The brilliant fame which she enjoyed seems to have subjected her to calumny and even to persecution, on account of which she left Lesbos. She must not be

confounded with a later Sappho, also a native of Lesbos, the place of whose birth was Eresus, famous for having thrown herself from the Leucadian rock, in despair, on account of her unrequited love for a youth named Phaon. The ancients ascribe various poems to the elder Sappho,—hymns, odes, elegies, and epigrams,—of which only fragments have come down to us: these display deep feeling, glowing imagination, and a high degree of finish. Elton, the celebrated classical scholar, when speaking of this poetess, says—"They who regard the fragments of Sappho as mere love-songs, degrade her genius. Her 'strain' was of a higher mood. Simple, vehement, rich in images, sparing in words, her poetry is the poetry of impulse. In all succeeding poets who have written on love, we can trace the wit of sentiment and the finished delicacy of art: in Sappho we have a total unconsciousness of effort; but such is the enthusiasm of her sensations, that she has infused sublimity into the softness of sexual passion. Longinus has instanced her bold selection and association of circumstances in the emotions of violent love as forming the true sublime. He does not, however, specify any peculiarity in the passion described by Sappho, as

distinguishing it from a common passion; and yet I am satisfied that these strong emotions have a deeper source. Persons who have been struck with the disproportion of the effects to the cause, have conceived *jealousy* to be intended: it is a mere figure, and has not the least appearance of being pointed at any particular lover. Longinus does not quote the ode as a just description of jealous uneasiness, but of 'amorous furor:' and his expressions are, 'All things of this kind happen to those who are in love; but the seizure of the chief particulars and the embodying of them in one whole, has effected the sublime.' I have no doubt that the passion of which Sappho describes the paroxysm, is a passion indulged by stealth, and concealed through a sense of guilt or apprehension. The first line of the succeeding stanza, which is lost, seems to hint at a disclosure: 'Yet must I venture all:' and I am confirmed in my inference by the traditional story of the physician who discovered the love of Antiochus for Stratonice by comparing the effects which her presence produced on his patient, with the symptoms enumerated by Sappho."

As a specimen of the style of Sappho we may quote a fragment of her amatory poetry as translated by Elton:—

"That man is like a god to me,  
Who, sitting face to face with thee,  
Shall hear thee sweetly speak, and see  
Thy laughter's gentle blanching.  
'Tis this astounds my trembling heart;  
I see thee, lovely as thou art:  
My fluttering words in murmurs start."

**SARDANAPALUS.**—This celebrated Assyrian monarch succeeded to the empire only to present a more perfect specimen of effeminacy, sloth, luxury, cowardice, crime, and elaborate folly, than was, perhaps, ever before exhibited to the detestation of mankind. Like his inglorious predecessor, the first of this effeminate dynasty, he secluded himself in his palace, assumed the dress of a woman and imitated her voice, painted his face, spun, and in short utterly disgraced his nature by the most unbounded licentiousness and the most outrageous depravity. Arbaces, the governor of Media, having been personally witness of his excesses in consequence of obtaining access to the palace, was inflamed with the resolution to put an end to his dominion, and instantly entered into a confederacy for the purpose with Belesis, viceroy of Babylon, who strengthened him by the assurance, which, as a priest and an astrologer, he considered himself entitled to give, that he should be the instrument of dethroning Sardanapalus and ascending his throne. Thus supported, as they both believed, by heaven itself, they began the revolt; the one by stirring up the Medes and Persians, the other by exciting dissatisfaction among the Babylonians. Having also gained over the king of Arabia, and secured his active co-operation, the conspirators secured the army, which was now newly raised at the expiration of the year, and which amounted to about 400,000 men. The king, being apprised of these proceedings, was somewhat roused from his voluptuous dreams by a sense of personal and immediate danger, and concentrating all the forces he could combine in this emergency, led them out to encounter his rebellious subjects. He was victorious in three successive battles, in the last of which, after using every effort in vain to prevent defeat, with all its consequent calamities, Arbaces was severely wounded. After the first victory a reward was of-

fered of 200 talents of gold to any man who should kill him or Belesis, and twice that amount to any one who should bring either of them alive to the emperor. But from all the impending dangers with which they were threatened they effected their escape.

His enemies, however, though defeated, were not disheartened, and they again rose in rebellion. Of this Sardanapalus remained ignorant, and occupied himself in the mean time in arranging a sacrifice, and a festival for the army with whom he had conquered his enemies. This account of his proceedings revived the hopes of Arbaces, who, having taken his measures with a characteristic sagacity and prudence, surprised the camp of the emperor, and rushed forward almost to the very gates of the city. Sardanapalus, now escaping from immediate danger, entrusted the conduct of the army to his brother-in-law, shutting himself up within the fortifications. After being twice defeated, the army was nearly annihilated, and the emperor was, in consequence, closely besieged, while the conspirators received large accessions of strength from the revolt of other provinces; but he buoyed up his spirits by confiding in a prediction that "Nineveh could never be taken, till the river became her enemy."

The city being abundantly supplied with provisions, the confederate forces remained two whole years before it without producing any visible impression, till the Tigris, at length being swollen by unusual quantities of rain, overflowed twenty stadia, or two miles and a half, of the wall, and thus made a practicable breach, which their whole art before had been unable to accomplish. Sardanapalus at once comprehended his danger, and, his last hope being thus unexpectedly extinguished, he fled into his palace, and ordering a vast pile to be reared in the court, on which he accumulated all his treasures, amounting to a prodigious value, and close to which he placed his eunuchs, his concubines, and, lastly, himself, he set fire to it, and perished amidst the splendid ruins. The conquerors destroyed the city, but treated the inhabitants with great moderation. Such was the termination of the Assyrian empire. Sardanapalus is said to have ordered two lines to be put upon his tomb, which imply his having taken with him all he had eaten and all the pleasures he had enjoyed, leaving the rest behind; an epitaph, as Aristotle very justly observes, fit for a hog.

**SARTI, GIUSEPPE.**—This celebrated composer was born at Faenza in 1730. In 1756 he held the situations of court chapel-master and music-master to the royal family in Copenhagen; he also composed there some operas, but which were only moderately successful. Some time after this he became chapel-master of the conservatory Della Pietà at Venice, and it is from this epoch that his high reputation in Italy must be dated. All the Italian theatres were anxious for his compositions, which he could not produce in sufficient number. In 1782 he was elected chapel-master of the Duomo at Milan. His most popular opera at this time was "Giulio Sabino," composed in 1781 for Venice, and published at Vienna in 1784. Some German critics, however, were of opinion, that the harmony of this opera was weak and defective, and that its only merit lay in the melody. Be that as it may, the high reputation of this work extended itself even to St. Petersburg, where the empress of Russia invited Sarti to her capital, with the appointment of imperial-chapel-master for a

term of three years. In 1785 he accordingly arrived there, and made his *debut* at St. Petersburg, by a *concert spirituel* for Good Friday, introducing also some Russian psalms, which were performed by sixty-six voices and a hundred Russian horns, besides the customary orchestra. Still, however, this concert was not noisy enough to please the Russians; so that shortly after, on the occasion of the taking of Okzarkow, he produced a "Te Deum," in which he introduced real firing of cannon: the guns being placed in the court of the castle, and discharged with great precision in the appointed passages of the music. After the representation of "Armida," in 1786, the empress presented Sarti with a gold snuff-box and diamond ring, and appointed him director of the conservatory of music at Catharinenslaf, with a salary of 35,000 rubles, besides his lodging, and a purse of 15,000 rubles as an indemnity for his travelling expenses. She also conferred on him a title of nobility. After a residence of eighteen years in Russia, and receiving various additional favours from the court and nobility, the emperor Alexander permitted him, in 1801, on account of his health, to retire, with the continuance of his pension, to a warmer climate. He then went to Berlin, but his constitution was so broken up, that he died in that city in the following year, 1802.

**SAUNDERS, SIR EDMUND**, a learned English judge, who lived in the reign of Charles II. He is well known for his "Reporter of Several Pleadings and Cases in Banco Regis Temp. Car. II.," which are peculiarly valuable on account of the correct state of the pleadings in the several cases. Sir Edmund Saunders was made chief justice of the court of king's bench in 1682, and died in the same year.

**SAUNDERS, WILLIAM**.—This venerable practitioner was born in 1743, and might doubtless have been considered the father of the college of the physicians of London, of which he was a fellow during many years. Having received a liberal education, and obtained considerable eminence by his town practice, he became in due time physician extraordinary to his royal highness the prince of Wales, and also senior physician to Guy's hospital. He at length, however, retired from his profession, from Russell Square, and died at Enfield, June 4th, 1817. Dr. William Saunders was a distinguished member of most of the medical and scientific institutions in the metropolis, and contributed not a little to attract the attention of the public to the virtues of the red Peruvian bark. He was the author of the following works:—"An Answer to Geach and Alcock, on the Devonshire Colic;" "Observationes de Antimonis;" "Treatise on the Mephitic Acid;" "A Treatise on the Red Peruvian Bark;" "Dissertation on the Structure, Economy, and Diseases of the Liver;" "Oratio Herveii;" "On the Chemical History of the Medical Powers of Some of the Most Celebrated Mineral Waters;" "On the Hepatitis of India."

**SAUNDERSON, NICHOLAS**.—This learned mathematician was born at Thurlston in Yorkshire, in 1682, and, when only a year old, entirely lost his eyesight. He, however, acquired a competent knowledge of the Latin and Greek languages, and particularly directed his attention to the study of mathematics. In 1707 he was, by the assistance of some friends, sent to Cambridge, where he soon commenced giving lectures, in which he was very successful; and subsequently became professor of mathematics

in the university. In 1728 George II. created him doctor of law by the royal mandate. His death took place in April 1739, and his very valuable work on algebra was published after his death.

**SAUVEUR, JOSEPH**.—This professor of mathematics at the royal college in Paris, and member of the academy of sciences, was born at La Flèche in 1653. He had not the faculty of speech till seven years of age. Another peculiarity of his life is, that he could not be prevailed on to see the person he was about to marry, till the contract of marriage was signed. He was fond of music, but had neither voice nor ear. His great object was to simplify the science, with which view he proposed to constitute one fixed key for all the music in the world, and also produced a specimen of a mode of writing music on *one* line. He also invented a musical chronometer. His treatises on music were all published in the "Memoirs of the Academy of Sciences," between the years 1701 and 1713. He died in 1716.

**SAURIN, JAMES**, an eminent divine, who was born at Nismes in 1677. His father retired, after the repeal of the edict of Nantes, to Geneva, at which place he died. Young Saurin made great progress in his studies, but abandoned them for some time that he might follow the profession of arms. In 1694 he made a campaign as a cadet in Lord Galloway's company, and soon afterwards procured a pair of colours. But when the duke of Savoy had concluded a peace with France, Saurin quitted the army; and on his return to Geneva again, directed his attention exclusively to philosophy and divinity. In 1700 he visited both Holland and England, but returned to the Hague in 1705. He possessed great talents, to which were added a good address and a most eloquent style of preaching. Five volumes of his sermons made their appearance at different times; the first in 1708, the second in 1712, the third some years after, the fourth in 1722, and the fifth in 1725. After his death, which took place at the Hague in 1730, the sermons relating to the passion of Christ, and other subjects, were published in two volumes. He also, by the advice of a friend who was preceptor to the children of George II. when prince of Wales, composed "A Treatise on Education," to which he prefixed a dedication to the young princes. This, though never printed, was followed by a handsome present from the princess of Wales. He obtained also a pension from the king, to whom he had inscribed the third volume of his sermons. In 1727 he published "The State of Christianity in France." But his most celebrated work was, "Discourses, Historical, Critical, and Moral, on the Most Memorable Events of the Old and New Testament." Two volumes made their appearance in folio, and were afterwards reprinted in four, in octavo. Six other Discourses form a part of a fifth volume, published by Mr. Roques, who undertook a continuation of the work, which is replete with learning. "A Dissertation on the Expediency of sometimes Disguising the Truth," made him many enemies. His principal antagonist was Armand de la Chapelle, to whom Francis Michael Ganicon replied in a work entitled "Lettres Serieuses et Jocoses." The three first of the letters in the second volume are in favour of Saurin. He was answered by La Chapelle with great violence. Saurin imagined that he should be able to terminate this dispute by reprinting the Dissertation separately, with a preface in defence of his assertions; but he was deceived, for La Chapelle pub-

lished a very long and scurrilous reply. This dispute was at length brought before the synod of Campen, who, in May 1730, ordered the churches of Utrecht, Leyden, and Amsterdam, to make their examinations, and report the result of them to the synod of the Hague, which was to sit in the September following. Commissaries were appointed for this purpose. The synod of Campen gave its opinion, and that of the Hague confirmed it; but, having made no mention of the instructions sent to the Walloon church at Utrecht, that assembly complained, and ordered Mr. Bonvoust, one of its ministers, to justify his proceedings and his doctrine. This he did in a large octavo volume, printed at Utrecht in 1731, after the death of Saurin, entitled "The Triumph of Truth and Peace; or, Reflections on the Most Important Events attending the Last Synod assembled to determine in the Case of Messieurs Saurin and Maty."

SAUSSURE, HORACE BENEDICT DE.—This celebrated natural philosopher was born at Geneva in the year 1740. His father resided at Conches, on the banks of the river Arve, half a league from Geneva. His residence was habitually in the country; this, together with an active education, gave a marked and striking character to his future pursuits, and developed in De Saussure the natural strength of constitution so necessary to the practical cultivation of natural history. Residing at the foot of the Salève, a mountain which he afterwards rendered famous by his meteorological researches, he was surrounded by the most interesting phenomena of nature, so that he thus became attached to natural history without imitating those learned men who form theories without leaving their cabinets, or those men of mere practice, who being continually surrounded by natural scenes, become incapable of admiring their beauty. His first pursuit was botany. A varied soil, producing almost every sort of plants, invited the inhabitants of the borders of the Lemane lake to cultivate this agreeable science. This taste of De Saussure led him to form a connexion with the great Haller. He paid him a visit in 1764, during his retirement at Bex, and has given an account in his travels of his first interview with that extraordinary man, who excelled in nearly all the natural sciences. De Saussure was still more excited to study the vegetable kingdom by his connexions with Charles Bonnet, who had married his aunt, and who soon perceived the value of his nephew's increasing talents. Bonnet was then employed on the leaves of plants, and in 1760 De Saussure published the result of his enquiries under the title of "Observations on the Cuticle of Leaves." About this time the place of professor of philosophy became vacant. De Saussure, then just in his twenty-first year, obtained it. At that time the two professors of philosophy taught by turns natural philosophy and logic. De Saussure filled those two offices with equal success. In 1779 De Saussure published the first volume of his "Travels in the Alps." We there find a complete description of the environs of Geneva, and an excursion to Chamouni, a village at the foot of Mont Blanc. The more he observed the mountains the more he perceived the importance of mineralogy. In order to study it to greater advantage he learned the German language; and in the last volume of his travels we may easily perceive how much new mineralogical knowledge he had acquired. De Saussure, being called upon by his office to attend to public educa-

tion, made it a particular object of his attention. He presented a plan for reforming the course of education at Geneva. He proposed to teach children very early the natural sciences and mathematics; he was even attentive to their physical education; and, that it might not be neglected, proposed the adoption of gymnastic exercises. This plan excited great attention in a town where every one is aware of the importance of education, though the mediocrity of their pecuniary resources was a great obstacle to perfect success. The Genevese were much attached to their established forms of education; and they had cause, for it had not only introduced general information among them, but had given the first spring to the talents of several distinguished mathematicians and natural philosophers. But public education did not alone claim the attention of De Saussure. He attended himself to the education of his two sons and his daughter, who have shown themselves worthy of such an instructor.

The second volume of his travels was published in 1786. It contains a description of the Alps which surround Mont Blanc. The author considers them as a mineralogist, geologist, and natural philosopher; and he particularly notices some very interesting experiments on electricity, and a description of his electrometer, which is one of the most complete we possess. We are likewise indebted to him for several measuring instruments; his *cyanometer*, designed to measure the intensity of the blue of the heavens, which varies according to its elevation; his *diaphanometer*, or his method of measuring the diaphaneity of the air; and his *anemometer*, in which, by means of a kind of balance, he ascertains the power of the wind. Some years after the publication of his second volume, De Saussure was received as a foreign associate of the academy of sciences. De Saussure founded the society of arts to which Geneva is indebted for much of its commercial prosperity. He presided in this society to the very last; and it was one of his principal objects to support that useful establishment.

De Saussure took an active part in the French revolution; and he was successively a member of the council of five hundred, and of the national assembly. It was from his assiduous attention to the sittings of the latter assembly that his health first began to fail; and in 1794 a paralytic stroke deprived him of the use of one side of his body. However painful his situation might then be, he lost nothing of the activity of his mind; for it was after this accident that he drew up the two last volumes of his travels, which appeared in 1796. They contain an account of his travels in the mountains of Piedmont, Switzerland, and in particular of his ascent to the summit of Mont Blanc. These two last volumes, so far from appearing to partake of the weakness of his condition, offer a considerable mass of important facts and observations in natural philosophy.

SAVAGE, RICHARD.—This talented English poet was a remarkable instance of the utter uselessness of genius and knowledge, without good moral principles and regularity of conduct. He was born in 1698, and was the son of Anne countess of Macclesfield, by the earl of Rivers, and might have been considered as the lawful child of the earl of Macclesfield; but his mother, in order to procure a separation from her husband, made a public confession of her shameless conduct. As soon as he was born, the countess treated him with every kind of unnatural

cruelty. She committed him to the care of a poor woman, to educate as her own. And she prevented the earl of Rivers from making him a bequest in his will of 6000*l.* by declaring him dead. She endeavoured to send him secretly to the American plantations; and at last, to bury him in poverty and obscurity for ever, she placed him as an apprentice to a shoemaker in Holborn. About this time his nurse died; and in searching her effects, which he imagined to be his right, he found some letters which informed him of his birth, and the reasons for which it was concealed. He now left his humble occupation, and tried every method to awaken the tenderness and attract the regard of his mother: but all his assiduity was without effect; for he could neither soften her heart nor open her hand, and he was reduced to the miseries of want. By the care of Lady Mason, mother to the countess, he had been placed at the grammar school at St. Alban's, where he had acquired all the learning which his situation allowed; and necessity now obliged him to become an author. The first effort of his uncultivated genius was a poem against Hoadley, bishop of Bangor; of which the author was afterwards ashamed. He then attempted to write for the stage, but with little success: yet this attempt was attended with some advantage, as it introduced him to the acquaintance of Sir Richard Steele and Mr. Wilks. Whilst he was in dependence on these gentlemen, he was an assiduous frequenter of the theatres, and never absent from a play for several years. In 1723 he brought a tragedy on the stage, in which he himself performed a part, the subject of which was "Sir Thomas Overbury." If we consider the circumstances under which it was written, it will afford a proof of strength of genius, and an evenness of mind not to be ruffled. Whilst he was employed upon this work, he was without lodging, and often without food; nor had he any other conveniences for study than the fields or the street. The profits of this play amounted to about 200*l.*, and it procured him the notice and esteem of many persons of distinction; and he might have now risen to importance had not his irregularities plunged him into a misfortune, by which not only his reputation, but his life, was in danger. In a night-ramble he entered a house of ill-fame, near Charing Cross, when a quarrel took place between him and a Mr. Sinclair, who was killed in the fray. Savage, with his companion, was taken into custody, tried for murder, and capitally convicted of the offence. His mother, at this juncture, used all means to prejudice the queen against him, and to intercept all the hopes he had of life from the royal mercy; but at last the countess of Hertford, out of compassion, laid a true account of the extraordinary story and sufferings of poor Savage before her majesty, and obtained his pardon. He now recovered his liberty, but had no means of subsistence; and a lucky thought struck him, that he might compel his mother to do something for him and extort that from her by satire which she had denied to natural affection. The expedient proved successful; and Lord Tyrconnel, on his promise to lay aside his design, received him into his family, treated him as his equal, and engaged to allow him a pension of 200*l.* a year. In this gay period of life, when he was surrounded by affluence and pleasure, he published "The Wanderer, a Moral Poem," which was approved by Pope, and which the author himself considered as his masterpiece. It was addressed to the

earl of Tyrconnel, with the highest strains of panegyric. These praises, however, in a short time he found himself inclined to retract, being discarded by that nobleman on account of his imprudent and licentious conduct. He now thought himself again at liberty to expose the cruelty of his mother, and accordingly published "The Bastard, a Poem." This had an extraordinary sale; and as it appeared at a time when the countess was at Bath, shame obliged her to quit the place.

Some time after this, Savage formed a resolution of applying to the queen: she had given him his life, and he hoped her goodness might enable him to support it. He published a poem on her birth-day, which he entitled "The Volunteer Laureat." She graciously sent him 50*l.*, with an intimation that he might annually expect the same bounty. His conduct with regard to this pension was very singular: as soon as he had received it, he immediately disappeared, and was for some time out of the reach of his most intimate friends. At length he would be seen again, penniless as before, but never informed any person where he had been, nor was his retreat ever discovered. His perpetual indigence, politeness, and wit, still raised him new friends, as fast as his misbehaviour lost him his old ones; and Sir Robert Walpole, the prime minister, was warmly solicited in his favour. Promises were given, but ended in a disappointment; upon which he published a poem in "The Gentleman's Magazine," entitled, "The Poet's Dependence on a Statesman."

This wretched life was rendered more unhappy, in 1738, by the death of the queen, and the loss of his pension. His distress was now publicly known, and his friends therefore concerted some measures for procuring him a permanent relief. It was proposed that he should retire into Wales, with an allowance of 50*l.* per annum, to be raised by subscription, on which he was to live in a cheap place. This offer he seemed to accept with great joy, and set out on his journey, with fifteen guineas in his purse. His friends, the principal of whom was Pope, expected now to hear of his arrival in Wales; but, on the 14th day after his departure, they were surprised with a letter from him, acquainting them that he was yet upon the road, and without money, and could not proceed without a remittance. The money was sent, by which he was enabled to reach Bristol; whence he was to go to Swansea by water. He could not immediately obtain a passage, and therefore was obliged to stay some time at Bristol; where, with his usual facility, he made an acquaintance with the principal people, and was treated with great kindness. At last he reached the place proposed for his residence; where he stopped a year, and completed a tragedy, which he had begun in London.

He was now desirous of coming to town to bring it on the stage; but his friends, and particularly Pope, opposed the design very strongly; and advised him to put it into the hands of Thomson and Mallet to fit it for the stage, and to allow his friends to receive the profits, out of which an annual pension should be paid him. The proposal he rejected, quitted Swansea, and set off for London; but, at Bristol, a repetition of the kindness he had formerly found invited him to stay. He stayed so long, that by his imprudence and misconduct he wearied out his friends. His wit had lost its novelty; and his irregular conduct and late hours grew very troublesome. His

money was spent, his clothes worn out, and his appearance made it difficult for him to obtain even a dinner. Here, however, he stayed in the midst of poverty, hunger, and contempt, till the mistress of a coffee-house, to whom he owed about 8*l.*, arrested him for the debt. He could find no bail, and was therefore committed to prison. During his confinement, he began and almost finished a satire, entitled, "London and Bristol Delineated."

When he had been several months in prison, he received a letter from Pope, containing a charge of great ingratitude. Savage returned a very solemn protestation of his innocence, and he appeared much pained by the accusation. In a few days after he was seized with a disorder, which at first was not supposed to be dangerous, but in a few days it took a fatal turn, and he died on the 1st of August, 1748. His death exhibited, to use the words of Johnson, "a convincing proof that nothing can supply the want of prudence, and that negligence and irregularity, long continued, will make knowledge useless, wit ridiculous, and genius contemptible."

SAVARY, JAMES, a learned French writer, who was born in a small town in Anjou in 1622, and early in life entered the mercantile profession, by which he, in a comparatively short time, acquired a competent fortune. He was married in 1650, and in 1667, when the king declared a purpose of assigning privileges and pensions to such of his subjects as had twelve children alive, Savary was not too rich to put in his plea. He was afterwards admitted of the council for the reformation of commerce, and the orders which passed in 1670 were drawn up from his instructions and advices. He was pressed by the commissioners to digest his principles into a volume, and to give it to the public, which he afterwards did at Paris, in 1675, under the title of "*Le Parfait Négociant, ou Instruction Generale pour ce qui regarde le Commerce des Marchandises de France et des Pays Etrangers.*" This work passed through several editions during the life of the author, and after his death it was subsequently edited by his son, and it has been translated into almost all European languages. In 1688 he published "*Avis et Conseils sur les plus Importantes Matieres du Commerce,*" which has been considered as a second volume to the former work, and often reprinted. He died in 1690, and, out of seventeen children which he had by one wife, left eleven.

SAVIGNY, FREDERIC CHARLES, a distinguished professor of civil law, who was born in 1779 at Frankfort on the Maine. After having finished his academic studies, in which Weis and Hugo were his chief guides, and having taken his degree as doctor of laws at Marburg in 1800, he travelled during several years in Germany, France, and Upper Italy, to investigate unexplored or little known sources of the civil law, and, after his return, was appointed professor of law at Marburg. In 1803 he wrote, at this place, his "*Law of Possession.*" In 1808 he was appointed professor at Landshut, and, in 1810, in the university established a short time previous at Berlin, where he continued to teach. He was a member of the academy of sciences at Berlin, of the council of state, and of the court of revision, or cassation, for the Prussian provinces on the Rhine, where the French code remained in force. His lectures on the pandects, the institutes and the history of the Roman law, were distinguished for clearness,

precision, and purity of language. Savigny belonged to the historical school of German lawyers, though he cannot be termed its founder without injustice to Hugo and Schlosser. He was, however, the first to adopt this name for himself and his followers, to distinguish his school from one which might, with equal reason, assume the title of the philosophical school, and call their opponents the unphilosophical, as they are far from disregarding the historical developments of law, though they endeavour to deduce law mainly from the higher principles of our nature. Savigny's views respecting the foundation of law—according to which it rests neither on positive legislation nor on the deductions of reason—are contained in a work published subsequently, in consequence of the wish expressed by other jurists, Thibaut, Schmid, Gönner, for the introduction of a general penal and civil code, and a uniform course of procedure throughout Germany. In this work, entitled "*Vom Beruf unserer Zeit für Gesetzgebung und Rechtswissenschaft,*" he endeavours to show that new codes are unnecessary and impracticable; that the codes of France, Austria, and Prussia are not adapted for introduction into other countries, and that the German language is not even sufficiently matured for a code. Savigny's work, though replete with proofs of extensive erudition, and not devoid of sound views, exhibits also numerous traces of the disposition to exalt the past and the distant, at the expense of the present and the near, so often met with among the learned, who are disposed to value most highly what has cost them most labour. The fondness for ancient laws and political institutions is most common in those countries which have the least political liberty. How often does a German philologist assert that the greatest orators are those who were formed under the political institutions of antiquity, forgetting the great names who adorn the history of English eloquence! The work of Savigny cannot be called very philosophical, but it contains much matter for reflection. He has published a "*History of the Roman Law in the Middle Ages*;" other fruits of his researches are contained in papers read before the academy of sciences, &c.

SAVILE, SIR HENRY, one of the most profound and elegant scholars of his age. He was born in 1549, and, after graduating at Brazenose college, Oxford, removed on a fellowship to Merton college in the same university. In his twenty-ninth year he made a tour on the continent, for the purpose of perfecting himself in elegant literature, and, on his return, was appointed tutor in Greek and mathematics to Queen Elizabeth. Seven years after, the wardenship of his college, which he held for about six-and-thirty years, the provostship of Eton being added to it in 1596, was conferred on him. In 1606 he founded two professorships in geometry and astronomy at Oxford, besides conferring several other valuable benefactions, both in property and books, many of the latter forming still a part of the Bodleian library. His chief works are, "*Commentaries on Roman Warfare,*" "*Rerum Anglicarum post Federam Scriptores,*" "*Prælectiones in Elementa Euclidis,*" and his edition of the writings of St. Chrysostom, in eight folio volumes. Sir Henry Savile was the correspondent of J. Scaliger, Meibomius, Isaac Casaubon, and other learned men of his day. He died in 1622.

SAVILE, GEORGE, MARQUIS OF HALIFAX, an English statesman and writer, who was born in

1630. On the death of Cromwell he distinguished himself by his exertions in favour of the absent king, and on the restoration was raised to the peerage. He was removed from the council in 1675, through the influence of the duke of York, in consequence of his opposition to that prince's measures in favour of the Roman catholic religion. But when the bill for excluding the duke from the succession was in agitation, his repugnance to that measure brought him into disgrace with the party with which he had hitherto acted. In 1682 he was created marquis of Halifax, keeper of the privy seal, and president of the council, which dignities he retained in the early part of the succeeding reign, till his opposition to the proposed repeal of the test acts caused his abrupt dismissal. From this moment Lord Halifax continued in opposition, till the flight of James II., when he was chosen speaker of the house of lords in the convention parliament, and contributed mainly to the elevation of William III. to the throne. But soon after the revolution he resigned the privy seal, and, during the remainder of his life, voted against the court. A mortification in the bowels carried him off in 1695. He was the author of "Advice to a Daughter," and of a variety of political tracts, the principal of which are, "Maxims of State," "The Character of a Trimmer," "Character of King Charles II.," "Anatomy of an Equivalent," &c.

SAVONAROLA, GERONIMO, an Italian monk, celebrated for his eloquence and his melancholy fate. He was born at Ferrara in September 1452, and was designed for the medical profession. Religious enthusiasm led him, at the age of fourteen, to leave his father's house secretly, and enter the order of Dominicans. Several years later he began to preach at Florence, but with so little success that he determined to abandon the pulpit, and, retiring to Bologna, he devoted himself to metaphysical and physical studies. The reputation of his talents and learning induced Lorenzo de' Medici to invite him to return to Florence. Here Savonarola began to preach again, and his discourses attracted such crowds that the church could not contain them. His extraordinary sanctity and his powerful eloquence gained him great influence over the minds of the Florentines, and he was emboldened to assume a prophetic tone, and to urge with vehemence, and in public, the necessity of a reform in the church. The multitude looked upon him as divinely inspired, while some ridiculed him as a fanatic, and others denounced him as an impostor. He soon broke off all connexion with his patron Lorenzo, whose character he assailed with prophecies of his approaching fall. He refused to make the customary visit to that chief, which it was his duty to do as prior of St. Mark's, and, when Lorenzo went himself to St. Mark's, refused to see him. Although Lorenzo de' Medici was repeatedly urged to adopt severe measures against him, he refused, either from lenity or from his respect for the character of the preacher. When Lorenzo lay on his death-bed in 1492, Savonarola obtained admission to him, and spoke to the dying man with the dignity of his office. After the death of Lorenzo, and the expulsion of his son Pietro, Savonarola took the most active part in the political affairs of Florence. He put himself at the head of those who demanded a more democratical form of government, asserted that God had commissioned him to declare that the legislative power must be extended

to the citizens, that he himself had been the ambassador of the Florentines to heaven, and that Christ had consented to be their king. The newly elected magistrates accordingly laid down their offices, and the legislative functions were entrusted to a council of the citizens, which chose a committee from their own number for the discharge of the duty. Dissensions, however, distracted the new republic; the aristocratical and democratical parties persecuted each other with great fury, the former consisting of the friends of the old order of things, and the latter of the devout admirers of the monk. But the zeal of Savonarola was not content with revolutionizing Florence, he meditated the reform of the Roman court, and of the irregularities of the clergy. The pontificate of Alexander VI. could not fail to supply causes of complaint on both heads. He accordingly wrote, as his eulogists assure us, to the Christian princes, declaring that the church was going to ruin, and that it was their duty to convoke a general council, before which he was ready to prove that the church was without a head, and that the reigning pope was not a true bishop, had never been worthy of the title, nor even the name of a Christian. Alexander excommunicated him, and the bull of excommunication was read in the cathedral at Florence, but Savonarola despised the thunders of the Vatican, and continued to preach.

His influence was still farther increased by the failure of an attempt of Pietro de' Medici to restore his family authority. But another party had, meanwhile, arisen in opposition to him. His innovations in St. Mark's and other monasteries had excited the enmity of the monks, especially of the Franciscans of the strict observance, who denounced him from the pulpit as an excommunicated heretic. Fra Domenico da Rescia, a monk of his convent, offered, in the heat of his fanatical zeal, to prove the truth of his master's doctrines by passing through fire, if one of his opponents would undergo the same ordeal in defence of their opinions. The challenge was accepted by a Franciscan monk, and Savonarola, with his champion, appeared at the head of a large procession, chanting psalm lxxviii.,—"Let God arise, and let his enemies be scattered." The Franciscan also presented himself, the fire was kindled, and Domenico was ready to enter the flames bearing the host in his hands. But the crowd exclaimed against this sacrilege, as they termed it; and, as Domenico persisted in his determination, he thus happily escaped the ordeal for which he had offered himself. But this event was fatal to Savonarola. The people loaded him with insults, and he was finally thrown into prison. A spiritual court, under the direction of two papal commissioners, was held for his trial. His firmness and eloquence at first threw his judges into confusion, but, being examined on the rack, he confessed that he had falsely arrogated supernatural powers. He was condemned, with some of his adherents, to be first strangled, and then burnt, and the sentence was executed on the 23rd of May, 1498, in presence of a large multitude, some of whom considered him as a martyr and a saint. This extraordinary man left, besides letters, "A Treatise against Astrology," and several philosophical and ascetical works. His sermons, though wanting in the characteristics of finished discourses, contain powerful and stirring passages.

SAXE, MAURICE, COUNT DE, a celebrated military officer, who was the natural son of Augustus,

king of Poland, by the countess of Konigsmark. He was born at Dresden in 1696, and even in childhood displayed some presages of his warlike genius. At the age of twelve he joined the allied army under the duke of Marlborough and the prince Eugene, and was present at the sieges of Lisle and Tournay, and at the battle of Malplaquet. His father then gave him a regiment of cavalry, with which he served in Sweden, and was at the taking of Stralsund. His mother procured his marriage with a German lady of rank when he was but fifteen: but the inconstancy of his temper occasioned a divorce after a few years. He was with Prince Eugene in Hungary, in the war with the Turks; but, after the treaties of Utrecht and Passarowitz, he withdrew to France, and was permanently attached to the service of that country by a brevet of *mareschal-de-camp*, given him in 1720 by the regent duke of Orleans. He applied himself to study at Paris, and made himself intimately acquainted with professional tactics. In 1726 he was a candidate for the duchy of Courland; and he formed various other schemes of ambition at different periods. On the death of his father he declined the command of the Saxon army offered him by his brother Augustus III., and joined the French on the Rhine, under the duke of Berwick. He distinguished himself at Dettingen and Philipsburg, and, in 1744, was rewarded with the staff of a marshal of France. He was employed in the war that followed the death of the emperor Charles VI., and, in 1745, gained the celebrated battle of Fontenoy, which was followed by the capture of Brussels, and many other places in Flanders. In 1747 he was victorious at Lafeldt, and, in the following year took Maestricht, soon after which the peace of Aix-la-Chapelle was concluded. Marshal Saxe survived that event a little more than two years, dying on the 30th of November, 1750. He wrote a treatise entitled "*Mes Réveries*," on the art of war.

SAXO, GRAMMATICUS, a learned historian, who flourished in the twelfth century. He is supposed to have been a native of Denmark, of which kingdom and its dependencies he compiled an elaborate history under the auspices of Absalom, bishop of Roschild. This work, which is said to have occupied him twenty years in its composition, has gone through several editions, especially those of Paris 1514, Basle 1534, and Sora in Denmark 1644, folio; of these the latter is by far the most perfect. Saxo was a priest in the cathedral of Roschild, and is said to have been deputed on a mission to Paris in 1161 for the purpose of inducing some of the monks of that capital to visit his native country and assist in reforming the discipline of the religious orders there. He died in 1208.

SAY, JEAN BAPTISTE, a distinguished political economist, who was born at Lyons in 1767, and went to Paris at an early period of the revolution, occupying himself with literature. He was subsequently one of the establishers of the "*Décade (Revue) Philosophique*," with which he was, however, connected but a short time. In 1799 he was a member of the tribunate, but, being removed by Napoleon, declined subsequent offers of office from him, devoting himself entirely to his literary labours. His chief works are his "*Traité d' Economie Politique*," translated into English by Prinsep, and his "*Cours Complet d' Economie Politique Pratique*." The third edition of his "*Catéchisme d' Economie Politique*" appeared in

1826. One of his most ingenious works was "*Le petit Volume contenant quelques Aperçus des Hommes et de la Société*." His statistical treatises, "*De l' Angleterre et des Anglais*" and "*Des Canaux de Navigation dans l' Etat actuel de la France*," are also esteemed.

SCALIGER, JOSEPH JUSTUS, a learned German scholar, who was the son of Julius Cæsar Scaliger. He was born at Agen in 1540, and was at an early age sent to Bordeaux, where he studied the Latin language for several years. The plague obliged him to return to his father, who required him to compose a Latin discourse daily, by which means he soon became thoroughly acquainted with that language. After the death of his father he went at the age of nineteen to Paris, where he devoted himself to the study of the Greek language. Shutting himself up in his chamber, he read Homer and the other Greek poets and prose writers with such industry that in the course of two years he had read them all. He next studied Hebrew and other oriental languages, and exercised himself in poetical compositions in the classical languages, having previously, when only sixteen years old, written a tragedy in Latin. He then for some time led an unsettled life, of which we have no particular account. His conversion to protestantism doubtless prevented his advancement in France; but in 1593 he was made professor of polite literature at Leyden, where he died in 1609. He had the character of a scholar, absorbed entirely in his books, and paying little attention to the common affairs of life, so that he was never rich; yet he refused several presents of money, sent him by distinguished men out of respect to his talents and learning. He was never married. In regard to pride and arrogance, he was little inferior to his father, whose tales respecting the origin of his family he endeavoured to confirm. He was also remarkable for his asperity and contemptuous tone towards his adversaries. He boasted that he knew thirteen languages; and he was so entirely immersed in his studies that he would pass whole days in his chamber without eating. Of his numerous works, the treatise "*De Emendatione Temporum*" is one of the most important. In this learned work he gave the first complete and scientific chronological system, and for these labours, and his discovery of the Julian period, deserves to be called the founder of this science. Many errors, which were exposed by Petavius and others, he corrected in the "*Thesaurus Temporum, complectens Eusebii Pamphili Chronicon*." His annotations to Theocritus, Nonnus, Catullus, Tibullus, Propertius, Seneca (tragedies), Varro, Ausonius, Festus, are characterized by an excessive subtlety, and too great freedom in regard to the text of the authors. His "*Poemata*" have little poetical merit; his "*Epistolæ*" are more valuable. On the whole, Joseph Scaliger had less genius than his father, but more learning and accuracy.

SCALIGER, JULIUS CÆSAR—The history of this celebrated scholar is involved in some obscurity, though principally through his own vanity. According to his own account he was descended from the celebrated house of the Scaligers, princes of Verona, and was born at the castle of Riva on Lake Garda, became a page of the emperor Maximilian, whom he served in war and peace for seventeen years, then received a pension from the duke of Ferrara, studied at Bologna, commanded a squadron under the French viceroy, applied himself to the study of natural law,

and in 1525 accompanied the bishop of Agen to his diocese in France, where he settled. This account found credit with some learned men, among whom was De Thou, the friend and admirer of his son Joseph; but others, even in his own day, as for instance, Scioppius, ridiculed it, and treated it as wholly or mainly fabulous. According to Tiraboschi, Scaliger was the son of Benedetto Bordone, a Paduan, who carried on the trade of a miniature painter in Venice, and received the name Della Scala, either from the sign or the situation of his shop. Scaliger resided in Venice or Padua till his forty-second year, occupied with study and the practice of medicine, and published some works under the name of Giulio Bordone. Either some promise, or the hope of bettering his condition, induced him to remove to Agen, where he spent the rest of his days. In 1528 he appears not to have formed any such design of giving himself out as a descendant of that princely family, for he was then styled, in his act of naturalization, Julius Cæsar della Scala di Bordone, doctor of medicine, of Verona in Italy.

He must, however, have appeared with some distinction in Agen, as in 1530 he married a young lady of a rich and noble family there. It was from this period that he began to assert his princely descent, without furnishing any proof of the truth of his pretensions. But his name acquired celebrity by his writings, which gave him a high rank among the scholars of his age, although his arrogance made many enemies. The boldness and freedom of some of his works rendered his faith suspected; but he died a good catholic, October 21, 1558, in the seventy-sixth year of his age. Scaliger was certainly a man of uncommon abilities; and although he was one of the "late learned," yet few men have surpassed him in erudition. He had a powerful memory and an active mind; he thought boldly, if not always logically. Of his physical works we may mention his "*Exercitationum exotericarum Liber quintus decimus de Subtilitate, ad Cardanum*," commentaries on the work of Hippocrates "*De Insomniis*," and a work upon the treatises of Theophrastus and Aristotle on plants, and of the latter on animals, with a translation. As a philologist, he wrote two discourses against the "*Ciceronianus*" of Erasmus, an excellent work on the Latin language, "*De Causis Linguae Latinæ Libri XVIII.*," the first philosophical treatise on this subject. His work "*De Arte Poeticâ Libri VII.*" gained him much reputation, but displays more grammatical learning than poetical imagination or critical spirit. Modern critics do not accord him the same praise which Lipsius, Casaubon, Vossius, &c., bestowed on him.

SCANDERBEG, a celebrated prince of Albania, whose proper name was George Castriotto. He was a son of a prince of that country, and was born in 1404. Being given by his father as a hostage to Sultan Amurath II., he was educated in the Mohammedan religion, and at the age of eighteen was placed at the head of a body of troops, with the title of sangiac. After the death of his father in 1432, he formed the design of possessing himself of his principality; and having accompanied the Turkish army to Hungary, entered into an agreement with Hunniades to desert to the Christians. This design he put into execution; and, having ascended the throne of his fathers, he renounced the Mohammedan religion. A long warfare followed; but, although frequently obliged to

retire to the fastnesses of mountains, he always renewed his assaults upon the first favourable occasion, until the sultan proposed terms of peace to him, which were accepted. The Venetians having entered into a war with Mohammed II., induced Scanderbeg to renounce his treaty with the sultan. He obtained repeated victories over the Turkish generals, and saved his own capital, although invested by an army commanded by Mohammed himself. He was at length carried off by sickness at Lissa, in the Venetian territories, in 1467, in his sixty-third year. His death was soon followed by the submission of Albania to the Turkish dominion. When the Turks took Lissa, they dug up his bones, of which they formed amulets, to transfer his courage to themselves.

SCAPULA, JOHN, the publisher of a valuable lexicon of the Greek language, published originally in quarto, in 1583, which has since gone through several editions, particularly an excellent one from the Elzevir press, and a more recent one by Major. Henry Stephens, while completing his "*Thesaurus*," having employed Scapula to correct the press, the latter secretly abridged the work. The dictionary, thus treacherously stolen, ruined the sale of that of his employer.

SCARLATTI, ALESSANDRO, a celebrated musical professor, who was chapel-master at the Neapolitan court. He was born at Naples in 1658, and educated at Rome under Carissimi. After residing some time in Germany and at Rome, he returned and passed the last years of his life at Naples, where he died in 1728. The Italians called him the pride of art and the first of composers. Hasse says that he was the greatest master of harmony among the Italians, and Jomelli considered his church music as the best of its kind. He composed a great number of motets, and about 200 masses. His opera "*La Principessa fidele*" is esteemed his masterpiece.

SCARPA, ANTONIO, one of the most celebrated anatomists and surgeons of the eighteenth century. He was born in Lombardy, about 1746, and his work, "*Anatomicæ Disquisitiones de Auditu et Olfactu*," appeared at Pavia in 1789, previously to which his "*Anatomicæ Observationes de Structura Fenestræ Rotundæ Auris*" had already attracted the notice of the learned. At the time of the revolution in Italy, he was deprived of his professorship in the university on account of his refusing to take the oath required by the Cisalpine republic. He now published his celebrated work on aneurisms. When Napoleon, after his coronation at Milan as king of Italy, arrived at Pavia and received the officers of the university, he inquired after Scarpa. He was informed that he had long ceased to be a member of the university, and was told the reason. "What," said Napoleon, "have political opinions to do here? Scarpa is an honour to Pavia and to my dominions. Let him be honourably restored." Scarpa was the author of several other surgical works, besides those already mentioned. He died in Pavia in 1826. Most of his works have been translated into French and English.

SCARRON, PAUL, a comic poet and satirist, who was born at Paris in 1610. His father, a counsellor of the parliament, wished to oblige him to take orders, but the son was averse to such a step. At the age of twenty-four he travelled into Italy, where he gave himself up, without restraint, to indulgences of every kind, and continued his excesses, after his return to Paris, in such a manner as to bring upon himself

the most painful diseases. At the age of twenty-seven, having appeared during the carnival at Mans as a savage, he was pursued by the populace and threw himself into a marsh. In consequence of this exposure he lost the use of his limbs. Notwithstanding his sufferings he never lost his gaiety; and, settling at Paris, his wit and social powers gained him the friendship of some of the most distinguished persons in the city and at court. After the death of his father he had a lawsuit with his mother-in-law, in which, although his whole fortune was at stake, he made a humorous defence of his claims and lost his cause. Madame de Hautefort, his friend, touched by his misfortunes, presented him to the queen. Scarron requested permission to call himself her majesty's valetudinarian. The queen smiled; and Scarron, taking her smile as a commission, styled himself thenceforth *Scarron, par la grace de Dieu, malade indigne de la reine*. He now obtained a pension by his praises of Mazarin, whom, however, he soon after offended by his "Mazarinade" and his "Typhon," and thus lost his pension. His marriage with Françoise d'Aubigné, afterwards wife of Louis XIV., and marchioness de Maintenon, however much it may have increased his happiness, did not improve his fortune; and he lived with so little economy that he soon became involved in pecuniary difficulties. The comedies which he wrote as a means of subsistence were borrowed from the Spanish theatre. His "Jodelet, ou le Maître Valet" had great success. His "Enfide Travestie," and his "Roman Comique," particularly the latter, are among the most esteemed of his works. His works appeared at Paris.

SCAURUS, MARCUS ÆMILIUS.—There were two distinguished Romans of this name, father and son. The former was chosen consul B. C. 116, and was afterwards *princeps senatus*. He was likewise celebrated as an orator, and assumed a severity and dignity of manner which gained him great consideration, both with the senate and people, artfully cloaking his ambition and rapacity. He also celebrated a triumph, on account of his victory over the Gauls. Although he allowed himself to be bribed in the war with Jugurtha, he conducted himself with such caution and cunning as to secure his re-election to the consulate, and his election to the censorship. His son was remarkable for the brilliant display which he made as *edilis curulis*. He built a large and splendid theatre, and exhibited public games at great expense. Cicero defended him, when he was accused of being guilty of oppressions in the province of Sardinia.

SCHADOW, JOHN GOTTFRIED, a distinguished sculptor, who was born in Berlin in 1764. His parents were poor; but fortunate circumstances, aiding his energetic character, enabled him to study sculpture, and go to Italy, where he made a group in *terra cotta* for the (so called) *concorso di Palestra*, and received the prize medal. Some of the best known works, made or modelled by him, are the statues of General Ziethen, and of Prince Leopold of Dessau, in Berlin, the monument of Luther in Wittenberg, the Victoria and the Brandenburg Gate in Berlin (which was carried to Paris, and afterwards restored), the monument of Blucher, at Rostock. His son Rudolf, who died in 1822, was one of the most promising sculptors at Rome. His Sandal-binder and Spinner are celebrated, and have often been copied. Another son, Frederic William, was

a clever painter, and director of the academy of painting at Dusseldorf.

SCHAFER, GODFREY HENRY, a distinguished German philologist, who was born at Leipzig in 1764, entered the university in 1781, and enjoyed the philological instructions of Ernesti, Reiz, and Beck. In 1796 appeared his edition of "Athenæus," which was followed by "The Opera Moralia" of Plutarch, an edition of Herodotus, and several other works. In 1806 his "Meletemata Critica in Dionysii Hal. Artem Rhetoricam" procured him the privilege of lecturing. In 1808 he was appointed professor extraordinary of philosophy, and, in 1813, librarian of the university. Besides numerous classical works, Greek and Latin, the publication of which he superintended, he published an improved edition of "Bois's Ellipses," and contributed many notes and remarks to the London edition of "Stephens's Thesaurus," of which he corrected the proofs; "Ammonius de Differentiis Verborum Affinium; Phalaris Epistolæ;" a revision of "Reiske's Demosthenes" and an improved edition of "Plutarch's Lives" are among his more recent labours. In some cases he merely gave a corrected impression of standard texts, in others corrected readings, while to some of the authors he added valuable commentaries.

SCHANCK, JOHN, a brave and scientific officer, who was born in 1746, and after completing his education, entered the merchant service, where he remained for some time, but subsequently entered a king's ship. After serving for many years, he was promoted to the rank of lieutenant, and shortly after was appointed superintendent of the naval department of St. John's in North America. He, the year following, received a second commission, nominating him to the elevated station of senior officer of the naval department in that quarter. In fact, he might have been truly called the civil commander in chief, all the conjunct duties of the admiralty and navy board being vested in him. The force under his direction was considerable; no less than four different flotillas, or squadrons of small vessels, being at one time subject to his direction in the civil line. His exertions and merit were so conspicuous as to draw forth the highest encomiums from the admiral commanding on the station, particularly on account of the celerity and expedition with which he constructed a ship of above 300 tons, called the *Inflexible*.

The *Inflexible* was originally put on the stocks at Quebec; her floors were all laid, and some timbers in; the whole, namely, the floors, keel, stem, and stern, were then taken down, and carried up the St. Lawrence to Chamblais, and thence to St. John's. Her keel was laid, for the second time, on the morning of the 2nd September; and by sunset, not only the above-mentioned parts were laid and fixed, but a considerable quantity of fresh timber was, during the same day, cut out, and formed into futtocks, wptimbers, beams, planks, &c. On the 30th September, being twenty-eight days from the period when the keel was laid, the *Inflexible* was launched; and on the evening of the 1st October, she actually sailed, completely manned, victualled, and equipped for service. In ten days afterwards this vessel was engaged with the enemy; so that it may be said, without the smallest exaggeration of Lieutenant Schanck's merits, that he built, rigged, and completed a ship, which fought and beat her enemy, in

less than six weeks, from the commencement of her construction.

Exclusively of the armaments which he had fitted out and equipped for service on the lakes Ontario, Erie, Huron, and Michigan, Lieutenant Schanck had the direction of four different dock-yards at the same time, situated at St. John's, Quebec, Carleton Island, and Detroit. In all these multifarious branches and divisions of public duty, his diligence and zeal were equalled only by the strict attention which he paid on all occasions to the economical expenditure of the public money; a rare and highly honourable example, particularly at that time of day when speculation and plunder were charges by no means uncommon, and when the opportunities which he possessed of enriching himself, without danger of incurring complaint, or risking discovery, were perhaps unprecedented. His services on this occasion were not solely confined to the naval department. When General Burgoyne arrived from England, and placed himself at the head of a formidable army, by means of which, in co-operation with other assistance, it was expected that America would be suddenly and completely subdued, Lieutenant Schanck's talents were again called into exertion. In a country so frequently intersected by creeks, rivulets, streams, and rapid rivers, the progress of troops was liable to an endless variety of obstructions. It is usual in Europe to make use of pontoons on similar occasions; but these were not always to be obtained in America, and even when procured became cumbersome and inconvenient in a forest, as they were to be carried through swamps and woods, sometimes impervious to waggons. To obviate the inconvenience to which General Burgoyne was subjected on this account, Lieutenant Schanck became not only the inventor, but the constructor of several floating bridges, by which the progress of the army was materially aided, and without which it would have been in all probability totally impeded much sooner than it really was. They were so constructed as to be capable of navigating themselves; and were not only equipped with masts and sails for that purpose, but, having been built at the distance of seventy miles from Crown-Point, were actually conveyed thither without difficulty, for the purpose of forming a bridge at that place. The result of General Burgoyne's expedition for the subjugation of the colonies is too well known; and it is almost unnecessary to remark, that the floating bridges, like the army destined to pass over them, were but too soon in the power of the enemy. Such services, however, as these could not but be followed by correspondent rewards; and accordingly Lieutenant Schanck was promoted, first to the rank of commander, and then to that of post-captain in 1783. It might naturally have been expected, that the interval of public tranquillity that ensued after the contest, which ended in the complete emancipation of our transatlantic colonies, would prove some bar, if not to the expansion, at least to the display of Captain Schanck's ingenuity and nautical abilities; this, however, was by no means the case. He invented, or, it may rather be said, he improved, a former invention of his own, relative to the construction of vessels, peculiarly adapted for navigating in shallow water. These were fitted with sliding keels, worked by mechanism.

In 1799 Captain Schanck was appointed to superintend the transport service connected with the

expedition to Holland; and on the formation of the transport board he was nominated one of the commissioners; a station he continued to hold, till the year 1802; when, in consequence of an ophthalmic complaint, he was under the necessity of retiring from the fatigues of public service. On the promotion of flag-officers, which took place in 1805, Commissioner Schanck was promoted to the rank of rear-admiral. He became a vice-admiral in July 1810, and an admiral of the blue in July 1821. Admiral Schanck was one of the original members of the society for improving naval architecture, set on foot by the late eccentric John Sewell, the bookseller; and some of the papers published by that institution were the productions of this officer. He appears also to have been the inventor of gun-boats with moveable slides, for firing guns in any direction. He likewise fitted the Wolverine sloop with the inclined plane in her gun-carriages, which is justly considered as the greatest modern invention in gunnery. On the 6th of March, 1823, Admiral Schanck died at Dawlish, in Devonshire, in the eighty-third year of his age.

SCHARNHORST, GEBHARD DAVID VON, was born in 1756 at Hamelsee, in Hanover. His father, in consequence of being embroiled in a lawsuit, was deprived of the means of giving him a good education; and young Scharnhorst was sent to a village school, where he remained till his fifteenth year. A few works on the seven years' war, and the Austrian war of succession, and more particularly the narratives of an invalid soldier, inspired him with a passion for the military life. To be at some future period a sergeant in command of an outpost was at this time his ideal of felicity. At length his father gained his protracted suit, and with it an estate; and young Scharnhorst was received into the military school of Count William of Schaumburg-Lippe-Buckeburg. He subsequently entered the Hanoverian service, and soon distinguished himself by several excellent military works. In 1780 he was appointed teacher in the military school at Hanover. In 1793 he was made captain of horse artillery. In 1794 he distinguished himself so much under General Hammerstein, that George III. gave him a sword of honour, and made him major. The duke of Brunswick recommended him to the king of Prussia, who appointed him lieutenant-colonel.

In the unfortunate battle of Auerstädt he was wounded twice; yet he took part in the battle of Eylau. After the peace of Tilsit, he was appointed president of the committee for the reorganization of the army, and there displayed great talents, giving the whole army a totally new constitution and spirit. He was equally practical and scientific. He infused into the army a truly national feeling, and thus tended to form that devoted phalanx which ultimately set the power of Napoleon and his legions at defiance. When Prussia rose *en masse*, in 1813, it was chiefly Scharnhorst who contrived, by means of the corps of volunteers, and the *landwehr*, as well as by having previously disciplined many more men than the peace of Tilsit authorized Prussia to keep in actual service, to arm all persons capable of doing military duty. In the spring of 1813 he was chief of the staff in the army under Blücher, in Saxony. In the battle of Lützen his leg was severely wounded; and not allowing himself necessary rest, but setting out too soon for

Vienna, to gain over the emperor of Austria to the cause of the allies, he died June 28, 1813, at Prague. His statue stands in the King's Square, in Berlin.

**SCHEELE, CHARLES WILLIAM**, a celebrated chemist, who was born at Stralsund, in Sweden, in 1742, and was apprenticed to an apothecary at Gottenburg. He became his own instructor in chemistry, went to Upsal in 1773, where his abilities introduced him to the notice of Professor Bergmann, and was admitted an associate of the academy. He subsequently became director of a pharmaceutical establishment at Kioping, where he continued to the close of his life, in 1786. He discovered the fluoric acid, and the acids of tungsten and molybden; and his experiments on barytes, chlorine, various animal and vegetable acids, on the composition of water, and several other subjects, are in the highest degree important.

**SCHELLING, FREDERIC WILLIAM JOSEPH VON**, one of the most distinguished philosophers of Germany, who was born at Leonberg, in Wirtemberg, in 1775, and studied at Leipsic and Jena, in which latter university he was a pupil of Fichte, whom he succeeded as professor there. Some years after he was made secretary of the academy of fine arts at Munich, and was ennobled by the king of Bavaria. His works are, "On the Possibility of a Form of Philosophy in general;" "Contributions towards a Philosophy of Nature;" "Of the Soul of the World, a Hypothesis of the Higher Natural Philosophy, for the Explanation of the General Organization of Things;" "First Sketch of the Philosophy of Nature;" "System of Transcendental Idealism;" "Lectures on the Method of Academical Study;" "Bruno, or, On the Divine and Natural Principle of Things;" "Philosophy and Religion;" his "Complete Philosophical Writings," of which the first volume only has yet appeared;" "On the First Principle of Philosophy, or, On the Unconditional in Human Knowledge;" "Philosophical Letters on Dogmatism and Criticism;" "A Discourse on the Relation of the Fine Arts to Nature, delivered in 1807, at the Festival of the Baptism of the King of Bavaria;" His "General Periodical, by and for Germans," of which but three numbers appeared; "Representation of the True Relation of the Philosophy of Nature to the improved Doctrine of Fichte." Schelling also occupied himself with mythological inquiries, a fruit of which was his treatise on the deities of Samothrace. To give a view of the philosophy of Schelling within our limits is impossible. It would require great minuteness of explanation, both of his phraseology and his ideas, and could not be made intelligible, in a limited space, to one who had not a previous knowledge of other German philosophical systems.

**SCHIAVONE, ANDREA**, an eminent painter of the Venetian school, who was born at Sebenico, in Dalmatia, in 1522. His parents, who were in humble circumstances, placed him with a house-painter at Venice, where, at his leisure hours, he studied the works of Parmegiano, Giorgione, and Titian. The latter took him under his care, and soon after employed him in the library of St. Mark, where he is said to have painted three entire ceilings. He was accounted one of the finest colourists of the Venetian school. Two of his compositions are in the church of the Padri Teatini, at Rimini, representing the nativity and the assumption of the Virgin. His Per-

seus and Andromeda, and the Apostles at the Sepulchre, are in the royal collections at Windsor. He died at Venice in 1582.

**SCHILLER, FREDERICK**.—This celebrated German writer was born at the little town of Mewbach, in the Wirtemberg territory, on the 10th of March, 1759. He was educated for the ministry, but after great reluctance on the part of his father, he was allowed to abandon the church, and direct his attention to the study of medicine. The works of Shakspeare, Goethe, Klopstock, and Leping occupied his attention, and he eventually devoted himself entirely to literature. Among his earliest productions were, "The Battle," "The Infanticide," and poems to Laura. In 1785 he went to Leipsic; towards autumn to Dresden, where intercourse with men of talents, the charming scenery, the beautiful gallery, and the library, detained him until 1787. Here he became acquainted with the father of the poet Körner. This gentleman has since written a biographical sketch of Schiller. During this period he studied all the works which he could procure relating to the history of Philip II., to prepare himself for his "Don Carlos;" and these studies led to his "History of the Revolt of the United Netherlands." His "History of the Most Remarkable Revolutionized Conspiracies," of which only one volume was published, was also produced at this period. "Don Carlos" first appeared at Leipsic in 1787; and it is a singular fact that Schiller himself wrote the best and severest critique on this piece, in his "Letters on Don Carlos."

"The Ghostseer" was probably caused by the tales respecting Cagliostro. In 1787 Schiller went to Weimar, where Wieland and Herder received him in a friendly manner. In 1788 he met Goethe, after the return of the latter from Italy. He had seen him but once before, in his boyhood, when Goethe, accompanied by the duke of Wirtemberg, visited the academy where he was studying. He did not like him at first: partly through his influence, however, he received in 1789 a professorship of philosophy at Jena.

Schiller entered on his office with the discourse, "What is Universal History, and for what is it studied?" He now devoted himself to history; and the few poetical productions which he wrote at this period are mostly of an historical character, though "The Gods of Greece" was composed at this time, and he also then formed the idea of an epic poem, the hero of which was to be Frederic the Great. He paid much attention to philosophy, particularly Kant's; and many of his philosophical and æsthetical treatises date from this period. He lectured on history, and began to publish "Historical Memoirs from the Twelfth Century to the Most Recent Times," and his "History of the Thirty Years' War," which appeared first in the "Pocket Almanack for Ladies," from 1790 to 1793. The French republic, at the beginning of the revolution, conferred on him the rights of citizenship, and the emperor of Germany ennobled him in 1802. Incessant study, protracted far into the night, and the use of stimulants, undermined his health. The periodical "Thalia" having ceased in 1793, he formed the plan of publishing, with the co-operation of the first writers of Germany, "The Horæ." He became more intimately acquainted with Goethe, returned with renewed ardour to poetry, and produced, particularly after 1795, the finest lyrical poems which appeared in "The Horæ."

and in his "Almanac of the Muses." In 1796 he conceived the plan of a play, to be called "The Knight of Malta;" but all his other projects gave way to "Wallenstein." Wallenstein's camp is a striking introduction to the parts which constitute the proper tragedy. From 1799 he lived in Weimar, where, in 1800 and 1801, "Maria Stuart" and "The Maid of Orleans" were produced. In 1803 appeared "The Bride of Messina," and his last dramatic work, "William Tell," in our opinion, is by far the best of his tragedies. Death prevented the completion of his "Pseudo-Demetrius." He also adapted Shakespeare's "Macbeth," Gozzi's "Turandot," Racine's "Phædra," &c., for the stage, with which his dramatic works closed. He died at Weimar, on the 9th of May, 1805, only forty-six years old, mourned by all Germany. Schiller hated nothing so much as the vulgar or mean. He strove perpetually for the noble and the beautiful; hence that melancholy hue which is sometimes spread over his productions.

SCHIMMELPENNINK, RUTGER JAN, the last chief magistrate of the republic of the United Netherlands, or grand pensionary of the Batavian republic. He was born at Deventer, in Holland, in 1761, and educated at Leyden, where he took his degree; on which occasion he published "Dissertatio de Imperio Populâri rite temperato." He afterwards practised at the bar with much credit. In 1798 he was appointed ambassador to France by the Batavian republic, in which post he acquitted himself with satisfaction to his country and honour to himself. In 1801 he was accredited in the same character, first to the congress assembled at Amiens, and afterwards to England. The war having again broke out, Schimmelpennink resumed his embassy to France. In 1805 he was created grand-pensionary of Holland, but with different powers from those anciently attached to that character. This power, however, ceased, in consequence of the elevation of Louis Bonaparte to the throne of Holland, and Schimmelpennink received, in lieu of his office, the grand-cordon of the order of Holland, about that time instituted, and became, by the change of government, a senator of France, as well as of Holland, the two countries being united. He received also the title of count, with the appointment of grand-treasurer of the three fleeces. He filled those offices down to the exclusion of Napoleon from the throne of France, and voted for the creation of a provisional government in the latter instance. In April 1814 he sent in his resignation, and retired into private life. He died at Amsterdam in 1825.

SCHINKEL, CHARLES FREDERIC, a distinguished architect, who was born in 1781 at New Ruppin. He lost his father early, and studied at the gymnasium of Berlin. He afterwards applied himself to architecture, went in 1803 into Italy and France, and returned to Germany in 1805. The disasters of Prussia in 1806 were severely felt by all architects, and Schinkel devoted himself to landscape painting, in which he succeeded remarkably well. One of his most successful attempts was to represent various historical periods in a series of pictures. When the royal family returned to Berlin, his plans for several arrangements in the royal palace were approved by the queen. In 1819 he received an appointment in the ministry of commerce, manufactures, and architecture, and, in this capacity, did much to improve the style of building in his country.

In 1821 Schinkel was ordered to rebuild the theatre at Berlin, and three years afterwards the French institute made him a member of their body, as did also the academy of arts at Copenhagen. Berlin has many architectural monuments by this master, and the provinces are full of churches and other edifices, public and private, planned by him. The new museum at Berlin, a splendid monument of art, was the last of his great works. It was finished in 1828. His last and best picture represents a landscape with buildings in Greece, at the time of her highest prosperity. It was given by the city of Berlin to the princess Louisa, daughter of the king, when married to Prince Frederic, son of the king of the Netherlands.

SCHLEGEL.—This name, [so distinguished in German literature, owes most of its celebrity to the two brothers, Augustus William and Frederic von Schlegel. John Elias, their uncle, born in 1718, at Meissen, was the first German dramatic writer, after Gryphius, who contributed to the advancement of German belles-lettres. He died in 1749.—His brother John Adolphus, a poet and pulpit orator, was born in 1721 at Meissen. He was the author of several valuable works, and made a translation of Batteux's "Les Beaux Arts reduits à un même Principe," which he accompanied with notes and treatises of his own. He died in 1753.—John Henry, the third brother, was born in 1724, at Meissen, and died at Copenhagen in 1780. He was the author of several valuable works on Danish history, and of some translations from English poets into German. Augustus William and Frederic were the sons of John Adolphus. The first was born in September 1767, at Hanover, and the other in 1772, at the same place. The former early manifested a great ability for learning languages, as well as much poetical talent. When eighteen years old, he recited, at the Lyceum of Hanover, a piece in hexameters on the birth-day of the king, in which he gave a sketch of the history of German poetry, which was justly admired. He first studied theology at Gottingen, but soon quitted it for philology. At Gottingen he gained the friendship of Burger, who, in the preface to the second edition of his poems, consecrated him to the service of the Muses, and prophesied his immortality in one of the finest German sonnets. After leaving Gottingen, Augustus William Schlegel acted as tutor for three years in the house of a banker in Amsterdam. He returned to Germany, and took part in the "Horæ," and Schiller's "Almanac of the Muses," in which his translations from Dante, with commentaries, attracted particular attention. Until 1799 he was one of the most active contributors to the "General Literary Gazette." Previous to which, however, he began his translation of Shakespeare. We know of no translation so perfect as this. It may well be called a German reproduction of the original. It has made Shakespeare a German popular poet to all intents and purposes, on the stage and in the closet. Schlegel had now become a professor at Jena, where he delivered lectures on æsthetics, and, from 1798 to 1800, was connected with his brother in the publication of "The Athenæum," a critical journal, which did much to promote a more independent spirit in German literature. The first editions of his poems appeared in 1800, and Schlegel became the second father of the German sonnet; and in that year he also published his poetic attack on Kotzebue. In 1801 appeared

his "Characteristics and Critiques," in two volumes, which was followed by the "Almanac of the Muses," published by him and Tieck together, which is pervaded by a mystico-symbolical spirit. Having separated from his wife, he went in 1802 to Berlin, where he delivered lectures which were published in Europe. He took an active part in the publication of the paper for the "Fashionable World," which was opposed by Kotzebue's "Freimuthige," or "Liberal;" and a paper war began, not very honourable to the latter. In 1803 appeared the first volume of the "Spanish Theatre," containing three pieces of Calderon: the second appeared in 1809. These translations fully satisfied the high expectations which the public had formed from his translation of Shakespeare. In 1805 he travelled with Madame de Staël, and lived with her at Copet, also in Italy, France, Vienna, and Stockholm. In his elegy to Rome, he celebrates his generous friend. He wrote many critiques during this time, partly in the "Jena Literary Gazette," partly in the "Heidelberg Annals." In 1807 he published at Paris his "Comparison of the Phædra of Euripides with that of Racine," which was written in French, and attracted much attention from the French literati.

In 1808 he delivered lectures on the dramatic art in Vienna, and published them at a later period, in three volumes. They have been translated into almost all the languages of Europe. In 1813 he became a political writer in French and German, accompanied the then crown-prince of Sweden as secretary, and received several orders, and the rank of nobility. After the fall of Napoleon, he returned to Madame de Staël, after whose death, in 1818, he accepted a professorship in the university of Bonn, which had been but a short time established. His brother Frederic von Schlegel was, as we have already stated, born in 1772, and was educated for the mercantile profession. He, however, became dissatisfied with that business, and his father withdrew him from the house in which he had been placed, and allowed him to follow the bent of his inclination. He immediately directed his whole attention to the study of philosophy, and by the time he had completed his academic course of studies there was no Greek or Latin author of importance whom he had not read at least once. About 1793 he first appeared as an author. He contributed to several periodicals of reputation, and in 1797 produced his "Greeks and Romans." In Berlin he undertook, in connexion with Schleiermacher, the translation of Plato, but he soon abandoned the project; and soon after appeared the first volume of his "Lucinda," which remained unfinished, and is reproached by many as an idealization of voluptuousness. In 1800 he settled as privatdocent at Jena, and appeared for the first time as a poet, publishing his productions in various periodicals. In 1802 he lived some time in Dresden, and then delivered lectures on philosophy in Paris, where he also published "Europa," and occupied himself with the fine arts, and the languages of the south, particularly those of India. In 1808 he published a treatise on the language and wisdom of the Indians. He now returned to Germany, went over with his wife to the catholic faith at Cologne, and repaired to Vienna. In 1809 he received an appointment at the head-quarters of the archduke Charles, where he drew up several powerful proclamations. When peace was concluded, he again delivered lectures in Vienna, on modern history and the literature

of all nations. His limited views in regard to religion, after his adoption of catholicism, appear particularly in his modern history. In 1812 he published the "German Museum," and gained the confidence of Prince Metternich by various diplomatic papers, a consequence of which he was appointed Austrian counsellor of legation at the diet in Frankfurt. In 1818 he returned to Vienna, where he lived as secretary of the court, and counsellor of legation, and published "A View of the Present Political Relations," and his complete works. In 1820 he undertook a periodical, called "Concordia," intended to unite the various opinions on church and state; but he did not continue it long. He also published, at a much earlier period, the "Writings of Novalis" in conjunction with his friend Tieck, and one volume of Florence's Memoirs written by his wife. In 1807 he also published a German translation of "Corinna," before the French original appeared. He died in August 1828.

SCHLEIERMACHER, FREDERIC DANIEL ERNEST, a distinguished German theologian and philologist, who was born at Breslau in 1768, and received his education at the academy of the Moravian Brethren at Niesky. In 1787 he ceased to be a member of this society, left Barby, where he had begun the study of theology, and went to Halle to continue it. In 1794, after having been employed as a teacher, he was ordained a clergyman and appointed assistant preacher at Landsberg on the Warte. From 1796 to 1802 he was minister in the Charité, a great hospital at Berlin. During this period he translated "Faccet's Sermons," contributed to "The Athænet," conducted by the two Schlegels, and wrote "The Discourses on Religion," and "The Monologues and Letters of a Minister out of Berlin." He soon after undertook his translation of Plato, and few men have ever entered so deeply into the spirit of that great philosopher. In 1802 he published his first "Collection of Sermons," which has since been followed by two others. In the same year he was appointed professor extraordinarius of theology at Halle, and preached to the university. In 1806, when Halle was separated from Prussia, he went to Berlin, and lectured there, as well as preached with the greatest boldness, on the existing state of things, although a hostile force under Davoust occupied the city. In 1809 he was appointed preacher at the Trinity church in Berlin, and married. In 1810, when the new university was opened in that city, he was appointed professor ordinarius, as he had been at Halle during the last part of his residence there. In 1811 he was elected a member of the academy of sciences, and in 1814 secretary of the philosophical class, when he was released from the duties which he had discharged in the department of public instruction in the ministry of the interior. At this period he wrote his "View of the Study of Theology." When Schmalz strove to lower the elevated feeling of the people after the wars of 1813, 14, and 15, to a tone more convenient for an absolute government, he brought out a pungent reply, characterized by a Platonic style of reasoning. His last work was his "Doctrines of the Christian Faith."

SCHLOSSER, FREDERIC CHRISTOPHER, a distinguished historical writer, who was born at Jena in 1776, and early showed a strong inclination for study. In 1793 he went to Göttingen to study theology; and, after acting for several years as a private tutor in several families, during which time

he prosecuted his studies in history, philology, and philosophy, with great industry, and subsequently as a teacher in classical schools, he was made professor of history in the Lyceum in Frankfort, and in 1817 in the university of Heidelberg. His "Lives of Beza, and Peter Martyr," his "Universal History," his "General View of the History and Civilization of the Ancients," and his "History of the Eighteenth Century," display an extensive acquaintance with the subjects, and much vigour and independence of thought. His "History of the Eighteenth Century" has been translated into French.

SCHMIDT, MICHAEL IGNATIUS, a German historian, who was born in 1736, at Arnstein, in Würzburg, and studied theology in the catholic seminary at Würzburg. During the seven years' war, he went to Suabia, received a benefice, and in 1771 was made librarian of the university at Würzburg. He received by degrees higher appointments in that sovereign bishopric, did much for education, and in 1778 began the publication of his "German History," to which he devoted the remainder of his life. The empress of Austria was anxious to have him in her service, and caused him to be appointed superintendent of the archives. Joseph II. made him teacher of history to his nephew, afterwards emperor Francis I. After a residence of fourteen years at Vienna, he died there in 1794. Schmidt was the first who wrote a really good history of the German nation; his predecessors only gave the history of the emperors, of the empire, or the estates. His chief aim was to show how the Germans became what they are; and he executed his plan with taste, judgment, and a philosophical spirit. His erudition was great, but in the account of the reformation he is not always impartial or faithful. This extensive work was published at Ulm, and later at Vienna. The Vienna edition of the early history is in eight volumes; of the modern history in seventeen. Dresch's "History of Germany since the Confederation of the Rhine," is a continuation of the work of Schmidt and Millbiller.

SCHNEIDER, JOHN GOTTLOB.—This celebrated philologist was born at Kolm in 1752, and studied under Ernesti at Leipsic, where a wealthy relation in Dresden supported him. His first publication was "Observations on Anacreon," and soon after which he went to Gottingen, and gained the favour of Heyne, who recommended him to Brunck, whom he accompanied to Strasburg, to assist him in the publication of his "Analecta." He lived in this place three years, and then received an invitation to the university of Frankfort on the Oder, and there, with Brunck, published "Oppian." For thirty-four years Schneider was professor of ancient languages there, and published a great number of critical editions of the ancient classics. He applied himself especially to those works of antiquity which related to natural science, as *Ælian's* "History of Beasts," and *Nicanor's* two didactic poems on medicine, with the Greek *Scholia*, and the *Periphrasis* of *Eutecnius*. His "Historia Amphibiorum," of which the two first volumes appeared in 1779, from unfavourable circumstances, was not completed. After thirty years of labour, he published the nine remaining books of *Aristotle*, containing the "History of Beasts;" also the physical and meteorological works of *Epicurus*, the "Analecta," relating to the metallurgy of the ancients, the "Eclogæ Physicæ," &c. His excellent

Greek Lexicon, which has passed through several editions, is the basis of that of *Passow*, and of the English-Greek Lexicon of *Donnegan*, (London, 1831.) It has contributed not a little to give a new impulse to the study of the Greek language in Germany. He also edited the political works of *Aristotle*; the works of *Xenophon*, *Æsop*, the "Pseudo-Orpheus," the "Scriptores Rei Rusticæ," *Vitruvius*, *Theophrastus*, and other writers. When the university was removed, in 1811, from Frankfort on the Oder to Breslau, Schneider went thither, and was made chief librarian, in addition to his other office. He died there, in January 1822.

SCHNEIDER, EULOGIUS, a German priest, who was vicar to the constitutional bishop of Strasburg, and afterwards public accuser before the criminal tribunal of the Lower Rhine. This man was one of the most pernicious agents of Robespierre and his confederates. Armed with the authority of St. Just and Lebas, commissioners from the convention at Strasburg, Schneider proceeded through the department with a body of troops, and followed by the guillotine, on which he immolated citizens of every rank, sex, and age, where interest or revenge furnished the slightest motive for their execution. Schneider was about to set on foot *noyades* at Strasburg, similar to those of Nantes, when he was cut short in his career. St. Just and Lebas, displeased, not by his crimes, but by his arrogance, had him arrested in December 1793, and conveyed to Paris, where he was condemned by the revolutionary tribunal, and guillotined at the age of thirty-seven.

SCHNORR, VEIT JULIUS VON KARLSFELD, an historical painter, who was born in March 1794 at Leipsic, where his father was director of the royal academy of arts. Julius Schnorr early showed indications of talent. In his sixteenth year he went with his two elder brothers to Vienna, where he supported himself by giving lessons in drawing. Michael Angelo's powerful genius at first attracted him, but by degrees he became undecided as to the style which he should adopt, and his internal struggle was so great that he was on the point of giving up the art in despair, and becoming a mechanic, when his father's counsels encouraged him to go on. He was now attracted by the old German school—a school which has great merits, but was at that time, like many other things, of a peculiarly German character, the subject of exaggerated admiration, on account of the great incentives to patriotism furnished by the circumstances of the time. Schnorr, like many others, now thought that the ideal of painting was to be found in the simplicity and naïveté, but at the same time close adherence to reality, and want of elevation, which characterize this school; but a journey to Italy inspired him with juster ideas. On the way he sketched the Marriage at Cana, which he finished for a Scotch gentleman. Soon after the Marchese Massimi engaged him to paint scenes from *Ariosto* in fresco, in the centre saloon of his villa at Rome. After several interruptions from the Roman fever Schnorr completed the paintings in 1825. They were the finest among the productions of the three partners employed in adorning the villa, breathing a truly great spirit. Shortly after King Louis of Bavaria called him to Munich, where he employed him to paint scenes from the *Nibelungenlied*.

SCHOEN, MARTIN, one of the earliest and most distinguished German painters. He was born at

Colmbach, and died in 1486 at Colmar. The Italians called him Buon Martino, or Martino d'Anversa. One hundred and twenty-one of his paintings, chiefly on scriptural subjects, are known to be still in existence. Schoen was remarkable for richness of invention, and for the life of his figures.

SCHOLL, MAXIMILIAN SAMSON FREDERIC, a distinguished lawyer, author, bookseller, and diplomatist, who was born in 1766 at a village in Nassau-Saarbrück. At fifteen years of age he entered the university of Strasburg. He afterwards became tutor to the son of a lady named Krook, and accompanied her and her family in their travels through France and Italy. He returned to Strasburg in 1790, where he devoted himself to law. The reign of terror drove him to Switzerland, but after the fall of Robespierre in 1795 he returned to his country, and, with a man named Decker, established a printing-office and bookseller's shop at Basle. After the peace of Luneville, Decker sold his share in the concern, and Scholl removed the establishment to Paris. At the entrance of the allies into Paris he was placed, by the recommendation of Alexander von Humboldt, in the cabinet of the king of Prussia, and, after the departure of the king, he remained in the Prussian legation. After many diplomatic missions he was in 1819 appointed a privy counsellor in Berlin, and received several other important appointments. Of many excellent works which he wrote and published we will mention his "*Histoire de la Littérature Romaine*," "*Histoire de la Littérature Grecque*," "*Congrès de Vienne*," "*Annuaire Généalogique*," "*Tableau des Peuples qui habitent l'Europe*." His continuation of Koch's "*Histoire des Traités de Paix*" is a valuable work. The "*Archives Politiques*" forms a supplement to it.

SCHOMBERG, FREDERIC HERMANN, DUKE OF, a distinguished military officer, who was a native of Germany, and born about 1619, being the son of Count Schomberg by the daughter of Lord Dudley. He began his military career under Frederic prince of Orange, and afterwards went to France, where he became acquainted with the prince of Condé and Marshal Turenne. He was then employed in Portugal, and established the independence of that kingdom, obliging the Spaniards to recognise the claims of the house of Braganza. He commanded the French army in Catalonia in 1672, and was afterwards employed in the Netherlands, where he obliged the prince of Orange to raise the siege of Maestricht. For these services he was rewarded with the staff of a marshal of France in 1675; but on the revocation of the edict of Nantes, Marshal Schomberg, who was a protestant, quitted the French service, and went to Portugal. Being also driven from that country on account of his religion, he retired to Holland, and subsequently engaged in the service of the elector of Brandenburg. He came to England in 1688, with William III., and, after the revolution, was created a duke, and obtained a grant of 100,000*l*. He was sent to Ireland in the following year to oppose the partisans of James II. Being joined by King William, he was present at the battle of the Boyne, in which he lost his life on the 1st of July, 1690, owing, it is said, to an accidental shot from his own troops, as he was passing the river to attack the enemy.

SCHOREEL, JOHN, a distinguished Dutch painter, who received his name from Schoreel, a village near Alkmaar, where he was born in 1495. His

love of painting appeared in his boyish sports. He copied every painted window, and covered with delicate figures every horn-inkstand that came in his way. At the age of fourteen years he was placed with the painter William Cornelis, and, three years after, he travelled to Amsterdam and, entered the establishment of Jacob Cornelis, one of the most celebrated painters and engravers on wood of that period. Here he spent several years. He next repaired to the first of the masters then living, John of Maubuse, in Utrecht. The disorderly life of his new master disgusted the young Schoreel; and he visited, successively, many large cities, where there were painters of eminence, especially Cologne and Spire, where he studied architecture and perspective. He also visited Dürer in Nuremberg, and was received kindly. At the age of twenty-two Schoreel passed through Carinthia to Venice. One of his countrymen, in a monastery there, persuaded him to undertake a pilgrimage with him to Palestine. For three years he remained within the walls of Jerusalem, sketching views of the city and surrounding country; and a large painting, probably by him, is still in the church, in the place where Christ is said to have been born. On his return he spent some time at Rhodes, which he painted, together with the surrounding country; and afterwards at Rome, among the works of Raphael, Michael Angelo, and Giulio, till Adrian VI., a native of Utrecht, ascended the papal chair in 1522, and committed to him the superintendence of the Belvedere. The death of Adrian, the following year, induced Schoreel to return home through France and Amsterdam. He now executed many splendid paintings in Utrecht, afterwards in Harlem, and, from time to time, in other cities in the Netherlands. He died at Utrecht in 1562. He has been compared with John van Eyck, whom he equalled in splendour and truth of colouring, in expression, a warmth of representation; and, at the most, was inferior to him only in the execution of particular parts. Unhappily, the rage of the fanatics, in a subsequent age, for destroying pictures, was fatal to many of his most valuable works.

SCHREVELIUS, CORNELIUS, a learned critic, who was born at Harlem about 1614. His father was rector of the school of Leyden, in which office he was succeeded by his son in 1642. The latter had taken his degree in medicine; but on his promotion to the school, he turned his attention exclusively to classical pursuits, in the course of which he published several *Variorum* editions of the classics, which display more industry than taste or judgment. His name is now principally known by a Greek and Latin Dictionary, which has been often reprinted in most countries of Europe. An edition, with great improvements, by Fleury-Lecluse, appeared in Paris in 1820; and it has been translated into English, with very extensive additions and improvements, by John Pickering. He died in 1667.

SCHUBART, CHRISTIAN FREDERIC DANIEL, a German poet of much natural talent, but of a defective education and an irregular life, who was born in 1739, at Obersontheim, in Suabia. He began the study of theology at Jena in 1758, but his dissipation involved him in many difficulties. For some time he supported himself by preaching; but music, for which he had much talent, drew him from theology; and in 1768 he became director of music at Ludwigsburg, near Stuttgart, but gave

himself up, more and more, to dissipation, so that he was imprisoned for some time, and exiled from Wirtemberg. He now lived an unsettled life, and undertook various employments, which he was always obliged to resign on account of his irregular life, his attacks upon the clergy, &c. His chronicle became a popular journal. But in 1777 he was seduced into the Wirtemberg territory, and arrested on account of some things which he had written. He remained ten years in prison at Hohenasperg, but was liberated at the request of Mad. Karschin, and made director of the music of the ducal theatre at Stuttgart. He began several works, but, before they were completed, he died, in 1791. His poems, which contain much inflated and unpolished matter,—interspersed, however, with many flashes of genius,—were published at Frankfort on the Maine, in 1787, in two volumes. His miscellaneous works were published by his son.

SCHULTENS, ALBERT, a celebrated orientalist, who was born at Groningen in 1686, studied theology and Arabic at that place, at Leyden and Utrecht, became a preacher in 1711, professor of the oriental languages in 1713, and in 1717 university preacher at Franeker. His chief works, "*Origines Hebrææ*," and "*Institutiones ad Fundamenta Linguae Hebraicæ*," had an important influence on the study of eastern languages.—His son, John Jacob Schultens, was the author of several learned dissertations and treatises.—Henry Albert Schultens, a son of the latter, who was born at Herborn in 1749, and was educated at Leyden, where he studied Arabic and Hebrew, and afterwards became a commoner in Wadham college, Oxford, and received the degree of master of arts there. On his return to Holland, he was chosen professor of the oriental languages at Amsterdam, where he resided until the death of his father, whom he afterwards succeeded at Leyden. He died in 1793. Besides his Arabian Anthology, he published an edition of Pilpay's Fables, and a supplement to the "*Bibliothèque Orientale*" of D'Harbelot.

SCHURMANN, ANNE MARIA, a celebrated literary lady, who was born at Cologne in 1607. Her parents were protestants of high rank, who had

her education conducted by the first masters; and so well did she profit by their instruction that at a very

early period of life she was mistress of the Greek, Hebrew, Syriac, and Arabian languages. In addition to which, she was well versed in music, painting, sculpture, and engraving, which union of talents procured her the appellation of the modern Sappho. After the death of her father she left Cologne, and settled at Utrecht with her mother, and devoted her time to the cultivation of learning and the arts. She corresponded with men of letters at home and abroad, and was visited by Queen Christina and other distinguished personages. In 1653 she formed a connexion with the celebrated mystic Labadie, and was believed to be secretly married to him. She embraced his principles, and lived for some years with him at Altona in Holstein, where he died in 1674. Immediately after this event, she assembled his followers, and conducted them to Wivert, in Friesland, where her own death took place in 1678. Mademoiselle Schurmann published many learned works: among them we may mention her "*Opuscula Hebræa, Græca, Latina, Gallica, Prosaica et Metrica*," and her dissertation entitled "*De Ingenii Muliebris ad Doctrinam et Meliores Litteras Aptitudine*."

SCHUYLER, PHILIP, a distinguished American revolutionary general, who was born at Albany, New York, in 1731, of an ancient and respectable family. He served as an officer in the war which commenced at Lake George in 1775. When quite young he became a member of the New York legislature, and was eminent for his intelligence and influence. To him and Governor Clinton it was chiefly owing that the province made an early and decided resistance to those British measures which terminated in the independence of the colonies. When the revolution commenced, he was appointed a major-general, and was directed to proceed immediately from New York to Ticonderoga, to secure the lakes, and make preparations for entering Canada. Being taken ill in September, the command devolved upon Montgomery. On his recovery, he devoted himself zealously to the management of the affairs in the northern departments. And he gave much of his attention to the superintendence of the Indian concerns. On the approach of Burgoyne in 1777, he made every exertion to obstruct his progress; but the evacuation of Ticonderoga by St. Clair occasioning unreasonable jealousies in regard to Schuyler in New England, he was superseded by General Gates in August, and an enquiry was directed by congress to be made into his conduct. He was afterwards, though not in the regular service, very useful to his country in the military transactions of New York. He was a member of the old congress; and, when the government of the United States commenced its operation in 1789, he was appointed a senator in the national legislature. He was chosen a second time, in 1797, to the same station. In the senate of New York he contributed, probably more than any other man, to the code of laws adopted by the state. He died at his seat near Albany, on the 18th of November, 1804, in the seventy-third year of his age. He possessed great strength of mind and purity of intention. In the contrivance of plans of public utility he was wise and circumspect, and, in their execution, enterprising and persevering.

SCHWARTZ, BERTHOLD.—This celebrated ecclesiastic was born in the first half of the fourteenth century. He was a monk of Cologne, and has been regarded as the inventor of gunpowder and fire-arms.

He is said to have been mixing together the ingredients of gunpowder,—viz. nitre, sulphur, and charcoal,—in an iron mortar, in the prosecution of some alchemical researches, when the composition exploded, from an accidental spark occasioned by the collision of the pestle and mortar. The former being driven forcibly to a distance, Berthold thence conceived the idea of forming pieces of artillery. Such is the story commonly told of the invention of gunpowder, said to have occurred in the early part of the fourteenth century. There is, however, much discrepancy in the accounts of this discovery; and it is certain that Roger Bacon, who died in 1292, was acquainted with an inflammable composition similar to gunpowder, the knowledge of which Europeans appear to have derived from the orientals.

**SCHWARTZENBERG, CHARLES PHILIP, PRINCE OF,** a celebrated Austrian field-marshal, who was born at Vienna in 1771, and served in the early wars of the French revolution, in which he distinguished himself on several occasions. In 1805 he was at the head of a division under General Mack, and at Ulm commanded the right wing of the Austrian forces. After the fortune of the day was decided, he forced his way through the enemy at the head of a body of cavalry. The battle of Austerlitz, at which he was present, was fought against his advice, before Bennigsen and the archduke Charles had come up. In 1808 Schwartzberg was ambassador to the Russian court, and in 1809 commanded the rear-guard after the battle of Wagram. In the campaign in 1812 he commanded the Austrian auxiliary corps of 30,000 men in Galicia,—which, however, remained almost entirely inactive,—and at the close of the year he received the marshal's staff. In 1813 he was appointed to command the army of observation in Bohemia; and after the declaration of war by Austria, Prince Schwartzberg was named generalissimo of the allied forces. After Napoleon's return from Elba, he commanded the allied forces on the Upper Rhine; but the contest was decided at Waterloo without his participation. The prince died in 1820. Many of his military dispositions have been censured, and Napoleon declared that he could not command 6000 men.

**SCHWEIGHAUSER, JOHN,** a distinguished German philologist, who was born at Strasburg in 1742, and became professor of the Greek and oriental languages in that place in 1778. He published valuable editions of Polybius, Athenæus, Arrian, Epictetus, &c., and especially of Herodotus. His academical writings were published in 1807, and in 1824 appeared his "Lexicon Herodotum." He died in 1830.

**SCHWERIN, KURT CHRISTOPHER,** a Prussian field-marshal, who was born in 1684 in Swedish Pomerania, and, after having served in the Dutch armies, entered the Prussian service in 1720, with the rank of major-general. Frederic II., who ascended the throne in 1740, esteemed him very highly, created him field-marshal and count, and gave him the command of his forces in the Austrian succession war in 1741. In 1756 he was again placed in command of one of the Prussian armies, and fell at the head of his troops, before Prague, in 1757.

**SCOTT, SIR WALTER.**—This illustrious Scottish writer was born at Edinburgh on the 15th of August, 1777. He was the son of Walter Scott, Esq., writer to the Signet, by Anne, daughter of

Dr. John Rutherford, professor of the practice of physic in the university of Edinburgh. This lady, who received an excellent education, lived in habits of familiar intercourse with the best literary society which that city then produced. Mrs. Scott possessed superior natural talents, had a good taste for poetry, and great conversational powers. She is said to have been well acquainted in her youth with Allan Ramsay, Beattie, Blacklock, and other Scottish authors of the last century; and independently of the influence which her own talents and acquirements may have given her in training the opening mind of her distinguished son, it is obvious that he must have been greatly indebted to her for his introduction, in early life, into the literary and intellectual society of which she and her near relations were ornaments.

Sir Walter was connected, both by the father and mother's side, with several Scottish families of ancient lineage and renown. His maternal grandmother was a daughter of Swinton of Swinton, a border family whose chivalric ancestor he has celebrated in his drama of "Halidon Hill;" and through his father he was descended, though more remotely, from the Scotts of Harden, in which race the chieftainship of that doughty border clan is understood to reside. It is, however, a curious fact that his more immediate ancestor in this warlike line was a quaker. This schismatic, to whom his illustrious descendant has humorously referred in some of his fictitious works, was Walter Scott, of Raeburn, third son of Sir William Scott, of Harden. He lived at the time of the restoration, and, having embraced the tenets of quakerism, he was on this account most iniquitously persecuted by the government of the day. He was imprisoned first in the tolbooth of Edinburgh, and afterwards in the gaol of Jedburgh, where even his own family were denied access to him. What was still more cruelly oppressive, his three children were, by an edict of the Scotch privy council, removed altogether out of his control, and placed for their education, at his expense, under the tuition of other relatives, with a view to imbue them with principles altogether alien to those their parent had conscientiously adopted. And this most arbitrary purpose, it appears, was fully attained; for the quaker Walter's three children became such staunch

Jacobites, that the second son, who was great grandfather to the poet, in testimony of his devotion to the unhappy house of Stuart, bound himself at the revolution, by a vow, which he kept till his dying day, never to shave his beard till the exiled race were restored to the British throne; and from this circumstance he acquired among his compatriots on the border the name of Beardie. Strong Jacobite predilections thus became hereditary in the family, and descended to the infant poet, mingled with all the endearing and exciting associations of family pride and feudal tradition. Like many other distinguished persons, however, Scott in his boyhood was subject to precarious health—a circumstance which occasioned his removal from the confinement of his father's house, in the College-Wynd at Edinburgh, to his grandfather's residence among the romantic hills of Roxburghshire. Here, along the banks of the Tweed, he wandered, and by Smaylholme Tower, a deserted little border-fort, musing upon many an olden legend. How vividly these scenes dwelt upon his youthful mind, may be seen in his poetry, and no where more conspicuously than in "Marmion:"—

"Thus whilst I ope the measure wild,  
Of tales which charmed me when a child;  
Rude though they be, still with the chime  
Return the thoughts of early time;  
And feelings roused in life's first day  
Glow in the line, and prompt the lay;  
Then rise those crags, that mountain tower,  
Which charm'd my fancy's wak'ning hour."

The tower of Smaylholme, perched high amid the crags, overlooks the country in every direction. Defended on three sides by a morass and precipitous cliffs, it is accessible only by a steep and a rocky path from the west. Although partially in ruins, the traveller might not long ago have climbed up to the bartizan at the summit of the castle. The charm of the spot would certainly not be diminished in the mind of Scott, by the recollection that the tower, together with the adjoining lands, was the property of his relation, Mr. Scott, of Harden. Hither, after long previous wandering, he would scramble up, carrying with him a store of books such as he delighted to dream over. The place formed a kind of poetical observatory, where he watched the varied aspects of the landscape, now darkened by the sweeping storm that howled through the desolate fortress, and now cheered by the shifting sunlight of an April or an October day. The scene of his noble ballad, "The Eve of St. John," was laid here. These poetic visions, however, were not the best preparation for a course of education at the Edinburgh high school, where Scott was duly entered. The colloquies of Corde-rius, Cæsar's commentaries, and Cornelius Nepos, were not half so soothing to the mind of the young scholar as

"patriot battles won of old  
By Wallace wight, and Bruce the bold.  
Stretch'd at length upon the floor  
To fight each combat o'er and o'er,  
Pebbles and shells, in order laid,  
The mimic ranks of war display'd."

One of the first persons who discovered the dawning of young Scott's genius was a Mrs. Cockburn. She thus speaks of him in a letter dated 1777:—

"I last night supped at Mr. Walter Scott's. He has the most extraordinary genius of a boy I ever saw. He was reading a poem to his mother when I went in. I made him read on; it was the description of a shipwreck. His passion rose

with the storm. He lifted his eyes and hands. 'There's the mast gone,' says he; 'crash it goes!—they will all perish!' After his agitation, he turns to me. 'That is too melancholy,' says he; 'I had better read you something more amusing.' I preferred a little chat, and asked his opinion of Milton and other books he was reading, which he gave me wonderfully. One of his observations was, 'How strange it is that Adam, just new come into the world, should know every thing—that must be the poet's fancy,' says he. But when he was told he was created perfect by God, he instantly yielded. When taken to bed last night, he told his aunt he liked that lady. 'What lady?' says she. 'Why, Mrs. Cockburn; for I think she is a virtuoso, like myself.' 'Dear Walter,' says aunt Jenny, 'what is a virtuoso?' 'Don't ye know? Why, it's one who wishes and will know every thing.' Now, sir, you will think this a very silly story. Pray, what age do you suppose this boy to be? Name it now, before I tell you. Why, twelve or fourteen. No such thing; he is not quite six years old."

With regard to Scott's progress at the high school, we are told some change for the better took place, when he was transferred to the class of the rector, Dr. Alexander Adam, who, in his peculiar department, was unquestionably a man of genius, and evinced the most persevering industry. Deeply read in the classics, the doctor took a real and enthusiastic interest in his own studies; in fact, might be represented as conferring in a limited degree the same services respecting Roman literature, which Sir Walter Scott afterwards effected with regard to the remnants of old minstrelsy. He traced out ideas, as well as words, to their origin; and delighted, by means of parallel passages, to illustrate and revive the great characters of antiquity, and explain ancient manners and customs, so that their tendency might be thoroughly felt and understood. Through the day he was of course occupied with his duties as head master; and his publications (especially, for example, the ancient geography) requiring much time, as well as labour, he was in the habit of rising, all the year round, at four in the morning. Consequently in winter he betook himself to the kitchen, where, by the aid of a "happin peat," left in the grate overnight, he kindled a good fire, without troubling any of his small establishment to assist him. Hither he brought his table and books, and passed many an hour in writing or research long before others thought of commencing the business of the day. Among Dr. Adam's peculiarities was his activity as a pedestrian, by which his health and spirits were promoted and preserved to a very advanced age. His example of temperance and early rising is thought, not without justice, to have influenced the youthful scholar in after time; but though he seems to have appreciated the activity of his tutor, all his efforts to imbue him with the spirit of classical learning proved ineffectual, and he departed from the high school without exciting any anticipation of future celebrity.

However backward the schoolboy Scott might have been in regard to classical attainments, he had, it seems, even then acquired a high character as a romancer. Of this curious fact he gives the following account in the general introduction to the new edition of "The Waverley Novels:"—

"I must refer to a very early period of my life were

I to point out my first achievements as a tale-teller; but I believe some of my old schoolfellows can still bear witness that I had a distinguished character for that talent, at a time when the applause of my companions was my recompence for the disgraces and punishments which the future romance-writer incurred for being idle himself, and keeping others idle, during hours that should have been employed on our tasks. The chief enjoyment of my holidays was to escape with a chosen friend, who had the same taste with myself, and alternately to recite to each other such wild adventures as we were able to devise. We told, each in turn, interminable tales of knight-errantry, and battles, and enchantments, which were continued from one day to another, as opportunity offered, without our ever thinking of bringing them to a conclusion. As we observed a strict secrecy on the subject of this intercourse, it acquired all the character of a concealed pleasure; and we used to select for the scenes of our indulgence, long walks through the solitary and romantic environs of Arthur's Seat, Salisbury Craigs, Braid Hills, and similar places in the vicinity of Edinburgh; and the recollection of those holidays still forms an *oasis* in the pilgrimage which I have to look back upon."

He entered the university of Edinburgh in October 1783, at the age of twelve years; but he appears to have attended only the Greek and Latin classes for two seasons, and that of logic one season. If he entered any other classes it seems probable that his irregular health had interrupted his attendance. The consequence was that he had little opportunity, even if he had had the ambition, to distinguish himself at college; and he then entered the world with a very desultory, and, as far as regards the classics, apparently a rather defective education. Nor was his course of private reading much calculated to remedy that disadvantage. He thus describes, in the autobiographical chapter already referred to, the intellectual dissipation to which he was at that period devoted.

"When boyhood, advancing into youth, required more serious studies and graver cares, a long illness threw me back on the kingdom of fiction, as if it were by a species of fatality. My indisposition arose, in part at least, from my having broken a blood-vessel, and motion and speech were for a long time pronounced positively dangerous. For several weeks I was confined strictly to my bed, during which time I was not allowed to speak above a whisper, to eat more than a spoonful or two of boiled rice, or to have more covering than one thin counterpane. When the reader is informed that I was at this time a growing youth, with the spirits, appetite, and impatience of fifteen, and suffered, of course, greatly under this severe regimen, which the repeated return of my disorder rendered indispensable, he will not be surprised that I was abandoned to my own discretion, so far as reading (my almost sole amusement) was concerned, and still less so, that I abused the indulgence which left my time so much at my own disposal.

"There was at this time a circulating library at Edinburgh, founded, I believe, by the celebrated Allan Ramsay, which, besides containing a most respectable collection of books of every description, was, as might have been expected, peculiarly rich in works of fiction. It exhibited specimens of every kind, from the romances of chivalry and the ponderous folios of Cyrus and Cassandra, down to the most

approved works of later times. I was plunged into this great ocean of reading without compass or pilot; and unless when some one had the charity to play at chess with me, I was allowed to do nothing, save read, from morning to night. I was, in kindness and pity, which was perhaps erroneous, however natural, permitted to select my subjects of study at my own pleasure, upon the same principles that the humour of children are indulged to keep them out of mischief. As my taste and appetite were gratified in nothing else, I indemnified myself by becoming a glutton of books. Accordingly, I believe I read almost all the old romances, old plays, and epic poetry, in that formidable collection, and no doubt was unconsciously amassing materials for the task in which it has been my lot to be so much employed.

"At the same time, I did not in all respects abuse the license permitted me. Familiar acquaintance with the specious miracles of fiction brought with it some degree of satiety, and I began by degrees to seek in histories, memoirs, voyages and travels, and the like, events nearly as wonderful as those which were the work of imagination, with the additional advantage that they were, at least, in a great measure true. The lapse of nearly two years, during which I was left to the service of my own free will, was followed by a temporary residence in the country, where I was again very lonely, but for the amusement which I derived from a good though old-fashioned library. The vague and wild use which I made of this advantage I cannot describe better than by referring my reader to the desultory studies of *Waverley* in a similar situation; the passages concerning whose reading were imitated from recollections of my own."

After his sixteenth year his health rapidly improved, a change to which his addiction to rural pursuits mainly contributed. The nature of his future profession became now a subject of consideration; and his peculiar habits seemed to suggest his fitness for the law. The first steps of the legal aspirant at Edinburgh are any thing but delightful. Sir Walter, though entertaining no partiality for his profession, contrived to be punctual in his attendance, and to escape the seduction of the "Stove school." The activity of his mind found a resource in the study of foreign languages, to which he applied himself with great industry, and soon made a considerable proficiency in Italian, French, and German; but his knowledge was limited to the power of translating; to the philology of a language he always retained an insuperable aversion; yet his critical knowledge of French must have been by no means despicable, if, as we are assured, he read through nearly all the old romances in that tongue. But from Germany came the light which kindled his imagination; he belonged to a small club who studied German under Dr. Wülich, who wished to lead his pupils through all the critical difficulties of the language; but Scott, whose only aim in the acquirement of it was to gain an acquaintance with the dramatic treasures it contained, adopted a method of his own, to the dismay of his instructor, and the laughter of his class-fellows. At that time German books were scarce commodities in the Scotch metropolis; but Scott, having obtained the works of Goethe, Schiller, and Bürger, began to dash out a free translation of the whole with a most spirited perseverance.

At the end of June 1792 the poet's father, when speaking of him in a letter to his friend, says,—"

have the pleasure to tell you that my son has passed his private Scots law examinations with good approbation." Shortly after this he was "gowned," for the particulars of which ceremony, and the "bit chack of dinner" which followed it, we must refer our readers, to "Redgauntlet" and the following pleasant anecdote:—"I have often heard both Alan and Darsie laugh over their reminiscences of the important day when they 'put on the gown.' After the ceremony was completed, and they had mingled for some time with the crowd of barristers in the outer court, Scott said to his comrade, mimicking the air and tone of a Highland lass waiting at the cross of Edinburgh to be hired for the harvest work,—'We've stood here an hour by the Tron, hinny, and diel a ane has speered our price.' Some friendly solicitor, however, gave him a guinea fee before the court rose; and as they walked down the High Street together, he said to Mr. Clerk, in passing a hosier's shop,—'This is a sort of a wedding day, Willie, I think I must go in and buy me a new night-cap.' He did so accordingly; perhaps this was Lord Jeffrey's 'portentous machine.' His first fee of any consequence, however, was expended on a silver taper-stand for his mother, which the old lady used to point to with great satisfaction, as it stood on her chimney-piece five-and-twenty years afterwards."

The five years which had elapsed between the time when Walter Scott was called to the bar, and his wedding-day, were years of developement, for during that period he came before the world as the translator of "Lenore"—of trial, for the lady of his love married another—of enjoyment, for he was making new friends every day, and enlarging the resources of that mind, which to him, indeed, "a kingdom was." Not the least delightful of his studies were those made from life and the open air, during his *raids* into Liddesdale. In the early part of the following letter, the love affair to which we have alluded is mentioned with as much earnestness as delicacy.

"It gave me the highest satisfaction to find, by the receipt of your letter of the 14th current, that you have formed precisely the same opinion with me, both with regard to the interpretation of —'s letter as highly flattering and favourable, and to the mode of conduct I ought to pursue—for, after all, what she has pointed out is the most prudent line of conduct for us both, at least till better days, which, I think myself now entitled to suppose, she as well as I myself, will look forward to with pleasure. If you were surprised at reading the important billet, you may guess how agreeably I was so at receiving it; for I had to anticipate disappointment—struggled to suppress every rising gleam of hope, and it would be very difficult to describe the mixed feelings her letter occasioned, which, *entre nous*, terminated in a very hearty fit of crying. I read over her epistle about ten times a-day, and always with new admiration of her generosity and candour; and as often take shame to myself for the mean suspicions which, after knowing her so long, I could listen to, while endeavouring to guess how she would conduct herself. To tell you the truth, I cannot but confess that my *amour propre*, which one would expect should have been exalted, has suffered not a little on this occasion, through a sense of my own unworthiness, pretty similar to that which afflicted Linton upon sitting down at Keir's table. I ought perhaps to tell you, what indeed you will perceive from her letter, that I was always atten-

tive, while consulting with you upon the subject of my declaration, rather to under than over-rate the extent of our intimacy. By the way, I must not omit mentioning the respect in which I hold your knowledge of the fair sex, and your capacity of advising in these matters, since it certainly is to your encouragement that I owe the present situation of my affairs. I wish to God, that, since you have acted as so useful an auxiliary during my attack, which has succeeded in bringing the enemy to terms, you would next sit down before some fortress yourself; and were it as impregnable as the rock of Gibraltar, I should, notwithstanding, have the highest expectations of your final success. Not a line from poor Jack—What can he be doing? Moping, I suppose, about some watering place, and deluging himself with specifics of every kind; or lowering and snorting in one corner of a post-chaise, with Kennedy, as upright and cold as a poker, stuck into the other. As for Linton and Crab, I anticipate with pleasure their marvellous adventures, in the course of which Dr. Black's self-denying ordinance will run a shrewd chance of being neglected. They will be a source of fun for the winter evening conversations. Methinks I see the pair upon the mountains of Tipperary—John with a beard of three inches, united and blended with his shaggy black locks, an ellwand-looking cane with a gilt head, in his hand, and a bundle in a handkerchief over his shoulder, exciting the cupidity of every Irish rapparee who passes him, by his resemblance to a Jew pedlar who has sent forward his pack.—Linton, tired of trailing his long legs, exalted in state upon an Irish garron, without stirrups, and a halter on its head, tempting every one to ask,—

'Who is that upon the pony.  
So long, so lean, so raw, so bony!'

—calculating, as he moves along the expenses of the salt horse, and grinning a ghastly smile, when the hollow voice of his fellow-traveller observes, 'God! Adam, if ye gang on at this rate, the eight shillings and sevenpence halfpenny will never carry us forward to my uncle's at Lisburn.' Enough of a thorough Irish expedition.

"We have a great marriage towards here—Scot of Harden, and a daughter of Count Bruhl, the famous chess-player, a lady of sixteen quarters, half-sister to the Wyndhams. I wish they may come down soon, as we shall have fine racketting, of which I will, probably, get my share. I think of being in town some time next month, but whether for good and all, or only for a visit, I am not certain. O, for November! Our meeting will be a little embarrassing one. How will she look, &c. &c. &c., are the important subjects of my present conjectures—how different from what they were three weeks ago! I give you leave to laugh, when I tell you seriously, I had begun to 'dwindle, peak, and pine,' upon the subject; but now, after the charge I have received, it were a shame to resemble Pharaoh's lean kine. If good living and plenty of exercise can avert that calamity, I am in little danger of disobedience, and so, to conclude classically,

"'Dicite Io pœan, et Io his dicite pœan!—

"'Jubeo te bene valere,

*Walter Scott*

The translation of "Lenore," we find, bears the date of the autumn of 1794; but the history of this, its success, and its literary consequences, are too well known to our readers (thanks to Scott's own inimitable prefaces) to call for further allusion. The "little volume, containing one or two other translations and ballads, which has no author's name on the title-page,"—the first of so brilliant a series,—was, however, not published till October 1796. In the spring of the following year, we find Scott's loyal feelings, as well as his chivalresque humour, indulged by his being made quarter-master of a corps of volunteer cavalry, raised under the prevalent apprehension of a French invasion.

In the autumn of 1796, while exploring the English lakes, with his brother and Adam Ferguson, he fixed his head quarters at Gilsland—"the St. Ronan's well" of that district; and here, at a ball, was presented to Miss Charlotte Margaret Carpenter—the lady to whom, on the 29th of the subsequent December, he was married. Previous to this event many letters passed between them, which have since been collected and published by Sir Walter's son-in-law, the celebrated Mr. Lockhart. Our limits will only permit of the insertion of one of these interesting documents—it was written by Miss Carpenter, and displays an admirable mixture of modesty, archness and affection:—

"Carlisle, November 27th.

"You have made me very triste all day. Pray never more complain of being poor. Are you not ten times richer than I am? Depend on yourself and your profession. I have no doubt you will rise very high, and be a great rich man, but we should look down and be contented with our lot, and banish all disagreeable thoughts. We shall do very well. I am very sorry to hear you have such a bad head, I hope I shall nurse away all your aches. I think you write too much. When I am mistress I shall not allow it. How very angry I should be with you if you were to part with 'Lenore.' Do you really believe I should think it an unnecessary expense where your health and pleasure can be concerned? I have a better opinion of you, and I am very glad you don't give up the cavalry, as I love any thing that is stylish. Don't forget to find a stand for the old carriage, as I shall like to keep it, in case we should have to go any journey; it is so much more convenient than the post-chaises, and will do very well till we can keep our carriage. What an idea of yours was that to mention where you wish to have your bones laid! If you were married, I should think you were tired of me. A very pretty compliment before marriage. I hope sincerely that I shall not live to see that day. If you always have those cheerful thoughts, how very pleasant and gay you must be.

"Adieu, my dearest friend; take care of yourself if you love me, as I have no wish that you should visit that beautiful and romantic scene, the burying-place. Adieu, once more, and believe that you are loved very sincerely by  
C. C."

After his marriage he took up his residence in North Castle Street, Edinburgh, and occasionally made what he called "raids" into Liddesdale, for the purpose of collecting the ballad poetry of that romantic and most primitive district. It was not only necessary on these occasions to write down old ballads from recitation, but also to collect the materials for writing notes and explanations, by which the

ballads themselves might be illustrated. The result of these "raids" appeared in his work entitled "The Minstrelsy of the Scottish Border." This work issued from the press in 1802, and it displayed, both in the text and notes, a great deal of learning, and an intimate acquaintance with a district of Scotland which had previously attracted but little attention.

Some amusing anecdotes have been printed, and others are yet extant in oral tradition among the border hills, of the circumstances attending the collection of these ballads. The old women, who were almost the only remaining depositaries of ancient song and tradition, though proud of being solicited to recite them by "so grand a man" as an Edinburgh advocate, could not repress their astonishment that "a man o' sense an' lair" (learning) should spend his time in writing into a book "nae ballads and stories of the bluidy border war o' papish times.

Mr. Hogg was well acquainted with Sir Walter and gave the following interesting account of his visit to Ettrick Forest, for the purpose of collecting materials for those valuable remains of "Scottish Minstrelsy," to which we have already alluded. He says,—One fine day in the summer of 1801, as I was busily engaged working in the fields at Ettrick House, Wat Shiel came over to me and said, that I had gang away down to the Ramseycleuch as fast as my feet could carry me, for there war some gentles there wha wantit to speak to me.

"Wha can be at the Ramseycleuch that want to speak to me?"

"I couldna say, for it wasna me that they spak o' i' the byganning. But I'm thinking it's the same an' some o' his gang."

I was rejoiced to hear this, for I had seen the first volumes of "The Minstrelsy of the Border," and had copied a number of old ballads from my mother's recital, and sent them to the editor preparatory for the third volume. I accordingly went towards home, put on my Sunday clothes, but before reaching home met with the shirra and Mr. William Laidlaw coming to visit me. They alighted and remained in the cottage for a space better than an hour, and my mother chanted the ballad of old Maitlan' to them, in which Mr. Scott was highly delighted. I had sent him a copy (not a very perfect one, as I found afterwards, from the singing of another Laidlaw), but thought Mr. Scott had some dread of a part being forged, that had been the cause of his journey into the wilds of Ettrick. When he heard my mother sing it he was quite satisfied, and I remember I asked her if she thought it had ever been printed, and her answer was, "Oo, na, na, sir, it was never printed i' the world, for my brothers an' me heard it frae old Andrew Moor, an' he learned it, an' our mae, frae old Baby Mettlin, that was housekeeper to the first laird o' Tushilaw."

"Then that must be a very old story indeed, Mr. Scott," said he.

"Ay, it is that! It is an auld story! But not that, except George Warton and James Stewart, there was never ane o' my sangs prentit till ye printed them yoursell, an' ye hae spoilt them a' thegither. They war made for singing, an' no for reading; and they're nouthier right spelled nor right setten down."

"Heh—heh—heh! Take ye that, Mr. Scott," said Laidlaw.

Mr. Scott answered by a hearty laugh, and then

cital of a verse, but I have forgot what it was, and my mother gave him a rap on the knee with her open hand, and said that it was true enough for o' that. We were all to dine at Ramsaycleuch with the Messrs. Brydon, but Mr. Scott and Mr. Laidlaw went away to look at something before dinner, and I was to follow. On going into the stable-yard at Ramsaycleuch I met with Mr. Scott's liveryman, a far greater original than his master, of whom I asked if the shirra was come?

"O, ay, lad, the shirra's come," said he. "Are ye the chiel that maks the auld ballads and sings them?"

"I said I fancied I was he that he meant, though I had never made ony very auld ballads."

"Ay, then, lad, gae your ways in an' speir for the shirra. They'll let you see where he is. He'll be very glad to see you."

During the sociality of the evening, the discourse ran very much on the different breeds of sheep, that curse of the community of Ettrick Forest. The original black-faced forest breed being always called "the short sheep," and the Cheviot breed "the long sheep," the disputes at that period ran very high about the practicable profits of each. Mr. Scott, who had come into that remote district to preserve what fragments remained of its legendary lore, was rather bored with the everlasting question of the long and short sheep. So at length, putting on his most serious calculating face, he turned to Mr. Walter Brydon and said, "I am rather at a loss regarding the merits of this very important question. How long must a sheep actually measure to come under the denomination of a long sheep?"

Mr. Brydon, who, in the simplicity of his heart, neither perceived the quiz nor the reproof, fell to answer with great sincerity,—"It's the woo, sir,—it's the woo that makes the difference. The lang sheep hae the short woo, and the short sheep hae the lang thing; and these are just kind o' names we gie them like." Mr. Scott could not preserve his grave face of strict calculation, it went gradually awry, and a hearty guffaw followed. When I saw the very same words repeated near the beginning of "The Black Dwarf," how could I have been mistaken of the author? It is true Johnnie Ballantyne persuaded me into a nominal belief of the contrary for several years following, but I could never get the better of that and several similar coincidences.

"The Lay of the Last Minstrel" appeared in 1805. The structure of the verse was suggested, as the author states, by the "Christabel" of Coleridge, a part of which had been repeated to him about the year 1800 by Sir John Stoddart. The originality, wildness, poetical beauty, and descriptive power of Scott's border romance produced an effect on the public mind only to be equalled, perhaps, by some of the earlier works of Byron.

In the spring of 1806 Sir Walter obtained an appointment which, he says, completely met his moderate wishes as to preferment. This was the office of a principal clerk of session, of which the duties are by no means heavy, though personal attendance during the sitting of the courts is required. Mr. Pitt, under whose administration the appointment had been granted, having died before it was officially completed, the succeeding Whig ministry had the satisfaction of confirming it, accompanied by very complimentary expressions from Mr. Fox to the nominee

on the occasion. The emoluments of this office were about 1200*l.* a year; but Scott received no part of the salary till the decease of his predecessor in 1812, the appointment being a reversionary one.

His literary efforts, meanwhile, underwent no respite. Constable purchased the copyright of "Marmion" for 1000*l.*, a sum required by the author, it is said, for "the special purpose of assisting a friend who was then distressed." The impression previously produced upon the public mind by "The Lay of the Last Minstrel" was exceeded by "Marmion." The happy construction of the plot, the animation of the figures, the life of the scenery, the torrent-like flow of the narrative, and the originality pervading the whole, were everywhere felt and acknowledged:—it was a romance in rhyme. We shall not in the present case attempt a critical review of Scott's productions, or even name all those of a miscellaneous character which he continually poured from the press. To assist the new house of Ballantyne and Co., in whose establishment he was mainly instrumental, he composed his charming poem, "The Lady of the Lake," which was "suggested by the deep impressions Perthshire had left on his remembrance." He mentioned this fact in his fragments of autobiography. "I took uncommon pains," he adds, "to verify the accuracy of the local circumstances of this story. I recollect, in particular, that, to ascertain whether I was telling a probable tale, I went into Perthshire to see whether King James could actually have ridden from the banks of Loch Vennachar to Stirling Castle within the time supposed in the poem, and had the pleasure to satisfy myself that it was quite possible." For "The Lady of the Lake" 4000*l.* were given by Messrs. Ballantyne, and the calculation warranted the amount. Visitors thronged from every part of England, and even from distant countries, to the solitudes of Loch Katrine, and the wheels of a thousand carriages "startled the untrodden roads of Callander."

The question will naturally be asked, how an individual so occupied by a fatiguing profession could find leisure for the fabrication of these works of art? but Scott had now entered upon a system of early rising, and the hours preceding breakfast were appropriated to literary composition; a determination materially aided, as he declared, by the exemplary character and admonitions of his friend Wallace, a little wiry-haired terrier, of which he was very fond. By this habit three hours of fresh and uninterrupted study were secured before his official engagements at the parliament-house—a portion of time amply sufficient, he affirmed, for all the demands of authorship.

When Swift declared that he never knew any man come to greatness and eminence who lay in bed of a morning, he certainly intended to limit his remark to political and active life; for in literature many authors besides Thomson have dreamed away the morning hours in a Castle of Indolence. But the habit of early rising is undoubtedly of inestimable value, and one of the most powerful implements in the hand of a man beating out his path to distinction; it was, indeed, a very common virtue among our ancestors. In Paris, we are told, that in the fourteenth century the shops were opened at four in the morning; and we know that in the reign of our own Henry VIII. the fashionable dinner hour was ten A. M. The superior elasticity and freshness of the intellectual

faculties in the morning are facts well known to every student. Doddridge attributed his commentary upon the New Testament to this practice, and observed that the difference between rising at five and seven in the morning for the space of forty years, supposing a man to go to bed at the same hour at night, is nearly equivalent to the addition of ten years to life.

The author of "Waverley" used to frequent the house of Mr. Ballantyne in South Hanover Street, where he was distinguished for the ease and mirthfulness of his manners. At these parties he sometimes appeared in full dress, with white silk stockings, a scarlet silk under-waistcoat, and uniform coat of the Border club. He went into society for the sake of recreation, not of display; and, as Mackintosh said of Canning, when a thought of deeper meaning fell from him, it stole forth in a conversational undress. His efforts all tended to promote the good temper and harmony of the party. So at a dinner at Lasswade, when Leyden was relating with great indignation the violent conduct of the antiquary Ritson, Scott, without saying a word in reply, "took up a large bunch of feathers tied to a stick for dusting pictures, shook it about the student's head and ears till he laughed, and then changed the subject." This trifling circumstance furnishes a happy illustration of his disposition. Sir Walter once related the following anecdote, which was told with characteristic unctiousness:—

"The dinner hour being so early as half-past four, there was ample time for conversation, and for a few minutes, I remember, it turned upon ghosts and apparitions. 'The most awkward circumstance about well-authenticated hobgoblins,' said he, 'is that they, for the most part, come and go without any intelligible object or purpose except to frighten people, which, with all due deference, seems rather foolish. Very many persons have either seen a ghost, or something like one, and I am myself among the number. There is a particular turning of the high road through the forest near Ashestiel, at a place which affords no possible means of concealment; the grass is smooth, and always eaten bare by the sheep; there is no heather, nor underwood, nor cavern in which any mortal being could conceal himself. Towards this very spot I was advancing one evening on horseback,—please to observe it was before dinner, and not long after sunset, so that I ran no risk of seeing double, or wanting sufficient light for my observations. Before me, at the distance of about a quarter of a mile, there stood a human figure, sharply enough defined by the twilight. I advanced—it stalked about with a long staff in its hand, held like a wand of office, but only went to and fro, keeping at the same corner till, as I came within a few yards, my friend all in an instant vanished. I was so struck with his eccentric conduct that although Mrs. Scott was then in delicate health, and I was anxious to get home to a late dinner, I could not help stopping to examine the ground all about, but in vain; he had either dissolved into air, or sunk into the earth, where I well knew there was no coal pit to receive him. Had he lain down on the green sward, the colour of his drapery, which was dusky brown, would have betrayed him at once, so that there was no practicable solution of the mystery. I rode on, and had not advanced above fifty yards when, on looking back, my friend was there again, and even more

clearly visible than before. Now, said I to myself, I must certainly have you, so wheeled about and spurred Finella; but the result was as before. He vanished instantaneously. I must candidly confess I had now got enough of the phantasmagoria; whether it were from a love of home, or a participation in my dislike of this very stupid ghost, no matter, Finella did her best to run away, and would by no means agree to any further process of investigation. I will not deny that I felt somewhat uncomfortable, and half inclined to think that this apparition was a warning of evil to come, or indication, however obscure, of misfortune that had already occurred. So strong was this impression that I almost feared to ask for Mrs. Scott when I arrived at Ashestiel; but, as Dr. Johnson said on a similar occasion—nothing ever came of it. My family were as usual; but I did not soon forget the circumstances because neither the state of the atmosphere, nor the line of the scenery, allowed of explanation by reference to any of those natural phenomena produced by apparitions, which, however remarkable, are familiar not only to James Hogg as a poet, but to almost every shepherd in a mountainous district."

With the appearance of "Waverley," the career of which from among a miscellaneous collection of curiosities Scott has so amusingly recorded, commenced a new and eventful era in the author's life. The progress of the novel was at first slow, but every day carried it into wider circulation, and the "living portrait of the baron of Bradwardine and his satellites" excited universal admiration and astonishment. Feelings still further heightened by the publication of "Guy Mannering" early in the ensuing year—a work which, for liveliness of character and force of narration, left its predecessor in the rear. In the same year came out the first series of "Tales of My Lord," under the assumed name of Peter Portman, which, after considerable opposition, were at length attributed to the same fertile pen. The magical charm was now in full operation, fiction after fiction shrouded in unexpected beauty upon the wondering eye—

"Like some tall palm the mystic fabric rose,  
Majestic in its silence!"

"Ivanhoe," with its splendid scenes of chivalry; "Kenilworth," with its gorgeous festivals, its historical paintings, its poetic grandeur and dignity; "The Antiquary," with its mellow colouring, its exquisite finish, its almost Attic raillery and humour; each, in another, without any apparent effort, delighted and amazed the literary public. And all these were seemed only the recreations of a mind constantly employed in professional duties, and continually making incursions into the various and opposite departments of literature.

In 1825 Scott visited Ireland, where he was received with every mark of attention; indeed he soon became "the lion" of that capital. For nearly a fortnight after his arrival, Scott was occupied in viewing the public buildings and institutions of Dublin. Among the rest, St. Patrick's cathedral, so closely connected with his editorial labours and the collections of Swift, attracted his earliest attention. He lingered long before the monumental tablet erected to Swift's memory, and with much feeling transmitted to the ladies who accompanied him, the nervous Latin epitaph inscribed on it, which records, in Scott's own words, his hatred of oppression, and exercises a

the cause of liberty. The humble memorial of Mrs. Hester Johnson (the unfortunate Stella) did not escape his notice; nor a small slab which Swift placed near the southern entrance, anciently called St. Paul's gate, in memory of the "discretion, fidelity, and diligence" of his faithful servant, Alexander M'Gee. At the deanery house he was shown the fine full-length original portrait of Swift, which is preserved there, having been painted by Bindon, in the year 1738, at the expense of the chapter, whose property it is. In passing from the deanery to the adjacent library, founded by Dr. Marsh, Scott was shown the ancient residence of the archbishop of Dublin, which, however, was not deemed worth a visit, as the exterior of the building alone retains any interest, it having been some time previously converted into a barrack for the horse police of the city. In Marsh's library he was much interested and amused by some marginal autograph notes, written, chiefly in pencil, in Clarendon's "History of the Rebellion," by Swift, in his most caustic and abusive style, containing the fiercest invectives against the Scottish nation. His notice was also called by the librarian to a desk of rather rude workmanship, which had long been used there by his deceased friend, Maturin, who, being in the habit of reading in this library for several hours every day, had with his own hands constructed this little desk for his convenience. On this, it is said, the great part of his novel of "The Albigenses," as well as some others of his works, had been written. Of Maturin's genius Scott had long entertained the very highest opinion; they had corresponded for a long time, and he had invited Maturin to Abbotsford, but it does not appear that they ever met. To his widow, Scott hastened to pay an early visit of condolence, and endeavoured to mitigate her sorrows by an act of munificent generosity. He had previously offered, in the most friendly manner, to edit Maturin's novels, or selections from them, with an introduction by himself, on his return home from Ireland; but before he could carry his intentions into effect, the disastrous consequences of his connexion with the house of Constable and Co., which met him almost on his arrival in Scotland, compelled him to relinquish his design, and he wrote back to Mrs. Maturin in the kindest terms, assuring her that nothing but the imperative necessity of devoting his exclusive attention and energies to his own pressing affairs, should have made him give up the task he had undertaken.

While Scott was in Dublin, he hoped to have been able to make some valuable additions to his library, of rare books and tracts relating to Irish history, which he supposed he would more probably have met with here than elsewhere; and he was accordingly indefatigable in his search at shops and standings where second-hand books are sold. More than once he sallied out by himself, at an early hour after breakfast, on this quest. Upon one occasion he was observed to remain at a book-standing upon the quay leading to the custom-house, for a considerable while, nearly a quarter of an hour, and during that time he never took down a single book from its place, or even removed his hands from behind his back, contenting himself with patiently and carefully going over the titles of the books inscribed on their backs. He expressed much disappointment at being totally unsuccessful in his search, and, in despair at his ill-fortune, he went, the day before he quitted Ireland, **BIOGRAPHY.—VOL. II.**

to the shop of Mr. Milliken, the bookseller, in Grafton-street, and there expended upwards of 60*l.* in the purchase of books relating solely to the history and antiquity of that country.

For some time before his visit to Ireland, a very general notion prevailed that he was the author of the *Waverley Novels*, and this idea certainly was far from diminishing the popularity he had acquired by his previously acknowledged works. This was most strikingly manifested in Dublin, not only at the theatre, where he was compelled, by the reiterated calls of a crowded audience, to come forward and return thanks for this flattering welcome, but also through the streets, where his carriage was followed by crowds in every direction, who pursued it, anxious to catch a glimpse of him from whose writings they had derived such gratification. It is said he was much pleased, as indeed was most natural, by these unequivocal demonstrations of public estimation and favour.

Various tokens of respect and esteem now poured in from every quarter on the distinguished stranger; many invitations he accepted, but they were invariably from private individuals; those from public bodies were politely but firmly declined. The freedom of the guild of merchants was conferred upon him soon after his arrival, a deputation of the guild having waited upon him at his house in Stephen's Green for the purpose; and soon after he was presented by the university with the degree of doctor of laws. He had also, some time before, been elected an honorary member of the royal Irish academy, and on the occasion of his visiting Cork, on his return from his tour from the south of Ireland, he was granted the freedom of that city at the same time with Major General Sir George Bingham, Admiral Plampin, and Mr. Serjeant Lefroy. He paid a visit of some days to Old Connaught, the hospitable residence of the lord chancellor, then Mr. Plunket; shortly afterwards he dined with the lord-lieutenant (Lord Wellesley) at Malahide Castle, where he resided for his health during the summer.

The first excursion Scott made to the country was to the county of Wicklow, several of the most picturesque spots of which he rapidly visited. No beauty of sylvan scenery, however, seems to have arrested his attention, or excited his interest in the same degree as the ecclesiastical ruins at Glendalough, Holycross, and the rock of Cashel. At "that inestimably singular scene of Irish antiquities," as he afterwards termed it in an article in "The Quarterly," the "Seven Churches of Glendalough," he remained an entire day, with great apparent pleasure, and examined these mouldering monuments of the ancient monastic splendour of Ireland with an excited enthusiasm which appeared extraordinary to the companions of his tour, to whom he frequently observed that he had never before seen ecclesiastical remains of equal antiquity or interest. He also, with all the ardour of a youthful mind, despite his lameness, boldly ascended the cliff, and entered that extraordinary hermit's cell, called St. Kevin's Bed; and, after the fashion of its visitors, inscribed his name upon the rock as a memorial of his daring.

Chaucer has compared poetry to a rock of ice; human life bears an equal resemblance to it; the adventurer cuts his slips as he advances; shaping out the path up the precipice with toil and peril, he attains the summit, and finds the opposite side smooth

as glass. The descent from prosperity is more rapid than the rise. The failure of Constable, the publisher of Sir Walter, in 1825, involved him in difficulties from which he was only extricated by death. The circumstances attending this unfortunate connexion—the heroic devotion with which he met this afflicting reverse of fortune, is absolutely sublime. Beneath the pressure of liabilities amounting to 100,000*l.* he applied himself with wonderful resolution and intrepidity to his literary engagements; and when a very large sum was placed by an anonymous friend at his disposal, “he returned it to the bankers from whose hands it came, with a letter, gratefully acknowledging, but steadily declining the favour.” Nor was the patriot lost in the man of misfortune; the political letters, published under the signature of Malgrowther, are said to have exercised a very beneficial influence upon the monetary system of Scotland. The death of Lady Scott threw him still more entirely upon literary pursuits. He now laboured almost unceasingly; and on his return to Edinburgh in May 1826 “he established himself at a third-rate lodging in St. David Street, such as might be considered suitable for a humble student attending the university.” Here he kept earlier hours than usual, sometimes in a single morning, and before the meeting of the court at ten, having finished a sheet of twenty-four pages for the printer. “His handwriting,” he says, “was now so small and cramped that one of his ordinary quarto pages made at least double that amount in print;” and, after all, he observed it “was really no great exploit to finish twelve pages in a morning.” But on his return from the Parliament House, however wearied he might be, the task was again resumed. Seldom receiving any company, he scarcely sat for a quarter of an hour at dinner, but turned directly to his writing-desk, being anxious, he said, to take all possible advantage of the long days, and “make hay while the sun shone.” In the midst of this severe and overwhelming application, and suffering under all the accumulated annoyances of his peculiar situation, he preserved, unclouded, the equanimity of his charac-

ter. “However heavy the task might be,” says a friend of his, “and however much he became pressed for time, there never appeared the slightest flurry or irritation in his demeanour; he never seemed vexed nor in a hurry, but, with a sort of smile on his countenance, took up the pen and went on, to all outward appearance, as willingly as if the whole had been for his own amusement.”

Sir Walter Scott's favourite residence in the days of his prosperity, and indeed his love for it remained unabated long after his fatal reverses, was “Abbotsford.” We cannot better describe this edifice, of which we give a view in the preceding engraving, than by quoting the words of Washington Irving, the well-known American writer. He says:—

“Beyond the gates you had an extensive park, laid out on the best and boldest principles of landscape gardening, as applicable to forest scenery; and within doors, you were surrounded in every apartment with objects calculated not only to realize the cherished visions of romance, but to awaken those associations which, to the historian, the biographer, and antiquary, are the most valuable and interesting. The domestic economy was equally agreeable, and the minutest accessories to comfort and convenience carefully provided. Not only on the table in the recesses of the library, but in every sleeping apartment, was placed the port-feuille, the paper, pens, ink, and sealing-wax. Match-box and taper, to those who knew the ways of the house, were unnecessary; for it was a practice to keep the oil gas burning, though at so very low a degree, that unless the stop-cock were touched, the consumption was insignificant, and the flame imperceptible. In the large antique dining-room there hung a very beautiful lustre, which in spring and autumn was always lighted, though invisibly, before dinner; and on the approach of darkness, instead of the usual parade of servants bringing candles, the full blaze of light could be produced, as if magically, by a single touch, or moderated to any degree.”

“With regard to the mansion itself,” adds the writer, “the room that always seemed to me the most imposing and effective, is the front hall or armoury; so faithful are its imitations of genuine models, so massive and sombre is the style, and so rich the collection of objects interesting to an antiquarian. A whole morning might be well employed in examining this one apartment with a carver who knew all its history. It is about forty feet long, has a tessellated pavement of black and white Scotch marble, and a noble roof, in rich Gothic style. Here, as in the rest of the mansion, though the general plan was of course original, Sir Walter Scott adopted the system of forming details; that is to say, roofs, fire-places, windows, and doors, by precise copies from the veritable antique; and where it was possible to employ actual portions of old buildings, either in wood or stone, they were, of course, used in preference. In the hall, if I mistake not, the richly carved panels, of black and imperishable oak, were brought from the ruins of Dumfries palace, or abbey; and the immense fireplace was exactly modelled after that of an existing old castle. I cannot imagine a scene more poetically impressive than this room, especially when viewed by moonlight.”

For five years after his pecuniary misfortune, namely, from January 1826 to the spring of 1831, Sir Walter continued his indefatigable labours. In that period, besides some eight or ten works of fiction, produced “The Life of Napoleon,” in ten volumes; a “History of Scotland,” in two volumes; “Tales of a Grandfather,” in nine small volumes; “Letters on Demonology;” “Malgrowther's Letters,” and a variety of smaller productions. The profits of these works, and of the new edition of the

Waverley Novels, which was commenced in 1829, were so considerable, that towards the end of the year 1830, 54,000*l.* of debt had been paid off; all of which, except six or seven thousand, had been produced by his own literary labours.

The prodigious labour which these numerous and voluminous works necessarily required, was too much, however, for even the most ready intellect and robust frame. The personal appearance of Sir Walter entirely changed in the five years which followed his ruin. A few years previously he looked a hale and active man in middle life; now, at the age of sixty, he appeared at least ten or twelve years older. His hair had become thin and perfectly white; the marks of old age were gathering fast upon his countenance; and, from increased decrepitude, he "hirpled" (as he expressed it) much more than formerly in his gait. His cordial kindness and conversational felicity, however, remained unimpaired, but something of his former hilarity of spirit was wanting. When told of the death of a gentleman of his acquaintance by paralysis, he appeared much struck, and made a remark which seemed at the time to indicate some secret apprehension in his own mind of that fatal malady then lurking in his own overwrought frame.

In 1830 he retired from his office as a principal clerk of session, but the relief he thereby gained (if indeed the time saved was not filled by more exhausting labours) came too late. The springs of life, so long overtaken, began to give way. During the ensuing winter symptoms of gradual paralysis (a disease of which his father, it seems, had also died, but at an advanced age) began to be manifested. His ameness became more distressing, and his utterance began to be obviously affected. Yet even in this afflicting and ominous condition he continued to work with undiminished diligence.

During the summer of 1831 he grew gradually worse. His medical attendants strictly forbade mental exertion; yet he could not be restrained altogether from composition. In the autumn a visit to Italy was recommended; and a passage to Malta in a ship of war was readily obtained for him. He was with difficulty prevailed on to leave Scotland, but yielded at length to the entreaties of his friends, and sailed in October, accompanied by his eldest son and unmarried daughter. His health seemed improved on the voyage; but after visiting Naples and Rome, both of which cities he was received with almost gal honours, his desire to return to his native land became irrepressible, and he hurried homeward with a rapidity which, in his state of health, was highly injurious, and doubtless accelerated the catastrophe which perhaps no degree of skill or caution could have long delayed. He experienced a further severe attack of his disorder in passing down the Rhine, and reached London in nearly the last stage of physical and mental prostration. Medical aid could only, it was found, for a short period protect dissolution; and, to gratify his most ardent wish, he was conveyed by the steam-packet to Edinburgh, and on the 11th July, 1832, reached once more his favourite house at Abbotsford,—but in such debilitated condition, that he no longer recognised his nearest and dearest relations. After lingering in this deplorable state till, in the progress of this melancholy lady—this living death—mortification had been some time proceeding in different parts of the mortal

frame—he expired without a struggle on the 21st of September, 1832.

On the 26th of September the honoured remains of Sir Walter Scott were consigned to the tomb, amid the unfeigned regret of thousands. Never perhaps was the esteem in which this truly great man was held more conspicuously displayed than on this melancholy occasion. We understand that cards had been issued to nearly 300 persons, who almost all attended, it being deemed an honour to be present at the funeral obsequies of so distinguished a character. One o'clock was the hour fixed on for the time of meeting, and for an hour afterwards carriages of different sorts, and gentlemen on horseback, continued to arrive from Edinburgh, Peebles, Selkirk, Galasheils, Melrose, Jedburgh, and other parts of the surrounding country. The company, having partaken refreshment, adjourned to the library, where they heard an eloquent and affecting prayer from Principal Baird; and a little after two o'clock the melancholy procession, consisting of carriages, numerous other vehicles, and horsemen, began to move from Abbotsford, and proceeded through the towns of Darnick and Melrose, and by the fly-bridge to Dryburgh Abbey. As the long funeral train passed through the villages and hamlets, one universal feeling of deep sorrow pervaded all classes. Groups of people were assembled at different parts of the road, and on elevated points from which a view could be obtained. Most of them were in mourning, and many standing uncovered. The decency, propriety, and reverential silence which was observed, gave a very impressive character to the scene. In passing through the towns those respectful observances were still more striking. The streets of Melrose were lined on both sides with inhabitants in mourning, and uncovered. The shops of this and other towns were shut; the sign-boards were covered with black; the aged and the lame came forth to pay their last tribute to departed worth; and along the many miles of picturesque country which the procession had to traverse, the ensigns of sorrow were every where displayed. These were the unbought and voluntary testimonies to the private virtues of the deceased from those among whom he had lived, and by whom he was best known. At Dryburgh Abbey the body, on being taken from the hearse, was borne by his own domestics to the grave, they having specially requested that no foreign hand should be allowed to touch the remains of a master so honoured and so beloved. The pall-bearers were—

Hugh Scott, Esq.,  
of Harden.

## Foot.

Wm. Keith, Esq., of Edinburgh.

Before the body was committed to the earth, the English burial-service was read by the Rev J. Williams, rector of the Edinburgh academy. A little past five in the afternoon the last offices were performed.

The effect of the scene was at this time impressive, far beyond what any words can convey, and in consideration of the genius and intellectual powers of the deceased, his wit, his eloquence, his fancy, none could help thinking of his own beautiful words,

"They sleep with him who sleeps below."

The spot in which Sir Walter Scott is laid, is in the north wing of the splendid ruin of Dryburgh Abbey, now, alas! containing a more splendid ruin than itself. Here is laid the body of Lady Scott, and also that of his uncle. The situation is secluded and romantic, and quite congenial to all the ideas of the deceased.

Perhaps no writer ever enjoyed so extensive a popularity as Sir Walter Scott. His reputation may be truly said to be not only British, but European, and even this is too limited a term, for he possessed the advantages of writing in a language used in two hemispheres by highly civilized communities, and widely diffused over the whole globe; and he wrote at a period when communication was facilitated by peace.

While the wonder of his own countrymen, he to an unexampled degree established an ascendancy over the tastes of foreign nations. His works have been sought by foreigners with an avidity equalling, nay, almost exceeding, that with which they have been received among us. The conflicting literary tastes of France and Germany, which, fifty years ago, seemed diametrically opposed, and hopelessly irreconcilable, have at length united in admiration of him. In France he effected a revolution in taste, and gave victory to the "Romantic School." He had not only readers, but imitators. Among Frenchmen, the author of "Cinq Mars" may be cited as a tolerably successful one. Italy, in which what we call novels were previously unknown, was roused from its torpor, and found a worthy imitator of British talent in the author of the "Promessi Sposi."

Previous to the appearance of Waverley, if any one had ventured to predict that a writer would arise, who, when every conceivable form of composition seemed not only to have been tried, but exhausted, should be the creator of one hitherto unknown, and which, in its immediate popularity, should exceed all others—who, when we fancied we had drained to its last drop the cup of intellectual excitement, should open a spring, not only new and untasted, but apparently deep and inexhaustible—that he should exhibit his marvels in a form of composition the least respected in the whole circle of literature, and raise the novel to a place among the highest productions of human intellect—his prediction would have been received, not only with incredulity, but with ridicule; and the improbability would have been heightened, had it been added, that all this would be effected with no aid from the influence of established reputation, but by a writer who concealed his name. They were, it is true, called historical novels; and works bearing that appellation had existed before. But these were essentially different; they were not historical in the same sense; and were as little to be classed with the Waverley Novels, as are a chronological index or a book of memoirs, because the same names and circumstances may be alluded to in each. The misnamed historical novels which we possessed before Waverley, merely availed themselves of historical names and incidents, and gave to the agents of their story the manners and sentiments either of the pre-

sent period, or, much more commonly, of none; but Sir Walter brings to our minds, not abstract beings, but breathing, acting, speaking individuals. Then what variety! What originality! What numbers! What a gallery has he set before us! No writer but Shakspeare ever equalled him in this respect. Others may have equalled, perhaps surpassed him, in the elaborate finishing of some single portrait (witness the immortal Knight and Squire of Cervantes, Fielding's Adams, and Goldsmith's Varney); or may have displayed, with greater skill, the moral anatomy of human feeling—and our slightest feelings and finer sensibilities have been more exquisitely touched by female hands—but none, save Shakspeare, has ever contributed so largely, so valuably to our collection of characters;—of pictures so strikingly original, yet, once seen, admitted immediately to be conformable to nature. Nay, even his immortal beings are felt to be generally reconcilable with our code of probabilities; and, as has been said of the supernatural creations of Shakspeare, we are impressed with the belief, that if such beings exist, they would be as he has represented them.

The descriptions of persons by Sir Walter Scott are distinguished chiefly by their picturesqueness. We always seem to behold the individual described. Dress, manner, features, and bearing, are so vividly set before us, that the mental illusion is rendered complete as words can make it. But if we feel so familiar with the personage introduced, it is not because the mind's eye has received his image, or because we are endowed with a knowledge of his character. It is the outward, not the inward, that most engages our attention. We compare Iago perfectly, without knowing what manner of man he was to look upon. But Varney, Roderigo, or Christian, must be presented mentally to us, as well as to the understanding, before we can have an equal intimacy. The method of Sir Walter Scott has the merit of individualizing an imaginary person in a remarkable degree, and is well suited to the nature of the novel. Its effects much of what drama, is supplied by the actor who represents character on the stage. But it is an inferior to that of unveiling the recesses of the mind, and presenting to us thoughts, passions, tastes, and energy of action.

It may be said of the novels of Sir Walter Scott, as of the plays of Shakspeare, that though they do not exhibit an attempt to enforce any distinct moral, they are, on the whole, favourable to morality. They are (to use a common expression) to keep the heart in its right place. They inspire generous emotions, and a warm-hearted and benevolent feeling towards fellow-creatures; and, for the most part, afford a clear and unperverted view of human character and conduct. Sir Walter Scott and Lord Byron have often been compared; and the question has been mooted to which we should assign superiority of genius. In Sir Walter Scott does not appear, like Lord Byron, to have written under the influence of morbid excitement, or availed himself of the resources of egotism. He did not draw from out the burning well of his own stormy passions. He was the master of his imagination, rather than the slave. He controlled it as with the rod of an enchanter, and compelled it to do his bidding, instead of becoming, like the frantic Pythoness, the utterer of the eloquent rhapsodies which were prompted by the demon that possessed

her. His writings display a calm consciousness of power. There is in them nothing of the feverishness of distemper; and they are not sullied and corroded by the operation of human passions. He seems to have looked forth upon nature, serene and unruffled, from the watch-tower of a commanding intellect.

Time may raise up other writers, whose comparative greatness may deprive him of his present eminence; but it cannot deprive him of the merit of originality, and of having first opened a new and delightful path in literature.

We cannot bring to a close the critical remarks on the writings of Sir Walter Scott without presenting our readers with a brief analysis of a few of his prose works, having already slightly adverted to his poetical ones according to the order of their publication.

The object of the novel of "Waverley," which was his first prose work, was evidently to present a faithful and animated picture of the manners and state of society that prevailed in this northern part of the island, in the earlier part of last century; and the author judiciously fixed upon the era of the rebellion in 1745, not only as enriching his pages with the interest inseparably attached to the narration of such occurrences, but as affording a fair opportunity for bringing out all the contrasted principles and habits which distinguished the different classes of persons who then divided the country, and formed among them the basis of almost all that was peculiar in the national character. That unfortunate contention brought conspicuously to light, and for the last time, the fading image of feudal chivalry in the mountains and vulgar fanaticism in the plains, and startled the more polished parts of the land with the wild but brilliant picture of the devoted valour, incorruptible fidelity, patriarchal brotherhood, and savage habits, of the Celtic clans on the one hand,—and the dark, untractable, and domineering bigotry of the covenanters on the other. Both forms of society had indeed been prevalent in the other parts of the country; but had there been so long superseded by more peaceable habits and milder manners, that their vestiges were almost effaced, and their very memory nearly forgotten. The feudal principalities had been extinguished in the south for near 300 years, and the dominion of the puritans from the time of the restoration. When the glens of the central highlands, therefore, were opened up to the gaze of the English, it seemed as if they were carried back to the days of the heptarchy; when they saw the decay of the west country Whigs, they might imagine themselves transported to the age of Cromwell. The great traits of clannish dependence, pride, and fidelity, may still be detected in many districts of the highlands, though they do not now adhere to the chiefs when they mingle in general society; and the existing contentions of burghers and antiburghers, and Cameronians, though shrunk into comparative insignificance, and left indeed without protection to the ridicule of the profane, may still be referred to as complete verifications of all that is here stated about Gifted Gilfillan, or Ebenezer Cruickshank. The traits of Scottish national character in the lower ranks can still less be regarded as antiquated or traditional; nor is there any thing in the whole compass of the work which gives us a stronger impression of the nice observation and graphical talents of the author, than the extraordinary fidelity and felicity with which all the inferior agents in the

story are represented. No one who has not lived extensively among the lower orders of all descriptions, and made himself familiar with their various tempers and dialects, can perceive the full merit of those rapid and characteristic sketches; but it requires only a general knowledge of human nature to feel that they must be faithful copies from known originals; and to be aware of the extraordinary facility and flexibility of hand which has touched, for instance, with such discriminating shades, the various gradations of the Celtic character, from the savage imperturbability of Dugald Mahony, who stalks grimly about with his battle-axe on his shoulder, without speaking a word to any body, to the lively unprincipled activity of Callum Beg, the coarse unreflecting hardihood and heroism of Evan Maccombich, and the pride, gallantry, elegance, and ambition, of Fergus himself. In the lower class of the Lowland characters again, the vulgarity of Mrs. Flockhart and of Lieutenant Jinker is perfectly distinct and original; as well as the puritanism of Gilfillan and Cruickshank, the atrocity of Mrs. Mucklewrath, and the slow solemnity of Alexander Saunderson. The baron of Bradwardine, and Baillie Macwheele, are caricatures no doubt, after the fashion of the caricatures in the novels of Smollett; or pictures, at the best, of individuals who must always have been unique and extraordinary. The plan of the story is as follows:—Waverley is the representative of an old and opulent Jacobite family in the centre of England, educated at home in an irregular manner, and living till the age of majority mostly in the retirement of his paternal mansion; where he reads poetry, feeds his fancy with romantic musings, and acquires amiable dispositions, and something of a contemplative, passive, and undecided character. All the English adherents of the abdicated family having renounced any serious hopes of the cause long before the year 1745, the guardians of young Waverley were induced, in that celebrated year, to allow him to enter into the army, as the nation was then engaged in foreign war, and a passion for military glory had always been one of the characteristics of his line. He obtains a commission, accordingly, in a regiment of horse then stationed in Scotland, and proceeds forthwith to head-quarters. Cosmo Comyne Bradwardine, Esq., of Tully-Veolan in Perthshire, had been an ancient friend of the house of Waverley, and had been enabled by their good offices to get over a very awkward rencontre with the king's attorney-general soon after the year 1715. The young heir was accordingly furnished with credentials to this faithful ally, and took an early opportunity of paying his respects at the ancient mansion of Tully-Veolan. The house and its inhabitants, and their way of life, are admirably described. The baron himself had been bred a lawyer, and was by choice a diligent reader of the Latin classics. His profession, however, was that of arms; and having served several campaigns on the continent, he had superadded to the pedantry and jargon of his forensic and academical studies, the technical slang of a German martinet, and a sprinkling of the coxcombry of a French mousquetaire. He was, moreover, prodigiously proud of his ancestry; and, with all his peculiarities, which, to say the truth, are rather more than can be decently accumulated in one character, was a most honourable, valiant, and friendly person. He had one fair daughter, and no more, who was gentle, feminine, and affectionate. Waverley, though struck at first

with the strange manners of this northern baron, is at length domesticated in the family; and is led by curiosity to pay a visit to the cave of a famous Highland robber or freebooter, from which he is conducted to the castle of a neighbouring chieftain, and sees the Highland life in all its barbarous but captivating characters. This chief is Fergus Vich Ian Vohr, a gallant and ambitious youth, zealously attached to the cause of the exiled family, and busy at the moment in fomenting the insurrection, by which his sanguine spirit never doubted that their restoration was to be effected. He has a sister still more enthusiastically devoted to the same cause—recently returned from a residence at the court of France, and dazzling the romantic imagination of Waverley not less by the exaltation of her sentiments, than his eyes by her elegance and beauty. While he lingers in this perilous retreat he is suddenly deprived of his commission in consequence of some misunderstandings and misrepresentations which it is unnecessary to detail, and in the first heat of his indignation is almost tempted to throw himself into the array of the children of Ivor, and join the insurgents, whose designs are no longer seriously disguised from him. He takes, however, the more prudent resolution of returning, in the first place, to his family; but is stopped on the borders of the Highlands by the magistracy, whom rumours of coming events had made more than usually suspicious, and forwarded as a prisoner to Stirling. On the march he is rescued by a band of unknown Highlanders, who ultimately convey him in safety to Edinburgh, and deposit him in the hands of his friend Fergus Mac-Ivor, who was mounting guard with his Highlanders at the [ancient palace of Holyrood, where the royal adventurer was then actually holding his court. A combination of temptations, far too powerful for such a temper, now beset Waverley; and inflamed at once by the ill-usage he thought he had received from the government, the recollection of his hereditary predilections, his friendship and admiration of Fergus, his love for his sister, and the graceful condescension and personal solicitations of the unfortunate prince, he rashly vows to unite his fortune with theirs, and enters as a volunteer in the ranks of the children of Ivor.

During his attendance at the court of Holyrood, his passion for the magnanimous Flora is gradually abated by her continued indifference and too entire devotion to the public cause; and his affections gradually decline upon Miss Bradwardine, who was leisure for less important concerns. He accompanies the adventurer's army and signalizes himself in the battle of Preston, where he has the good fortune to save the life of an English officer, who turns out to be an intimate friend of his family, and remonstrates with him with considerable effect on the rash step he has taken. It is now impossible, however, he thinks, to recede with honour, and he pursues the disastrous career of the invaders into England (during which he quarrels and is again reconciled to Fergus), till he is finally separated from his corps in the confusion and darkness of the night-skirmish at Clifton; and, after lurking for some time in concealment, finds his way to London, where he is protected by the grateful friend whose life he had saved at Preston, and sent back to Scotland till some arrangements could be made about his pardon. Here he learns the final discomfiture of his former associates, is fortunate enough to obtain both his own

pardon and that of old Bradwardine, and, after making sure of his interest in the heart of the young lady, at last bethinks him of going to give an account of himself to his family at Waverley-Honour. In his way he attends the assizes at Carlisle, where all his efforts are ineffectual to avert the fate of his gallant friend Fergus, whose heroic demeanour in that last extremity is depicted with great feeling; has a last interview with the desolated Flora; obtains the consent of his friends to his marriage with Miss Bradwardine; puts the old baron in possession of his forfeited manor, and in due time carries his blooming bride to the peaceful shades of his own paternal abode.

Such is the outline of the story; although it is broken and diversified with so many subordinate accidents, that what we have now given will afford but a very inadequate idea even of the narrative part of this performance. Though that narrative is always lively and easy, however, we think the great charm of the work consists in the characters and descriptions, of which we must now present our readers with one specimen:—

"It was about noon when Captain Waverley entered the straggling village, or rather hamlet, of Tull-veolan, close to which was situated the manse of the proprietor. The houses seemed miserable to the extreme, especially to an eye accustomed to the smiling neatness of English cottages. They stood without any respect for regularity, on each side of a straggling kind of unpaved street, where children almost in a primitive state of nakedness lay sprawling, as if to be crushed by the hoofs of the first passing horse. Occasionally, indeed, when such a commotion seemed inevitable, a watchful old grandmother with her close cap, distaff, and spindle, rushed like a sybil in frenzy out of one of these miserable cells dashed into the middle of the path, and snatching to her own charge from among the sun-burnt louters, saluted him with a sound cuff, and transported him back to his dungeon, the little white-headed rascal screaming all the while, from the very top of his lungs, a shrilly treble to the growling remonstrance of the enraged matron. Another part in this corner was sustained by the incessant yelping of a score of idle useless curs which followed, snarling, barking, howling, and snapping at the horses' heels; a nuisance at that time so common in Scotland, that a French tourist, who like other travellers longed to find a good and rational reason for every thing he saw, has recorded, as one of the memorabilia of Caledonia, that the state maintained in each village a relay of curs, called *collies*, whose duty it was to chase the *chevaux de poste* (too starved and exhausted to move without such a stimulus) from one hamlet to another, till their annoying convoy drove them to the end of their stage. The evil and remedy (such as it is) still exist. But this is remote from our present purpose, and is only thrown out for consideration to the collectors under Mr. Dent's dog-bill.

"As Waverley moved on, here and there an old man, bent as much by toil as years, his eyes blinded with age and smoke, tottered to the door of his hut to gaze on the dress of the stranger, and the looks and motions of the horses; and then assembled with his neighbours in a little grouse at the smithy, to discuss the probabilities of whence the stranger came, and where he might be going. Three or four village girls returning from the well or brook with pails on

and pails upon their heads, formed more pleasing objects, and with their thin short gowns and single petticoats, bare arms, legs, and feet, uncovered heads and braided hair, somewhat resembled Italian forms of landscape. Nor could a lover of the picturesque have challenged either the elegance of their costume, or the symmetry of their shape; although to say the truth, a mere Englishman in search of the comfortable (a word peculiar to his native tongue) might have wished the clothes less scanty, the feet and legs somewhat protected from the weather, the head and complexion shrouded from the sun; or, perhaps, might even have thought the whole person and dress considerably improved by a plentiful application of spring water, with a *quantum sufficit* of soap. The whole scene was depressing; for it argued, at the first glance, at least a stagnation of industry, and perhaps of intellect. Even curiosity, the busiest passion of the idle, seemed of a listless cast in the village of Tully-veolan; the curs aforesaid alone showed any part of its activity; with the villagers it was passive. They stood and gazed at the handsome young officer and his attendants, but without any of those quick motions and eager looks that indicate the earnestness with which those who live in monotonous ease at home look out for amusement abroad. Yet the physiognomy of the people, when more closely examined, was far from exhibiting the indifference of stupidity; their features were rough, but remarkably intelligent; grave, but the very reverse of stupid: and from among the young women, an artist might have chosen more than one model whose features and form resembled those of Minerva. The children also, whose skins were burned black, and whose hair was bleached white, by the influence of the sun, had a look and manner of life and interest. It seemed upon the whole as poverty and indolence, its too frequent companion, were combining to depress the natural genius and acquired information of a hardy, intelligent, and reflecting peasantry."

Having thus given our readers a brief sketch of the novel of "Waverley," we will now direct our attention to "Rob Roy." The characters in this work are, as usual, admirably portrayed. The best perhaps of the men is the Baillie. Nothing can promise less originality or interest than the portrait of a conceited, petulant, purse-proud tradesman; full of his own and his father's local dignity and importance, and of mercantile and presbyterian formalities, and totally without tact or discretion, who does nothing in the story but give bail, take a journey, and marry his maid. But the courage, the generosity, and the frank naïveté and warm-heartedness, which are united to these unpromising ingredients, and above all, perhaps, the "Hieland blude of him that warms at thae daft tales o' venturesome deeds and escapes—tho' they are all sinfu' vanities," and makes him affirm before the council that Rob Roy "set apart what he had dune again the law o' the country, and the heirship o' the Lennox" (i. e. the laying waste and plundering a whole country), "and the misfortune o' some folk losing life by him, was an honest man than stude on any o' their shanks," make him both original and interesting in the highest degree. Rashleigh is among the best portraits of that difficult subject, a well-drawn villain, that we recollect. The reader feels that his hypocrisy might have deceived—that of the common fictitious one would only disgust. Rob Roy himself well answers our precon-

ceptions of his character. The man who, without rank or fortune, could for thirty or forty years set all law at defiance, who, though peculiarly obnoxious to the government, not merely as breaking its laws and plundering its subjects, but as a rebel and a traitor, and at deadly feud with the great men on whose property he lived, could resist all their power, and elude all their stratagems, without being ever overwhelmed by superior force, or betrayed by the treachery of his own companions—taken as many of them must have been from among the least trustworthy of men—must have been a man of extraordinary talents, and mixed, with his great vices, of extraordinary virtues. He must have had the first in order to play his own part well, the second in order to retain in devoted fidelity his associates.

With regard to the next best character in "Rob Roy," namely, Diana Vernon, many have considered her as unnatural throughout. She ought perhaps to have been somewhat older, but grant the author what he has always a right to claim for his heroine, if he is bold enough to think he can support them, great talents and excellence of disposition, and add, what certainly is possible, an education perfectly unfemale, under the superintendence of two men of talent and learning, and add the pride of high birth, and the enthusiasm of an adherent to a persecuted religion and an exiled king—exclude her from the ordinary wishes and schemes of young girls by predestining her to a hateful object or a cloister, and give her, instead of their ordinary amusements and employments, political intrigues, Greek and Latin, and field-sports, and you have the rough outlines of the portrait, to which Sir Walter has given such relief and colouring.

But we must turn to "The Heart of Mid Lothian," which, with the exception perhaps of "Waverley," is the most perfect of the whole series. Among the many scenes, perhaps the most perfect is the meeting of the sisters before the trial. The trial has not perhaps the same merit from its difficulty, but is as striking in its execution. Effie is a perfect specimen of the fit subject for fictitious misfortune;—not so good as to make her calamities absolutely revolting; not so bad as to make them appear appropriate punishments. Had it been deeper, her sufferings would, of course, have excited less pity; had it been none at all, they would have raised, instead of pity, horror and indignation. As it is, pity for her is mingled with admiration for her father, which produces an intensity of interest, which extends itself, not only to the important incidents, but to the minute formalities, of the trial, which is even heightened by the foolery of Saddletree, and the bad taste of her advocate, and is not destroyed even by our constant anticipation of the event.

We cannot bestow the same unqualified praise on another celebrated scene, Jeannie's interview with Queen Caroline. Jeannie's pleading appears too rhetorical for the person and for the occasion; and the queen's answer, supposing her to have been overpowered by Jeannie's entreaties, "This is eloquence," is still worse. Had it been eloquence, it must necessarily have been unperceived by the queen. Effie, when she entreats Sharpitlaw to allow her to see her sister, is eloquent, and his answer accordingly betrays perfect unconsciousness that she has been so. "You shall see your sister," he began, "if you'll tell me;" then interrupting himself, he

added in a more hurried tone, "No, you shall see your sister whether you tell me or no."

The duke himself is, perhaps, a little too fine spoken in his opening conversation with the queen, but his character is in general happily finished. The vanity which covered his great qualities with a varnish, and has perhaps contributed to the permanence of his reputation, is very gracefully insinuated. Douce Davie Deans is magnanimous in his affliction, and amusing in his prosperity. We have but one fault to find with him—the laugh which is constantly raised by his religious peculiarities. It may be said that the weight of his religion, like that of armour of proof, if it sometimes repels the impulses of nature when they are right, always secures him from them when they are wrong; that, if it loads him with unnecessary scruples, it arms him with heroic self-devotion and constancy; and if it sometimes makes him absurd, leaves him often venerable and always respectable in his absurdity. But it is precisely to this union of good and evil consequences, that, as a subject of general representation, we object. When religion, or what resembles it, is represented as rendering sanguinary and merciless such a fanatic as Burley, every reader can perceive that his belief does not create his bad passions, but only decides their course. Pride, violence, and malignity, are essential parts of his character; and if he had been an atheist instead of a Cameronian, they would have only changed their objects. But the religion of David Deans is the basis of his whole character; his faults and follies seem, no less than his virtues, to spring from it.

The delineation of George Robertson is quite worthy of his author, though he is somewhat too melo-dramatic. Men, whatever may be their remorse, do not profusely apply to themselves the terms villain, murderer, and devil; or calmly affirm themselves predestined to evil here and hereafter. They have always a reserve as to the goodness of their hearts, especially where they are ready, as Robertson is described to be, to sacrifice their lives to save that of another. Saddle-tree is less annoying than persons of his character generally are, because there is less of him. His wife is happily contrasted to him, and her indignation to "see sae mony o' them set up yonder in their red gowns and black gowns, and a' to take the life o' a bit senseless lassie," is well told. We must not close our remarks without taking a more formal leave of Jeannie. She is a perfect model of sober heroism; of the union of good sense with strong affections, firm principles, and perfect disinterestedness; and of the calm superiority to misfortune, danger, and difficulty, which such an union must create. A hero so characterized generally spoils the interest of a novel, both because the reader knows him to be protected among all his dangers by the strong arm of poetical justice, and because his conduct, almost upon every occasion, is anticipated. The first of these inconveniences is skilfully obviated by making another person the object of the dangers on which the interest of the story depends, and using Jeannie only as the means of averting them; the second, by placing her in humble life, and then exposing her to situations in which no good sense could supply the want of experience. As it is, she is a splendid exception to the insipidity of perfect characters, and excites and retains the reader's deepest interest without possessing the advantage of a single fault.

We next come to "The Bride of Lammermoor." It is

a tragedy of the highest order, and unites excellence of plot to Sir Walter's usual merits of character and description. It may be objected, that poor Lucy Ashton's misfortunes are too much the sufferings of innocence to be the fit subjects of tragical sympathy. Her forming the engagement with Ravenswood cannot, as it is described, be considered even as an error. She adheres to it, through every persecution of violence and art, while her reason remains unimpaired, and her final breach of it is scarcely an act of the will. Perhaps the answer is, that a voluntary breach of engagement is a fault, to which so much disapprobation is attached that some degree of disapprobation—that degree which affords a pretext for the misfortune of tragedy—is attached to one that is involuntary. Although there is no deficiency of faults in Ravenswood, it is perhaps a blemish that his faults are so remotely connected with his misfortunes. There is in motion, it is true, the train of causes on which his misery and his death ultimately depend. If he had not been violent and revengeful, the lord keeper would not have feared him; if the lord keeper had not feared him, he would not have endeavoured to seduce him by effecting an intimacy with Lucy Ashton. Without that intimacy there would have been no engagement; without the engagement he would not have received the challenge, or been lost on his way to meet it. But it is not to the remote and accidental, but to the immediate and appropriate, effects that the reader looks. Now all the immediate effects of Ravenswood's spirit of pride and vengeance are advantages; it frightens a powerful enemy into a friend, gives him the affections of a charming girl, and appears to have great influence in obtaining a valuable patron. His misfortunes spring from the enmity of Bucklaw and Lady Ashton; both arising from causes out of his own control, and as likely to have arisen if he had been the meekest of mankind. As a character he is excellent, admirably drawn, and admirably grouped and contrasted with those around him. Indeed we recollect no work of our author's in which contrast is more skilfully used. Ravenswood is opposed to Lucy, and Sir William to his lady; and those characters, which at first appear the same, are beautifully distinguished from each other. Sir William and Lucy are flexible and timid; Ravenswood and Lady Ashton firm and decisive. But the flexibility of Sir William, arising from fear of personal consequences, and fickleness of purpose, differs as much from that of his daughter, which springs from affectionateness of disposition, anxiety not to give pain, and preference of others to herself, as the firmness of Lady Ashton does from that of Ravenswood. Lady Ashton's firmness is nurtured in affluence and power, strengthened by the subservience of him who fills the station of her superior, and confirmed by the direction of all her purposes to family aggrandizement. Ravenswood's is grounded, in a great measure, on the want of those advantages, the possession of which contributes to that of Lady Ashton; on an habitual feeling that he is defrauded of his just rank in society, and habitual exertions to force those who cross him to acknowledge it. He treats them as inferiors, whom accident and injustice have made his equals, and follows his own impulses without deference for their opinions or their feelings. But, as one impulse succeeds another, his course, though vehement and intrepid, is not always consistent. Lady Ashton is governed by calculation, and is therefore unvarying.

The three hags are a bold, we had almost said a not unequal, rivalry of the "Weird Sisters." Their professional praise of Ravenswood is whimsically horrible.

"He is a frank man and a free-handed man, the Master," said Annie Winnie, "and a comely personage—broad in the shoulders and narrow around the lungies. He wad mak a bonnie corpse; I wad like to have the streaking and winding of him."

"It is written on his brow, Annie Winnie," replied the octogenarian, her companion, "that hand of woman, or of man either, will never straught him—dead deal will never be laid to the back, make your market of that, for I hae it frae a sure hand."

"Will it be his lot to die on the battle ground then, Ailsie Gourlay?"

"Ask nae mair questions about it—he'll not be graced sae far," replied the sage.

We must not quit "The Bride of Lammermoor" without remarking upon its deviation from the usual management of a narrative. The fatal nature of the catastrophe is vaguely indicated in the very beginning; at every rest in the story it is more and more pointedly designated; long before the conclusion we are aware of the place and means of its accomplishment. We are first told of the malignant fiend under whose influence the tissue of incidents is to be woven. We are told that a dreadful punishment awaits Sir William's selfish calculations on the supposed attachment of Ravenswood and Lucy. Before the lovers have thrice met we are told what were his remarks after the catastrophe of their love; and, however he might disregard, in real life, the ominous fatality of the mermaid's well, the raven that is killed as the lovers quit it, the thunderstorm that marks their interview at Wolf's Craig, or even the prophecies of Ailsie Gourlay and True Thomas, every reader feels that, in fiction, these are tokens true as holy writ; and yet our interest in the story is strengthened, instead of being destroyed, by our fore-knowledge of the conclusion.

We may now notice the splendid masque, "Ivanhoe." Of all our author's works, this is formed of the most peculiar materials. Kings, crusaders, knights, and outlaws, Cœur de Lion, and the Templars, and Robin Hood, and Friar Tuck, and the Forest of Sherwood, the names, and the times, and the scenes, which are entwined with our earliest and dearest recollections, but which we never hoped again to meet with in serious narrative, become as familiar in our mouths as household terms. Names coupled with such associations would be interesting, however trivial the actions in which they were engaged—and they are used as profusely as they are collected. We have the public and private life of our Saxon and of our Norman ancestors, the domestic meal, and the formal banquet, the tournament in both its forms, the storm of a baronial castle, the solemn trial, and the judicial combat. These are among the scenes immediately before us, and, as we pass through them, views perpetually open on each side of our path, that show the contemporary state of Europe and Asia, with glimpses of Palestine, and Saladin, and the crusaders in the distance.

Its principal deficiency is one which besets ordinary novelists, but from which Sir Walter is in general eminently free—want of individuality in the principal characters. Ivanhoe, Rowena, Front de

Rebecca, are each marked with one, or at most two, predominating qualities, without the counterbalancing merits and defects, which, by reciprocally modifying each other, distinguish every man, in real life, from his neighbour. Ivanhoe and Rowena are the traditional hero and heroine of romance. He, brave, and strong, and generous; she, beautiful and amiable; and both of them constant—very well qualified for their employment at the end of the story, to marry and live happily together, and a little insipid during its progress. Front de Bœuf is the traditional giant—very big and very fierce—and his active and passive duties are those always assigned to the giant—the first consisting in seizing travellers on the road, and imprisoning them in his castle, to the danger of the honour of the ladies, the life of the knights, and the property of all others; and the second, in being beaten at tournaments and killed by the knight-errant, to whom the author at length issues his commission of general castle-delivery. Brian de Bois Guilbert belongs to that hacknied class, the men of fixed resolve and indomitable will—fine ingredients in a character which is marked by other peculiarities, but too uniform and inartificial, and, in fictitious life, too trite to serve, as they do here, for its basis. As Bois Guilbert is almost all in shadow, Rebecca is all in light. Brought up among examples of nothing but extortion and cruelty on one side, and cowardice, meanness, and avarice on the other, in the situation most certain to break the courage, and sour the temper, and narrow the heart, she emerges—perfect. From an education combining every disadvantage, she rises, such as no advantages could have made her. But in Rebecca the beauty of the execution more than redeems the improbability of the conception.

But nothing can be more bold than the conception of the other characters, or more vigorous than the representation of Richard and Friar Tuck. Scarcely any other author could have ventured to engraft the outlaw on the priest, or could have prevented the union from being unnatural or hateful. But the humour, which is thrown over it, solders together its heterogeneous parts, and makes the compound as amusing as it is original. Prince John, and Cedric, and Athelstan, and De Bracy, and Prior Aymer, and Gurth, are all excellent—and even Higg the son of Snell, and Hubert the forester, and Father Dennett, though their outlines are indicated only by a few negligent strokes, stand out from the canvass with all the prominence of real existence.

The most striking scene in the whole work is the storming of Front de Bœuf's castle. Every reader must have felt the peculiar vividness with which the first assault is painted. We give a short extract from it:—

"It was not, however, by clamour that the contest was to be decided, and the desperate efforts of the assailants were met by an equally vigorous defence on the part of the besieged. The archers, trained by their woodland pastimes to the most effective use of the long bow, shot, to use the appropriate phrase of the time, so 'wholly together,' that no point at which a defender could show the least part of his person escaped their cloth-yard shafts. By this heavy discharge, which continued as thick and sharp as hail, while, notwithstanding, every arrow had its individual aim, and flew by scores together against each embrasure and opening in the parapets, as well as at

every window where a defender either occasionally had post, or might be suspected to be stationed,—by this sustained discharge, two or three of the garrison were slain, and several others wounded. But, confident in their armour of proof, and in the cover which their situation afforded, the followers of Front de Bœuf and his allies showed an obstinacy in defence proportioned to the fury of the attack, and replied with the discharge of their large cross-bows, as well as with their long bows, slings, and other missile weapons, to the close and continued shower of arrows; and, as the assailants were necessarily but indifferently protected, did considerably more damage than they received at their hand. The whizzing of shafts and of missiles, on both sides, was only interrupted by the shouts which arose when either side inflicted or sustained some notable loss.

“‘And I must lie here like a bedridden monk,’ exclaimed Ivanhoe, ‘while the game that gives me freedom or death is played out by the hand of others!’—Look from the window once again, kind maiden, but beware that you are not marked by the archers beneath—Look out once more, and tell me if they yet advance to the storm.’

“‘With patient courage, strengthened by the interval which she had employed in mental devotion, Rebecca again took post at the lattice, sheltering herself, however, so as not to be visible from beneath.

“‘What dost thou see, Rebecca?’ again demanded the wounded knight.

“‘Nothing but the cloud of arrows, flying so thick as to dazzle mine eyes, and to hide the bowmen who shoot them.’

“‘That cannot endure,’ said Ivanhoe; ‘if they press not right on to carry the castle by pure force of arms, the archery may avail but little against stone walls and bulwarks. Look for the knight of the fetterlock, fair Rebecca, and see how he bears himself; for as the leader is, so will his followers be.’

“‘I see him not,’ said Rebecca.

“‘Foul craven!’ exclaimed Ivanhoe; ‘does he blench from the helm when the wind blows highest?’

“‘He blenches not! he blenches not!’ said Rebecca, ‘I see him now; he leads a body of men close under the outer barrier of the barbican.—They pull down the piles and palisades; they hew down the barriers with axes.—His high black plume floats abroad over the throng, like a raven over the field of the slain.—They have made a breach in the barriers—they rush in—they are thrust back!—Front de Bœuf heads the defenders, I see his gigantic form above the press. They throng again to the breach, and the pass is disputed hand to hand and man to man.—God of Jacob! it is the meeting of two fierce tides—the conflict of two oceans moved by adverse winds.’

“‘She turned her head from the lattice, as if unable longer to endure a sight so terrible.

“‘Look forth again, Rebecca,’ said Ivanhoe, mistaking the cause of her retiring; ‘the archery must in some degree have ceased, since they are now fighting hand to hand—Look again, there is now less danger.’

“Rebecca again looked forth, and almost immediately exclaimed, ‘Holy prophets of the law! Front de Bœuf and the black knight fight hand to hand on the breach, amid the roar of their followers, who watch the progress of the strife.—Heaven strike with the cause of the oppressed and of the captive!’ She then

uttered a loud shriek, and exclaimed, ‘He is down—he is down!’

“‘Who is down?’ cried Ivanhoe; ‘for our lady’s sake, tell me which is fallen?’

“‘The black knight,’ answered Rebecca, faintly; then instantly again shouted with joyful eagerness—‘But no—but no!—the name of the Lord of Hosts be blessed!—he is on foot again, and fights as if there were twenty men’s strength in his single arm.—His sword is broken—he snatches an axe from a valiant man—he presses Front de Bœuf with blow on blow.—The giant stoops and totters like an oak under the steel of the woodman—he falls—he falls!’

“‘Front de Bœuf!’ exclaimed Ivanhoe.

“‘Front de Bœuf,’ answered the Jewess; ‘he rushes to the rescue, headed by the haughty Templar—their united force compels the champion to pause.—They drag Front de Bœuf within the walls.’

“‘The assailants have won the barriers, have they not?’ said Ivanhoe.

“‘They have—they have—and they press the besieged hard upon the outer wall; some plant ladders, some swarm like bees, and endeavour to ascend upon the shoulders of each other—down go stones, beams, and trunks of trees upon their heads, and as fast as they bear the wounded to the rear, fresh men supply their places in the assault.—Great God! hast thou given men thine own image, that it should be thus cruelly defaced by the hands of their brethren!’

“‘Think not of that,’ replied Ivanhoe; ‘there is no time for such thoughts.—Who yield?—who pass their way?’

“‘The ladders are thrown down,’ replied Rebecca, shuddering; ‘the soldiers lie grovelling under them like crushed reptiles.—The besieged have the better.’

“‘Saint George strike for us!’ said the Knight; ‘do the false yeomen give way?’

“‘No!’ exclaimed Rebecca, ‘they bear themselves right yeomanly—the black knight approaches the postern with his huge axe—the thundering blow which he deals, you may hear them above all the din and shouts of the battle. Stones and beams are haled down on the bold champion—he regards them no more than if they were thistle-down or feathers.’

“‘By Saint John of Acre,’ said Ivanhoe, raising himself joyfully on his couch, ‘methought there was but one man in England that might do such a deed.’

“‘The postern gate shakes,’ continued Rebecca, ‘it crashes—it is splintered by his blows—they rush in—the out-work is won—Oh God!—they harry the defenders from the battlements—they throw them into the moat—O men, if ye be indeed men, spare them that can resist no longer!’

“‘The bridge—the bridge which communicates with the castle—have they won that pass?’ exclaimed Ivanhoe.

“‘No,’ replied Rebecca, ‘the Templar has destroyed the plank on which they crossed—few of the defenders escaped with him into the castle—the shrieks and cries which you hear tell the fate of the others.—Alas! I see that it is still more difficult to look upon victory than upon battle.’”

“The Monastery” is generally considered as the least powerful of Sir Walter’s works. We believe the principal deficiency lies in, what is usually the author’s principal excellence, the female characters. In general, his men add to the boldness and animation of the scene, but his women support almost all

its interest. Perhaps this must always be the case where both are equally well drawn. We sympathize more readily with simple, than with compound, feelings; and therefore less easily with those characters, the different ingredients of which have, by mutual subservience, been moulded into one uniform mass, than with those in which they stand unmixed and contrasted. Courage restrained by caution, and liberality by prudence, loyalty, with a view only to the ultimate utility of power, and love never forgetting itself in its object, are the attributes of men. Their purposes are formed on a general balance of compensating motives, and pursued only while their means appear not totally inadequate. The greater susceptibility, which is always the charm, and sometimes the misfortune, of women, deprives them of the same accurate view of the proportion of different objects. Hence the enthusiasm of their loyalty, the devotedness of their affection, the abandonment of self, and the general vehemence of emotion, which, in fiction as well as in reality, operate contagiously on our feelings.

But the great merit of "The Monastery" is, that it is a foundation for the abbot. This not only relieves, in a great measure, the reader from the slow detail, or the perplexing retracings and eclairsissements, which detain or interrupt him in a narrative that is purely fictitious, but is an improvement on some of the peculiar advantages of one that is historical. In the latter, the meagre outline of his previous knowledge seldom contains more than the names and mutual relations of the principal personages, and what they had previously done, with very little of what they had previously felt. But where one fiction is founded on another we are introduced, not merely to persons who are notorious to us, but to old acquaintances and friends. The knight of Avenel, the abbot Ambrosius, and the gardener Blinkhoolie, are the Halbert, and Edward, and Boniface, into whose early associations and secret feelings we had been admitted. We meet them as we meet in real life with those whom we have known in long-past times, and in different situations, and are interested in tracing, sometimes the resemblance, and sometimes the contrast, between what has passed and what is present; in observing the effect of new circumstances in modifying or confirming their old feelings, or in eliciting others which before lay unperceived. We view with interest the fiery freedom of Halbert's youth ripened into the steady and stern composure of the approved soldier and skilful politician; and when, as knight of Avenel, he sighs for birth and name, we recognise the feelings that drove him from the obscure security of a church vassal, to seek with his sword the means of ranking with those proud men that despised his clownish poverty. And when Ambrose acknowledges that, bent as he is by affliction, he has not forgotten the effect of beauty on the heart of youth—that even in the watches of the night, broken by the thoughts of an imprisoned queen, a distracted kingdom, a church laid waste and ruinous, come other thoughts than these suggest, and feelings than belong to an earlier and happier course of life; a single allusion sends us back through the whole intervening time, and we see him again in the deep window recess of Glendearg, and Mary's looks of simple yet earnest anxiety watching for his assistance in their childish studies. The allusion would have been pretty, but how inferior, if

Ambrose had been a new character, and we had been forced to account for it by some vague theory as to his former history.

The abbot has, however, far greater advantages over its predecessor than those, great as they are, that arise from their relative situation. We escape from the dull tower of Glendearg, with its narrow valley and homely inmates, to Edinburgh, and Holyrood House, and Lochleven Castle, and the field of Langside, and to high dames and mighty earls, and exchange the obscure squabbling of the hamlet and the convent for events where the passions of individuals decided the fate of kingdoms; and, above all, we exchange unintelligible fairyism for human actors and human feelings.

It is true there is a sorceress on the stage, but one endowed with powers far greater "for evil or for good" than the White Lady.

History has never described, or fiction invented, a character more truly tragic than Queen Mary. The most fruitful imagination could not have adorned her with more accomplishments, or exposed her to greater extremes of fortune, or alternated them with greater rapidity. And the mystery which, after all the exertions of her friends and enemies, still rests on her conduct, and which our author has most skilfully left as dark as he found it, prevents our being either shocked or unmoved by her final calamities. The former would have been the case, if her innocence could have been established. The latter would have followed, if she could have been proved to be guilty. Her sufferings, bitter as they were, were less unmixed than those of Bothwell. He too endured a long imprisonment, but it was in a desolate climate, without the alleviations which even Elizabeth allowed to her rival, without the hope of escape, or the sympathy of devoted attendants: such was his misery, that his reason sunk under it. And though his sufferings were greater than those of his accomplice, if such she were, his crime was less. He had not to break the same restraints of intimate connexion and of sex. But nobody could read a tragedy of which his misfortunes formed the substance; because we are sure of his guilt, they would excite no interest. While we continue to doubt hers, Mary's will be intensely affecting.

In "Kenilworth" Sir Walter was again upon tragic ground; a ground which, either from the advantages we have ascribed to tragedy, in its independence of any concealment of the catastrophe, and wider admission of historical subjects, or from the peculiar bent of his talents, he always appears to us, on a reperusal, to tread most successfully. But though "Kenilworth" must rank high among his works, we think it inferior, as a whole, to his other tragedies, "The Bride of Lammermoor," the historical part of "Waverley," and "The Abbot," both in materials and in execution. Amy Robsart and Elizabeth occupy nearly the same space upon the canvass as Catherine Seyton and Mary. But almost all the points of interest which are divided between Amy and Elizabeth, historical recollections, beauty, talents, attractive virtues and unhappy errors, exalted rank and deep misfortune, are accumulated in Mary; and we want altogether that union of the lofty and the elegant, of enthusiasm and playfulness, which enchanted us in Catherine. Amy is a beautiful specimen of that class which long ago furnished Desdemona, the basis

of whose character is conjugal love, whose charm consists in its purity and its devotedness, whose fault springs from its undue prevalence over filial duty, and whose sufferings are occasioned by the perverted passions of him to whom it is addressed. Elizabeth owes almost all her interest to our early associations, and to her marvellous combination of the male and female dispositions in those points in which they seem most incompatible. The representation of such a character loses much of its interest in history, and would be intolerable in pure fiction. In the former its peculiarities are softened down by the distance, and Elizabeth appears a fine, but not an uncommon object; a great, unamiable sovereign; and the same peculiarities shown in the microscopic exaggeration of fiction, would, if judged only by the rules of fiction, offend as unnatural; but, supported by the authority of history, they would be most striking. A portrait might be drawn of Elizabeth, uniting the magnanimous courage, the persevering but governable anger, the power of weighing distant against immediate advantages, and the brilliant against the useful, and of subjecting all surrounding minds which dignify men, and men only of the most manly character, with the most craving vanity, the most irritable jealousy, the meanest duplicity, and the most capricious and unrelenting spite, that ever degraded the silliest and most hateful of her sex.

Sir Walter did not, however, in this case make the most of his opportunities. He has complied with the laws of poetical consistency without recollecting that, in this instance, the notoriety of Elizabeth's history warranted their violation. Instead of pushing to the utmost the opposing qualities that formed her character, he has softened even the incidents that he has directly borrowed. When Leicester knelt before her at Kenilworth, "ere she raised him she passed her hand over his head, so near as almost to touch his long curled and perfumed hair, and with a movement of fondness that seemed to intimate she would, if she dared, have made the motion a slight caress." This, however, is Sir James Melvil's account of the real occurrence:—"I was required to stay till he was made earl of Leicester, which was done at Westminster, the queen herself helping to put on his ceremonial, he sitting upon his knees [kneeling] before her with great gravity; but she could not refrain from putting her hands into his neck, smilingly tickling him, the French ambassador and I standing by. Then she turned, asking at me how I liked him?" Again, when she discovers Leicester's conduct, in which every cause of personal irritation is most skilfully accumulated, she punishes him only by a quarter of an hour's restraint under the custody of the earl marshal. When, at a later period, and under circumstances of much less aggravation, she detected his marriage with Lady Essex, she actually imprisoned him. Our author has not ventured on the full vehemence of her affection or her rage. But, after all, his picture of the lion-hearted queen, though it might, perhaps, have been improved by the admission of stronger contrasts, is so vivid, and so magnificent, that we can hardly wish it other than it is.

But we must now bring to a close our analysis of the principal works of this highly gifted author. "The Fourth Series of the Tales of My Landlord" appeared in 1832. This was his last work; and he appeared but too well acquainted with the fact; for at the conclusion of the tales was the following most

affecting address to the public. He says,—"The gentle reader is acquainted that these are, in all probability, the last tales which it will be the lot of the author to submit to the public. He is now on the eve of visiting foreign parts; a ship of war is commissioned by its royal master to carry the author of 'Waverley' to climates in which he may possibly obtain such a restoration of health as may serve him to spin his thread to an end in his own country. Had he continued to prosecute his usual literary labours, it seems indeed probable that, at the term of years he has already attained, the bowl, to use the pathetic language of Scripture, would have been broken at the fountain; and little can one who has enjoyed, on the whole, an uncommon share of the most inestimable of worldly blessings, be entitled to complain, that life, advancing to its period, should be attended with its usual proportions of shadows and storms. They have affected him at least in no more painful manner than is inseparable from the discharge of this part of the debt of humanity. Of those whose relation to him in the ranks of life might have insured him their sympathy under indisposition, many are now no more; and those who may yet follow in his wake, are entitled to expect, in bearing inevitable evils, an example of firmness and patience more especially on the part of one who has enjoyed no small good fortune during the course of his pilgrimage.

"The public have claims on his gratitude, for which the author of 'Waverley' has no adequate means of expression; but he may be permitted to hope, that the powers of his mind, such as they are, may not have a different date from those of his body; and that he may again meet his patronising friends, if not exactly in his old fashion of literature, at least in some branch, which may not call forth the remark, that—

"Superfluous lags the veteran on the stage."

SCOTT, DANIEL, a dissenting minister, who was born in London, where his father was a merchant. He received an excellent education, which was completed at Utrecht, in Holland, and took his degree of doctor of law in that city, and almost immediately after returned home. Having taken up his residence in the metropolis, he commenced writing, and one of the first works which he published was an "Essay towards a Demonstration of the Scripture Trinity." This was followed by "A New Version of St. Matthew's Gospel, with Critical Notes." Some years after, he published, in two folio volumes, an "Appendix to Stephens's Greek Lexicon." By this work he was a very considerable loser; and that fact, and his close application, caused his death, which took place in March 1759.

SCOTT, GEORGE, a mathematician, who was born in the kingdom of Hanover, where his father held a public post under George I. His son received a good education, and was for some time sub-preceptor to George III., when young. He became distinguished for his general talents, and was elected a fellow of the royal society, and a commissioner of the board of excise. He assisted in the "Supplement of Chambers's Dictionary," and died in 1760. His wife was a sister of the celebrated Mrs. Montagu, and was the authoress of several good works.

SCOTT, JOHN, a talented English poet, who was born in 1730, in London, where he remained till his tenth year, when his father removed his family to the

picturesque village of Amwell, in Hertfordshire. While there he received but an indifferent education; yet at the early age of seventeen he became a poet. In 1760 he published "Four Elegies, Descriptive and Moral," which attracted the notice of several distinguished persons, especially of Dr. Young, Mrs. Talbot, and Mrs. Carter, who loved poetry, and loved it most when in conjunction with piety. But for many years he abstained from further publication, determined to put forth no claims that were not strengthened by industry and frequent and careful revision. In 1761, during the prevalence of the smallpox at Ware, he removed to the village of St. Margaret's, which is about two miles distant from Amwell, where he made the first sketch of his poem of "Amwell," to which he then gave the title of "A Prospect of Ware and the Country Adjacent." In 1766 he became sensible of the many disadvantages he laboured under by living in continual dread of the smallpox, and had the courage to submit to the operation of inoculation, which was successfully performed by Baron Dimsdale. He then visited London more frequently, and formed an acquaintance with Dr. Johnson, and other persons distinguished in literature. Notwithstanding the great difference of their political principles, Scott had too much love for genius not to be highly gratified in the opportunity of cultivating a friendship with that great veteran of learning.

In 1767 he married. The bride was, previous to her nuptials, admitted a member of the society of quakers. His wife died in childbed, in 1768, and the same year he lost his father and his infant child. He immediately removed from Amwell to the house of a friend at Upton. Here, when time and reflection had mellowed his grief, he honoured the memory of his wife by an elegy, in which tenderness and love are expressed in the genuine language of nature.

In November 1770 he married his second wife, Mary de Horne, "a lady whose amiable qualities promised him many years of uninterrupted happiness." During his visit in London, he increased his literary circle of friends by an introduction to Mrs. Montagu's parties. Among those who principally noticed him were, Lord Lyttleton, Sir William Jones, Mr. Potter, Mr. Mickle, and Dr. Beattie. In 1773 he published "Observations on the Present State of the Parochial and Vagrant Poor." It is needless to add, that his advice in this matter was rather approved than followed. Some of his propositions, indeed, were incorporated in Mr. Gilbert's bill in 1782, but the whole was lost for want of parliamentary support. In 1776 he published his "Amwell," a descriptive poem, which he had long been preparing, and in which he hoped to immortalize his favourite village.

In 1778 he published a work of great labour, entitled "A Digest of the Highway and General Turnpike Laws." In this compilation all the acts of parliament in force are collected together, and placed in one point of view; their contents are arranged under distinct heads, with the addition of many notes, and an appendix on the construction and preservation of public roads. A part of this work appeared in 1773, under the title of "A Digest of the Highway Laws." In the spring of 1782 he published what he had long projected, a volume of poetry, including his elegies, "Amwell," and a variety of hitherto unpublished pieces.

Mr. Scott came to London in 1783, and while there was attacked by putrid fever, of which he died in October in that year. After his death, a work of his was published with a life of the author; it was

entitled, "Critical Essays." The favourite residence of Mr. Scott, at Amwell, is given in the above engraving.

SCOTT, JOHN, a clever English writer, who was the original editor of the "London Magazine." After the restoration of the French royal family he went to France, and on his return published "A Visit to Paris in 1814, being a Review of the Moral, Political, Intellectual, and Social Condition of the French Capital." He was also the author of "Paris Revisited in 1815, by way of Brussels, including a Walk over the Field of Waterloo;" and a poem entitled "The House of Mourning." In January 1820 he commenced the publication of "The London Magazine," which he conducted with great success till the beginning of the following year. He then published some remarks which gave offence to the editor of Blackwood's "Edinburgh Magazine," and a duel took place between Mr. Scott and a friend of that gentleman, on the 16th of February, 1821, and Mr. Scott died a few days after from the wound which he received on that fatal occasion.

SCOTT, DR. JOHN, a learned English divine, who was born in the parish of Chippenham, in Wiltshire, about 1638. He became an apprentice, much against his will, for about three years; but his strong predilection for learning induced him to leave his business and go to Oxford, where he was admitted to New Inn in 1657. He subsequently entered holy orders, and became minister of St. Thomas's in Southwark. In 1677 he was made rector of St. Peter's Poor in London, and was collated to a prebend in St. Paul's cathedral in 1684. In 1685 he accumulated the degrees of bachelor and doctor in divinity. In 1691 he succeeded Sharp, afterwards archbishop of York, in the rectory of St. Giles's in the Fields, and the same year was made canon of Windsor. Wood says that "he might soon after have been a bishop, had not some scruples hindered him;" Hicks says what those scruples were; he says, "He refused the bishopric of Chester, because he could not take the oath of homage; and afterwards another bishopric, the deanery of Worcester, and a prebend of the church of Windsor because they all were places of deprived men." He died in 1694, and was buried in St. Giles's church.

Dr. Scott wrote an excellent work called "The Christian Life," which has been much read. The first part was published in 1681, with the following title:—"The Christian Life, from its beginning to its consummation in glory; together with the several means and instruments of Christianity conducing thereunto, with directions for private devotion and forms of prayer fitted to the several states of Christians;" in 1685, another part, "in which the fundamental principles of Christian duty are assigned, explained, and proved."

He also published two works against the catholics; the first was called "Examination of Bellarmine's Eighth Note concerning Sanctity of Doctrine;" the second was "The Texts examined which Papiets cite out of the Bible concerning prayer in an unknown tongue." He wrote, also, "Certain Cases of Conscience Resolved, concerning the lawfulness of joining with forms of prayer in public worship," in two parts; which were both reprinted and inserted in a work entitled, "A Collection of Cases and other discourses lately written to recover Dissenters to the Communion of the Church of England," 1685. He published, lastly, a considerable number of sermons.

SCOTT, JOHN, a celebrated engraver, who was born at Newcastle-upon-Tyne, and was apprenticed to a very humble occupation in that town. So strong however was his love of art, that he spent all his leisure in acquiring a competent knowledge of drawing and painting, and finally came to London, where he soon rose to eminence in his new profession. Mr. Scott was one of the original founders of the joint stock fund for the benefit of decayed artists, their widows and children, in the year 1809, and which has prospered so well that the society have, from their own subscriptions, and gentlemen and amateurs' contributions; in government securities, from eight to ten thousand pounds! Some five or six years since Mr. Scott's health became infirm, and after serving as steward to the institution he became a quarterly dependant on the very institution of which he was a principal founder. He subsequently lost his reason, in which state his life terminated at Chelsea, in the fifty-fifth year of his age.

SCOTT, JONATHAN, an English writer, who was a native of Shrewsbury, and received the rudiments of his education at the free grammar school in his native town. He went to India at twelve years of age, and continued to reside there for many years; during which period he employed all his leisure in acquiring a knowledge of the languages and history of that country. He became a captain in the East India Company's service; and his rising abilities and meritorious conduct soon gained him the patronage of Warren Hastings, then governor-general of Bengal, &c., to whom, from his excellent knowledge of the Persian language, he was appointed Persian secretary, and he was also elected a member of the Asiatic society, Calcutta. In oriental literature in general Dr. Scott was well skilled; perhaps equalled by few of his contemporaries; and has added much to the store of information respecting the extensive empire of Hindostan. History was his favourite study, with which, in a political and civil point of view, he was well acquainted. On his return to England for retirement he was not allowed to remain inactive, but received the appointment of oriental professor at the royal military and East India colleges, &c., a situation which he filled with great credit, and the

university of Oxford conferred upon him the honorary degree of doctor of laws, June 26, 1805. As an author he will long be remembered in the following works which he published.

In 1786, "A Translation of the Memoirs of Erad Khan (a nobleman of Hindoostan), containing interesting anecdotes of the Emperor Alumgeer Aurumzebe, and of his successors Shah Aulum, and Jahaundar, Shah, in which are displayed the cause of the very precipitate decline of the Mogul Empire." In 1794, "A Translation of Ferishta's History of Dekkan, from the first Mahummedan Conquest, with a continuation from other native writers of the events in that part of India, to the reduction of its last monarchs by the Emperor Aulumgeer Aurumzebe. Also the reigns of his successors in the empire of Hindoostan to the period of publication. With the History of Bengal from the Accession of Aliverdee Khan to the year 1780." In 1798, an "Historical and Political View of the Decan, including a sketch of the extent and revenue of the Mysorean Dominions, as possessed by Tippoo Sultaun at the commencement of the war in 1798."

This pamphlet contains an appendix, preceded by a refutation of some strictures on the accuracy of the revenue statements, and showing the alterations which have happened in the finance and relative condition of the prince Tippoo, in consequence of the partition treaty concluded in 1792, and subsequently to the time when the pamphlet was published. In 1799, "Bahar Danush; or, Garden of Knowledge, an Oriental Romance, translated from the Persian of Eiwaunt Oollah."

In 1800, "Tales, Anecdotes, and Letters, from the Arabic and Persian." In 1811 he published, in six volumes, "The Arabian Nights' Entertainments," carefully revised and corrected from the Arabic; to which he added a selection of new tales, then first translated from the Arabic originals. To these he prefixed a copious introduction, interspersed also by many valuable notes illustrative of the religion, manners, and customs of the Mahmedans. Mr. Scott died in February 1829, in the seventy-eighth year of his age.

SCOTT, MICHAEL, a celebrated Scottish philosopher of the thirteenth century, who was born at Balwree in Fifeshire. He early became distinguished for his knowledge and learning, and was one of the ambassadors sent to bring the Maid of Norway to Scotland. He wrote a commentary upon Aristotle, printed at Venice in 1496, and several treatises upon natural philosophy, from which it appears that he was addicted to the abstruse studies of judicial astrology, alchymy, physiognomy, and chiromancy; hence he passed among his contemporaries for a skilful magician. The memory of Michael Scott survives in many a legend in the south of Scotland, and, to use the words of the author of "Waverley," any work of great labour and antiquity is ascribed to the agency of "Auld Machael, or Sir William Wallace, or the devil." He was buried in Melrose Abbey, and in the "Lay of the Last Minstrel" Sir Walter Scott thus describes the opening of his grave, which was also supposed to contain his magical books:—

"I would you had been there to see  
How the light broke forth so gloriously;  
Streaming upward to the chancel roof,  
And through the galleries far aloof!  
No earthly flame blazed e'er so bright;

It shone like heaven's own blessed light  
And issuing from the tomb.

Before their eyes the Wizard lay,  
As if he had not been dead a day;  
His hoary beard in silver rolled;  
He seemed some seventy winters old;  
A palmer's amice wrapped him round,  
With a wrought Spanish baldric bound,  
Like a pilgrim from beyond the sea:  
His left hand held his book of might,  
A silver cross was in his right;  
The lamp was placed beside his knee:  
High and majestic was his look,  
At which the fellest fiends had shook;  
And all unruffled was his face—  
They trusted his soul had gotten grace."

SCOTT, REYNOLD, a learned English writer, who was born at Scott Hall in Kent, and received his education at Hart Hall college, Oxford. He subsequently directed his attention to the study of agriculture and witchcraft. His first work was entitled "A Perfect Platform of a Hop-Garden." His second was "The Discovery of Witchcraft." This work was reprinted in 1651, with the following addition to its title: "Scott's Discoverie of Witchcraft, proving the common opinion of witches contracting with devils, spirits, familiars, and their power to kill, torment, and consume the bodies of men, women, and children, or other creatures, by diseases or otherwise, their flying in the air, &c., to be but imaginary erroneous conceptions and novelties. Wherein also the practices of witchmongers, conjurers, enchanters, soothsayers; also the delusions of astrology, alchemy, legerdemain, and many other things, are opened, that have long lain hidden, though very necessary to be known for the undeceiving of judges, justices, and juries, and for the preservation of poor people, &c., with a treatise upon the nature of spirits and devils," &c. In the preface to the reader he declares that his design in this undertaking was, "first, that the glory of God be not so abridged and abased as to be thrust into the hand or lip of a lewd old woman; whereby the work of the Creator should be attributed to the power of a creature; secondly, that the religion of the gospel may be seen to stand without such peevish trumpery; thirdly, that favour and Christian compassion be rather used towards these poor souls, than rigour and extremity," &c.

A doctrine of this character, advanced in an age when the reality of witches was so universally believed, that even the great Bishop Jewel, touching upon the subject in a sermon before Queen Elizabeth, could "pray God they might never practise farther than upon the subject," must needs expose the author to animadversion and censure. The work was opposed by James I., in the preface to his "Demonologie," printed first at Edinburgh, 1597, and afterwards at London, 1603, where he observes, that he "wrote that book chiefly against the damnable opinions of Wierus and Scott; the latter of whom is not ashamed," the king says, "in public print to deny that there can be such a thing as witchcraft, and so maintains the old error of the Sadducees in the denying of spirits." Dr. John Reynolds, in his "Prælectiones upon the Apocrypha," animadverts on several passages in Scott's "Discovery;" Dr. Casaubon treats him as an illiterate person; and Glanvil, whom for his excellent sense in other respects we are sorry to be able to quote on this occasion, affirms that "Mr. Scott doth little but tell odd tales and silly legends, which he confutes and laughs at, and pretends this to be a confutation of the being of witches

and apparitions; in all which his reasonings are trifling and childish, and when he ventures at philosophy he is little better than absurd." This learned and pious man died in 1599.

SCOTT, SAMUEL, an eminent English painter, who was born at the commencement of the eighteenth century. He adopted the style of Vandervelde, whom he equalled in the beauty of his sea-side views. The figures in his pictures are admirably selected, and finished with taste and judgment. Many of his best works were purchased by Sir Robert Walpole, in whose estimation he stood very high. His death took place in 1772.

SCHOUGAL, HENRY, a learned Scottish divine, who was born at Saltoun, in East Lothian, in 1650. He received his education at the university of St. Andrew's, where he became professor of oriental philosophy at the age of twenty. In 1674 he was made professor of theology, and at the same time employed himself as a preacher, in which vocation he became very popular. His exertions, however, brought on a decline, of which he died at the early age of twenty-eight. He was the author of an able work entitled "The Life of God in the Soul of Man."

SEABURY, SAMUEL.—This celebrated prelate was the first bishop of the episcopal church in the United States of America. He was born in 1728, and educated at Yale college, after which he was sent to Scotland to study medicine. Preferring however, the ecclesiastical profession, he directed his studies to the requisite branches of learning, and was ordained in London in 1753. He then returned to America, and settled at New London in Connecticut. In 1784 he came to London to be consecrated as bishop of Connecticut: he, however, met with much opposition, and in consequence went to Scotland, where he was consecrated by three bishops of the Scottish episcopal church. Thus qualified, he returned to his native country, where he fulfilled his pastoral duties till his death in 1796.

SEBASTIAN, DON, a celebrated king of Portugal, who was a posthumous son of the infant John and of Joanna, daughter of Charles V. He was born in 1554, and ascended the throne in 1557, at the death of his grandfather, John III. He showed a great love for knowledge, and was educated, unfortunately, in an injudicious way, by his guardian, Catharine of Austria, wife of John III. Fanaticism took the place of piety in his mind, and Quixotism that of bravery. In order to distinguish himself from all other princes, he assumed the title of "Most obedient king," as the king of France was styled "Most Christian king," and the king of Spain "Most catholic king." His devotion to the church was only equalled by his aversion to unbelievers. He conversed with the Jesuits around him on nothing but the happy moment when he should shed the blood of the Moors. His adventurous spirit appeared in an expedition which he made at the age of twenty years, with 800 or 900 Portuguese, to Tangier, among the mountains of the northern coast of Africa, where he fell upon the unsuspecting inhabitants. His success on this occasion led him to undertake more daring enterprises. The nephew of the sheriff of Fez and Morocco, Muley Mohammed, was involved in an open war with his uncle, whom he aimed to deprive of the throne; and Sebastian promised him his assistance, hoping to effect something for Christianity and the fame of Portugal. He communicated his design to

Philip II., who, according to some authors, earnestly dissuaded him from it; according to others, he not only encouraged him, expecting, in case of his death, to be made king of Portugal, but even promised him fifty galleys and 10,000 soldiers. In spite of the admonitions of the widowed queen, and the representations and offers of Muley Moloch, the sheriff of Morocco, who promised to cede to him four fortified places on the coast of Africa, he equipped a fleet and an army, part of which he had collected in Spain, Germany, and Italy, and sailed for Africa, on the 24th of June, 1578, at the age of twenty-three years. The fleet comprised about 1000 vessels of different sizes, and had on board 9000 Portuguese, 3000 Germans, 700 Englishmen, and 2300 Spaniards. They landed safely at Alzira, and Muley Mohammed came directly with 300 Moors to offer his son as a hostage. In the mean time the sheriff of Morocco had collected a force of 100,000 men, and marched to the shore. He again, however, attempted to negotiate a peace, but without success. And on the 3rd of August, 1578, the two armies approached. "As the Portuguese is resolved upon his ruin," said Muley Moloch, "let him perish." Sebastian summoned a council of war. Some advised an attack, and others a retreat. The hostile forces were separated by a river. Sebastian's camp was distressed by want of provisions, and the enemy had taken possession of all the heights. Muley Mohammed was himself in favour of a retreat to the coast; for there the fleet was ready to receive the soldiers in case of defeat, and the sickness of his uncle Moloch made him sure of the throne in the event of his death, without unsheathing a single sword. But the king would not be persuaded. He was even unwilling to defer the attack till the afternoon, when the early approach of darkness would greatly diminish the danger of his soldiers, in case of defeat. He rode round and encouraged his men, after they were drawn up in battle array. But his adversary was not, in the mean while, inactive. The Moorish troops advanced in a large semicircle, having in the van the thousands who had been driven by fanaticism out of the south of Spain, and on the wings 10,000 horsemen. Weak as he was, Muley Moloch left his litter, and mounted on horseback. The engagement soon became general. Sebastian was foremost in the contest, and broke through the first and second lines of the enemy. Muley Moloch was obliged to retire from the battle. He died in his litter, but his death was concealed from his troops. The ardour of the young king soon bore him into the midst of the enemy, who were already pouring on the rear of his troops. He had the alternative to die or yield. The friends who surrounded him remained faithful to him to the last extremity. Muley Mohammed was drowned in his flight. Thus fortune baffled the hopes of all three leaders. All the Portuguese troops were killed or taken. There were different reports about the fate of Sebastian. Some said he perished in the thickest of the fight, others that he was taken, but soon killed, because the Moors quarrelled about the possession of him. On the morning after the battle, Moloch's brother was proclaimed sheriff, and immediately ordered a search to be made on the field for the body of Sebastian. A valet of the Portuguese king found a corpse, which he supposed to be that of his master; but it was so disfigured with wounds that it was impossible to identify it. The

consequence was, that his death remained doubtful; and after Portugal had come into the hands of Philip, four adventurers appeared successively, pretending to be Sebastian. One was the son of a stonemason, and another the son of a brickmaker. One of these ended his life on the scaffold, and the other in the galleys. The last of the four played a most conspicuous part. He appeared, twenty years after Sebastian's defeat, at Venice, where he described particularly the mode in which he concealed himself on the battle-field among the dead and wounded, and declared that he remained in Barbary, lest he should disturb the tranquillity of Portugal. After this he lived as a hermit in Sicily, and at length resolved to make himself known to the pope. He had been plundered by robbers, and by chance recognised by some Portuguese, and carried to Venice. This was his story. He was banished by the senate, returned, and was thrown into prison. In the examination which he underwent, he appeared so innocent and simple that all Europe was moved with sympathy. The senate set him at liberty, but banished him from Venice. A Dominican friar, Joseph Taxera, in Paris, moved every court in Europe to take an interest in his case. In the meantime he was apprehended again in Florence, and sent to Naples, where he was treated as a galley-slave, but persisted in his story. Finally, according to some reports, he was sent to Castile, where he died. Sebastian's enterprise destroyed the flower of the Portuguese nobility, and the treasury was exhausted in the equipment of his fleet. There were no immediate heirs to the throne, and three separate houses claimed it—Parma, Braganza, Spain. The last, under Philip II., succeeded by its superior strength.

SEBASTIANI, HORACE FRANCOIS DELLA RORTA, a celebrated French minister of foreign affairs, who was born in Corsica in 1775, and, having entered the French service in 1792, rose rapidly through the different ranks to that of colonel. Colonel Sebastiani took an active part in the revolution of the 18th Brumaire, and in 1802 the first consul sent him on a mission to the Levant. After having brought about a reconciliation of the differences between the court of Sweden and the regent of Tripoli, and compelled the pacha to acknowledge the Italian republic and salute its flag, he repaired to Alexandria, and had an interview with General Stewart, in order to insist on the terms of the treaty of Amiens for the evacuation of Alexandria. To this demand the English general replied, that he had not received any orders from his court. M. Sebastiani went, therefore, to Cairo, and had many conferences with the pacha on the subject, and offered, in conformity with his orders from the first consul, to open a communication with the bey; but the offer was not accepted, the orders of the porte being to make it a war of extermination. He afterwards went to St. Jean d'Acre, with the object of settling with the pacha a treaty of commerce, and found him pacifically inclined. In November he set out on his return to France, having accomplished all the objects of his mission.

He was, after his arrival, employed on various services, and, among the rest, in a diplomatic mission to Germany. He distinguished himself in the campaign of 1804, was wounded at the battle of Austerlitz, where he obtained the rank of general of division. Napoleon entertained a high opinion of

his diplomatic talents, and named him, in 1806, ambassador to the Ottoman Porte—a mission which he filled for some years with much ability. He established, at Constantinople, a printing-office for the Turkish and Arabic languages, and by this means contributed not a little to the French influence in that country. The English having forced the passage of the Dardanelles, and menaced Constantinople, Sebastiani immediately organized a plan of defence, marked out the batteries, and prepared for the most vigorous resistance; but the inhabitants broke out into insurrection, and he was obliged to depart for France. He was subsequently sent to Spain, where he distinguished himself on numerous occasions; and he served in the Russian-German war under Murat. In July 1812 he was surprised by the Russians at Drissa, but he recovered his character by his exertions at the battle of Borodino. On the invasion of France he had a command in Champagne and defended Châlons. M. Sebastiani sent to M. Talleyrand his adhesion to the provisional government, and shortly after received from the king the cross of St. Louis. On the return of Napoleon, in 1815, he was elected deputy of the lower chamber, and, after the second abdication of Napoleon, was one of the commissioners to treat for peace with the allies. In 1819 he was elected a member of the chamber of deputies by the island of Corsica, and after that he constantly showed himself a friend of constitutional liberty and of national independence. His lucid and manly eloquence was employed to throw light over all the great questions of finance, war, foreign politics, and domestic administration, and proved that he possessed, at once, the talents of an orator and the knowledge of a statesman.

SECKENDORF, VIET LOUIS VON, a German divine and historian, who was born in 1626 at Aurach in Franconia, and received his education with the children of Ernest the Pious, duke of Saxe-Gotha, to whom he became librarian, privy-counsellor, minister, and consistorial director. In 1664 he entered into the service of the duke of Saxe-Weitz, and at length into that of the elector of Brandenburg, who made him counsellor of state in 1691, and also chancellor of the university of Halle. His death took place in 1692. He was the author of a defence of Luther in answer to Maimbourg's "History of Lutheranism," which appeared in 1688 and 1692, under the title of "Commentarius Historicus et Apologeticus de Lutheranism," and a political work, entitled, "Deutscher Fürstenstaat."

SECKER, THOMAS, a learned English prelate, who was born of dissenting parents in 1693. Being designed by his friends for the ministry in their connexion, he early directed his attention to theological pursuits; but from scruples of conscience declined the appointment of a pastor, and went to Paris, in 1719, with a view of practising medicine, to the study of which he had devoted the three preceding years. While in this metropolis he formed an intimacy with Talbot, son of the bishop of Durham, which eventually ripened into the sincerest friendship. By the persuasion of the latter, who promised him his father's interest in promoting his advancement, Secker became avowedly a member of the church of England. In 1722 he was ordained by Bishop Talbot, and in 1733 he received the living of St. James's, Westminster, having, in the preceding year been appointed a king's chaplain, on which occasion he

graduated as LL.D. Two years afterwards he was elevated to the see of Bristol, whence he was translated in 1737 to that of Oxford, with which he held the valuable deanery of St Paul's. In 1758 the duke of Newcastle, then at the head of the cabinet, placed Bishop Secker in the primacy. As a scholar, he was elegant rather than profound, although in some of his writings, especially in his "Lectures on the Catechism of the Church of England," he displays much depth of argument as well as perspicuity of style. His works, consisting of charges and sermons, have been collected and printed in twelve octavo volumes, with a life by Bishop Porteus, his chaplain. There was also published by him, in his life-time, "A Reply to Mayhew on the Charter and Conduct of the Society for Propagating the Gospel," without the author's name. This controversy relates to a proposed establishment of bishops in the American colonies. Archbishop Secker died at Lambeth Palace in 1768.

SEDGWICK, THEODORE, an American judge who was born at Hartford, Connecticut, in May 1746. His father, a respectable merchant, died when he was about ten years of age, leaving little property; but the generosity of his eldest brother enabled him to study at Yale college. He then turned his attention to divinity, which, however, he abandoned for law; and, before he was twenty years old, in April 1766 he was admitted to the bar. He embarked in the revolutionary struggle with his constitutional ardour, and in 1776 he served under General Thomas, in the expedition to Canada, and subsequently made great exertions in procuring supplies for the army. At the same time his humanity in affording protection to the British put his popularity in no small hazard. He represented Sheffield in the Massachusetts general court several times, before and after the revolution. In 1785 and 1786 he was a member of congress, under the old confederation; and, in the winter of 1787, he contributed much to the suppression of the insurrectionary spirit then pervading the state, frequently exposing himself to outrage, insult, and even death. His exertions in putting down what was called Shay's rebellion, are honourably mentioned in the history of the times. In 1788 he was a representative of Stockbridge, in the state convention that adopted the federal constitution, of which he was one of the principal advocates. In the same year he was a member of the house of representatives of the state, and was chosen its speaker. In 1796 he was chosen to the senate, where he remained until March 1799, having, during a considerable portion of one session, acted as president *pro tem*. In the latter year he was again elected a member of the house of representatives and chosen speaker. In 1802 he was appointed judge of the supreme court of Massachusetts, and retained that office until his death, January 24, 1813. As a statesman and jurist, Mr. Sedgwick enjoyed a high reputation. His philanthropic efforts in the course of the emancipation of the negroes deserve especial record. He was one of the counsel who, soon after the adoption of the constitution of Massachusetts, procured a decision, by which such a construction was given to that instrument as to abolish slavery in the state.

SEDLEY, SIR CHARLES, a celebrated wit of the age of Charles II., who was the son of Sir John Sedley, of Aylesford in Kent, where he was born in 1639. At the age of seventeen he was entered at Oxford, but quitted the university without a degree

and retired to his estates till after the restoration in 1660. His credit with the king was heightened by his never asking favours, although the debauchery into which he plunged soon dissipated his pecuniary resources. A fine of 500*l.* was imposed upon him by Chief Justice Hyde, for an indecent riot committed at a public house, where he harangued the mob from the balcony, in company with Lord Buckhurst and Sir Thomas Ogle. Being returned member of parliament for the borough of New Romney, in Kent, in 1661, he sat for that place in four successive parliaments. James II. carried on an intrigue with his daughter, afterwards created by that monarch countess of Dorchester. Sir Charles was so little pleased by this elevation that it is said to have been the principal cause of his subsequently taking a strenuous part in bringing about the revolution; and to a gentleman who taxed him with a want of loyalty, he replied that, "as the king had made his daughter a countess, the least he could do was to assist in making his majesty's daughter a queen." Sir Charles died about the commencement of the last century. He was the author of six dramatic pieces, printed with his miscellaneous poems in 1719, in two octavo volumes. The latter consist of pastorals, prologues, songs, epilogues, and occasional poems, which, though not free from the licentiousness of the age, are clear of much of its grossness.

SEEBECK, a distinguished German natural philosopher, who was born in 1770 at Reval, and studied medicine in Berlin and Göttingen. He was principally known by the discovery of thermomagnetism. He also partook in the discovery of the "metalloides," discovered the "entoptic" phenomena, for which he received a prize from the French institute, and enlarged in other ways the field of optics. After 1818 he lived in Berlin, where he was elected a member of the academy of sciences, and died in December 1831.

SEETZEN, ULRIC JASPER, a German traveller who was a native of East Friesland, and received his education at Göttingen, where he particularly studied philosophy and natural history under Professor Blumenbach. Having published some tracts on natural history, statistics, and political economy, he was appointed aulic counsellor to the czar in the principality of the Jever. He was desirous of visiting Africa and the East; and, being encouraged by the Dukes Ernest and Augustus of Saxe-Gotha, he set off, in August 1802, for Constantinople. He proceeded to Syria, and remained a considerable time at Aleppo, making excursions into the neighbouring territories. In 1806 he explored the course of the river Jordan and the Dead Sea, travelled through Palestine, and went to Hebron and Mount Sinai. His enthusiastic desire for knowledge prompted him to profess Mohammedanism, that he might undertake a pilgrimage to Mecca and Medina, which he visited in 1809 and 1810. In the month of November 1810 he was at Mocha, whence he wrote the last letters which arrived from him in Europe. Having had his property seized by the Arabs, under the pretext of his being a magician, he proceeded towards Sana, in December 1811, to complain to the iman of that place; and a few days after his departure, he died suddenly at Taes, probably from the effects of poison given him by order of the iman. No complete account of the researches of this unfortunate traveller ever appeared; but his letters, which he addressed to Baron von Zach, were inserted in the

"Geographical and Astronomical Correspondence," published at Gotha; and a translation was printed in the French "*Annales des Voyages*." Extracts from his letters to Blumenbach, and others also were published in the "*Magasin Encyclopedique*."

SEGAR, SIR WILLIAM, an English herald, who lived in the reign of Elizabeth and James I. He was imprisoned during the reign of the queen for having made out a grant of a coat of arms for a common executioner, whose name was Brandon. Not of course, being aware of his character or office, he made a grant of the royal arms of Arragon, with the canton of Brabant. However, on being proved that he had been the dupe of a conspiracy, he was released from his confinement. He held the office of Northern herald in 1602, and in that year published a work entitled "*Honor, Military and Civill, contained in four bookes*." His death took place in 1633.

SEGUR, an ancient French family, which has produced several distinguished men; among them we may mention the following:—Joseph Alexandre Segur, was born at Paris in 1752, and died in 1806. He was the author of several comedies and operas, which still remain popular, of the "*Correspondance Secret entre Ninon du l'Enclos, le Marquis de Villars et Mad. de Maintenon*," and a romance "*Sur les Femmes*." His brother, Louis Philip Segur, was born in 1753, died in 1830, peer of France, and member of the French academy, served in America under Rochambeau, and, after the peace of 1763, was ambassador to St. Petersburg. In 1790 he was sent to Berlin; but, after the deposition of the king, he retired from public affairs, and in 1798 published his "*Théâtre de l'Hermitage*,"—a collection of plays which he had composed for the private theatre of the empress of Russia. In 1800 appeared his masterpiece "*Histoire de Regne de Frédéric Guillaume II. de la Décade Historique*." In 1803 he was chosen a member of the institute, and Napoleon appointed him one of the council of state. After the restoration he was received into the chamber of peers. His son, Paul Philip Segur, was born in 1780, and served with distinction on various occasions. He executed several diplomatic missions, and in 1812 he was created *maréchal de camp*, and distinguished himself in several bloody actions in 1813 and 1814. In December 1831 he was created a peer for life, being one of the thirty created for the purpose of giving ministers a majority on the question of an hereditary peerage. His "*Histoire de Napoléon et de la Grande Armée pendant l'Année 1812*" has passed through numerous editions, and given rise to several controversies, particularly one with Gourgaud, which ended with a duel between the parties.

SEIDELMANN, JAMES, a celebrated professor in the academy of fine arts, who was born in 1750. He perfected himself in painting, under Mengs, at Rome, and subsequently invented an entirely new manner of drawing in sepia, chiefly for the representation of the antique. His works executed in this style, and his copies in oil, are numerous, and gained him much reputation. In his style of drawing in sepia he and his wife were unrivalled, though there were many imitators. His wife was born in Venice, and perfected herself in miniature painting under Theresa Maron, sister to Raphael Mengs. She made the drawing of the Madonna del Sisto, from which Maitre prepared his admirable engraving.

SEJANUS.—This celebrated favourite of Tiberius

was the son of a Roman knight. Although he knew how to dissemble his ambition and pride before his master, yet he spared no means of gratifying his passion. He acquired the confidence of the suspicious Tiberius, so as to govern him completely; and the servile senate paid the greatest respect to the powerful favourite. The pretorian cohorts were also favourable to him, and there was no obstacle in the way of his attaining the supreme power, but Drusus, son of Tiberius, and the sons of Germanicus, the nearest of kin to the emperor. Drusus was put out of the way by poison; the latter, with their mother, were banished and thrown into prison—a step which they did not long survive. Several distinguished Romans, friends of Germanicus, were beheaded at the instigation of Sejanus; and when Tiberius finally retired from Rome and withdrew from the government, Sejanus governed with absolute power, and the senate ordered that the statues erected in his honour should be publicly worshipped. But at the moment of his highest elevation, the suspicions of Tiberius were awakened, and his measures were taken so cautiously that Sejanus suspected nothing until he was openly accused by the emperor before the senate. He was then imprisoned, condemned to death, and executed on the same day.

SELDEN, JOHN.—This eminent lawyer and critic was born at Salvington, in December 1584, and received the rudiments of his education at the free grammar school in Chichester; after which he completed his studies at Hart Hall, Oxford. He then removed to Clifford's Inn, and subsequently to the Inner Temple, where he stood high for his prompt attention to his studies. In 1610 he published his work entitled "*Jani Anglorum Facies Altera*." In 1612 he published notes and illustrations on the first eighteen songs in Michael Drayton's "*Polyolbion*;" and the year after, wrote verses in Greek, Latin, and English, upon Brown's "*Britannia's Pastorals*;" which, with other poems prefixed to the works of various authors, occasioned Sir John Suckling to give him a place in his "*Session of the Poets*." In 1614 came out his "*Titles of Honour*," a work which, "as to what concerns our nobility and gentry," says Bishop Nicholson, "all will allow ought to be first perused, for the gaining a general notion of the distinction of a degree, from an emperor down to a country gentleman." In 1616 he published "*Notes on Fortescue's 'De Laudibus Legum Angliæ'*;" and in 1617, "*De Diis Syris Syntagma Duo*," which was reprinted at Leyden, 1620. In 1617 his "*History of Tithes*" was printed, in the preface to which he reproaches the clergy with ignorance and laziness, with having nothing to keep up their credit, but beard, title, and habit. This book gave great offence to the clergy, and was animalverted on by several writers; by Dr. Richard Montague, afterwards bishop of Norwich, in particular. The author was also called before the privy council, and obliged to express his sorrow for publishing a book which, against his will, had given offence, yet without recanting any thing contained in it.

In 1621 King James I., being displeased with the parliament, and having imprisoned several members whom he suspected of opposing his measures, ordered Mr. Selden also to be committed to the custody of the sheriff of London; for though he was not then a member of the house of commons, yet he had been sent for and consulted by them, and had given his

opinion very strongly in favour of their privileges, in opposition to the court. However, by the interest of Andrews, bishop of Winchester, he, with the other gentlemen, was set at liberty in a few weeks. He then returned to his studies, and wrote and published several learned works. In 1623 he was chosen a burgess for Lancaster, and two years after was chosen member for Great Bedwin in Wiltshire. In the first parliament of King Charles I. he declared himself warmly against the duke of Buckingham, and when that nobleman was impeached in 1626, was one of the managers of the articles against him.

He opposed the court-party the three following years with great vigour. The king having dissolved the parliament in 1628, and ordered several members of the house of commons to be committed to the Tower, Mr. Selden, who was one of this number, insisted upon the benefit of the laws, and refused to make any submission to the court; upon which he was removed to the king's bench prison. He was released the latter end of the year, and the parliament afterwards ordered him 5000*l.* for the losses he had sustained on that occasion. In 1650 he was again committed to custody, with the earls of Bedford and Clare, Sir Robert Cotton, and Mr. St. John, being accused of having dispersed a libel, entitled, "*A Proposition for his Majesty's Service to bridle the Impertinency of Parliaments*;" but it was proved that Sir Robert Dudley, then living in the duke of Tuscany's dominions, was the author.

In 1634 a dispute arose between the English and the Dutch respecting the herring-fishery upon the British coast, and Grotius having previously published his "*Mare Liberum*" in favour of the latter, Selden was prevailed upon by Archbishop Laud to draw up his "*Mare Clausum*;" and it was accordingly published in 1636. This book recommended him to the favour of the court, and he might have obtained preferment there, but his attachment to the liberties of his country made him averse to preferment. In 1640 he published "*De Jure Naturali et Gentium juxta Disciplinam Hebræorum*." Le Clerc says, "that in this book Mr. Selden has only copied the rabbins, and scarcely ever reasons at all. His rabbinical principles are founded upon an uncertain Jewish tradition, namely, that God gave to Noah seven precepts to be observed by all mankind. Besides, his ideas are very imperfect and embarrassed." There is certainly some foundation for this; and what is here said respecting this particular work may be more or less applied to all he wrote.

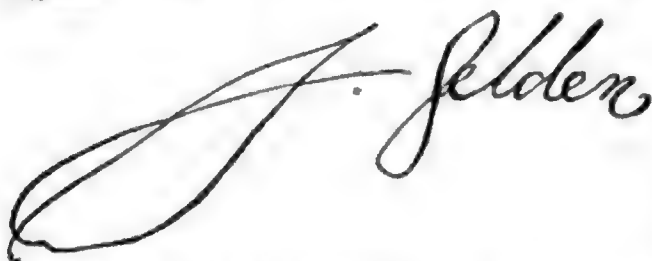

The same year, 1640, he was chosen member of parliament for the university of Oxford; and though he was opposed to the court, yet in 1642 the king had thoughts of taking the seal from the lord-keeper Littleton, and giving it to him. The lord Clarendon says that the lord Falkland and himself, to whom his majesty referred the consideration of that affair, "did not doubt of Mr. Selden's affection to the king" but "he was in years," continues the noble historian, "and of a tender constitution; he had for many years enjoyed his ease, which he loved; was rich, and would not have made a journey to York, or have lain out of his own bed, for any preferment which he had never affected." The noble historian might have added, that he was too much attached to the liberties of his country to be at all inclined to promote the king's views. In 1643 he was appointed one of the lay members to sit in the assembly of divines at

Westminster. In 1643 he was, by the parliament, appointed keeper of the records of the Tower. In 1644 he was elected one of the twelve commissioners of the admiralty; and the same year was nominated to the mastership of Trinity college in Cambridge, which he did not however accept. About this time he did great services to the university of Oxford, as appears from several letters written to him by that university which are printed; and indeed he never concurred in any violent or unjust measures, but often opposed, and always discountenanced them. Upon the publication of the "Eikon Basilike," Cromwell employed all his interest to engage him to write an answer to that book; but he refused. In the beginning of 1654 his health began to decline; and he died on the 30th of November in that year, in White Friars, at the house of Elizabeth, countess of Kent. He was buried in the Temple church, where a monument was erected to him; and Archbishop Usher preached his funeral sermon. He left a valuable library to his executors, Matthew Hale, John Vaughan, Edward Heywood, and Rowland Jewks.

Mr. Selden's extensive learning procured him the esteem of nearly all the learned men of his time in Europe; and even the celebrated Grotius, with a generosity not common in literary rivals, styles him "The glory of the English nation." But the noblest testimony of his talents is that of his friend the earl of Clarendon, with whose sketch of his character we shall close his life. "Mr. Selden was a person," says he, "whom no character can flatter or transmit in any expressions equal to his merit and virtue. He was of so stupendous learning in all kinds, and in all languages, as may appear from his excellent and transcendent writings, that a man would have thought he had been entirely conversant among books, and had never spent an hour but in reading and writing; yet his humanity, courtesy, and affability were such, that he would have been thought to have been bred in the best courts, but that his good nature, charity, and delight in doing good, and in communicating all he knew, exceeded that breeding. His style in all his writings seems harsh, and sometimes obscure; which is not wholly to be imputed to the abstruse subjects of which he commonly treated out of the paths trod by other men, but to a little undervaluing the beauty of style, and too much propensity to the language of antiquity; but in his conversation he was the most clear discourser, and had the best faculty in making hard things easy, and presenting them to the understanding, of any man that hath been known."

His works were collected by Dr. Wilkins, and printed in three volumes, folio. The first two volumes contain his Latin works, and the third his English.

SELKIRK, ALEXANDER.—This extraordinary individual, whose solitary residence in the island of Juan Fernandez suggested the matchless fiction of

"Robinson Crusoe," was a native of Largo, a village on the north shore of the Frith of Forth, in Scotland. He was the son of a shoemaker in good circumstances, and was born in the year 1676. Though he displayed some aptitude at school, especially in learning navigation, he was a restless and troublesome youth, of a quarrelsome temper, and almost always engaged in mischief. His father was one of those stern disciplinarians who formerly abounded in Scotland, and whose severity in dictating repulsive exercises and restraining from innocent indulgences was so frequently rewarded, in the case of children of lively temperaments, with effects so different from what were expected. The mother, on the other hand, who was soft and pliant, made the young Selkirk a favourite, on account of his being a seventh son, born without the intervention of a daughter; which, in her opinion, marked him out for a lucky destiny. The boy's own wish was to go to sea; that of his father, to keep him at home as an assistant in his own trade; and it appears that the mother advocated the views of her son, as most likely to lead to the realization of her superstitious hopes. It must be allowed that these circumstances, operating in a humble walk of life, at the time and place alluded to, were not calculated to soothe an irritable control a reckless, or even to preserve the original features of an amiable character.

After working till about his twentieth year at his father's trade, Alexander Selkirk left his native village in order to avoid ecclesiastical censure for domestic quarrelling, and was at sea for four years. On his return in 1701 he once more excited public scandal by his conduct in the family circle; and being again cited by the Kirk-sessions, along with his father, mother, and other relations, he on this occasion gave satisfaction by submitting to a rebuke in church, and promising amendment. Having spent the winter at home, he returned in spring to England in search of employment as a mariner. The war of the Spanish succession was now breaking out, and among the means adopted by Britain for distressing the enemy, was the employment of those daring half-piratical commodores who used to scour the South Seas at all seasons in search of Spanish merchantmen and bullion-ships, allowing no regular principle of warfare, except that there never was peace beyond the line. The celebrated Captain Dampier had projected an enterprise with two war-armed vessels, under the commission of the admiralty; designing to sail up the river La Plata, and seize a few of the rich galleons which usually sailed once a-year from that port to the mother country. His vessels were respectively entitled the *St. George* and the *Cinque Ports*, of twenty-six and sixteen guns; and Selkirk, who was probably recommended by experience in the same kind of employment, was appointed sailing-master of the smaller ship. The terms on which both officers and men entered the expedition were very simple: they were to have no wages beyond a certain share of their prizes. Such, however, had been the success of many previous expeditions of the same kind, that no doubt was entertained by any one on board, that they would each return with an immense load of Spanish gold. The two vessels sailed in September 1703, but were too late for the galleons, all of which had got to port before they reached Madeira. Dampier then relinquished his design upon the river La Plata, and

resolved to attack some rich town on the Spanish main. But before they left this range of isles, dissensions began to break out, and, by orders of Dampier, the first lieutenant of the *St. George*, with whom he had quarrelled, was left with his servant upon *St. Jago*. They soon after reached the coast of Brazil, where they had the misfortune to lose Captain Pickering of the *Cinque Ports*, who was acknowledged to be the most sensible man on board, and the main stay of the enterprise. This vessel was now very leaky, and, falling under the command of a man of brutal character named Stradling, it was no longer a place of comfort for Selkirk, who about this time had a dream, which he esteemed as a forewarning of the failure of the expedition and the loss of the *Cinque Ports*, and formed the resolution to withdraw at the first opportunity. The situation of the men in general may be guessed from the fact that nine of the crew of the *St. George* went ashore upon the isle of *La Granda*, preferring the hazard of perpetual slavery among the Spaniards to continuing any longer with their countrymen. The two vessels now doubled Cape Horn and sailed for the isle *Juan Fernandez*, where they were refitted. Here, however, a violent quarrel broke out between Stradling and his crew, forty-two of whom (probably including Selkirk) went ashore, vowing that they would not return to the vessel, in which there were not now so many as twenty men left. It was not without great difficulty, nor till they had become somewhat tired of the island, that they could be prevailed upon to change their resolution. For some months after this revolt the two vessels cruised along the coast of Chili, capturing a few worthless merchant vessels, which supplied them with fresh stores, but altogether failing in the principal object of their expedition. At length Dampier and Stradling parted company, and the *Cinque Ports* returned to *Juan Fernandez* to refit.

Stradling and Selkirk had for some time been on such terms that the latter was now determined to remain upon the island, the capability of which to support him was proved by two men, who had lived upon it since the vessels were there in spring. Accordingly, when the vessel was about to weigh, he went into a boat with all his effects, and was rowed ashore under the direction of the captain in October 1704. His first sensation on landing was one of joy, arising from the novelty of an exemption from the annoyances which had been oppressing him for such a length of time; but he no sooner heard the strokes of the receding oars, than the sense of solitude and helplessness fell upon his mind, and made him rush into the water to entreat his companions to take him once more on board. The brutal commander only made this change of resolution a subject of mockery, and told him it would be best for the remainder of the crew that so troublesome a fellow should remain where he was.

Here, then, was a single human being left to provide for his own subsistence upon an uninhabited and uncultivated isle, far from all the haunts of his kind, and with but slender hopes of ever again mingling with his fellow-creatures. Vigorous as the mind of Selkirk appears to have been, it sank for some days under the horrors of his situation, and he could do nothing but sit upon his chest and gaze in the direction in which the ship had vanished, vainly hoping for its return. On partly recovering his equa-

nimity, he found it necessary to consider the means of continuing existence. The stores which he had brought ashore, consisted, besides his clothing and bedding, of a firelock, a pound of gunpowder, a quantity of bullets, a flint and steel, a few pounds of tobacco, a hatchet, a knife, a kettle, a flip-can, a Bible, some books of devotion, and one or two concerning navigation, and his mathematical instruments. The island he knew to contain wild goats; but being unwilling to lose the chance of observing a passing sail, he preferred for a long time feeding upon shell-fish and seals, which he found upon the shore.

The island, which is rugged and picturesque, but covered by luxuriant vegetation, and clothed to the tops of the hills with wood, was now in all the bloom and freshness of spring; but upon the dejected solitary its charms were spent in vain. He could only wander along the beach, pining for the approach of some friendly vessel, which might restore him, under however unpleasant circumstances, to the converse of his fellow-creatures.

At length the necessity of providing a shelter from the weather supplied him with an occupation that served in some measure to divert his thoughts. He built himself two huts with the wood of the pimento tree, thatching them with the long grass which grows upon the island. One was to serve as a kitchen, the other as a bedroom. But yet, every day for the first eighteen months he spent more or less time on the beach, watching for the appearance of a sail upon the horizon. At the end of that time, partly through habit, partly through the influence of religion, which was awakened in full force upon his mind, he became reconciled to his situation. Every morning after rising, he read a portion of the Scripture, sang a psalm, and prayed, speaking aloud in order to preserve the use of his voice; he afterwards remarked, that during his residence on the island he was a better Christian than he had ever been before, or would probably ever be again. He at first lived much upon turtles, which abounded upon the shores; but afterwards found himself able to run down the wild goats, whose flesh he either roasted or stewed, and of which he kept a small stock tamed, around his dwelling, to be used in the event of his being disabled by sickness. One of the greatest inconveniences which afflicted him for the first few months was the want of salt; but he gradually became accustomed to this privation, and at last found so much relish in unsalted food that, after being restored to society, it was with equal difficulty that he reconciled himself to take it in any other condition. As a substitute for bread, he had turnips, parsnips, and the cabbage palm, all of excellent quality, and also radishes and water-cresses. When his clothes were worn out, he supplied their place with goat-skins, which gave him an appearance much more uncouth than any wild animal. He had a piece of linen, from which he made new shirts by means of a nail and the thread of his stockings; and he never wanted this comfortable piece of attire during the whole period of his residence on the island. Every physical want being thus gratified, and his mind soothed by devotional feelings, he at length began to positively enjoy his existence, often lying for whole days in the delicious bowers which he had formed for himself, abandoned to the most pleasant sensations.

Among the quadruped inhabitants of the isle were multitudes of rats, which at the first annoyed him

by gnawing his feet while asleep. Against the enemy he found it necessary to enter into a treaty, offensive and defensive, with the cats, which also abounded in his neighbourhood. Having caught and tamed some of the latter animals, he was soon freed from the presence of the rats, but not without some disagreeable consequences, in the reflection, that, should he die in his hut, his friendly auxiliaries would probably be obliged, for their subsistence, to devour his body. He was in the meantime able to turn them to some account for his amusement, by teaching them to dance and perform a number of antic feats, such as cats are not in general supposed capable of learning, but which they might probably acquire, if any individual in civilised life were able to take the necessary pains. Another of his amusements was hunting on foot, in which he at length, through healthy exercise and habit, became such a proficient that he could run down the swiftest goat. Some of the young of these animals he taught to dance in company with his kittens; and he often afterwards declared, that he never danced with a lighter heart or greater spirit than to the sound of his own voice in the midst of these dumb companions.

Selkirk was careful, during his stay on the island, to measure the lapse of time, and distinguish Sunday from the other days of the week. Anxious, in the midst of all his indifference to society, that, in the event of his dying in solitude, his having lived there might not be unknown to his fellow-creatures, he carved his name upon a number of trees, adding the date of his being left, and the space of time which had since elapsed. When his knife was worn out, he made new ones, and even a cleaver for his meat, out of some hoops which he found on the shore. He several times saw vessels passing the island, but only two cast anchor beside it. Afraid of being taken by the Spaniards, who would have consigned him to hopeless captivity, he endeavoured to ascertain whether these strangers were so or not, before making himself known. In both cases he found them enemies; and on one of the occasions, having approached too near, he was observed and chased, and only escaped by taking refuge in a tree. At length, on the last day of January, 1709, four years and four months from the commencement of his solitary life, he had the unspeakable satisfaction of observing two British vessels approach, evidently with the intention of touching at the island. The night having fallen before they came near, he kindled a large fire on the beach, to inform the strangers that a human being was there. During the night, hope having banished all desire of sleep, he employed himself in killing goats, and preparing a feast of fresh meat for those whom he expected to be his deliverers. In the morning he found that the vessels had removed to a greater distance, but, ere long, a boat left the side of one of them, and approached the shore.

Selkirk ran joyfully to meet his countrymen, waving a linen rag to attract their attention; and having pointed out to them a proper landing-place, soon had the satisfaction of clasping them in his arms. Joy at first deprived him of that imperfect power of utterance which solitude had left to him, and the strangers were for a time so surprised by his rude habiliments, long beard, and savage appearance, as to be in much the same condition. But in a little time they were mutually able to make explanations, when it appeared that the two vessels, called the

Duke and Duchess, formed a privateering expedition similar to that of Dampier, under the command of Captain Woodes Rogers, the former commander being here employed only as a pilot. Dover, the second captain, and Fry, the lieutenant, of Rogers's own vessel, were of the boat party, and, after partaking of Selkirk's hospitality, invited him on board. But so little eager was he to leave his solitude, that he was not prevailed upon to do so till assured that Dampier had no situation of command in the expedition. He was then brought on board the Duke, along with his principal effects, and, by the recommendation of Dampier, who said he had been the best man in the Cinque Ports, was engaged as a mate. He now found that if he had remained on board the Cinque Ports, he must have experienced a worse fate than his late solitude, for, soon after leaving Juan Fernandez, Stradling had been obliged to surrender himself and his crew to the Spaniards, on account of the leaky state of the vessel, and had ever since been in confinement.

A few weeks after leaving the island, Selkirk was appointed to the command of a prize which was taken out as a privateer; and in this situation he conducted himself with a degree of vigour and prudence that reflects credit on his character. The business in which he was engaged, was certainly one by no means calculated to give play to the more amiable qualities of human nature; but even in the scenes of coast towns, and expeditions of plunder into the interior, which for months formed his chief employment, our hero seems to have mingled humanity as high a proportion as possible with the execution of his duty.

The expedition of Rogers was as remarkable for steadiness, resolution, and success, as that of Dampier had been for quarrelling and indecision; and it excites a curious feeling of surprise when we learn that the church of England service was regularly read on the quarter-decks of these piratical vessels, and all hands piped to prayers before every action. Selkirk proved himself, by his steadiness, decent manners, and religious turn of mind, a most appropriate member of the corps commanded by Rogers, and was accordingly much valued by his superiors. At the beginning of the ensuing year the vessels began their voyage across the Pacific, with the design of returning by the East Indies, and in this part of the enterprise Selkirk acted as a sailing master. He did not, however, reach England till October 1712, when Selkirk had been absent from his country for eight years. Of the enormous sum of 107,000*l.* which Rogers had realized by plundering the coast, Selkirk seems to have shared to the amount of about 800*l.*

In the spring of 1712 Selkirk returned on a Friday forenoon to his native village, and finding that his friends were at church, went thither, and for some time sat eyeing them without being recognized. A suit of elegant gold-laced clothes perhaps helped to preserve his incognito. At length his mother, after gazing on him for some time, uttered a cry of joy and flew to his arms. For some days he felt pleasure in the society of his friends, but in time began to pine for other scenes, his mind still reverting with regret to his lost solitude. It would appear, indeed, that so long an absence from society had in some measure unfitted him for it. He tried solitary fishing, built a bower like that of Juan Fernandez's

the garden behind his brother's house, and wandered for days in the picturesque solitude of a glen beneath the brow of Largo Law. But nothing could compensate for the meditative life which he had lost. At length, having formed an attachment to a rustic maiden, named Sophia Bruce, whom he met in the glen just named, he suddenly disappeared with her, and never more was seen at Largo. Nothing else is known with any certainty except that he went to sea again in 1717, and died in the situation of lieutenant on board one of his majesty's ships, leaving a widow, who subsequently claimed his property in his native village.

**SEMIRAMIS.**—A celebrated Assyrian queen, who was born at Ascalon, but the exact date of her birth is not known. It is said that her surpassing beauty, combined with great talents, captivated the affections of Menon, governor of Assyria, during the reign of Ninus, king of that country. Her husband accompanied the king during his campaign in Bactria, where, after they had subdued all the cities and strong holds, Ninus besieged Bactria, the capital of the empire. Semiramis having acquired that ascendancy which superior understandings soon obtain over those of less penetration and sagacity, she ventured to express herself freely upon the methods which were adopted in conducting the siege, pointing out what she deemed to be errors, and suggesting especially the advantage likely to ensue from attacking the citadel, one of the chief places of strength, instead of confining their efforts to more vulnerable, indeed, but less important parts of the defence. She prevailed so far as to be appointed to lead a division of picked men, who were particularly skilled in climbing, and with these she completely succeeded in seizing on the citadel, and opening a passage for the Assyrians. The extraordinary daring displayed in this action, and the success of her spirited efforts, soon met with an appropriate reward, and, together with her beauty, occasioned Ninus ultimately to cherish so irresistible a passion for her, that he used every means to induce her husband to relinquish her to him. In vain however did he solicit; in vain did he even promise Menon his own daughter Sosana in marriage; till at last, proceeding from entreaties to threats, and particularly the cruel one of putting out his eyes, her husband committed suicide in despair, and the infamous conqueror possessed himself of Semiramis, and exalted her to an ill-acquired sovereignty.

After the return of Ninus from this war, in which he had accumulated immense treasures, Semiramis brought him a son, who was called Ninyas. Soon after Ninus died, leaving the government in the hands of his bride. Some have attributed his death to assassination, and that by her who was indebted for her honours solely to his partiality. They represent Semiramis as requesting the king to entrust her with the sovereign power for five days, with which his ardent affection induced him to comply. No sooner was she in this situation, than, having already secured the interest of the principal persons of the state by her unbounded liberalities, she put Ninus to death, or at least placed him in prison for the remainder of his days. This act of perfidy can scarcely, however, with any probability, be imputed to her, especially as she paid her husband extraordinary sepulchral honours, rearing over him a mound of earth nine stadia in height and ten in breadth, which was visible from every quarter, to a considerable distance

in the surrounding country, and continued for many ages.

Semiramis now determined to commence some mighty undertaking that should transmit her name to succeeding generations; and, as it regarded her contemporaries, in particular, effectually conceal the meanness of her birth. Collecting therefore, out of all the numerous provinces of her empire, no fewer than two millions of men, she set about the building of Babylon, a city whose magnitude and magnificence have excited the astonishment of all subsequent times. The natural propensity of mankind, however, to exaggeration, ought perhaps to induce us to receive, with some abatements, the wonderful descriptions of the ancient writers. By some this work is ascribed to Belus, and Nebuchadnezzar is admitted to have completed the labour.

Peaceful and laborious occupation did not long furnish scope enough for the enterprising ambition which now ruled the Babylonish empire. Assembling a numerous army, Semiramis marched at the head of it into Media, and at her first considerable encampment, near a mountain called Bagistan, she arranged a beautiful garden twelve stadia in circumference. At the base of the mountain she had a statue erected representing herself attended with a hundred of her guards. It is reported that she ascended from the plain to the summit on the packs and loads carried by the beasts of burden in her train; a circumstance by no means unlikely, being quite in union with her adventurous and heroic character, and eminently calculated to advance her reputation in such an age and country. Always intent upon whatever might conduce to throw a magnificence around her name and dominion, at the next encampment, which was at Chaon, a Median city, she formed another garden on the summit of a lofty hill or rock, and added several splendid edifices, from which she might command a view of her army and the widely extended prospects that stretched before the eye in every direction. Ecbatan or Ecbatana, was the next halting place, in the way to which the queen cut a passage through a precipitous mountain, called Zarcærum, or, as some represent it, levelled it to the plain, though of considerable extent; and upon her arrival at the city proceeded upon her usual magnificent plan of erecting something to perpetuate her name and glory. In the present instance, this was a palace of great extent and splendour; to which work she added others of more importance, as the formation of aqueducts to supply the city with water, of which it had hitherto been in extreme need.

Semiramis proceeded hence into Persia, and traversed the rest of her Asiatic provinces, everywhere erecting palaces, towns, and cities, levelling hills that obstructed her course, or were calculated to impede the progress of the future traveller; and in the more champaign countries, raising up hills to diversify the scene and to serve as memorials of her principal commanders. These were generally called the "works of Semiramis," and long survived her.

From Asia she passed into Egypt and the sandy tracts of Libya, where her curiosity induced her to pay a visit to the celebrated temple of Jupiter Ammon, for the particular purpose of making inquiry of the oracle how long she had to live. The answer was little calculated to afford her satisfaction, unless her personal comforts were of inferior consideration to her posthumous reputation. She was told, as

Diodorus Siculus reports, that she should die when her son Ninyas conspired against her life; and that after her decease, some of the nations of Asia should render her divine honours.

At length she marched back again to Bactria, after settling the affairs of Ethiopia; but her restless spirit was unable to remain inactive and tranquil. New projects presented themselves to her imagination, which she hastened to carry into execution. India, of whose immense riches and boundless fertility she had been informed, attracted her first and, as it proved, her last attention. She appointed Bactria as the rendezvous for an army of prodigious magnitude, which she assiduously collected out of every province of her empire. The choicest men were everywhere selected, and shipwrights from Phœnicia, Syria, Cyprus, and other places, were employed to frame vessels, which she proposed to transport over land in detached pieces, in order to cross the Indus. The cause for this measure seems to have been the information that the banks of that river, and the vicinity in general, were infertile in wood, which circumstance might have occasioned a considerable hinderance, if not a final frustration of her enterprise.

Having found that the Indians relied upon their elephants, in which their strength was considered as chiefly consisting, Semiramis devised a very singular expedient. To meet her adversary on equal terms, at least to impress him with that sentiment respecting her preparations, she determined to attempt an imitation of these elephants, since she had no means of procuring them, and accordingly caused 300,000 oxen to be slaughtered, distributing their flesh among her necessitous subjects. This being done, she ordered their hides to be stuffed, and so placed upon camels that these animals might resemble elephants in their size; and, to complete the delusion, each one was to be led by a man, according to the Indian method of advancing to battle.

Such preparations for war could not long remain concealed from the party against whom they were destined; and accordingly, the Indian king, Stabrobates, as soon as he obtained information of the projected invasion of his territory, applied himself to every precautionary measure. He assembled an army which he thought might be competent to meet the sharp encounter with that of Semiramis, and, in fact, which greatly exceeded it in point of numbers: and having despatched his hunters in every direction, procured a fresh and large supply of elephants. That nothing might be defective, he constructed 4000 boats of the bamboos which the rivers of India furnish in abundance.

Thus prepared for the attack, Stabrobates, however, did not neglect any proceeding which might tend to avert the threatened calamity and spare the fatal consequences that must necessarily attend upon the commencement of hostilities. He accordingly despatched ambassadors to the invading army to demand the reason of the meditated attack, to enquire who she was, and to upbraid her for this unprovoked act of aggression. A private letter was communicated at the same time to the queen, in which her character was by no means spared, and in which, in case of victory, she was threatened with the most cruel death. This only excited a smile, and she desired the king's ambassador to return for answer, that she would in a little time let him know who she was, that her actions would soon make him better

acquainted with her. Advancing to the river Indus, she immediately attempted the passage by means of boats prepared for the purpose, notwithstanding the show of resistance which the enemy made on the opposite shore. The two fleets encountered each other, and, animated with an equal courage, the contest was long and sanguinary; the one party was fighting for glory, and stimulated by the recollection of a splendid succession of past achievements; the other, for hereditary empire, which an insatiable ambition was endeavouring to wrest from a just possession. Victory for a considerable time seemed to hover between each hostile armament, till at length she descended among the invaders, who sunk 1000 of the Indian boats, and captured an immense multitude of prisoners. Before quitting the vicinity of the river, the conqueror had taken from the various villages and towns no less, it is said, than 100,000. Success stimulating her activity, Semiramis pressed forward into the country in pursuit of her fugitive enemies—fugitive, as some report, by stratagem, and for the purpose of decoying the queen into circumstances from which she would not be able to extricate herself. It seems probable, however, had this been the real plan of the Indians, the passage of the river and the possession of the opposite banks would not have been so fiercely contested; and consequently, that necessity, rather than cunning, dictated a hasty withdrawal of the Indian forces. Be this as it may, the queen, having left a division of 60,000 men to guard the bridge of boats which she had constructed to cross the river, marched into the heart of the country. Her array of counterfeit elephants at first struck terror into the Indian army, but their fears were soon dissipated by the treacherous information of certain deserters, who gave them an account of this stratagem, and re-inspired them with courage. Facing about, therefore, to meet their pursuers, a second battle ensued. Some advantage was at first obtained on the side of Semiramis: the horses of the enemy being thrown into confusion by the unusual scent of the hides, which the queen perceiving, commenced a furious attack, and drove them back upon the main body. The Indian infantry, however, under the immediate command of Stabrobates, and supported by their elephants, advanced to battle with great regularity and firmness. The counterfeit elephants of Semiramis soon proved not only useless, but obstructive, and contributed materially to a speedy and most disastrous defeat. The two chiefs of the respective armies now met in single combat, the Indian prince having advanced at the head of his right wing on a stately elephant, while Semiramis charged in front of her left. The king wounded her in two places, first in the arm with an arrow; then, as she was turning to retreat, finding the day irretrievably lost, in the shoulder. The swiftness of her horse, however, enabled her to escape the mortal wound, and she hurried back with her whole army to the river which she had so lately passed amidst shouts of triumph. She was indebted to two circumstances for her ultimate escape: the one was the superstition of her pursuers (Stabrobates having been warned against crossing the river, by an oracular interdiction); the other by a judicious manœuvre of her own; for so soon as the main body of the army had effected the passage, and many of the Indians were rushing over in pursuit, the queen ordered the bridge to be destroyed, which instantly placed her in circumstances of security, while many

of the enemy perished. She suffered a prodigious loss, not only in the battle, but on the brink of the Indus, in consequence of the excessive crowd of her fugitive army, who trampled each other to death, or forced multitudes of their companions into the river. An exchange of prisoners now took place, and the disappointed invader retreated with only one-third of her original army, to console her ambition at Bactria.

Thus ended the glory of Semiramis, and, soon after, her life. One of the eunuchs of her palace had inspired her own son with the desire of poisoning his mother. When she discovered the conspiracy she did not proceed to punish the offenders, from her recollecting, as it is said, the oracular prediction of Jupiter Ammon, and deeming it the express appointment of heaven that at this time she should die. She accordingly relinquished the government in favour of her son, and issued proclamations to her subjects intimating her desire that he should be received as king. Her retirement seems to have been partly compulsory and partly ambitious, for she wished to have divine honours paid to her, in consequence, as the oracle had expressed it, of "vanishing from the sight of men." It was given out that she left this world in the form of a dove, attended by a flock of those birds, which settled on her palace at the very crisis of her departure, in consequence of which the Assyrians worshipped the dove ever afterwards. She died at the age of sixty-two, after having reigned forty-two years over the greatest portion of Asia.

SENECA.—This celebrated philosopher was the son of a Roman knight, and was born a short time previous to the Christian era. The extraordinary talents which he displayed were early improved by lessons of philosophy from the first stoics of the age; and he became a rigid follower of the Pythagorean doctrine. He was appointed to the office of quæstor, but some aspersions being cast on his private character, the emperor banished him for some time to Corsica. From thence he was recalled by the empress Agrippina, to direct the education of her son Nero. But the corruption of the age and court rendered such a preceptor of no benefit; and Nero sacrificed a man whose good examples and salutary advice he was too profligate to follow. His death was decreed on account of his supposed participation in the conspiracy of Piso against the imperial monster whom he had educated. He was, however, allowed to select his own mode of dying. He therefore, with all the characteristic ostentation of a stoic, finished his life in the midst of his friends, conversing on philosophical subjects, while the blood was flowing from his veins, which he had caused to be opened, considering that as the easiest mode of ending his life.

SESOSTRIS, a king of Egypt, who by some writers has been deemed the Shishak of Scripture, but whom Champollion has shown to be a different person. He reigned in the fifteenth century B. C. Sesostris was a great conqueror, who overran Asia, and is said to have erected magnificent temples in all the cities of his empire, to have built a great wall on the eastern boundary of Egypt, and to have dug a number of canals from the Nile, for the purposes of commerce and irrigation.

SESTINI, DOMENICO, a learned numismatist who was born at Florence in 1750. After having completed his studies at the school of St. Marco, he entered the clerical order; but in 1774 he left his na-

tive city, and visited Rome, Naples, and the Sicilies. In order to prosecute his studies with more effect, he went from Sicily, through Malta and Smyrna to Constantinople, where he prepared his observations on the plague, which then prevailed. He made a short journey from Constantinople into Asia and Europe, and lived a short time in the house of Prince Ypsilanti, hospodar of Walachia. At length he went to Vienna, and returned along the Danube and over the Black Sea to Constantinople. The British ambassador at the porte, Sir Robert Ainslie, was then forming a collection of ancient coins. For sixteen years Sestini was his agent, and in the course of his travels collected the celebrated cabinet which he has described in his "*Lett. e Dissertazioni Numismatiche sopra alcune Medaglie rare della Collezione Ainsliana*," "*Descr. Numor. vett. ex. Museis Ainslie, Bellini, etc., necnon Animadverss. in Opus Eckhel. Doctrina Numorum vett.*" To gain a thorough knowledge of ancient coins, he travelled through Germany, visited Gotha, Dresden, and Berlin, where he settled, and was appointed, by the king, superintendent of the collection there. In 1810 he went to Paris, where he was elected a corresponding member of the académie des inscriptions et belles lettres, and two years later he received the appointment of antiquary and librarian of the princess Eliza, then grand-duchess of Tuscany. When Ferdinand III. ascended the throne, he confirmed him in this office, and added the title of honorary professor of the university of Pisa. In November 1825 he was living with Count Viczay at Hedervan. His principal writings are, "*Diss. Intorno al Virgilio di Aproniano*," "*Della Peste di Constantinopoli del 1778*," Yverdun, "*Lettere Odeporiche, ossia Viaggio per la Penisola di Cizico*," "*Viaggio di Constantinopoli a Bassora*," Yverd. 1786; "*Viaggio di Ritorno da Bassora a Constantinopoli*," and his dissertation on numismatics, which appeared at Leghorn, Rome, Berlin, Milan, Pisa, and Florence, from 1789 to 1820.

SETTLE, ELKANAH, an English poet, who was born in 1648. At the age of eighteen he entered at Oxford, but quitted the university without taking a degree, and came to London, where he commenced author by profession. He wrote numerous political pamphlets, and, in reply to Dryden's poem entitled "*The Medal*," occasioned by the Whig party striking a medal to commemorate the throwing out of the bill against the earl of Shaftesbury, a work called "*The Medal Reversed*;" and, soon after, a poem entitled "*Azaria and Hushai*," designed as an answer to the "*Absalom and Achitophel*." In 1685 he published a poem on the coronation of James II., and about the same time obtained a pension from the city, for writing an annual inauguration panegyric on lord mayor's day. Settle was, besides, an indefatigable writer for the stage, and produced fifteen dramatic pieces, none of which are now known on the boards. In the decline of life he received a salary from the proprietor of a booth at Bartholomew fair, as a writer of "*Drolls*," which were generally very successful, and is said to have been, at that time, the best contriver of theatrical machinery in the kingdom. He died at the Charter House in 1724.

SEUME, JOHN GOTTLIEB, a man of a vigorous mind, but eccentric disposition, who was born at Poserne in 1763. He was left an orphan, but was placed, by a charitable person, at the Nicolai school in Leipsic. Here he began the study of theo-

occupation at this time, we have no information; but it would appear that both were in a considerable degree neglected by his associating with a gang of deer-stealers. Being detected with them in robbing the park of Sir Thomas Lucy, of Charlecote, near Stratford, he was so rigorously prosecuted by that gentleman as to be obliged to leave his family and business, and take shelter in London. Sir Thomas, on this occasion, is said to have been exasperated by a ballad Shakspeare wrote,—probably his first essay in poetry,—of which the following stanza was communicated to Mr. Oldys:—

“A parliemente member, a justice of peace,  
At home a poor scare-crowe, at London an asse,  
If lowsie is Lucy, as some volke miscale it,  
Then Lucy is lowsie whatever befall it:  
He thinks himself greate,  
Yet an asse in his state.  
We allowe by his ears but with asses to mate.  
If Lucy is lowsie, as some volke miscall it,  
Sing lowsie Lucy, whatever befall it.”

These lines, it must be confessed, do no great honour to our poet, and probably were unjust; for although some of his admirers have recorded Sir Thomas as a “vain, weak, and vindictive magistrate,” he was certainly exerting no very violent act of oppression in protecting his property against a man who was degrading the commonest rank of life, and had at this time bespoke no indulgence by superior talents. The ballad, however, must have made some noise at Sir Thomas’s expense, as the author took care it should be affixed to his park-gates, and liberally circulated among his neighbours.

On his arrival in London, which was probably in 1586, when he was twenty-two years old, he is said to have made his first acquaintance in the play-house, to which idleness or taste may have directed him, and where his necessities, if tradition may be credited, obliged him to accept the office of call-boy, or prompter’s attendant. This is an assistant whose employment it is to give the performers notice to be ready to enter as often as the business of the play requires their appearance on the stage. Pope, however, relates a story communicated to him by Rowe, but which Rowe did not think deserving of a place in the life he wrote, that must have retarded the advancement of our poet to the office just mentioned. According to this story, Shakspeare’s first employment was to wait at the door of the play-house, and hold the horses of those who had no servants, that they might be ready after the performance. But “I cannot,” says his acute commentator, Mr. Steevens, “dismiss this anecdote without observing that it seems to want every mark of probability. Though Shakspeare quitted Stratford on account of a juvenile irregularity, we have no reason to suppose that he had forfeited the protection of his father, who was engaged in a lucrative business, or the love of his wife, who had already brought him two children, and was herself the daughter of a substantial yeoman.” Mr. Malone has remarked, in his “Attempt to ascertain the Order in which the Plays of Shakspeare were Written,” that “he might have found an easy introduction to the stage; for Thomas Green, a celebrated comedian of that period, was his townsman, and perhaps his relation. The genius of our author prompted him to write poetry; his connexion with a player might have given his productions a dramatic turn; or his own sagacity might have told him that fame was not incompatible with profit, and

that the theatre was an avenue to both. That it was once the general custom to ride on horseback to the play, I am likewise yet to learn. The most popular of the theatres were on the Bank-side; and we are told by the satirical pamphleteers of that time that the usual mode of conveyance to these places of amusement was by water, but not a single writer so much as hints at the custom of riding to them, or at the practice of having horses held during the hours of exhibition. Some allusion to this usage (if it had existed) must, I think, have been discovered in the course of our researches after contemporary fashions. Let it be remembered, too, that we receive this tale on no higher authority than that of Cibber’s ‘Lives of the Poets.’ Sir Wm. Davenant told it to Mr. Betterton, who communicated it to Mr. Rowe, who, according to Dr. Johnson, related it to Mr. Pope.” Mr. Malone concurs in opinion that this story stands on a very slender foundation, while he differs from Mr. Steevens as to the fact of gentlemen going to the theatre on horseback. With respect likewise to Shakspeare’s father being “engaged in a lucrative business,” we may remark that this could not have been the case at the time our author came to London, if the preceding dates be correct. He is said to have arrived in London in 1586, the year in which his father resigned the office of alderman; unless, indeed, we are permitted to conjecture that his resignation was not the consequence of his necessities. Prior to his leaving Stratford he placed his wife with her children in a small cottage at the village of Shottery, where her family had long resided; and some notion of their humble means at this period may be gathered from a sketch of the rude edifice, made by the late Mr. Ireland.

Shakspeare was received into the dramatic profession at first in a very humble rank; but his admirable wit, and the natural turn of it to the stage, soon distinguished him, if not as an extraordinary actor, yet as an excellent writer. His name is printed, as the custom was in those times, amongst those of the other players, before some old plays, but without any particular account of what sort of parts he used to play.

Mr. Rowe regrets that he cannot inform us which was the first play he wrote. More skilful research has since proved that “Romeo and Juliet,” and “Richard II. and III.,” were printed in 1597, when he was thirty-three years old; there is also some

estate had been sold out of the Clopton family for above a century at the time when Shakspeare became the purchaser, who, having repaired and modelled it to his own mind, changed the name to "New Place," which the mansion-house afterwards erected, in the room of the poet's house, retained for many years. The house and lands belonging to it continued in the possession of Shakspeare's descendants to the time of the restoration, when they were repurchased by the Clopton family. Here, in May 1742, when Mr. Garrick, Mr. Macklin, and Mr. Deane visited Stratford, they were hospitably entertained under Shakspeare's mulberry-tree by Sir Hugh Clopton. His executor, about 1752, sold New Place to the Rev. Mr. Gastrell, a man of large fortune, who resided in it but a few years, in consequence of a disagreement with the inhabitants of Stratford. As he resided part of the year at Lichfield, he thought he was assessed too highly in the monthly rate towards the maintenance of the poor; but, being very properly compelled by the magistrates of Stratford to pay the whole of what was levied on him, on the principle that his house was occupied by his servants in his absence, he peevishly declared that that house should never be assessed again; and soon afterwards pulled it down, sold the materials, and left the town. He had some time before cut down Shakspeare's mulberry-tree, to save himself the trouble of showing it those whose admiration of our great poet led them to visit the classic ground on which it stood. That Shakspeare planted this tree appears to be sufficiently authenticated, as is also the fact that the chair, of which we furnish the accompanying sketch, was for a long time in the possession of the poet, who appears to have originally acquired it through his wife, Anne Hathaway.

Shakspeare died on his birth-day, Tuesday, April 23, 1616, when he had exactly completed his fifty-second year, and was buried on the north side of the chancel, in the great church at Stratford, where a monument is placed in the wall, on which he is represented under an arch in a sitting posture, a cushion spread before him, with a pen in his right hand, and his left resting on a scroll of paper. In

addition to a short Latin inscription, there are the following lines on his monument:—

"Stay, passenger, why dost thou go so fast?  
Read, if thou canst, whom envious death hath placed  
Within this monument; Shakspeare, with whom  
Quick nature died; whose name doth deck the tomb  
Far more than cost; since all that he hath writ  
Leaves living art but page to serve his wit.

"Obiit Ano. Dni. 1616.  
"æt. 53, die 23 Apri."

The monument was originally coloured to resemble life, but was thickly covered over with white paint in the year 1793, at the instigation of Mr. Malone. The pen was long since detached by some visitor, and a recent attempt was made to abstract one of the fingers of the bust, which was actually broken off, but recovered and replaced. The removal of the coating of white paint, and the renewal of the original colours of the monument, are supposed to be practicable without the chance of injury to the original work. This interesting relic of our great dramatic bard is represented beneath.

In the year 1741 a monument was erected in Westminister Abbey, by the direction of the earl of Burlington, Dr. Mead, Mr. Pope, and Mr. Martyn. It was the work of Scheemaker, who received 300*l.* for it, after a design of Kent, and was opened in January of that year. The performers of each of the London theatres gave a benefit to defray the expenses, and the dean and chapter of Westminister took nothing for the ground. The money received by the performers at Drury Lane theatre amounted to above 200*l.*, but the receipts at Covent Garden did not exceed 100*l.*

There have been several festivals to commemorate the fame of this extraordinary poet. Our

space will not, however, admit of our describing more than one. It occurred in 1769, and is emphatically called the Grand Jubilee. "On the 6th of September, about six o'clock in the morning, the fete opened at Stratford by a triple discharge of seventeen pieces of cannon, and twelve small mortars, planted on the banks of the Avon. At eight o'clock the apartments of Mr. Garrick and Lord Spencer were serenaded by several of the Drury Lane performers, disguised in mean apparel, and with besmeared faces. These performers afterwards chanted ballads through the streets, accompanying their singing with guitars and German flutes. A little after eight Mr. Garrick went to the Town-Hall, where he was joined by the mayor and corporation, who presented him with a complimentary address, and a medallion of Shakspeare, carved on a piece of the poet's famous mulberry-tree, and richly set in gold. Then began the breakfasting, during which the company were entertained with martial music. About eleven Dr. Arne's oratorio of *Judith* was performed at the church; at the conclusion of which the company retired to the grand booth to dinner, which was served with the utmost order to more than 1000 persons. This evening concluded with a ball. On Thursday morning, the 7th, a public breakfast was given similar to that of the previous day; after which the company repaired from the Town-Hall to the amphitheatre, where the dedication-ode was performed under the direction of Dr. Arne. The recitative parts were spoken by Garrick, and it was thought that in all the characters he ever played he never evinced more power or judgment, or made a stronger impression on the minds of his audience. At the conclusion of the ode Mr. King got up in the character of a Macaroni, wholly unlooked for by the auditors, and with great apparent earnestness attacked Shakspeare, whom he censured as a very ill-bred fellow, for making people laugh or cry as he thought proper. Mr. King acted admirably, and occasioned much mirth. It was intended to make a procession to the amphitheatre of all the characters in Shakspeare's plays, but the weather being unfavourable, it was postponed to the next day, as were also the grand fireworks prepared by Mr. Angelo. During the performance the prodigious pressure of the company occasioned some of the benches to give way, but fortunately no serious injury ensued."

The Shakspearean who visits Stratford for the first time treads enchanted ground. The last 200 years seem annihilated, and between the realities which he sees with his bodily eyes, and the realities which he beholds with the more subtle but not less vivid sight of the imagination, he gets fairly thrown back to the seventeenth century. Stratford, notwithstanding some alterations within the last few years, has still an Elizabethan air. The houses generally are small and irregularly built, and many are of great antiquity. There is one beautiful specimen in the High Street in admirable preservation, which was certainly an old house in Shakspeare's day.

The free-school is still standing in which he acquired his early education, and, in the absence of proof to the contrary, it is easy to believe that some of the rude furniture was there in his school-boy days. The house in Henley Street in which he was born, and the fine old church wherein his dust is treasured, are, however, the main objects of attraction. It is painful to know that the former has suf-

fered great alterations even since the year 1765, and so long as it remains private property we have no security against its total demolition. The portion which remains unaltered consists of four rooms only, including the chamber which is said to have been the place of the poet's birth. It is small and rudely built; but the most unimaginative visitor reverentially uncovers his head as he enters. The walls are whitewashed, and literally written all over with the names of visitors. Of late years a book has been kept for these inscriptions, and they already occupy several volumes.

The birthplace of Shakspeare has long been a "place of pilgrimage" for those who have been into its neighbourhood; but of those who have left the most lasting mementos of their admiration, living certainly stands prominent. In describing his visit he says, "From the birthplace of Shakspeare a few paces brought me to his grave. He lies buried in the chancel of the parish church, a large and venerable pile, mouldering with age, but richly ornamented. It stands on the banks of the Avon, at an embowered point, and separated by adjoining gardens from the suburbs of the town. Its situation is quiet and retired: the river runs murmuring at the foot of the churchyard, and the elms which grow upon its banks droop their branches into its bosom. An avenue of limes, the boughs of which are curiously interlaced, so as to form in summer an arched way of foliage, leads up from the gate of the yard to the church porch. The graves are overgrown with grass; the grey tomb-stones, some of them nearly sunk into the earth, are half covered with moss, which has likewise tinted the old reverend building. Small birds have built their nests among the cornices and fissures of the walls, and keep up a continual flutter and chirping; and rooks are cawing and cawing about its lofty grey spire."

"We approached the church through the screen of limes, and entered by a Gothic porch, highly ornamented, with carved doors of massive oak. The interior is spacious, and the architecture and embellishments superior to those of most country churches. There are several ancient monuments of nobles and gentry, over some of which hang funeral effigies, and banners dropping piecemeal from the walls. The tomb of Shakspeare is in the chancel. The place is solemn and sepulchral. Tall elms stand before the pointed windows, and the Avon, which runs at a short distance from the walls, keeps up a low perpetual murmur. A flat stone marks the spot where the bard is buried. There are four lines inscribed on it, said to have been written by himself, and which have in them something extremely affecting. If they are indeed his own, they show that solicitude about the quiet grave which seems natural to all sensibilities and thoughtful minds:—

'Good friend for Jesus' sake, forbear  
To dig the dust enclosed here.  
Blessed be he that spares these stones,  
And cursed be he that moves my bones.'

"Just over the grave, in a niche of the wall, is a bust of Shakspeare, put up shortly after his death, and considered as a resemblance. The aspect is pleasant and serene, with a finely arched forehead, and I thought I could read in it clear indications of that cheerful, social disposition by which he was so much characterized among his contemporaries as of the vastness of his genius. The inscription memorial

his age at the time of his decease—fifty-three years; an untimely death for the world: for what fruit might not have been expected from the golden autumn of such a mind, sheltered as it was from the stormy vicissitudes of life, and flourishing in the sunshine of popular and royal favour? The inscription on the tomb-stone has not been without its effect. It has prevented the removal of his remains from the bosom of his native place to Westminster Abbey, which was at one time contemplated. A few years since also, as some labourers were digging to make an adjoining vault, the earth caved in so as to leave a vacant space almost like an arch, through which one might have reached into his grave. No one, however, presumed to meddle with his remains, so awfully guarded by a malediction; and lest any of the idle or the curious, or any collector of relics, should be tempted to commit depredations, the old sexton kept watch over the place for two days, until the vault was finished and the aperture closed again. He told me that he had made bold to look in at the hole, but could see neither coffin nor bones; nothing but dust. It was something, I thought, to have seen the dust of Shakspeare.

"Next to his grave are those of his wife, his favourite daughter Mrs. Hall, and others of his family. On a tomb close by, also, is a full-length effigy of his old friend John Combe, of usurious memory; on whom he is said to have written a ludicrous epitaph. There are other monuments around, but the mind refuses to dwell on any thing that is not connected with Shakspeare. His idea pervades the place: the whole pile seems but as his mausoleum. The feelings, no longer checked and thwarted by doubt, here indulge in perfect confidence; other traces of him may be false or dubious, but here is palpable evidence and absolute certainty. As I trod the sounding pavement, there was something intense and thrilling in the idea, that, in very truth, the remains of Shakspeare were mouldering beneath my feet. It was a long time before I could prevail upon myself to leave the place; and as I passed through the churchyard I plucked a branch from one of the few trees, the only relic I have brought from Stratford. He who has sought renown about the world, and has reaped a full harvest of worldly favour, will find, after all, there is no love, no admiration, no applause, so sweet to the soul as that which springs up in his native place. It is there that he seeks to be gathered in peace and honour among his kindred and his early friends. And when the weary heart and failing head begin to warn him that the evening of life is drawing on, he turns, as fondly as does the infant to the mother's arms, to sink to sleep in the bosom of the scene of his childhood. How would it have cheered the spirit of the youthful bard, when, wandering forth in disgrace upon a doubtful world, he cast back a heavy look upon his paternal home, could he have foreseen that, before many years, he should return to it covered with renown; that his name should become the boast and glory of his native place; that his ashes should be religiously guarded as its most precious treasure; and that its lessening spire, on which his eyes were fixed in tearful contemplation, should one day become the beacon, towering amidst the gentle landscape, to guide the literary pilgrim of every nation to his tomb!"

We have hitherto abstained from any critical notice of the works of our great dramatist, and now

purpose furnishing the substance of Dr. Johnson's view of his literary merits. Shakspeare is, above all writers, the poet of nature; the poet that holds up to his readers a faithful mirror of manners and of life. His characters are not modified by the customs of particular places, unpractised by the rest of the world; by the peculiarities of studies or professions which can operate but upon small numbers; or by the accidents of transient fashions or temporary opinions; they are the genuine progeny of common humanity, such as the world will always supply, and observation will always find. His persons act and speak by the influence of those general passions and principles by which all minds are agitated, and the whole system of life is continued in motion. In the writings of other poets a character is too often an individual; in those of Shakspeare it is commonly a species. It is from this wide extension of design that so much instruction is derived. It is this which fills the plays of Shakspeare with practical axioms and domestic wisdom. It was said of Euripides, that every verse was a precept; and it may be said of Shakspeare, that from his works may be collected a system of civil and economical prudence. Yet his real power is not shown in the splendour of particular passages, but by the progress of his fable, and the tenor of his dialogue; and he that tries to recommend him by select quotations will succeed like the pedant in Hierocles, who, when he offered his house for sale, carried a brick in his pocket as a specimen.

It will not easily be imagined how much Shakspeare excels in accommodating his sentiments to real life, but by comparing him with other authors. It was observed of the ancient schools of declamation, that the more diligently they were frequented, the more was the student disqualified for the world, because he found nothing there which he should ever meet in any other place. The same remark may be applied to every stage but that of Shakspeare. The theatre, when it is under any other direction, is peopled by such characters as were never seen, conversing in a language which was never heard, upon topics which will never arise in the commerce of mankind. But the dialogue of this author is often so evidently determined by the incident which produces it, and is pursued with so much ease and simplicity, that it seems scarcely to claim the merit of fiction, but to have been gleaned by diligent selection out of common conversation and common occurrences.

Upon every other stage the universal agent is love, by whose power all good and evil is distributed, and every action quickened or retarded. To bring a lover, a lady, and a rival into the fable; to entangle them in contradictory obligations, perplex them with oppositions of interest, and harass them with violence of desires inconsistent with each other; to make them meet in rapture, and part in agony; to fill their mouths with hyperbolical joy and outrageous sorrow; to distress them as nothing human ever was distressed; to deliver them as nothing human ever was delivered, is the business of a modern dramatist. For this, probability is violated, life is misrepresented, and language is depraved. But love is only one of many passions, and as it has no great influence upon the sum of life, it has little operation in the dramas of a poet, who caught his ideas from the living world, and exhibited only what he saw before him. He knew that any other passion, as it was regular or exorbitant, was a cause of happiness or calamity. Characters

thus ample and general were not easily discriminated and preserved, yet perhaps no poet ever kept his personages more distinct from each other. We will not say with Pope, that every speech may be assigned to the proper speaker, because many speeches there are which have nothing characteristic; but, perhaps, though some may be equally adapted to every person, it will be difficult to find any that can be properly transferred from the present possessor to another claimant. The choice is right, when there is reason for choice. Other dramatists can only gain attention by hyperbolic or aggravated characters, by fabulous and unexampled excellence or depravity, as the writers of barbarous romances invigorated the reader by a giant and a dwarf; and he that should form his expectations of human affairs from the play, or from the tale, would be equally deceived. Shakspeare has no heroes; his scenes are occupied only by men, who act and speak as the reader thinks that he should himself have spoken or acted on the same occasion: even where the agency is supernatural, the dialogue is level with life. Other writers disguise the most natural passions and most frequent incidents; so that he who contemplates them in the book will not know them in the world: Shakspeare approximates the remote, and familiarizes the wonderful; the event which he represents will not happen, but if it were possible, its effects would probably be such as he has assigned; and it may be said, that he has not only shown human nature as it acts in real exigencies, but as it would be found in trials to which it cannot be exposed. This therefore is the praise of Shakspeare, that his drama is the mirror of life; that he who has mazed his imagination, in following the phantoms which other writers raise up before him, may here be cured of his delirious ecstasies, by reading human sentiments in human language; by scenes from which a hermit may estimate the transactions of the world, and a confessor predict the progress of the passions.

His adherence to general nature has exposed him to the censure of critics, who form their judgments upon narrow principles. Dennis and Rymer think his Romans not sufficiently Roman; and Voltaire censures his kings as not completely royal. Dennis is offended that Menenius, a senator of Rome, should play the buffoon; and Voltaire perhaps thinks decency violated when the Danish usurper is represented as a drunkard. But Shakspeare always makes nature predominate over accidents; and if he preserves the essential character, is not very careful of distinctions superinduced and adventitious. His story requires Romans or kings, but he thinks only on men. He knew that Rome, like every other city, had men of all dispositions; and wanting a buffoon, he went into the senate-house for that which the senate-house would certainly have afforded him. He was inclined to show an usurper and a murderer not only odious, but despicable; he therefore added drunkenness to his other qualities, knowing that kings love wine like other men, and that wine exerts its natural power upon kings. These are the petty cavils of petty minds; a poet overlooks the casual distinction of country and condition, as a painter, satisfied with the figure, neglects the drapery. The censure which he has incurred by mixing comic and tragic scenes, as it extends to all his works, deserves more consideration. Let the facts be first stated, and then examined.

Shakspeare's plays are not, in the rigorous critical sense, either tragedies or comedies, or compositions of a distinct kind; exhibiting the state of sublunary nature, which partakes of good and evil, joy and sorrow, mingled with endless variety of proportion and innumerable modes of combination; and expressing the course of the world, in which the loss of one is the gain of another; in which, at the same time, the reveller is hasting to his wife, and the mourner burying his friend; in which the malignity of one is sometimes defeated by the frailty of another; and many mischiefs and many benefits are done and hindered without design. Out of this chaos of mingled purposes and casualties, the ancient poets, according to the laws which custom had prescribed, selected some the crimes of men, and wrote their absurdities; some the momentous vicissitudes of life, and some the lighter occurrences; some the terrors of distress, and some the gaieties of prosperity. Thus rose the two modes of imitation known by the names of tragedy and comedy, compounded intended to promote different ends by contrary means, and considered as so little allied, that we do not collect among the Greeks or Romans a single writer who attempted both.

Shakspeare has united the powers of exultation, laughter and sorrow not only in one mind, but in one composition. Almost all his plays are divided between serious and ludicrous characters, and, in the successive evolutions of the design, sometimes produce seriousness and sorrow, and sometimes levity and laughter. That this is a practice contrary to the rules of criticism will be readily allowed; but there is always an appeal open from criticism to nature. The end of writing is to instruct; the end of poetry is to instruct by pleasing. That the mingled drama can convey all the instruction of tragedy or comedy cannot be denied, because it includes both in its attractions of exhibition, and approaches nearer than either to the appearance of life, by showing how great combinations and slender designs may promote or alleviate one another, and the high and the low co-operate in the general system by unavoidable connection.

It is objected, that by this change of scenes the passions are interrupted in their progression, and that the principal event, being not advanced by a gradation of preparatory incidents, wants at last the power to move, which constitutes the perfection of dramatic poetry. This reasoning is so specious that it is received as true even by those who in daily experience feel it to be false. The interchanges of mingled scenes seldom fail to produce the intended vicissitudes of passion. Fiction cannot move so much, but that the attention may be easily transferred, although it must be allowed that pleasing melancholy may be sometimes interrupted by unwelcome levity. Let it be considered likewise, that melancholy is not pleasing, and that the disturbance of one may be the relief of another; that different passions have different habitudes; and that, upon the whole, all pleasure consists in variety. The players, whose edition divided our author's works into comedies, histories, and tragedies, seem not to have distinguished the three kinds by any very exact or finite ideas. An action which ended happily in the principal persons, however serious or distressing through its intermediate incidents, in their opinion constituted a comedy. This idea of a comedy can-

continued long amongst us; and plays were written, which, by changing the catastrophe, were tragedies to-day, and comedies to-morrow. Tragedy was not in those times a poem of more general dignity or elevation than comedy; it required only a calamitous conclusion, with which the common criticism of that age was satisfied, whatever lighter pleasure it afforded in its progress. History was a series of actions, with no other than chronological succession, independent on each other, and without any tendency to introduce or regulate the conclusion. It is not always very nicely distinguished from tragedy. There is not much nearer approach to unity of action in the tragedy of "Antony and Cleopatra" than in the history of "Richard the Second." But a history might be continued through many plays; as it had no plan, it had no limits.

Through all these denominations of the drama, Shakspeare's mode of composition is the same; an interchange of seriousness and merriment, by which the mind is softened at one time and exhilarated at another. But whatever be his purpose, whether to gladden or depress, or to conduct the story, without vehemence or emotion, through tracts of easy and familiar dialogue, he never fails to attain his purpose; as he commands us, we laugh or mourn, or sit silent with quiet expectation, in tranquillity without indifference. When Shakspeare's plan is understood, most of the criticisms of Rymer and Voltaire vanish away. The play of "Hamlet" is opened, without impropriety, by two sentinels; and, in "Othello," Iago shouts at Brabantio's window without injury to the scheme of the play, though in terms which a modern audience would not easily endure; the character of Polonius is reasonable and useful; and the grave-diggers themselves may be heard with applause.

Shakspeare engaged in dramatic poetry with the world open before him; the rules of the ancients were yet known to few; the public judgment was unformed; he had no example of such fame as might force him upon imitation, nor critics of such authority as might restrain his extravagance: he therefore indulged his natural disposition, and his disposition, as Rymer has remarked, led him to comedy. In tragedy he often writes with great appearance of toil and study, what is written at last with little felicity; but in his comic scenes he seems to produce, without labour, what no labour can improve. In tragedy he is always struggling after some occasion to be comic, but in comedy he seems to repose, or to luxuriate, as in a mode of thinking congenial to his nature. In his tragic scenes there is always something wanting, but his comic scenes often surpass expectation. His comedy pleases by the thoughts and the language, and his tragedy for the greater part by incident and action. His tragedy seems to be skill, his comedy to be instinct. The force of his comic scenes has suffered little diminution from the changes made by a century and a half, in manners or in words. As his personages act upon principles arising from genuine passion, very little modified by particular forms, their pleasures and vexations are communicable to all times and to all places; they are natural, and therefore durable; the adventitious peculiarities of personal habits are only superficial dyes, bright and pleasing for a little while, yet soon fading to a dim tint, without any remains of former lustre; but the discriminations of true passion are the colours of nature; they pervade the whole mass, and can only

perish with the body that exhibits them. The accidental compositions of heterogeneous modes are dissolved by the chance which combined them; but the uniform simplicity of primitive qualities neither admits increase nor suffers decay. The sand heaped by one flood is scattered by another, but the rock always continues in its place. The stream of time, which is continually washing the dissoluble fabrics of other poets, passes without injury by the adamant of Shakspeare. If there be in every nation a style which never becomes obsolete, a certain mode of phraseology so consonant and congenial to the analogy and principles of its respective language as to remain settled and unaltered; this style is probably to be sought in the common intercourse of life, among those who speak only to be understood, without ambition of elegance. The polite are always catching modish innovations, and the learned depart from established forms of speech in hope of finding or making better; those who wish for distinction forsake the vulgar, when the vulgar is right; but there is a conversation above grossness and below refinement, where propriety resides, and where this poet seems to have gathered his comic dialogue. He is, therefore, more agreeable to the ears of the present age than any other author equally remote, and among his other excellencies deserves to be studied as one of the original masters of our language.

These observations are to be considered not as unexceptionably constant, but as containing general and predominant truth. Shakspeare's familiar dialogue is affirmed to be smooth and clear, yet not wholly without ruggedness or difficulty; as a country may be eminently fruitful, though it has spots unfit for cultivation: his characters are praised as natural, though their sentiments are sometimes forced, and their actions improbable; as the earth upon the whole is spherical, though its surface is varied with protuberances and cavities.

Shakspeare with his excellencies has likewise faults, and faults sufficient to obscure and overwhelm any other merit. His first defect is that to which may be imputed most of the evil in books or in men. He sacrifices virtue to convenience, and is so much more careful to please than to instruct, that he seems to write without any moral purpose. From his writings indeed a system of social duty may be selected, for he that thinks reasonably must think morally, but his precepts and axioms drop casually from him; he makes no just distribution of good or evil, nor is always careful to show in the virtuous a disapprobation of the wicked; he carries his persons indifferently through right and wrong, and at the close dismisses them without further care, and leaves their examples to operate by chance. This fault the barbarity of his age cannot extenuate; for it is always a writer's duty to make the world better, and justice is a virtue independent on time or place. The plots are often so loosely formed that a very slight consideration may improve them, and so carelessly pursued that he seems not always fully to comprehend his own design. He omits opportunities of instructing or delighting, which the train of his story seems to force upon him, and apparently rejects those exhibitions which would be more affecting, for the sake of those which are more easy. It may be observed, that in many of his plays the latter part is evidently neglected. When he found himself near the end of his work and in view of his reward, he shortened the

labour to snatch the profit. He therefore remits his efforts where he should most vigorously exert them, and his catastrophe is improbably produced or imperfectly represented. He had no regard to distinction of time or place, but gives to one age or nation, without scruple, the customs, institutions, and opinions of another, at the expense not only of likelihood, but of possibility. These faults Pope has endeavoured, with more zeal than judgment, to transfer to his imagined interpolators. We need not wonder to find Hector quoting Aristotle, when we see the loves of Theseus and Hippolyta combined with the Gothic mythology of fairies. Shakspeare, indeed, was not the only violator of chronology, for in the same age Sidney, who wanted not the advantages of learning, has, in his "Arcadia," confounded the pastoral with the feudal times; the days of innocence, quiet, and security, with those of turbulence, violence, and adventure. In his comic scenes he is seldom very successful when he engages his characters in reciprocations of smartness, and contests of sarcasm; their jests are commonly gross, and their pleasantry licentious; neither his gentlemen nor his ladies have much delicacy, nor are sufficiently distinguished from his clowns by any appearance of refined manners. Whether he represented the real conversation of his time is not easy to determine; the reign of Elizabeth is commonly supposed to have been a time of stateliness, formality, and reserve; yet perhaps the relaxations of that severity were not very elegant. There must, however, have been always some modes of gaiety preferable to others, and a writer ought to choose the best. In tragedy his performance seems constantly to be worse, as his labour is more. The effusions of passion which exigence forces out, are for the most part striking and energetic; but whenever he solicits his invention, or strains his faculties, the offspring of his throes is tumour, meanness, tediousness, and obscurity. In narration he affects a disproportionate pomp of diction, and a wearisome train of circumlocution, and tells the incident imperfectly in many words, which might have been more plainly delivered in few. Narration in dramatic poetry is naturally tedious, as it is unanimated and inactive, and obstructs the progress of the action; it should, therefore, always be rapid, and enlivened by frequent interruption. Shakspeare found it an encumbrance, and, instead of lightening it by brevity, endeavoured to recommend it by dignity and splendour.

His declamations or set speeches are commonly cold and weak, for his power was the power of nature; when he endeavoured, like other tragic writers, to catch opportunities of amplification, and, instead of inquiring what the occasion demanded, to show how much his stores of knowledge could supply, he seldom escapes without the pity or resentment of his reader. It is incident to him to be now and then entangled with an unwieldy sentiment which he cannot well express, and will not reject; he struggles with it a while, and if it continues stubborn, comprises it in words such as occur, and leaves it to be disentangled and evolved by those who have more leisure to bestow upon it. Not that always where the language is intricate the thought is subtle, or the image always great where the line is bulky; the equality of words to things is very often neglected, and trivial sentiments and vulgar ideas disappoint the attention to which they are recommended by sonorous epithets and swelling figures.

But the admirers of this great poet have most reason to complain when he approaches nearest to his highest excellence, and seems fully resolved to strike them in dejection, and mollify them with tender emotions by the fall of greatness, the danger of innocence, or the crosses of love. What he does best he soon ceases to do. He is not long soft and pathetic without some idle conceit or contemptible equivocation. He no sooner begins to move than he counteracts himself; and terror and pity, as they are near in the mind, are checked and blasted by sudden frigidity. A quibble is to Shakspeare what luminous vapours are to the traveller; he follows it at all adventures; it is sure to lead him out of his way, and sure to engulf him in the mire. It has some malignant power over his mind, and its fascinations are irresistible. Whatever be the dignity or profundity of his disposition, whether he be enlarging knowledge or exalting affection; whether he be amusing attention with incidents, or enchanting it in suspense, but a quibble spring up before him and he leaves his work unfinished. A quibble is the golden apple for which he will always turn aside from his career, or stoop from his elevation. A quibble, poor and barren as it is, gave him such delight that he was content to purchase it by the sacrifice of reason, propriety, and truth. A quibble was to him, indeed, the fatal *Claypatra* for which he lost the world.

His histories, being neither tragedies nor comedies, are not subject to any of their laws; nothing more necessary to all the praise which they expect, than that the changes of action be so prepared as to be understood, that the incidents be various and striking, and the characters consistent, natural, and distinct. No other unity is intended, and therefore none is to be sought. In his other works he has well enough preserved the unity of action. He has not, indeed, an intrigue regularly perplexed and regularly unravelled; he does not endeavour to hide his design only to discover it, for this is seldom the order of real events; and Shakspeare is the poet of nature, but his plan has commonly what Aristotle requires—a beginning, a middle, and an end; one event is concatenated with another, and the conclusion follows by easy consequences. There are perhaps some accidents that might be spared, as in other poets there is much talk that only fills up time upon the stage, but the general system makes gradual advances, and the end of the play is the end of expectation. In the unities of time and place he has shown no regard, and perhaps a nearer view of the principles on which they stand will diminish their value, and withdraw from them the veneration which, from the time of Corneille, they have very generally received, by discovering that they have given more trouble to the poet than pleasure to the auditor.

The necessity of observing the unities of time and place arises from the supposed necessity of making the drama credible. The critics hold it impossible that an action of months or years can be possibly believed to pass in three hours; or that the spectator can suppose himself to sit in the theatre, while ambassadors go and return between distant kings, while armies are levied and towns besieged, while an hero wanders and returns, or till he whom they see courting his mistress, shall lament the untimely death of his son. The mind revolts from evident falsehood, and fiction loses its force when it departs from the resemblance of reality.

From the narrow limitation of time necessarily arises the contraction of place. The spectator, who knows that he saw the first act at Alexandria, cannot suppose that he sees the next at Rome, at a distance to which the dragons of Medea could, in so short a time, have transported him; he knows with certainty that he has not changed his place, and he knows that place cannot change itself; that what was a house cannot become a plain; that what was Thebes can never be Persepolis. Such is the triumphant language with which a critic exults over the misery of an irregular poet, and exults commonly without resistance or reply. It is time therefore to tell him, by the authority of Shakspeare, that he assumes, as an unquestionable principle, a position which, while his breath is forming it into words, his understanding pronounces to be false. It is false that any representation is mistaken for reality; that any dramatic fable in its materiality was ever credible, or, for a single moment, was ever credited. The objection arising from the impossibility of passing the first hour at Alexandria, and the next at Rome, supposes, that when the play opens the spectator really imagines himself at Alexandria, and believes that his walk to the theatre has been a voyage to Egypt, and that he lives in the days of Antony and Cleopatra. Surely he that imagines this may imagine more. He that can take the stage at one time for the palace of the Ptolemies, may take it in half an hour for the promontory of Actium. Delusion, if delusion be admitted, has no certain limitation; if the spectator can be once persuaded that his old acquaintance are Alexander and Cæsar, that a room illuminated with candles is the plain of Pharsalia or the bank of Granicus, he is in a state of elevation above the reach of reason or of truth, and from the heights of empyrean poetry may despise the circumscriptions of terrestrial nature. There is no reason why a mind thus wandering in ecstasy should count the clock, or why an hour should not be a century in that calenture of the brain that can make the stage a field. The truth is, that the spectators are always in their senses, and know, from the first act to the last, that the stage is only a stage, and that the players are only players. They come to hear a certain number of lines recited with just gesture and elegant modulation. The lines relate to some action, and an action must be in some place; but the different actions that complete a story may be in places very remote from each other; and where is the absurdity of allowing that space to represent first Athens, and then Sicily, which was always known to be neither Sicily nor Athens, but a modern theatre?

By supposition, as place is introduced, time may be extended; the time required by the fable elapses for the most part between the acts; for, of so much of the action as is represented, the real and poetical duration is the same. If, in the first act, preparations for war against Mithridates are represented to be made in Rome, the event of the war may, without absurdity, be represented, in the catastrophe, as happening in Pontus; we know that there is neither war nor preparation for war; we know that we are neither in Rome nor Pontus; that neither Mithridates nor Lucullus are before us. The drama exhibits successive imitations of successive actions, and why may not the second imitation represent an action that happened years after the first, if it be so connected with it that nothing but time can be supposed to intervene? Time is, of all modes of existence, most obsequious

to the imagination; a lapse of years is as easily conceived as a passage of hours. In contemplation we easily contract the time of real actions, and therefore willingly permit it to be contracted when we only see their imitation.

Voltaire expresses his wonder that our author's extravagancies are endured by a nation which has seen the tragedy of "Cato." Let him be answered, that Addison speaks the language of poets, and Shakspeare of men. We find in "Cato" innumerable beauties which enamour us of its author, but we see nothing that acquaints us with human sentiments or human actions; we place it with the fairest and the noblest progeny which judgment propagates by conjunction with learning; but "Othello" is the vigorous and vivacious offspring of observation impregnated by genius. "Cato" affords a splendid exhibition of artificial and fictitious manners, and delivers just and noble sentiments, in diction easy, elevated, and harmonious, but its hopes and fears communicate no vibration to the heart; the composition refers us only to the writer; we pronounce the name of Cato, but we think on Addison.

The work of a correct and regular writer is a garden accurately formed and diligently planted, varied with shades, and scented with flowers; the composition of Shakspeare is a forest, in which oaks extend their branches, and pines tower in the air, interspersed sometimes with weeds and brambles, and sometimes giving shelter to myrtles and to roses; filling the eye with awful pomp, and gratifying the mind with endless diversity. Other poets display cabinets of precious rarities, minutely finished, wrought into shape, and polished into brightness. Shakspeare opens a mine which contains gold and diamonds in inexhaustible plenty, though clouded by incrustations, debased by impurities, and mingled with a mass of meaner minerals.

The sonnets of Shakspeare have been justly admired by every person capable of appreciating their exquisite pathos and delicacy of feeling, and we cannot do better than close the present article by selecting two of his sonnets, the first devoted to truth, and the last to love, both of which are unrivalled in their character.

## TRUTH.

"O how much more doth beauty beauteous seem  
By that sweet ornament which truth doth give!  
The rose looks fair, but fairer we it deem,  
For that sweet odour which doth in it live.  
The canker blooms have full as deep a dye  
As the perfumed tincture of the roses,  
Hang on such thorns, and play as wantonly  
When summer's breath their masked bud discloses:  
But, for their virtue only is their show,  
They live unwooded, and unrespected fade;  
Die to themselves. Sweet roses do not so:  
Of their sweet deaths are sweetest odours made:  
And so of you, beauteous and lovely youth,  
When that shall fade, my verse distils your truth."

## LOVE.

"Let me not to the marriage of true minds  
Admit impediments. Love is not love  
Which alters when it alteration finds,  
Or bends with the remover to remove;  
O no! it is an ever-fixed mark  
That looks on tempests and is never shaken;  
It is the star to every wandering bark,  
Whose worth's unknown, although his height be taken.  
Love's not Time's fool, though rosy lips and cheeks  
Within his bending sickle's compass come;  
Love alters not with his brief hours and weeks,  
But bears it out even to the edge of doom:  
If this be error, and upon me prov'd,  
I never writ, nor no man ever loved."

the morning of the 27th of November, 1781, one of the proudest in the annals of war; when the Spanish floating batteries were destroyed, and British magnanimity shared with British valour in the honours of the victory. From Titchfield Street he removed to Acton, keeping an apartment, which he occasionally occupied, in London Street, Fitzroy Square; and from Acton he removed to Chiswick, where he had not resided long before he was attacked by dropsy in the chest, which terminated his life at the age of seventy-four, on the morning of Sunday, the 25th of July.

**SHARP, JAMES.**—This celebrated prelate was a native of Banffshire, and born in 1618. He was early destined, by his family, for the ministry. With this view he was placed at the Marischal college in Aberdeen, but, objecting to take the "solemn league and covenant," quitted the university, and came to London. During the civil wars he returned to his native country, and obtained a professorship in the university of St. Andrew's. His eloquence and reputation caused him to be selected, by the moderate presbyterian party in Scotland, to advocate their cause with the protector, Cromwell, against the demands of the more rigid Calvinists; and he was subsequently sent to Breda, by Monk, for the purpose of procuring the sanction of Charles II. to the proposed settlement of the ecclesiastical affairs of Scotland. He returned to Scotland, and delivered to some of the ministers of Edinburgh a letter from the king, in which the latter promised to protect the government of the church of Scotland, "as it is settled by law." The clergy, understanding this declaration in its obvious sense, were satisfied; but it subsequently appeared that Sharp had in view to subvert the church government, which he affected to maintain, pleading to the friends of episcopacy that this letter would pledge the king to nothing, as the parliament had only to establish episcopacy to transfer the pledge of the monarch to its support. The presbytery being accordingly overturned by parliament, Sharp was rewarded with the primacy, and appointed archbishop of St. Andrew's. The wanton cruelties which followed, confirmed the horror entertained against him, and raised the fury of some of his more bigoted opponents to attempts against his life. In 1678 he narrowly escaped assassination from the hand of James Mitchell, an enthusiast, who was some time after taken and executed. A similar attempt, the following year, was more successful. His carriage in which he was travelling on Magnus Muir, about three miles from St. Andrew's, on the 3rd May, 1679, was met by some fanatics, headed by John Balfour of Burley, who were waiting there to intercept a servant of the archbishop's, named Carmichael. To tempers thus heated by fanaticism, the appearance of the archbishop himself was deemed a sign of the intention of Providence to substitute a more important victim; and, regardless of the tears and entreaties of his daughter, they dragged him from his carriage, and despatched him with their swords, with which they inflicted no less than twenty-two wounds.

**SHARP, GRANVILLE,** was born at Durham, in November 1735. Early in life he left his native city, where his education had been but superficial, and, having repaired to London, was bound apprentice to a linen-draper of the name of Halsey, a quaker, residing on Great Tower Hill. On the death of his

master he was "turned over to a presbyterian, or rather, as he was more properly called, an independent;" he afterwards lived "with an Irish papist;" and also with "another person, who had no religion at all." In consequence of his controversies with a Socinian, Granville, about this period, betook himself to the study of the Greek tongue; while he learned Hebrew for the express purpose of being able to dispute with a learned Jew. In 1758 he obtained a subordinate appointment in the ordnance-office; and in 1765 engaged in a literary controversy with Dr. Kennicott, the learned publisher of the Hebrew Bible. Nearly at the same time "his attention was directed by chance to the sufferings of a race of men who had long been the sport and victims of European avarice. In the first moments of his action he had no other object in view than the relief of a miserable fellow-creature, struggling with disease and extreme indigence; but such was then, under heaven, the widely increasing spirit of social charity, that England was destined shortly to behold (and to be herself the scene of the extraordinary spectacle) a private and powerless individual standing forward, at the divine excitement of mercy, to rescue those whom the force of disgraceful custom injuriously bound in chains;—to see him, when opposed in his benevolent efforts, arm himself by the study of our laws, to assert the unalterable course of justice, and for that end prepare to resist the formidable decisions of men who had filled the highest stations in our courts of judicature; maintaining his ground against them with unanswerable arguments, and finally overthrowing the influence of authoritative, but unjust opinions;—an event not more glorious to the individual himself than to our country's constitution, of which it demonstrated the mild and liberal spirit, friendly to every consideration that can be suggested for the benefit of mankind." Jonathan Strong, an African, originally a slave to Mr. David Lisle, a lawyer of Barbadoes, was brought to England by his master, who, after treating him with great brutality, and reducing the poor wretch to a state that rendered him useless, actually turned him adrift in the street. By the united care of Mr. Granville Sharp and his brother William, the negro was restored to health, and placed in service; but on being seen in his improved condition, by his *quondam* master, he was seized, and carried to the Poultry Compter, whence he was rescued by the subject of this memoir, and finally obtained his liberty, notwithstanding a challenge had been delivered and a law-suit commenced.

Perceiving that on this occasion the current of legal opinion ran strongly against him, and that even his own professional advisers doubted the justice of his arguments, Mr. Sharp devoted himself, for nearly two years, to the study of the laws, so far, at least, as concerned the liberty of person in British subjects. This gave rise to a tract "On the Injustice of Tolerating Slavery in England," in which he combated the opinions of a York and a Talbot, by the authority of Lord Chief Justice Holt, who maintains a contrary doctrine. His success was complete. Meanwhile his uncle, the Rev. Granville Wheler, strongly and repeatedly pressed his nephew to enter into holy orders; and at the same time offered to resign a living of 300*l.* per annum in his favour: but this was repeatedly, yet respectfully declined.

His next exploit, which occurred in 1768, was to

bring an action, and rescue from slavery in Barbadoes, a female slave of the name of Hylas, who had been kidnapped, taken from her husband, and sent thither. Notwithstanding this decision, "a black girl, the property of J. B., eleven years of age, who is extremely handy, &c.," was actually advertised for sale, in one of the London newspapers, during the course of the very next year! At no great distance of time, a third case of enormous oppression came under the notice of Mr. Sharp, who, at the request and at the expense of Mrs. Banks, mother to the late Sir Joseph, released Thomas Lewis, an African, who had been forcibly carried on board a ship in the Downs, to be transported to Jamaica, by means of a writ of habeas corpus. An action was brought by the pretended owner, but a jury, by an unanimous verdict, declared "that he possessed no property in him."

About this period it became evident that, although several verdicts had been actually obtained in favour of African slaves, their general right to freedom in England was still an unsettled question, wholly dependent on the fluctuations of opinion, and not as yet solemnly recognised by the laws. At length the case of James Somerset occurred, who had been brought over from Jamaica by Mr. Charles Stewart, and on leaving his service was seized unawares, and shipped for that island. On this occasion Mr. Sharp received the most generous offer of professional assistance on the part of Mr. Hargrave, who distinguished himself greatly by his very judicious, apposite, and learned arguments against the legal existence of slavery in England. On February 7th, 1772, this cause was brought on before the lord chief justice Mansfield, assisted by the justices Ashton, Willes, and Ashhurst; and after two adjournments, and the hearing of five counsel, the serjeants Davy and Glynn, with Messrs. Mansfield, Hargrave, and Alleyne, all of whom appear to have most generously declined fees on this occasion, the negro was discharged, on the principle,—“That as soon as any slave sets his foot on English ground, he becomes free.”

The noble conduct pursued by the subject of our memoir produced a lasting friendship on the part of Dr. Fothergill, a most amiable and humane physician, who resided in London. It also occasioned a correspondence with Anthony Bereget, who was labouring to extirpate slavery in North America; and, indeed, to the honour of the quakers, they have since released all the bondmen in their service from captivity, and retained them in the character of hired servants. In 1772 we find Mr. G. Sharp interesting himself in behalf of the Caribbs in the island of St. Vincent's, whose chief crime, it is here hinted, consisted in having better lands than their white neighbours. On the unhappy dispute taking place between the parent country and her colonies, he declared, in a letter to Governor Franklin, that in his opinion "the British parliament had no right to make any laws whatever, binding on the colonies; and that the king (not the king, lords, and commons, collectively) is their sovereign; and that the king, with their respective parliament, is their only legislator." Nor did he stop here; for so conscientious was he, that on hearing of the first battle in America, and finding that a large demand had been made on his office for ordnance stores, he resigned his situation at the board, the salary of which had been lately

augmented, although nearly the whole of his patrimony had been expended in acts of beneficence.

Time was now found for various literary publications; the principal of these were, a little work entitled "A Short Introduction to Vocal Music;" "Remarks concerning the Encroachments on the River Thames, near Durham Yard;" a tract against duelling; "A Declaration of the People's Natural Right to share in the legislature;" and a "Plan for the Gradual Abolition of Slavery in the Colonies." Nor had his unwearied performance of duties of every kind precluded an attention to his favourite pursuits of science and taste, or the exercise of those talents which enabled him to prosecute them. The cultivation of musical learning was customary in Mr. Sharp's family. He himself loved the theory and enjoyed the practice of music as adapted to professional purposes. He was not, nor did he aim at being, a tasteful performer; and the most studied execution gave him little pleasure. Singing and playing were his favourite recreations; and he played on the common English flute, clarionet, hautboy, and double flute. He had constructed, if not invented, a harp with two rows of strings, called a traverse harp, in which he accompanied his own voice in singing. At the Sunday evening concerts, which were held alternately at the houses of his brothers, James and William, he beat the kettle-drums. Those concerts consisted wholly of performances of sacred music, in which voices and instruments were united to swell the praises of the Supreme Being. The family band was augmented by the gratuitous assistance of the most eminent professional performers.

In 1776 commenced Mr. Sharp's acquaintance with General Oglethorpe, the founder of the colony in Georgia, in consequence of the perusal of "the act of retribution." A friendship was now formed, which lasted through life, and extended to the widow of the latter, who bequeathed to him a manor in Essex. At the war with the colonies had now taken a new turn, seamen of all descriptions were frequently torn from their families, both on land and water. This excited the attention and aroused the indignation of our patriot, who exerted himself powerfully in behalf of "impressed citizens." In consequence of his influence and information, the corporation of London interposed in behalf of one of its freemen, and actually obtained his liberation, after an appeal to a court of king's bench. In 1783 it appears that 13 negroes "had been thrown alive into the sea, from on board an English slave-ship." This was done by the master, under pretext that he might be distressed for want of water; and he accordingly destroyed the most sickly of his cargo. On his return to England the owners of the ship claimed from the insurers the full value of those drowned slaves; but they denied the existence of the alleged necessity, and a court of justice; and this contest of pecuniary interest brought to light a scene of horrid brutality. It is painful to relate that Mr. Sharp failed to tempt to try Luke Collingwood, the commander of the ship, for murder. In 1786 he engaged with others, in a plan for settling a colony of negroes and people of colour at Sierra Leone. But partly from the disputes among the settlers, and partly from the badness of the climate, and, finally, in consequence of being twice plundered by the coast-guard, this did not prove a flourishing institution. Government, indeed, interposed, and a supply of money

granted; but the undertakers were obliged at length to relinquish their project, after a severe loss. This ill-fated colony was accordingly surrendered to the crown.

In 1787 a society was formed for the abolition of the slave-trade between the colonies of England and the coast of Africa. In his capacity of chairman, our worthy and venerable patriot had an interview with Mr. Pitt, who recurred to delays and promises, but effected nothing. The boon was reserved for the administration of Mr. Fox and Lord Grenville; and it is here observed of the former, that this great man expressed himself thus on his death-bed: "Two things I wish earnestly to see accomplished; peace with Europe, and the abolition of the slave-trade; but, of the two, I wish more the latter." On receiving intelligence that the abolition bill had passed both houses of parliament, Mr. Sharp is said to have immediately fallen on his knees, and piously poured forth his devotion and gratitude to his Creator.

In 1780 the first Bible society was instituted, for the express purpose of "opposing the rapid decay of piety and religion;" and, on this occasion, the subject of this memoir took an active and decided part. We next find him subscribing to the London society for promoting Christianity among the Jews; but he does not appear to have displayed any extraordinary degree of zeal on this occasion. It was far otherwise in respect to the African institution, of which he became a warm and efficient member. He considered that society as tending greatly to promote humanity and civilization among a people rendered barbarous by a vile and perfidious traffic in their fellow-creatures; and he devoted his pen, his time, and his fortune, to forward so laudable a purpose. He was accordingly chosen one of the directors, and contributed not a little, by his name and exertions, to ensure its prosperity. His conduct as chairman of the protestant union is not so likely, in the present age, to obtain general approbation. He opposed the system of popery, as subversive of the principles of genuine liberty; and, accordingly, took a lively interest in the discussion of the Roman catholic question, the object of which was to extend the rights and franchises of our fellow-subjects in Ireland.

At length, after a short illness, this pious and worthy man expired on the 6th July, 1813, in the seventy-eighth year of his age.

**SHARPE, GREGORY**, an oriental scholar, who was a native of Yorkshire. He entered holy orders, and obtained the appointment of preacher at a chapel in Westminster, and also became chaplain to the king. He devoted all his leisure to literature, and was the author of several able works: among them we may mention that "On the Origin of Languages, and the Powers of Letters," with an Hebrew lexicon. His death took place in 1771.

**SHAW, GEORGE**, a distinguished writer on natural history, who was for many years one of the librarians at the British museum, and also filled the office of assistant keeper of the cabinet of natural history. He published several valuable works, the principal of which are entitled, "General Zoology," "Zoological Lectures," and "The Zoology of New Holland." His death took place in 1813.

**SHAW, STEBBING**, a celebrated topographical writer, who was born in 1762, at Stone, in Staffordshire, in the neighbourhood of which town his mother inherited a small landed estate, which descended to

her only son. He received the rudiments of his education at the school of Repton, near Hartshorn, after which he in 1780 became a resident member of Queen's college, in Cambridge. At this period his first literary predilections were fixed on English poetry. But even this partiality yielded to his propensity for music, in which his performance on the violin occupied a large portion of his time, and he had already attained considerable excellence. In due time he took his degree of B. A., was elected to a fellowship, and went into orders. Not long afterwards, the intimacy which, for almost half a century, had subsisted between his father and his neighbour, Sir Robert Burdett, of Foremark, induced him to undertake the care of his son. With this pupil he made a tour to the Highlands of Scotland in the autumn of 1787, of which he kept a diary. This diary, originally composed merely for private amusement, he afterwards inconsiderately published, and thus, it must be confessed, made his first appearance as an author with some disadvantage. In the following year he made a tour to the west of England, of which he published an account. The book was well received, and though the style is not simple and easy, yet it discovered an attention to the history of families and property, to which his industrious researches were afterwards directed with considerable success. In 1789, about the time of the publication of his tour, he obtained admission to the reading-room of the British museum. His account of the vast stores of topographical and genealogical materials deposited there appeared in a periodical publication, entitled "The Topographer," which commenced in the spring of 1789, and was carried on for more than two years, during which many useful materials towards the topographical history of the kingdom were communicated. Amongst other researches Mr. Shaw spent part of the summer of 1790 in Sussex, and visited very many parishes, and collected a large store of church notes, of which only a small number was exhausted when the work closed. In these perambulations his own faithful and constantly exercised pencil enabled him to be doubly useful. In the summer of 1791 Mr. Shaw retired to his father's house at Hartshorn. Here, still amusing himself with topographical researches, he soon afterwards, during his frequent visits into Staffordshire, conceived the idea of undertaking the history of that county. The plan succeeded, for instead of confining himself merely to the dry investigations of antiquarian lore, he conciliated by an attention awake to every thing which the title of his work could comprehend. Natural history, agriculture, scenery, manufactories, and arts, all excited his curiosity, and flattered the various turns of those by whom the acquisition of his materials was facilitated. At length he discovered and obtained the MSS. written and collected by Dr. Wilkes for a similar undertaking, which had long been supposed to be lost. From the moment of this acquisition his success became certain, the expectation of the county rapidly increased, and he received countenance and assistance from every quarter. He had already made a great variety of drawings of mansions, churches, monuments, and antiquities. He now employed four years in augmenting and digesting his collections, and about 1796 began to print the first volume, which was laid before the public in August 1798, and answered, and indeed exceeded, the expectations it had raised. In 1801 he pub-

lished the first part of his second volume, which was in all respects equal to the former. He had now succeeded his father, who died at the close of 1799, in the living of Hartshorn, a village rendered remarkable as the birthplace of the celebrated Dean Stanhope, whose father enjoyed this preferment. Here he spent the summer, and found some relaxation from his severe studies in improving his house and garden. But his enjoyments were not uninterrupted. A bilious habit rendered him perpetually subject to slow fevers, and fatigue of exercise in a burning sun now brought on a more fierce attack. He recovered, however, and returned to London in the winter of 1801, and went on with his work. But it was soon perceived that his constitution had received an alarming shock. Early in the spring he found himself unfit for his usual occupations. A new attack of fever ensued, but from this too he was at length restored. All application to books was now prohibited, and in June or July it was deemed advisable for him to pay a visit to the Kentish coast, attended by his only relation, the daughter of his father by a second wife. They went first to Ramsgate, and thence removed to the more quiet seclusion of Sandgate, near Hythe. Here he passed the autumn, and was so well that he joined some friends in a few days' expedition to the opposite coast, and visited Boulogne. Towards the end of October 1802 his disorder suddenly returned with more violence than before. After a struggle of ten days it was deemed right to remove him to London for better advice, where he died on the 28th of that month.

SHAW, THOMAS, a celebrated English traveller, who was born at Kendal, in Westmoreland, about 1692. He received his education at the grammar school of that place, and was admitted of Queen's college, Oxford, in 1711, where he took the degree of B. A. in July 1716; after which he went into orders, and was appointed chaplain to the English factory at Algiers. During his absence he was chosen fellow of his college, and at his return took the degree of D.D. in 1741. He published the first edition of his *Travels at Oxford* in 1738, and bestowed on the university some natural curiosities, and some ancient coins and busts which he had collected in his travels. On the death of Dr. Felton in 1740, he was nominated by his college principal of St. Edmund Hall, which he raised from a ruinous condition by his munificence, and was presented at the same time to the vicarage of Bramley, in Hants. He was also regius professor of Greek at Oxford till his death, which took place in 1751.

SHEE, MARTIN ARCHER.—This celebrated portrait painter was a native of Ireland, and was as much distinguished as a poet, as by his talents as an artist. His works consist of "Elements of Art, a Poem;" "Rhymes on Art, or the Remonstrance of a Painter;" "A Letter to the President of the British Institution, on the Encouragement of Historical Painting;" and "The Commemoration of Reynolds, and other Poems." He died in 1830, having first attained high rank in the royal academy.

SHEFFIELD, JOHN BAKER HOLROYD, EARL OF.—This nobleman was the friend of Gibbon, and the editor of his works. After finishing his education he entered the army, and obtained the command of a troop of light horse, called the Royal Foresters, under the marquis of Granby, as early as 1760. The short duration of the war precluded all

opportunity of promotion; consequently Mr. Holroyd obtained no higher rank than that of captain. On the ratification of peace, three years afterwards, he passed over to the continent, and travelled through the principal states of Europe. It was during this absence from England that he commenced an acquaintance, at Lausanne, with the celebrated historian of the Roman empire, who thus alludes to it in the interesting autobiography prefixed to his "Miscellaneous Works." "In my second visit to Lausanne, which was in 1764, among the crowd of my English companions, I knew and esteemed Mr. Holroyd (now Lord Sheffield), and our mutual attachment was renewed and fortified in the subsequent stages of our Italian journey. Our lives are in the power of chance, and a slight variation on either side, in time or place, might have deprived me of a friend, whose activity, in the ardour of youth, was always promoted by a benevolent heart, and directed by a strong understanding."

In 1767, Captain Holroyd, having returned to his native country, united himself to Miss Abigail War, the only daughter of a gentleman of considerable opulence. His marriage with this lady, of whom Gibbon entertained a very exalted opinion, is thus jocosely alluded to in one of the historian's letters to his friend, dated Bereton, April 29, 1767:—"I happened to-night to stumble upon a very odd piece of intelligence in the 'St. James's Chronicle;' it related to the marriage of a certain Monsieur Olive (the name was so spelt in the newspapers), formerly captain of hussars. I do not know how it came into my head that this captain of hussars was not unknown to me, and that he might possibly be an acquaintance of yours. If I am not mistaken in my conjecture, pray give my compliments to him, and tell him from me, that I am at least as well pleased he is married as if I were so myself. Assure him, however, that though, as a philosopher, I may prefer celibacy, yet as a politician, I think it highly proper that the species should be propagated; assure him, even, that I am convinced that if celibacy be exposed to fewer miseries, marriage can alone promise real happiness, since domestic enjoyments are the source of every good. May such happiness as is bestowed on few, be given to him; the transient blessings of beauty, and the more durable ones of fortune and good sense, and an amiable disposition."

In 1780, Colonel Holroyd, having expressed an inclination to be returned to parliament, had the good fortune to be elected, without any opposition, for Coventry. He did not possess any property in that place, or its vicinity: his election was in all probability the consequence of a temporary residence there, and an occasional connexion with the inhabitants; that city having been for some time the headquarters of the Sussex regiment of light dragoons.

On December 10th, 1780, Colonel Holroyd experienced a signal mark of the royal favour. His majesty advanced him to the peerage of Ireland, by the name, style, and title of Lord Sheffield, Baron of Dunamore, in the county of Meath. And by letters from St. James's, 17th September, 1783, his majesty was pleased further to create him Baron Sheffield of Roscommon, extending the honour in failure of heirs male on his issue female.

Towards the close of the American war, Lord Sheffield began to study the nature of the country.

revenues, and resources of this country. He also became, for the first time, an author; and, in a publication on the trade of the United States of America, gave abundant proofs of his industry to investigate, and sagacity to develop, the interests of Great Britain. He strenuously advocated the maintenance of the navigation act and the extension of the carrying trade of this country; and when Mr. Pitt, "in his youthful ardour (to use his lordship's own words) for grasping the advantages of the American commerce, brought in a bill for the provisional establishment and regulation of trade and intercourse between the subjects of Great Britain and those of the United States of America," Lord S. saw the dangerous tendency of the measure, and opposed it with becoming firmness. "Had it passed into a law," adds he, "it would have affected our most essential interests in every branch of commerce, and, in every part of the world, it would have deprived of their efficacy our navigation laws, and undermined the naval power of Britain."

When the abolition of the slave trade was attempted in 1792, and both Fox and Pitt supported the measure, Lord Sheffield reprobated the strong language made use of by these gentlemen, and took an opportunity in the course of the debate to attempt a justification of the character of the notorious Captain Kimber, then in Newgate, whom his lordship represented as a cruelly injured man. In the event, however, Lord Sheffield assented to the proposition of putting a stop to the importation of negroes into the colonies; but the acquiescence in his measure was given in so reluctant a manner that it looked more like a compromise than a cheerful compliance with a just and necessary suggestion.

In 1793, Lady Sheffield died, and shortly afterwards Gibbon came to England. We give the arrival of Mr. Gibbon's visit at Sheffield Place, in his lordship's own words:—"Mr. Gibbon had engaged to pass a year with me in England; with an alertness by no means natural to him he almost immediately took a circuitous journey along the frontiers of an enemy worse than savage, within the sound of theirannon, within the range of the light troops of the different armies, and through roads ruined by the enormous machines of war.

"The readiness with which he engaged in this kind of office, at a time when a selfish spirit might have pleaded a thousand reasons for declining so hazardous a journey, conspired, with the peculiar charms of his society, to render his arrival a cordial to my mind. I had the satisfaction of finding that his own delicate and precarious state of health had not suffered in the service of his friend. He arrived at the beginning of June at my house in Downing street, in good health; and after passing about a month with me there, we settled at Sheffield Place for the remainder of the summer, where his wit, learning, and cheerful politeness, delighted a great variety of characters."

Lord Sheffield enjoyed the society of his celebrated friend until October, when he took his departure to visit Mrs. Gibbon, and subsequently Lord Spencer,

Althorpe. Excepting only a visit to Lord Egremont and Mr. Hagley, Lord Sheffield and Mr. Gibbon were never absent from Sheffield Place until the latter bade farewell to him entirely. The society

of his lordship's seat was entirely of a literary description; Messrs. North, Jekyll, Douglas, and

Hagley, were often guests at Sheffield Place during Mr. Gibbon's stay. A few months afterwards the historian paid his lordship a second visit, but the unfortunate state of Mr. Gibbon's health precluded all enjoyment to either party. He returned to London in a few weeks, where he died of the disease under which he had been suffering so acutely during his last visit.

The affectionate attentions which Gibbon received at all times, but more especially during his last illness, from Lord Sheffield and his amiable family, entitle them to the highest commendation. On his death, he constituted Lord Sheffield, in conjunction with John Thomas Butt, Esquire, his executors. In the will, his lordship is distinguished in the most flattering manner. "I constitute and appoint John Lord Sheffield, &c. &c. &c. I shall indulge these gentlemen in the pleasure of this last disinterested service, without wronging my feelings, or oppressing my heirs, by too light or too weighty a testimony of my gratitude. My obligations to the long and active friendship of Lord Sheffield, I could never sufficiently repay." On the publication, by Lord Sheffield, of his valuable edition of the miscellaneous writings of Gibbon, he received many highly complimentary letters, and from persons, too, whose opinions were really valuable.

In 1800 his lordship published a work entitled "Remarks on the Deficiency of Grain, occasioned by the bad harvest of 1799; on the means of present relief and future plenty; with an appendix, containing accounts of all the corn imported and exported, with the prices from 1697 to the 10th October, 1800."

In July 1798 Lord Sheffield's important services to the political economy of the country, both as a senator and an author, were rewarded by an elevation to the British house of lords, by the title of Lord Sheffield, of Sheffield, in Sussex. His lordship closed a long and eminently useful life on the 30th of May, 1821.

Lord Sheffield was the author of a variety of pamphlets, principally referring to commercial and political economy. Gibbon has given the following character of his lordship's works:—

"The sense and spirit of his (Lord Sheffield's) political writings have decided the public opinion on the great questions of our commercial interests with America and Zealand. The sale of his 'Observations on the American States' was very considerable; their effect beneficial: the navigation act, the palladium of Britain, was defended, and perhaps saved, by his pen; and he proves, by the weight of fact and argument, that the mother-country may survive and flourish after the loss of America. My friend has never cultivated the arts of composition; but his materials are copious and correct, and he leaves on his paper the clear impression of an active and vigorous mind. His 'Observations on the Trade, Manufactures, and Present State of Ireland,' were intended to guide the industry, to correct the prejudices, and to assuage the passions of a country which seemed to forget that she could be free and prosperous only by a friendly connexion with Great Britain. The concluding observations are written with so much ease and spirit that they may be read by those who are the least interested in the subject."

SHEFFIELD, JOHN, duke of Buckingham, a celebrated nobleman who was born in 1649, was the son of the earl of Mulgrave, to whose title he succeeded in 1658. At the age of seventeen he engaged

as a volunteer in the first Dutch war. On his return, by the union of wit and spirit so agreeable to Charles II., he became a great favourite at court. On the accession of James II. he was made lord chamberlain, and his attachment to that sovereign induced him to take a seat in the ecclesiastical commission, and practise other compliances, though he opposed many of the counsels which brought ruin on his master. At the revolution he took the part of an anti-courtier, but in 1694 became member of the cabinet. On the accession of Anne, to whom he is said once to have been a suitor, he was advanced to the dukedom of Buckingham; but the jealousy of the duke of Marlborough drove him from office until the change of 1710, when he was made first steward of the household, and then president of the council under the administration of Harley. After the death of Anne he employed his time chiefly in literary pursuits, until his death in 1720. His literary fame was mainly assisted by his rank and influence in his own day. In his "Essay on Satire" he was supposed to have been assisted by Dryden; and few of his other pieces merit attention. His widow published a splendid edition of his works in 1723, in two volumes quarto; the first of which contained his poems upon various subjects, and the latter his historical memoirs, character, speeches, and essays.

SHELBY, ISAAC, a distinguished American revolutionary officer, who was born in 1750, near Hagers Town, Maryland. He received a common English education in Fredericktown, and acted as a deputy sheriff in Frederic county previous to his becoming of age. In 1774 he was appointed a lieutenant in the expedition under Lewis, against the Shawanees and other Indian tribes north-west of the Ohio. In 1776 the committee of safety in Virginia appointed him captain of a minute company—a species of troops organized upon the first breaking out of the revolution—but not called into service from the extreme frontier on which he lived; and soon after he was appointed, by the governor of Virginia, a commissary to supply rations for the militia posted in several garrisons to guard the back settlements, and to lay in supplies for a grand treaty, to be held at the Long Island of Holston river, with the Cherokees. These supplies were not to be obtained nearer than Staunton in Virginia, a distance of 300 miles; and to accomplish it required the exertion of all the energy, enterprise, and perseverance, which marked his character. In 1778 he was engaged in the commissary department to provide supplies for the continental army, and for a formidable expedition against the north-western Indians. He was also appointed by Governor Henry to furnish supplies for a campaign against the Chickamoggy Indians—a numerous banditti on the south side of the Tennessee river, under the control of a daring Cherokee chief called Draggon Canoe; who, after his defeat at the Long Island of Holston in 1776, had declared eternal war against the whites. The frontiers from Georgia to Pennsylvania suffered from their depredations more than from all the other hostile tribes together. Owing to the poverty of the treasury the government was unable to advance the necessary funds, and the whole expense of the supplies, including transportation, was sustained by his individual credit. In the spring of the same year he was elected a member of the Virginia legislature from Washington county, and in the autumn was commissioned by Governor Jefferson as a major in the escort of guards to the commissioners for extending

the boundary between Virginia and North Carolina. After the surrender of Charleston, and the loss of the southern army in 1780, he devoted himself to the military service of his country, and throughout the residue of the revolutionary struggle was actively engaged in fighting her battles in the south. For his conduct in the battle of King's mountain in 1780, he received a vote of thanks and an elegant sword from the legislature of North Carolina.

In 1781 he was chosen a member of that body, and the following year was re-elected. He was also appointed one of the commissioners to settle the pre-emption claims on the Cumberland river, and arrange the lands allotted to the officers and soldiers of the North Carolina line, south of where Nashville now stands. After the separation between Virginia and Kentucky, and the formation of a constitution for the latter state by a convention, of which Colonel Shelby was a member, he was chosen governor of Kentucky in 1792. From 1796, after the expiration of his term of office, until 1812, he lived in retirement, discharging no public duty whatever, except that of elector for president and vice-president, to which he was invariably called. In the latter year he was again chosen governor, and during the war was zealous in his exertions to aid the common cause. In 1813 he marched at the head of 4000 men across the state of Ohio, to the frontier, where General Harrison commanded the American forces. In 1820 he experienced a paralytic stroke, which rendered his right arm useless, and occasioned a slight lameness during the remainder of his life.

SHENSTONE, WILLIAM, an English poet, was born in November 1714, and after completing the rudiments of his education at Hales Owen, in Shropshire, he was sent to Pembroke college, Oxford. While there he devoted much of his time to poetical composition, and in 1737 published a Miscellany, but without his name. In 1741 appeared his "Judgment of Hercules," addressed to Mr. Lyttelton, whose interest he supported with great warmth at an election; this was next year followed by the "Schoolmistress." Mr. Dolman, who was his guardian, died in 1743, and the care of his own fortune now fell upon him. He took the whole estate into his own hands, more to the improvement of its beauty than the increase of its produce. This employment made him fond of rural pleasures and rural elegance: "he began from this time to point his prospects, to diversify his surface, to entangle his walks, and to wind his water, which he did with such judgment and such fancy, made his little domain the envy of the great and the admiration of the skilful; a place to be visited by travellers, and copied by designers. Whether to plant a walk in undulating curves, and to place a bench at every turn where there is an object to catch the view, to make water run where it will be heard, and to scintillate where it will be seen; to leave intervals where the eye will be pleased, and to thicken the plantations where there is something to be hidden, demands great powers of mind." Shenstone spent so much time and money on his estate that he became deeply involved in debt; which circumstance, no doubt, hastened his death, which took place in 1763, and he was buried in his native place. Gray, the poet, who speaking of him, says—

"I have read too an octavo volume of 'Shenstone's Letters.' Poor man! he was always waiting for money, for fame, and other distinctions; and he

whole philosophy consisted in living against his will in retirement, and in a place which his taste had adorned, but which he only enjoyed when people of note came to see and commend it: his correspondence is about nothing else but this place and his own writings, with two or three neighbouring clergymen, who wrote verses too." His poems consist of elegies, odes, and ballads, humorous sallies and moral pieces. His conception of an elegy he has, in his preface, very judiciously and discriminately explained. It is, according to his account, the effusion of a contemplative mind, sometimes plaintive and always serious, and therefore superior to the glitter of slight ornaments. His compositions suit not ill to this description. His topics of praise are the domestic virtues, and his thoughts are pure and simple; but, wanting combination, they want variety. The peace of solitude, the innocence of inactivity, and the unenvied security of an humble station, can fill but a few pages. That of which the essence is uniformity will be soon described. His elegies have therefore too much resemblance to each other. The lines are sometimes, such as elegy requires, smooth and easy; but to this praise his claim is not constant: his diction is often harsh, improper, and affected; his words ill-coined or ill-chosen, and his phrase unskilfully inverted. But the four parts of his "Pastoral Ballad" demand particular notice. "I cannot," says Johnson, "but regret that it is pastoral; an intelligent reader, acquainted with the scenes of real life, sickens at the mention of the crook, the pipe, the sheep, and the kids, which it is not necessary to bring forward to notice, for the poet's art is selection, and he ought to show the beauties without the grossness of the country life. His stanza seems to have been chosen in imitation of Rowe's 'Despairing Shepherd.'"

His "Levities" are by their title exempted from the severities of criticism; yet it may be remarked in a few words, that his humour is sometimes gross, and seldom sprightly. Of the moral poems the first is "The Choice of Hercules," from Xenophon. The numbers are smooth, the diction elegant, and the thoughts just; but something of vigour is still to be wished, which it might have had by brevity and compression. His "Fate of Delicacy" has an air of gaiety, but not a very pointed and general moral.

SHERIDAN, RICHARD BRINSLEY.—This celebrated dramatist, wit, and statesman, was born in Dublin, in October 1751. He was the son of Thomas Sheridan, well known both as an actor and lecturer on elocution. His mother was distinguished for her beauty and accomplishments, and was the author of several works of considerable merit. Her eastern romance, entitled "Nourjhad," has since been dramatized with great success.

As the elder Mr. Sheridan aspired to, and at length obtained, his majesty's countenance and protection, it was probably on this account that he made choice of one of the poor knights' houses at Windsor for his place of residence on leaving Ireland. It was to that town, therefore, that his two sons were sent in the autumn of 1759. As Charles, at an early period, evinced superior diligence; as he displayed at the same time great correctness of ear and powers of voice; and contrived when only eleven years of age, to the great delight of his father, with whose peculiar province this qualification was intimately connected, to recite various passages from Milton in an elegant and impressive manner; no fears were entertained

for this lad, who afterwards distinguished himself as the historian of that revolution at Stockholm which put an end to every trace of Swedish liberty and independence. But in respect to the other, who was placed at Harrow school immediately after the Christmas recess of 1762, he was sprightly and wild, and appears to have been sent thither for the express purpose of learning how to get through the world. His mother, on this occasion at least, seems to have displayed a certain degree of prophetic sagacity, when she remarks to a correspondent as a reason for the change, "that as Dick probably may fall into a bustling life, we have a mind to accustom him early to shift for himself!"

Dr. Sumner, the head master, with all his penetration, could discover no glimpse of future talents in young Sheridan. The merit was reserved for the nearer inspection of Dr. Parr, then one of the sub-preceptors. It was he who aroused his pupil into activity and exertion; it was he who, substituting emulation for coercion, induced him to take a pride in the performance of his duties; to aspire to praise and to distinction; to exert his memory, which was strong and powerful; to display his dawning genius, and to exhibit some early specimens of that versatility of powers and endowments which afterwards rendered him so conspicuous. At this period too he gave some occasional symptoms of his future character, for he was ambitious of applause; more eager to acquire than to retain popularity; careless about his own interests; at times studious to excess; always witty, facetious, and entertaining; but in general so indolent, more especially when not excited by any ruling passion, that he seemed actually to have lost, rather than to have suspended, his powers of action. Such was Richard Sheridan at the age of eighteen—he was never sent to the university. For this various reasons may be assigned; in the first place, he himself might not have been very desirous; in the second, his acquirements at Harrow were, perhaps, deemed fully sufficient for all useful purposes; and finally, the derangement of the family affairs is likely to have precluded the possibility of such a measure. This last argument must appear to be preponderant when it is recollected, on one hand, how expensive such a system of education is; and on the other, that his father neither possessed any patrimonial or acquired property; while his professional pursuits were both unprofitable and precarious. Indeed the family chiefly, if not wholly, subsisted at this very period on a pension of 200*l.*, and the profits derived from lectures on elocution. Young Sheridan, however, entered himself a student of the Middle Temple, and kept to his commons while there. He indeed never received a call to the bar; and he is said to have chiefly supported himself at this critical period by his literary labours. There can be no doubt but, both on this and future occasions, he wrote frequently for the newspapers; and indeed until his last fatal illness he kept up a constant connexion with more than one of the editors of the periodical journals.

From an early period of life Mr. Sheridan was accustomed to the stage, and constantly frequented the theatres. But notwithstanding his father had distinguished himself by his histrionic powers, yet so lofty were his own peculiar notions that he would have rather perished with hunger in the street than have acquired all the opulence of Garrick, provided he should have been obliged, like him, to assume the

character of an actor! Notwithstanding this, it seemed fore-doomed by fate, that his life should assume a new colour, and his pursuits a fresh direction, from the drama. It was on the stage he first saw and heard Eliza Linley, at an oratorio; and on the stage too of Drury Lane, where he himself was fated afterwards to assume, not only the lead and superintendence, but also, for a while, to irradiate all around him by the splendour of his talents in genteel comedy.

Mr. Sheridan followed the young lady to Bath, and as it was the custom at that period to signalize a youthful lover's affection by a duel, he contrived to fight two with Mr. Mathews, a gentleman of fortune; one at a tavern in Henrietta Street, Covent Garden, and another at Kingsdown, near Bath. The latter was not unattended with bloodshed; and both the combatants are said to have conducted themselves with great gallantry on this occasion. A trip to the continent, and a marriage there, with a repetition of the ceremony in England, after their return, rendered the whole affair romantic in the extreme. But the *denouement* of this romance was not at all pleasing to Mr. Linley, the father, who, by the skill, and voice, and taste of his beautiful daughter Eliza, hoped to enrich himself. At length, however, after the lapse of a decent period, a reconciliation ensued; and Maria Linley, less lovely, but not less interesting, than her elder sister, filled, or rather occupied, her situation in the oratorios, which at that period were fashionably attended.

Both before and after this unfortunate event, proposals were conveyed in the most delicate manner, with a view to induce Mrs. Sheridan to accept of a lucrative engagement; a wish on the part of her majesty was also expressed for this lady, who united all the requisites of scientific skill with the finest gifts of nature, in her own person, to assist at her private concerts. But the first were rejected with disdain, and the second declined with all due politeness. The proprietors of the Pantheon, who tempted Mrs. Sheridan's necessities, with the offer of 2000*l.* for twelve nights only, experienced a similar rebuff with the patentees of the winter theatres; and yet, at that very period, this young couple were almost literally destitute of a dinner, and utterly unable to pay the house rent of their residence in Orchard Street, Portman Square.

But although Mr. Sheridan would not suffer his lady to appear before the public in the character of a singer, he himself had no objections to subject the fruits of his talents to the judgment of the self-same tribunal. It has been confidently and repeatedly asserted that his first attempts in the dramatic art were not propitious, even in his own estimation. Notwithstanding this, such was his reputation as a poet that his friends advised him to persevere; and as the dramatic Muse then, as now, rewarded her successful votaries with great liberality, he resolved to attempt a comedy. "The Rivals" was accordingly produced at Covent Garden theatre, and laid the foundation of his future eminence in this line of composition. True it is that it was withdrawn in consequence of some marks of disapprobation. After some judicious alterations, curtailments, and emendations, it was again brought forward, and has ever since continued to be what is termed a "stock piece" in the language of the theatres. Having at length succeeded, to a certain degree at least, in a play that exhibited a consi-

derable portion of feeling and sentiment, he next determined to vary his powers by producing a farce calculated to display broad wit and vulgar merriment. The farce of "St. Patrick's Day" is said to have been written within the space of forty-eight hours, and gratified the galleries exceedingly.

At the commencement of the autumn of 1776 Mr. Sheridan obtained new and increased applause by producing the comic opera of "The Duenna." On this occasion his lyric powers proved highly serviceable by infusing grace, variety, and humour into his songs; while the elegance, correctness, and point of the diction, added new zest to the dialogue. In every thing contributed to render this drama pleasing, popular, and productive. Yet, after all, it is but fair to add, that both the success and celebrity of that production were not a little assisted by the excellence of the music and the talents of the singers.

Mr. Sheridan's reputation had now reached its utmost pinnacle of dramatic fame, and yet his fortune had obtained but little increase. Gay, volatile, dissipated, and hospitable to excess, his table was open to the whole circle of his friends. Yet, notwithstanding the notoriety of his expenses, and the deficiency of his revenues, such were the fascinating manner, talents, and reputation of the author of "The Duenna" at this moment, that he contrived to enter into and succeed in a negotiation with Garrick for a purchase of a part of his share of the patent of Drury Lane theatre. On this occasion he associated himself with Dr. Ford and Mr. Linley: these gentlemen in 1776 agreed to pay 30,000*l.* to the English Society, who at the same time reserved to himself certain other claims on, and advantages from, the house. On this occasion Mr. Sheridan is allowed to have displayed great talents at finance, for it must be obvious that he was incapable of advancing a single shilling; he, however, contrived, by mortgage and sale, to obtain the money and fulfil all his engagements.

"A Trip to Scarborough," first performed on the 24th of February, 1777, brought crowded houses to the great satisfaction of the new partnership, and "The School for Scandal" literally filled their treasury. This far-famed comedy first delighted an English audience on the 8th of May of the same year, and during the whole season obtained the numerous commendations of all the gay, genteel, fashionable circles. It ought not to be forgotten, however, that the grace and dignity of the countess of Derby, together with the singular and appropriate powers of a King, a Palmer, and a Smith, contributed not a little to heighten the success.

A musical piece, called "The Camp," had been brought out during the preceding season to gratify the taste of the public for military spectacle, we being then at war with America. "The Critic," although manifestly modelled from the duke of Buckingham's "Familiar," was soon after received with applause on account of the novelty and application of the satire. "Fretful Plagiary" was a character entirely new to the drama, although not to real life. The death of Garrick in 1779 produced a monody from the same pen. It was delivered by Mrs. Yates, in the character of the Tragic Muse, with much pathos; but it was not calculated, even with all her powers, to produce the necessary stage effect.

Mr. Sheridan had now enjoyed an uninterrupted career of applause for many years without being enriched by labours which would have rendered at

other man not only independent, but affluent. He would have still continued, perhaps, to write for the stage, and to have received and expended large sums annually, had not the secret whisperings of ambition intimated a new road to glory. Mr., afterwards Lord John Townshend, a younger son of the first Marquis Townshend, was, like himself, a poet; and it is not at all to be wondered that the congeniality of their minds should have produced, first an acquaintance, and then an intimacy. They are supposed, indeed, to have combined with several other wits of the day in producing a series of mock heroic poems, which were eagerly read and diffused from one end of the kingdom to the other. It was this gentleman who first introduced Mr. Sheridan to Mr. Fox, and this incident converted the poet into a politician and a patriot. After some ineffectual attempts to obtain a seat in parliament through patronage, Mr. Sheridan at length, in 1780, offered himself as a candidate for the borough of Stafford. The mere expenses of this election are said to have cost him 1000*l.*, a sum which he borrowed with some difficulty; and he was fortunate enough to be returned at so trifling an expense, though there was a petition against him to the fifteenth parliament of Great Britain, along with Mr. Monckton, uncle to Viscount Galway. What is not a little remarkable, he and this gentleman were colleagues during no fewer than six successive parliaments for the same place. Mr. Sheridan, now entirely relinquishing the Muses, became a regular attendant in St. Stephen's chapel; and both there, and at all the public meetings of the time, was a strenuous opposer of the American war, and, consequently, a violent foe to Lord North's administration. On the conclusion of hostilities, he joined with many celebrated men in a plan for procuring a reform in parliament, and actually sat in a convention for that express purpose with Mr. Pitt, the duke of Norfolk, the Rev. Mr. Wyville, then chairman of the Yorkshire committee; Sir Cecil Wray, Bart., and a multitude of other distinguished characters.

Notwithstanding this, he was now deemed so able, and at the same time so useful an assistant, that in 1782, when the Rockingham administration came into power, he was immediately nominated under-secretary to his friend Mr. Fox, who was selected at that period to preside over the foreign department. In this new situation time sufficient for a display of his abilities was not allowed; for the earl of Shelburne having been declared first lord of the treasury by the especial intervention of the king, on the demise of the marquis of Rockingham, Mr. Fox resigned, after a few months' enjoyment of office, and was of course followed by his secretary.

At length, a reconciliation having taken place between two great politicians, who had bitterly attacked each other during the American contest, they soon gained the ascendant in the house of commons by their united talents and influence; and Mr. Sheridan accordingly formed a part of the coalition administration, by being appointed to the confidential and important office of secretary of the treasury in 1783.

While in this station he for the first time began to display the expansive and versatile powers of a mind singularly fraught with a combination of different talents. As if awed hitherto by the splendid talents of a Burke, a Fox, and a Pitt, he had either preserved complete silence, or only taken a very subordinate part in the debate. But when the India bill, which

suddenly overset the new administration, came under the cognizance of the house of commons, his parliamentary talents suddenly burst forth, and from that day he began to be considered a rising orator.

In the same year Mr. Sheridan made a motion relative to the better regulation of the police of Westminster. On this occasion he stated that the disgraceful riots in 1780 had proceeded from a venal and incompetent magistracy; he deprecated the idea of again seeing "orderly sergeants attending in Westminster Hall, and the courts of justice beset with soldiers." He concluded by moving three propositions, the last of which was for appointing a committee to inquire into the conduct of the civil power of the city of Westminster in respect to the riots in June last. He added, "it was then, and indeed always his opinion, that the city of Westminster should be governed by a corporate body, elected by the people, in the same manner as has been practised for ages in the metropolis of the British empire."

In July 1784, Sheridan, who had before strenuously and ably supported Mr. Fox's India bill, now exhibited equal talents in attacking the counter plan for regulating the affairs of India, produced on the part of Mr. Pitt. When the latter gentleman, soon after, moved for paying the arrears of the civil list, Mr. Sheridan, by way of reply, read the king's speech to his parliament, in which his majesty most graciously observed:—"I have carried into strict execution the several reductions in my civil list expenses. I have introduced a further reform into other departments, and suppressed several sinecure places in them. I have by this means so regulated my establishment that my expenses shall not in future exceed my income."

The Westminster scrutiny, the Irish resolutions, the taxes on cottons, stuffs, female servants, the Irish propositions, all occupied the attention, and were spoken to, when before parliament, by the member for Stafford in 1785. In 1786 he ably and manfully opposed the extravagant plans of the late duke of Richmond for fortifying and protecting the dock yards, by means of numerous, extensive, and expensive works, instead of recurring to the natural defence of Great Britain arising out of a powerful navy. On this occasion he alluded to the constitutional jealousy of the military power of the crown, which originated in this:—"That it was in the nature of kings to love power, and in the constitution of armies to obey kings." He also observed, "that the strongholds now contended for, if maintained as they must be, in peace, by full and disciplined garrisons; if well provided, and calculated to stand regular sieges as the present plans professed; and if extended to all the objects to which the system must inevitably lead, whether they were to be considered as inducements to tempt a weak prince to evil views, or as engines of power in case of actual rupture; would in truth present ten times the means of curbing and subduing the country that could be stated to arise even from doubling the present military establishment; with this extraordinary aggravation attending the folly of consenting to such a system, that those very naval stores and magazines, the seed and sources of our future navy, the effectual preservation of which was the pretence for these unassailable fortresses, would in that case become a pledge and hostage in the hands of the crown, which, in a country

circumstanced as this was, must insure an unconditional submission to the most extravagant claims which despotism could dictate."

In the spring of 1786 commenced the proceedings against Mr. Hastings, in which Sheridan was actively engaged for several years. The first difficulty encountered, by those who brought the charges, was an evident unwillingness on the part of Mr. Pitt and Mr. Dundas to produce the necessary documents. At length Mr. Burke, on the 4th of April, 1786, charged the late governor-general of Bengal with high crimes and misdemeanours, and lodged nine articles against him on the table of the house of commons. The first of these, which comprehended the Rohilla war, was lost on June 1st. On the 13th of the same month Mr. Fox brought forward the Benares charge, which was carried by a majority, the chancellor of the exchequer concurring in the vote.

On February 7th, 1787, in a committee of the whole house, Mr. Sheridan presented the fourth charge, viz., the resumption of the Jaghires, and the confiscation of the treasures of the princesses of Oude; on which occasion, during a speech of five hours and a half, he commanded the universal attention and admiration of all who heard him.

We can only notice a few passages, but they will sufficiently mark its high oratorical character. He commenced his speech by some pointed allusions to the conduct of Sir Elijah Impey, who had printed hand-bills of defence, in favour of Mr. Hastings, in respect to the present articles of accusation. Neither the informality of any subsisting evidence, nor the adducement of any new explanations on the part of the late chief justice of Bengal, could make the slightest impression upon the vast and strong body of proof now intended to be brought forward. The long and unwearied attention paid by parliament to the affairs of India,—the voluminous productions of their committees,—the repeated recommendations of his majesty,—were all undeniable proofs of the moment and magnitude of the consideration, and incontrovertibly established this plain, broad fact, that parliament had directly acknowledged that the British name and character had been dishonoured, and rendered detested throughout India, by the malversation and crimes of the principal servants of the East India company. To some sarcasms propagated in another place he would ask, "Is parliament mispending its time by inquiring into the oppressions practised on millions of unfortunate persons; and endeavouring to bring the daring delinquent, who had been guilty of the most flagrant acts of enormous tyranny and rapacious speculation, to exemplary and condign punishment? Was it a misuse of their functions to be diligent in attempting to wipe off the disgrace attached to the British name in India, and to rescue the national character from lasting infamy?"

As to the present charge, "He professed to God, that he felt in his own bosom the strongest personal conviction; and it was from that conviction he believed the conduct of Warren Hastings, in regard to the nabob of Oude and the Begums, comprehended every species of human offence. He had proved himself guilty of rapacity, at once violent and insatiable—of treachery, cool and premeditated,—of oppression, useless and unprovoked,—of breach of faith, unwarrantable and base,—of cruelty, unmanly and unmerciful. These were the crimes of which, in his

soul and conscience, he arraigned Warren Hastings, and of which he had the confidence to say he should convict him! As there were gentlemen ready to stand up as his advocates, he challenged them to watch him,—to watch if he advanced one inch of assertion for which he had not solid ground: for he trusted nothing to declamation. I desire credit," added he, "for no fact which I shall not prove, and which I do not demonstrate beyond the possibility of refutation. I shall not desert the clear and invincible ground of truth, throughout any one particle of my allegations against Mr. Hastings, who, to obtain even a surreptitious approbation of the measures he had predetermined to adopt,—the Begums being in actual rebellion, might not the nabob confiscate their property? 'Most undoubtedly,' was the ready answer of the judge. Not a syllable of inquiry intervened as to the existence of the imputed rebellion; nor a momentary pause, as to the ill purposes to which the decision of a chief justice might be perverted. It was not the office of a friend to mix the grave caution and circumspection of a judge with an opinion taken in such circumstances; and Sir Elijah had previously declared that he gave his advice, not as a judge, but as a friend; a character he equally preferred, in the strange office which he undertook of collecting offensive affidavits on the subject of Benares."

After the orator had expatiated, in a vein of irony on the conduct of Sir Elijah, whom he styled in ridicule the "oriental Grotius," who had given "the premature sanction for plundering the Begums," and "become the posthumous support of the extortion and pillage of the rajah Cheit Sing;" he fully and ably insisted on the gross perversion of both the judicial and executive power of India. "At the same moment," continued he, "that the sword of government was turned to an assassin's dagger, the pillar of justice was stained and disgraced with the basest and meanest contamination. Under such circumstances did Mr. Hastings complete the treaty of Chunar; a treaty which might challenge all the treaties that ever subsisted, for containing, in the strictest compass, the most extensive treachery. Mr. Hastings did not conclude that treaty until he had received from the nabob a present, or rather a bribe of 100,000*l*. The circumstances of this present were as extraordinary as the thing itself. For months afterwards, and not till then, Mr. Hastings communicated the matter to the company. Unfortunately for himself, however, this tardy disclosure was conveyed in words which betrayed his original meaning; for, with no common incaution, he stated the present was of a magnitude not to be concealed. And what was the consideration for this extraordinary bribe? No less than the withdrawing from Oude, not only all the English gentlemen in official situations, but the whole also of the English army; and that too at the very moment when he himself had stated the whole country of Oude to be in open revolt and rebellion. Other very strange articles were contained in the same treaty, which must have but this infamous bribe could have occasioned. Together with the reserve which he had in his own mind, of treachery to the nabob; for the only object of the treaty which he ever attempted to carry into execution was to withdraw the English gentlemen from Oude. The nabob, indeed, considered this as essential to his deliverance, on account of their supposed rapacity. Accordingly, at the very moment

he pocketed the extorted spoil of the nabob, with his usual grave hypocrisy and cant. 'Go,' he said to the English gentlemen, 'go, you oppressive rascals; go from this worthy, unhappy man, whom you have plundered, and leave him to my protection. You have robbed him,—you have plundered him,—you have taken advantage of his accumulated distresses; but, please God, he shall in future be at rest; for I have promised him he shall never see the face of an Englishman again.' This, however, was the only portion of the treaty which he even affected to fulfil; for as to all other parts, we learn from himself, that, at the very moment he made it, he intended to deceive the nabob. Accordingly, he advised general, instead of partial resumptions, for the express purpose of defeating his views; and instead of giving instant and unqualified assent to all the articles of the treaty, he perpetually qualified, explained, and varied them with new diminutions and reservations. Was there any theory in Machiavel, any treachery upon record, any cold Italian fraud, which could in any degree be put in comparison with the disgusting hypocrisy and unequalled baseness which Mr. Hastings had shown on that occasion? But there were some, who found an apology for the atrocity of these crimes in the greatness of his mind;—but does not this quality arise out of great actions, directed to great ends? In them, and in them alone, we are to search for true and estimable magnanimity; to them only can we justly affix the splendid title and honours of real greatness. His course was an eternal deviation from rectitude,—he pursued the worst objects by the worst means,—he either tyrannized or deceived, and was by turns a Dionysius and a Scapin. As well might the writhing obliquity of the serpent be compared to the swift directness of the arrow, as the duplicity of Mr. Hastings's ambition to the simple steadiness of genuine magnanimity. In his mind all was shuffling, ambiguous, dark, insidious, and little: nothing simple, nothing unmixed: all affected plainness and actual dissimulation;—a heterogeneous mass of contrary qualities; with nothing great but his crimes; and even these, contrasted by the littleness of his motives, which at once denoted both his baseness and his meanness, and marked him for a raitor and a trickster."

Mr. Sheridan now showed, by evidence, that the wofold accusation against the Begums was unjust; and that, first, they were not the ancient disturbers of the government; and secondly, that the charge of having induced the Jaghierdars to resist the nabob, was no less untrue—the fact, indeed, being fully substantiated, that no one of these ever did resist. He stated it to be incontrovertible, "that the Begums were not concerned either in the rebellion of Bulbuler, or the insurrection at Benares; nor did Mr. Hastings ever once seriously think them guilty. Their treasures were their treason; and Asoph ul Dowlah thought like an unwise prince when he blamed his father for bequeathing him so little wealth. His father, Sujah ul Dowlah, acted wisely in leaving his son with no temptation about him to invite acts of violence and rapacity. He clothed him with poverty as with a shield, and armed him with necessity as with a sword!—The third charge was equally false, did they resist the resumption of their own Jaghierdars? Although they had resisted, there would not have been any crime, seeing that these were confirmed by solemn treaty; yet the nabob himself, with all

the load of obloquy imputed to him, never so much as accused them of stirring up opposition to his authority. To prove the falsehood of the whole of this charge, and to show that Mr. Hastings originally projected the plunder,—that he threw the whole odium in the first instance on the nabob, and that he imputed the crimes to them before he had received one of the rumours which he afterwards manufactured into affidavits, would be seen from the dates of the various papers now about to be adduced; which would also implicate Mr. Middleton and Sir Elijah Impey. "The Begums, by age and by infirmities, were almost the only persons in India who could not have a thought of distressing that government by which alone they could hope to be protected; and to charge them with a design to depose their nearest and dearest relatives, was equally odious and absurd. To ascribe to the princesses those insurrections which had constantly taken place in Oude, was wandering even beyond the improbabilities of fiction; it might with equal probability have been insisted that, but for them, famine would not have pinched, nor thirst have parched, nor extermination have depopulated. Mr. Hastings, wanting a motive for his rapacity, had found it in fiction. But we are told, 'that they complained of the injustice done them.' And, God of heaven! had they not a right to complain of the injustice,—after a solemn treaty violated,—after being plundered of all their property,—and on the eve of the last extremity of wretchedness, were they to be deprived of the last resource of impotent wretchedness,—complaint and lamentation? Was it a crime that they should crowd together in fluttering trepidation, like a flock of restless birds on seeing the felon kite who, having darted at one devoted individual, and missed his aim, singled out a new object, and was springing on his prey with redoubled vigour in his wing, and keener vengeance in his eye? The simple fact is, having failed as to Cheit Sing, he felt the necessity of procuring a sum of money somewhere; for he knew that to be the never-failing receipt to make his peace with the directors at home! Let the fancy of the governor-general but conceive the proud spirit of Sujah Dowlah, looking down upon the ruin and devastation of his family, and beholding that palace which had been restored to him, plundered by that very army with which he himself had vanquished the Mahrattas; that very Middleton, who had been engaged in managing the previous violations, most busy to perpetrate the last; that very Hastings, whom he had left, on his death-bed, the guardian of his wife, and mother, and family, turning all those dear relations, the objects of his solemn trust, forth to the merciless seasons, and a more merciless soldiery! I have heard of factions and parties in this house, and know that they exist. The prerogative of the crown finds its advocates among the representatives of the people: the privileges of the people will find their opponents, even among the commons of England,—there is no subject on which we are not broken and divided,—habits, connexions, parties, all lead to diversity of opinion; but when inhumanity presents itself to observation, it finds no division among us,—it is attacked as the common enemy, and is never left until completely overthrown. It is not given to this house to behold the objects of their compassion and benevolence; they cannot see the workings of the heart, the quivering lips, the trickling tears, the loud and

tremulous joys of the millions whom their vote of this night would for ever save from the cruelty of corrupted power. But though they could not directly see the effect, is not the true enjoyment of their benevolence increased by the blessing being conferred unseen? Would not the omnipotence of Britain be demonstrated to the wonder of nations by stretching its mighty arm across the deep, and saving by its fiat distant millions from destruction? And would the blessings of the people thus saved dissipate in empty air? No!—We shall constitute heaven itself our proxy, to receive for us the blessings of their pious gratitude, and the prayers of their thanksgiving. It is with confidence, therefore, that I move you on this charge, 'that Warren Hastings be impeached.'"

The subject of this accusation, including the resumption of the Jaghires, and the confiscation of the treasures of the princesses of Oude, was particularly calculated to display all the pathetic power, and call forth all the energies of the orator. His speech occupied a period of nearly six hours in delivery, and so brilliant was the eloquence, and so argumentative the mode adopted on the present occasion, that when Mr. Sheridan sat down, the whole house, as if fascinated with his eloquence, after a short pause, burst into an involuntary tumult of applause. Mr. Burke declared it to be the most extraordinary effort he had ever witnessed; while Mr. Fox said, "all that he had ever heard,—all that he had ever read, when compared with it, dwindled into nothing, and vanished like vapour before the sun." Even Mr. Pitt acknowledged, "that it surpassed all the eloquence of ancient or modern times, and possessed every thing that genius or art could furnish, to agitate and control the human mind."

The next great object in which we find Mr. Sheridan engaged was the contest in parliament relative to the affairs of the prince of Wales. On coming of age, in 1783, the ministers had proposed to settle the establishment of his royal highness at 100,000*l.* per annum; but this was violently opposed by the king, and 50,000*l.* per annum only was allowed. In 1786 a debt was found to be contracted of 150,000*l.*; and as the king refused to grant any relief, the prince immediately dismissed all the officers of his court, and reduced his household to that of a private gentleman; while a sum of 10,000*l.* per annum was set apart, and vested in the hands of trustees, for the payment of debts. In this state of embarrassment, Mr. Alderman Newnham, in April 1787, brought forward a motion for relief; and Mr. Sheridan on this, and every subsequent occasion, took a warm and animated part in the affairs of his royal highness.

In 1789 he was unwearied in his efforts respecting the regency question, on which occasion he combated with great force and ability in favour of the claims of the prince of Wales. Soon after this the French revolution became an object of great importance; and on the army estimates being moved for on February 9, both he and Mr. Fox paid a tribute of applause to those who had produced that great event. He deprecated the unqualified abuse and abhorrence of Mr. Burke, and conceived that revolution to be fully as just, and necessary, and glorious, as our own in 1688. He at the same time defended the general views and conduct of the national assembly, and could not understand what was meant by the charge of "having overturned the laws, the justice, and the

revenues of their country. What were their laws?—the arbitrary mandates of capricious despotism. What their justice?—the partial adjudications of venal magistrates. What their revenues?—national bankruptcy." Mr. Burke, in reply, declared "that henceforth his honourable friend and he were separated in politics."

Nearly at the same time Mr. Sheridan gave a bold and decisive opinion relative to the baseness, cruelty, and injustice of the slave trade. He incessantly urged the house to come to an immediate determination relative to that crying outrage; and added, that the power possessed by a West India planter over his slaves was such as no human creature ought to be suffered to exercise. On this subject, as well as on a reform of parliament, he was equally strenuous and uniform, whether in or out of place; and, indeed, as to his political conduct, no man in England was ever less impeachable than the member for Stafford.

When Mr. Pitt assumed the reins of government he found a formidable opponent in Sheridan. The most trifling, as well as the most important measures of the youthful premier were sure to be exposed to the keenest shafts of his satire, the masked battens of his wit, or the still more formidable ordnance of powerful arguments which he marshalled in hostile array against the indignant treasury bench. Accordingly, Mr. Pitt's perfumery bill was ridiculed with the happiest irony, and the defects of the Irish propositions were searched into with an eagle's eye. While debating on the fourth article, he displayed great knowledge both of the common and relative interests of England and Ireland; and, instead of seeming, as he actually was, a gay, dissipated, dissipated man, a manufacturer from Lancashire or Belfast would have supposed that he had been brought up behind the counter, and applied himself, from his earliest infancy, to the consideration of mercantile affairs alone.

The charms of Mr. Sheridan's conversation have been already alluded to; and it may be fairly added, they were accompanied with a sort of "witchery," that enchanted all his companions, and generally prolonged the pleasures of the festive board until the morning's dawn; or rather, until broad daylight. It is well known that he had become acquainted with the heir apparent to the crown; was a frequent guest at Carlton House; and in his turn, often entertained his royal highness at home. In fine, he was supposed to be a great favourite; and every one prognosticated that at the first opportunity Sheridan could not fail of enjoying a high and distinguished situation in the public councils of his country. The opportunity seemed actually to have occurred, and at a moment too when it was least expected. In 1788, during the recess of parliament, his majesty had gone to Cheltenham, and was supposed to have derived great and essential benefits from the waters. On his return, however, in the autumn, some extraordinary symptoms were discovered; and it was no longer to be concealed that a mental derangement had occurred, which totally precluded him from transacting public business.

On the 28th of November the state of the king's health was officially notified to both houses of parliament; and on the 4th of December the examination of the physicians upon oath was submitted to their inspection by the privy council. A contest for

power immediately ensued; and Mr. Fox, who was at this period in Italy, was instantly recalled, to be the effective leader of administration: for the prince of Wales was displeased with Mr. Pitt, and the other ministers, at this critical moment; while he deemed himself under great and lasting obligations to the opposition, the members of which had always advocated his cause. In short, the list of a new cabinet, of which the duke of Portland was to be the ostensible chief, was actually prepared, and Sheridan was to have occupied a high and honourable station in it.

When the mutiny occurred at the Nore, Mr. Sheridan arose in his place, in the house of commons, and supported the ministers; and when this country was threatened with an invasion, he publicly avowed, "that the time had now arrived when his majesty possessed an undoubted right to call on his subjects, of all ranks and descriptions, for their zealous co-operation in supporting the due execution of the laws, and in giving every possible efficiency to the measures of government." Notwithstanding this, he considered the conduct of Mr. Pitt, both as to the origin of the war and the mode in which he conducted it, objectionable in the extreme. Accordingly, in 1793, he presided at a meeting of the friends "of the liberty of the press," and opposed all the restrictions on that noble instrument of public liberty. He also contended against the unjust mode of government adopted for, or rather against, the Irish nation; and so sensible was the minister himself of this fact that he actually formed the project of an union with the sister nation, one of the main objects of which was, by assimilating the laws and constitutions of both kingdoms, to meliorate the fate and condition of our fellow subjects. Meanwhile an event occurred, which it was thought would have put an end to the war and given to the opposition a permanent hold of power. On the demise of Mr. Pitt a coalition was formed between Mr. Fox and Lord Grenville; and they and their friends, constituting what was then termed "all the talents of the country," immediately occupied the great offices of state. On this occasion Mr. Sheridan was nominated a privy councillor, and obtained the office of treasurer of the navy, estimated at 4000*l.* per annum. It would have been happy, both for himself and his family, if he had accepted a patent place for life of 2000*l.* a-year, as was suggested by Mr. Fox, but he declined this proposition, and on a new writ being issued for Stafford, he was rechosen, for the last time, February 10, 1806.

In 1807, Mr. Sheridan became a popular candidate for the city of Westminster, but Lord Cochrane obtained a decisive majority. During this second contest, he maintained, from the hustings, that it was his intention, were he returned, to attempt the accomplishment of two objects, highly conducive to the interests of his constituents; "the first of these was to regulate the conduct of the hired magistracy of Westminster; and the second, to prevent the publicans from being entirely dependent on the brewers." He concluded by confessing, "that the chief motive of the present struggle, was to seat him on for Ilchester, and himself for Westminster; so that liberty might have two friends instead of one in the house of commons."

Having thus failed in the second city in the kingdom, Mr. Sheridan was nominated for the borough first alluded to, and continued to represent that place during two parliaments. But he no longer distin-

guished himself by the ardour of his attacks, the brilliancy of his replies, the pertinacity and promptness of his questions. In short, he but seldom attended the house, and seemed to have deserted his party, which soon afforded it but too good an apology for that utter desertion and abandonment of himself. The first Mrs. Sheridan having died of a decline in 1792, at the expiration of two or three years, Miss Ogle, the youngest daughter of Dr. Newton Ogle, dean of Winchester, became the object of his attentions. On his marriage with this lady, an estate at Pollesden, near Leatherhead, in Surrey, was purchased chiefly with her fortune; and there they occasionally resided, during several years. A grant, from the prince, of the receiver-generalship of the duchy of Cornwall, estimated perhaps too high at 1200*l.* a year, was soon after added to his income. He had also a valuable interest in Drury Lane theatre; and his appearance in the court of chancery, in defence of his claims, forms an epoch in the proceedings of that tribunal. On this occasion he displayed an unusual portion of acuteness and penetration; he entered into the minutiae of accounts with a wonderful degree of precision; and while, as usual, he charmed all around him, Lord Eldon himself declared from the bench, that he had convinced him of every thing but his "own prudence!"

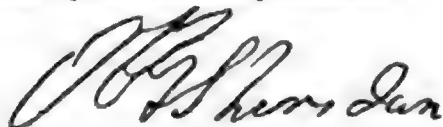

At length Mr. Whitbread, wishing to regulate the affairs of Drury Lane for the common benefit of the public and the proprietors, undertook both the reform and management of that theatre, and perished in the attempt. Mr. Sheridan, now no longer in office, or even in parliament, had obtained, however, a valuable consideration for his claims. But former debts, and present expences, soon swallowed up the sum assigned to him, large as it was. Such was his constitutional imprudence that he is actually said to have carried a large portion of it loosely rolled up in his coat pocket, and to have satisfied the demands against him as they occurred, without giving himself any particular trouble in counting the bank notes. At length, as had been long expected by all around him, disease began to threaten his life. In the spring of 1816 his constitution was completely broken up, his money spent, and his fate pronounced inevitable. At this critical and alarming period he was attended by the Drs. Baillie and Baines; and it is said to be attributed to their firmness alone that the myrmidons of the law did not seize upon his body, as they had repeatedly done on his effects. And yet, at this very period, so loud and frequent were the inquiries after the health of their patient that it was found absolutely necessary to take down the knocker from the street door to avoid noise. On this occasion, also, two gentlemen remained faithful, when he appeared to be deserted by all the world: the one a poet, the other a prelate. Both administered to his necessities to the very last; and to these he added another constant and sincere friend. Nor ought it to be forgotten, that on this trying occasion he experienced all the consolation that could be derived from the presence of a beloved son, and the kind, affectionate, and faithful attentions of a wife, who closed his eyes, and received his last sigh, on Sunday the 7th of July, 1816.

Mr. Sheridan must have been originally favoured by nature with a strong constitution. The dissipation of forty winters had not injured his matchless eloquence or impaired his astonishing memory. It

was not until a little before his demise that he ceased to think, to speak, and to act like himself.

Although the finances of the Sheridan family were in a deplorable state, and the funeral therefore intended to be simple and inexpensive, yet there was something grand and imposing in it, in consequence of the intervention of an old, faithful, and tried associate, Mr. Moore, M. P. for the city of Coventry. That gentleman had the corpse brought, on the day antecedent to the burial, to his own house, in Great George Street, Westminster; and having assembled the relations and friends of the deceased there, and all such as were desirous to pay a compliment to his memory, the procession set out for Westminster Abbey, accompanied by many persons of senatorial rank, headed by one of the royal dukes.

**SHERIDAN, THOMAS**, an Irish divine, who was born in the county of Cavan. He was a protestant, we are told, "and a man of very generous sentiment; well beloved in his neighbourhood for his hospitable disposition, and particularly esteemed by the gentry around on account of his spirit as a sportsman and his superior skill in the management of horses and dogs. That knowledge and liberality, however, which raised him in the estimation of his neighbours, only served to impoverish his circumstances, and to embarrass him in difficulties. These were at last so great that, though he contrived to give his only son Thomas an excellent education at the school of Cavan, he found himself incapable of supporting him at the university. Such was the great-grandfather of Richard Brinsley Sheridan. As to his grandfather, we find, that at the age of sixteen, through the recommendation of his relation, Dr. William Sheridan, "the deprived bishop of Kilmore," and some friends of the family, he was entered a scholar at Trinity college, Dublin. "Here he pursued his studies, with great credit, and procured the good opinion of his superiors by his readiness to oblige, and the friendship of his companions by his pleasantry. Having taken his degrees, and entered into orders, he succeeded to a fellowship, but soon lost the benefit of it by marrying before he had obtained such a provision in the church as was necessary for the support of a family. His wife was Elizabeth Macfadden, the only child of an Irish gentleman of the province of Ulster. Having thus made a serious change in his condition, Mr. Sheridan, by the advice of his friends, removed to Dublin. The house which he took for a school was called King James's Mint, because, while that unfortunate monarch resided in Ireland, his necessities obliged him to adopt a coinage there, of base metal, for the payment of his troops. Such was the reputation of Mr. Sheridan as a scholar, and so well was he respected for his good nature and entertaining qualities, that his school rapidly acquired distinction, and the number of his pupils increased from all parts of Ireland. What served to enhance his importance, and multiply his gains, if he had properly improved that connexion, was the friendship which he formed with Dr. Swift." But it was impossible even for the dean to assist such a man as this. He actually dissipated the sum

of 1000*l.* per annum, arising from his pupils, on the pleasures of the table, and in the company of worthless flatterers. He next refused the endowed grammar-school of Armagh, worth 400*l.* per annum, in which he might have carried the students, who were greatly attached to him, because he could not banish himself from the temptations of the capital; his name was struck out of the list of royal chaplains in consequence of some omission on his part: he next exchanged a living he had obtained near Carr for one of half the value in a more distant spot. He then mortgaged his lands without lessening his expenses, and we find him at last residing at Carr, on an abridged income of only 80*l.* a-year! The next generation does not appear to have acquired additional prudence. Thomas Sheridan, M. A., the third son of Dr. Sheridan, was educated, first at Westminster school, and then at the university of Dublin. During his residence at the latter, he conceived "the romantic idea, that oratory, or rather elocution, constituted the first of human accomplishments." Accordingly, having endeavoured to accomplish himself for that purpose, on the 19th of January, 1742-3, he appeared in the character of Richard III. at Smock Alley theatre. He obtained much celebrity in his new profession both at Dublin and London. He, however, became a manager, and that circumstance led him to ruin, especially after the establishment of a rival theatre. He then left the stage, and for some time employed himself in lecturing on elocution, but on his obtaining a pension of 200*l.* per annum, he came to England and resided for some years at Windsor. His death took place in 1788, while on his road to Lisbon for the benefit of his health; when, however, he arrived at Margate, previous to embarkation, his health would not allow him to proceed further, and he ended his days in that town.

**SHERLOCK, WILLIAM**, an episcopal clergyman, who was born at Southwark about 1641, and studied at Eton, and afterwards at Peterhouse, Cambridge, where he took his degree of doctor in divinity in 1680. After the revolution, having refused to take the oath of allegiance to William III., he was suspended from the pastoral office; but, on his subsequent compliance, he was restored, and in 1707 promoted to the deanery of St. Paul's. His death took place in 1707. Dr. Sherlock distinguished himself as a polemical divine against the dissenters, and carried on a controversy with Dr. South on the doctrine of the Trinity. His works on practical theology, especially his discourses on duty and on judgment, are much esteemed, and have passed through numerous editions.

**SHERLOCK, THOMAS**, son of the preceding, a divine, who was born in London in 1678, and received his education at Catharine Hall, Cambridge, where he obtained a fellowship. In 1714 he was chosen master of Catharine Hall, and was promoted to the deanery of Chichester in 1716, after which he entered into a controversy with Bishop Hoadly in defence of the corporation and test acts. In 1720 he published discourses on prophecy, intended to obviate the infidel objections of Anthony Collins. Dr. Sherlock, in 1728, succeeded Hoadly in the bishopric of Bangor, and in 1734, in that of Salisbury. He was offered the primacy on the death of Archbishop Potter in 1747, but he refused it, and, the following year, he was translated to the see

of London, where he remained till his death in 1761. Bishop Sherlock was the author of "The Trial of the Witnesses of the Resurrection of Jesus;" and his sermons are among the best specimens of English pulpit eloquence extant.

**SHERWIN, JOHN KEYSE**, an eminent historical engraver, who was all the early part of his life employed in the art of wood-cutting. He, however, at last obtained better employment, and became a pupil to the celebrated artist Bartolozzi, under whom he improved rapidly. Among his best works are the engravings of Christ and Mary Magdalen in the Garden, and Christ leaving the Cross. He died at a comparatively early age in 1790.

**SHERWOOD, WILLIAM**.—This highly respectable bookseller and publisher was born at Bristol in 1776. His father and mother died young, and after visiting Monmouth, where he remained for some time, he ultimately settled in the house of Mr. Symonds in Paternoster Row. In 1806 Mr. Sherwood entered into partnership with Messrs. Neely and Jones, and carried on the business with them till 1826, when he entered into partnership with Messrs. Gilbert and Piper, and we need hardly add, that the firm justly acquired a high character for the integrity and punctuality of its dealings. Mr. Sherwood enjoyed good health till a short time previous to his death, which occurred September 7th, 1837. On the 17th of the previous month he felt unwell, and said he could not see to read; he lay down for some time on the sofa, when his daughter arrived and took him from Paternoster Row. On the way home to Holloway he appears to have lost all consciousness; he was seen in the evening by Dr. Tweedie and bled from the arm as well as cupped. He partially recovered from some dangerous symptoms which followed; but it was discovered that the right side was paralyzed; the power of motion was lost, but a dull sensibility remained in the side to the last. After the first shock he could never speak distinctly, but appeared conscious, recognised persons, burst into tears when Mrs. Sherwood (who had been ill herself) approached him, and warmly pressed the hands of some medical friends who visited him.

Mr. Sherwood's private character was unsullied, and the enjoyments of his home, to which he was devotedly attached, formed the only solace from the most severe toil in his extensive business. It may be proper to add, that the firm materially benefitted both the theory and practice of medicine by their cyclopædia of that science.

**SHIELD, WILLIAM**, a celebrated musical composer, who was born at Shalwell in 1749. He received the first rudiments of music from his father, a singing-master, and at the early age of six began to practice the violin, and afterwards the harpsichord, on both of which instruments, but particularly the former, he soon acquired considerable proficiency. When he had attained his ninth year he lost his father, who left a widow and four children with very scanty means of subsistence. As it now became imperatively necessary that he should think of some business as a future means of subsistence, he had the choice proposed to him of becoming a sailor or a boat-builder. He fixed on the last, and was accordingly bound apprentice to Edward Davison of North Shields. He has often been heard to describe his feelings when he packed up his clothes, not forgetting his violin and little stock of music left him by his fa-

ther, bade adieu to his mother, little brothers and sisters, and proceeded with a heavy heart to the place of his destination. He, however, found a kind and indulgent master, who, so far from checking him in his favourite pursuit, encouraged his love for music, and even forwarded his views by enabling him in several instances to turn his talents on the violin to account by playing at the musical meetings of North Shields, as well as at the parties of the principal families of the town.

As soon as the term of his apprenticeship was expired he resolved to quit the trade of boat-building and devote himself to an art to which his disposition inclined him, and to the pursuit of which the encouragement he had already received operated as an additional stimulus. He had by this time made such progress on the violin as to be able to lead the Newcastle subscription concerts, where he repeatedly played the solo parts of Geminiani's and Giardini's concertos. His talents attracted the notice of the celebrated Avison, known by his elegant "Essay on Musical Expression," who, with the kindness which characterised him, gave him lessons in thorough bass. He shortly after afforded a striking proof of the manner in which he had profited by this instruction. A new church was to be consecrated at Sunderland: he composed an anthem for the occasion, which was accepted and performed by the choir of Durham cathedral to an immense congregation. The best judges pronounced it an excellent specimen of church music; the dignitaries of the church invited him to their tables, and his reputation began to rise from that moment.

He was shortly afterwards invited to undertake the direction of the fashionable concerts at Scarborough, and became the leader in the orchestra of the theatre, for which he composed several songs written by his friend, the much-admired pastoral poet, Cunningham, who was an actor in the Scarborough company at that period. Here he became acquainted with those well-known performers, Borghi and Fischer, who were so satisfied with his talents and execution that they strongly advised him to visit London, and afterwards represented his abilities in so favourable a light to the celebrated Giardini, leader of the band at the opera house, that an engagement was offered him in that orchestra, which he accepted. He took his station among the second violins; but the season following, attracting the notice of Mr. Cramer, who had become leader, he was promoted to the rank of principal viola, a post which he retained for upwards of eighteen years.

Mr. Shield's first appearance as a dramatic composer was in the year 1778, in the music to the after-piece of "The Flitch of Bacon," which obtained great success. The words were from the pen of the Rev. Mr. Bate, afterwards Sir Henry Bate Dudley, being also his first dramatic attempt. Some time after this he accepted the situation of composer to Covent Garden theatre, in which capacity several of his most popular works were produced. A difference, however, between himself and the manager respecting pecuniary matters, induced the former, after having filled the situation for several years with great success, to send in his resignation. In the year 1790, while on a visit to Taplow, he had the good fortune to make the acquaintance of Haydn; and he has been heard to declare that he gained more important information in four days' communion with

that founder of a style which has given fame to so many imitators, than ever he did by the best directed studies of any part of his life. "I had seen him," says Shield, "at the concert of ancient music the preceding evening; and, having observed his countenance expressive of rapture and astonishment at the performance of the chorus in "Joshua," "The nations tremble at the dreadful sound," I took the favourable opportunity of asking his opinion of that composition. His reply was, 'I have long been acquainted with music, but never knew half its powers till I heard this. I am quite certain,' added he, 'that only one author, and that author inspired, ever did, or ever could, pen so sublime a composition.'"

On his return to England in the autumn of 1792, Mr. Shield renewed his engagement with the manager of Covent Garden theatre; but another difference of a pecuniary nature arising, he entirely relinquished that situation and devoted his time to other musical pursuits. His residence in Italy, though short, was followed by the most important results to him, as a musical critic and writer on the principles of the art, for it removed many prejudices at that time not uncommon among English musicians, and furnished him with abundant materials for thinking, of which his active and intelligent mind made the best possible use. But it is quite erroneous to state that as a composer he derived much advantage from this tour: his two best operas, namely, "Rosina" and "The Poor Soldier," were produced several years anterior to his Italian journey. In these he displayed that genius for melody which no study, no intercourse with even the greatest of foreign artists, could have imparted, or in any considerable degree have improved, and melody was his forte. Of the advantages gained from his Italian journey he gave no mean proof, a few years afterwards, by the publication of his well-known "Introduction to Harmony." The principal object of this work is to facilitate the acquisition of a practical knowledge of harmony, by simplifying its laws, and divesting the science of that forbidding complexity which deters so many from venturing into its precincts. In 1809 Mr. Shield printed a volume of ballads, rounds, glees, duets, terzettos, &c. under the title of "A Cento;" but, being published by subscription, its circulation was rather limited.

On the death of Sir William Parsons in 1817, the prince regent (afterwards George IV.) advanced Mr. Shield to the situation of master of the band of musicians in ordinary to the king. This appointment was given in a manner as creditable to the feelings of the illustrious personage who bestowed it as to the professional and general character of him on whom it was conferred. The prince, who had long known Mr. Shield's value, both as a musician and as a member of society, seized the first opportunity that presented itself of serving a distinguished artist and a man whom he esteemed, without waiting for even the slightest request; and when Mr. Shield attended at the pavilion to express his gratitude, his royal highness interrupted him in the midst of his acknowledgments, by the flattering words,—“My dear Shield, the place is your due; your merits, independently of my regard, entitle you to it.” At the coronation of George IV. he, in his robes of office, conducted the musical part of that ceremony in Westminster Abbey; but as the performance of an ode at St. James's palace on the

king's birth-day and new year's day never was called for during the time he held the appointment of master of the band, he had no opportunity of showing his zeal in the execution of this, the most important part of the duty that used to attach to the office. He enjoyed his 250*l.* per annum, rather as the reward of past services than as a retaining fee for services here, perhaps, intended to be required. Mr. Shield was one of the original members of that body which wrought so remarkable a change in the musical taste of this country, the philharmonic society, though he never took any active share in its management. Indeed he began to feel the infirmities of age rather earlier than usual. He was naturally disposed to corpulency, the tendency to which was not diminished by the sedentary habits that grew on him. During the few latter years of his life, his health and strength visibly declined, and in the beginning of the winter of 1828, symptoms of water on the chest assumed a decided character to be mistaken. The disease made rapid progress, and on the 25th of January, 1829, he expired at his house in Berner's Street, where he had long resided.

SHIPLEY, WILLIAM, an English divine was born in October 1745, and at an early age was sent to Westminster school; but upon the appointment of his father, in 1760, to the deanery of Winchester, he was removed to the college there; whence he went to Oxford in 1763, and was admitted student of Christ Church, of which society his father had been a canon some few years before. Here he took the degree of M. A. in 1770, and soon afterwards was collated by his father, then bishop of St. Asaph to the vicarage of Wrexham, Denbighshire, whence he left the university, and from that time resided in Wales. Upon the death of Dr. Herring in 1774, he succeeded to the deanery of St. Asaph, and likewise to the office of chancellor of that diocese. From his father, a prelate of whose distinguished and venerable character it is here unnecessary to speak at large, the dean inherited a sincere attachment to an excellent constitution in church and state, and to those liberal principles which produced the revolution and established the house of Brunswick on the throne of these kingdoms. It was the defence of these principles that engaged him in the contest which, at the time, drew the general attention of the public, and will ever be regarded as a proof of his manly and disinterested character; for the principles which he maintained were then no longer fashionable.

With this contest is connected the illustrious name of Sir William Jones, who not long afterwards became the dean's brother-in-law, by his marriage with Anna Maria, eldest daughter of the bishop of St. Asaph. About the close of the American war that steady friend to liberty had written and published a little piece on the subject of government, entitled, "A Dialogue between a Gentleman and a Farmer." Of this piece he was the known and acknowledged author. The dean of St. Asaph published it in Wales, upon which he was indicted for a libel by a political adversary. The prosecution was long and vexatious; for the prosecutor, after twice bringing the cause for trial into the Westbury court, suddenly removed it by *certiorari* to Shrewsbury. When it came there to a hearing before Justice Buller, the jury were inclined to negative the charge of libel, and refused to give a general verdict against the dean. In this celebrated trial the

question was, whether or not the matter was libellous; and the single point in debate, whether or not the jury were to decide upon it. For the prosecution it was contended, that they were not; and the judge, in summing up, inculcated the same doctrine, which indeed at that period was generally current in the courts. The jury, however, gave a verdict, by which they found the publishing only; evidently meaning that they found nothing libellous in the matter: but this verdict not satisfying the judge, it was altered, by the suggestion of the prosecutor's counsel (Mr. Bearcroft), and given, according to his dictation, in these words, "guilty of publishing, but whether a libel or no we do not find." The case was then brought up for judgment into the king's bench, when that court had the sagacity to discover a flaw in some part of the proceedings, and thereupon quashed the whole. Such was the termination of that long-protracted case; but it led to an alteration which was made some years afterwards in the law of libel, or rather in the practice of the courts. We allude to the statute by which, in cases of libel, the jury are authorised to decide upon the law as well as the fact. The statute did not pass without great repugnance on the part of the lawyers: the two chiefs of the profession, viz., the Lords Thurlow and Kenyon, thought fit to enter their protest against it.

Throughout the whole of this transaction, the dean's conduct was irreproachable. He knew the principles of the dialogue to be sound, and those he resolutely maintained, but without any mixture of personal animosity, much less with any criminal design. From his father he had learned to "pay due reverence to the constitution:" he had learned that "it was his duty to study its principles, and consider its structure, that he might be qualified to defend, to preserve, and to improve it." From the same source he had learned, that "in whatever hands power is lodged under any government, there always goes with it an obligation to use it to those purposes of public good for which it appears to have been given;" that "this is the only good tenure by which all authority is held." These were the principles in which the dean was educated, and throughout the course of his long life he found no reason to change them.

This adherence to his principles appeared in the preface which he wrote when he gave an edition of his father's works in 1792. He there asserts, "that the teachers of a religion whose principles is to do good to all men, cannot, without deserting their office, forbear to teach the duties of princes and magistrates, and to show the guilt and ruin arising from the violation of those duties,—that on such occasions it becomes necessary to raise our conceptions above the common business of private life, and venture to apply the simple precepts of our Saviour to the greatest and most important operations of government,—that in the plainness of those precepts there is a depth of wisdom sufficient to direct the highest actions of men,—that the sublimity of the Christian morals consists in the usefulness, the extent, the universality of the principles,—that they give laws, not only to the vulgar, but to statesmen, princes, and lawgivers themselves." And farther, "that the ministers of religion should consider themselves as the teachers of whatever is good and useful to mankind; or, in other words, as teachers of the gospel." "Let the clergy (says he), like the rest of their fellow-subjects, pay all due submission to the powers that

are set over us for our good; tribute to whom tribute, honour to whom honour is due: but let them teach the greatest their duty; that they are not only servants of our common Master, but, by the very tenure of their office, servants of the people."

The dean wrote this preface partly to vindicate his father's line of conduct in our unhappy contest with the American colonies. That contest the bishop earnestly deprecated, and the measures which led to it he uniformly opposed, both in parliament and in various publications; particularly in "A Speech on the Bill for altering the Charters of Massachusetts' Bay." In the conclusion of that speech his lordship thus stated the grounds of his opposition,—"If the tendency of this bill is, as I own it appears to me, to acquire a power of governing them (the colonies) by influence and corruption, in the first place this is not true government, but a sophisticated kind, which counterfeits the appearance, but without the spirit or virtue of the true; and then, as it tends to debase their spirits, and corrupt their manners, to destroy all that is great and respectable in so considerable a part of the human species, and by degrees to gather them together with the rest of the world, under the yoke of universal slavery, I think, for these reasons, it is the duty of every wise man, of every honest man, and of every Englishman, by all lawful means, to oppose it." The bill passed; but the design, which was to bring the colonies to unconditional submission, miscarried; and we have no desire to recall to mind the disasters and failure of the war that followed: this only we shall not scruple to add, that the war, if completely successful, would have been still more injurious to our country.

And as the dean of St. Asaph enjoyed this domestic example for his conduct in general, so especially had he the same excellent pattern for the substance and manner of his preaching. The sermons of his father are distinguished by such doctrines as the following: that "to establish among men the practice of moral goodness and righteousness is the great end of true religion,"—that "matters of positive institution are subordinate and useful only as they promote the practice of real godliness, virtue, and charity,"—that "we do not think justly of our holy religion, unless we remember that it is the most extensive and universal of all religious dispensations,"—that "it is not only revealed, but adapted to every country and every climate, to all the different races of men, and to all the infinite forms of society and government in which they can be placed,"—that "by mixing intimately with the springs and principles of action, it assumes a right to conduct and govern every scene of human life, and forms (as the exigencies of the world require) not only saints and martyrs, but princes and statesmen." These doctrines were conveyed in an unaffected style, which, for purity and elegance, has not any superior in our language. Such was the rational and liberal course of preaching which the dean had for his example, and which he respectfully and uniformly followed. Dr. Shipley died at Boddryddan, on the 7th of June, 1826, in the eighty-first year of his age.

SHIRLEY, JAMES, a poet and dramatic writer, who was descended from an ancient family, and born in London about 1594. He received an excellent education, and entered holy orders; but having become a member of the church of Rome, he of course lost his ecclesiastical preferments. He therefore

settled in London and commenced writing for the stage, in which department of literature he was very successful, till the breaking out of the civil war, when he opened a school and educated the children of several distinguished men of that period. After the restoration his plays again became very popular; but having lost considerably by the great fire of London, he was so much affected that he died shortly after. He wrote nearly forty plays, besides poems and other works.

**SHOVEL, SIR CLOUDESLEY**, a celebrated English admiral who was born near Clay, in Norfolk. He entered the navy at a very early age, and at first filled the humble office of cabin-boy; at the same time he spent all his leisure time in the study of navigation. In 1674 the English merchants in the Mediterranean being very much annoyed by the piratical state of Tripoli, a strong squadron was sent into those parts, under the command of Sir John Narborough, who arrived before Tripoli in the spring of the year, and found considerable preparations for defence. Being, according to the nature of his instructions, desirous to try negotiation rather than force, he sent young Shovel, then a lieutenant, to demand satisfaction for what was past, and security for the time to come. Shovel went on shore and delivered his message; but the dey treated him with much disrespect, and sent him back with an indefinite answer. Shovel, on his return to the admiral, acquainted him with some remarks he had made on shore. Sir John sent him back with another message, and well furnished him with rules for conducting his inquiries and observations. The dey's conduct was worse the second time; and young Shovel, on his return, assured the admiral it was very practicable to burn the ships in the harbour, notwithstanding their lines and forts. Accordingly, in the night of the 4th of March, Shovel, with all the boats in the fleet filled with combustibles, went boldly into the harbour and destroyed the vessels in it; after which he returned safe without the loss of a man, and the Tripolines were so much struck with the boldness and success of the attack as immediately to sue for peace. Of this affair Sir John Narborough gave so honourable an account in all his letters that the next year Shovel had the command given him of the *Sapphire*, a fifth rate; whence he was not long after removed into the *James* galley, a fourth rate, in which he continued till the death of Charles II. In 1690 he was employed in conveying King William (who had previously knighted him), and his army, to Ireland; who was so highly pleased with him that he made him rear-admiral of the blue with his own hand. Just before the king set out for Holland, in 1692, he made him rear-admiral of the red, at the same time appointing him commander of the squadron that was to convoy him thither. On his return, Shovel joined Admiral Russell with the fleet, and had a share in the glory of the victory at La Hogue. When the British fleet was put under the command of joint admirals in the succeeding year, he was one; and, as Campbell says, "if there had been nothing more than this joint commission, we might well enough account from thence for the misfortunes which happened in our affairs at sea, during the year 1693." In 1702 he was sent to bring the spoils of the Spanish and French fleets from Vigo, after the capture of that place by Sir George Rooke. In 1703 he commanded the fleet up the Straits, where he protected the British merchantmen, and did all that was possible to be done for the relief of the protestants then

in arms in the Cevennes, and countenanced such of the Italian powers as were inclined to favour the allies. In 1704 he was sent with a powerful squadron to join Sir George Rooke, who commanded a grand fleet in the Mediterranean, and had his share in the action of Malaga. Upon his return he was presented to the queen by Prince George, as lord high admiral, and met with a very gracious reception; and was the following year employed as commander in chief. After the unsuccessful attempt upon Toulon, Sir Cloudesley bore away for the Straits, and soon after resolved to return home. He left Sir Thomas Bligh at Gibraltar, with nine ships of the line, for the security of the coasts of Italy; and then proceeded with the remainder of the fleet, consisting of ten ships of the line, four fire-ships, a sloop, and a yacht, for England. When he came into the soundings he had ninety fathom water. About noon he lay by, but at six in the evening he made sail again, and stood on under his courses, believing, as it is supposed, that he saw the light on St. Agnes, one of the islands of Scilly. Soon after which several ships of his fleet made the signal of distress, as he himself did; but the admiral's, and some more, perished with the board. How this accident happened has never been known. Sir Cloudesley Shovel's body was thrown ashore the next day upon the island of Scilly, when some fishermen took him up; and having stolen a valuable emerald ring from his finger, stripped and buried him. This fact becoming known, his body was taken up and carried to Portsmouth. It was thence conveyed to London, and buried in Westminster Abbey with great solemnity, where a monument was afterwards erected to his memory by the queen's direction.

**SICARD, ROCH AMBROISE CUCURRON** was born in 1642, at Fousseret, near Toulouse, and entered into holy orders. He devoted himself to the instruction of persons born deaf and dumb, and became, in 1786, director of a school established for that purpose by the archbishop of Bordeaux, whence in 1789; he removed to Paris, and was chosen successor to the abbé l'Épée, in whose system he made some important improvements. In 1793 he was arrested in the midst of his pupils by order of the commune of Paris, and was transferred to the prison of the abbey of St. Germain, where he narrowly escaped becoming a victim in the ensuing massacre. On the foundation of the normal school, in 1796, he was appointed professor of grammar; and, at the same time, he was made a member of the institute. He then became one of the conductors of the "Annales Catholiques," on account of which he was included by the directory in the number of the royalists sentenced to be exiled to Sinamaria. He concealed himself and thus avoided deportation; but he was not till after the overthrow of the directory that he was able to return to his situation at the school for instruction for the deaf and dumb. The old age of Sicard was clouded with misfortunes arising from his improvidence; but, after the restoration, he was made a knight of the legion of honour, administrator of the hospital of the Quinze-Vingts, &c. His death took place on the 10th of May, 1822. Besides other works, he was the author of "Éléments de Grammaire générale appliquée à la Langue Française," "Cours d'Instruction d'un Sourd-muet de Naissance;" and "Théorie des Signes pour l'Instruction des Sourds-muets."

**SIDDONS, SARAH.**—This highly gifted actress was born in South Wales on the 14th of July, 1755. Her father was a provincial manager, and her mother was the daughter of another provincial manager. In her fifteenth year Mrs. Siddons was in the employment of a lady named Greathead, where she remained about two years, after which she married Mr. Siddons, who was also an actor. He was described, by a person who knew him at that period, as a "fair and very handsome man, sedate and graceful in his manners, and, in his youth, capable of inspiring a passion quite as ardent as his own." He was, at the time, sustaining the first line of business in the company of his father-in-law—that is, he could play any thing. It is said that before her marriage, and while living at Mr. Greathead's, Mrs. Siddons contrived to obtain an introduction to Garrick, in whose presence she recited some of the speeches of "Jane Shore." He was pleased, we are told, with her utterance and deportment, admitted her merits, but declined offering her an engagement. It was not very likely, indeed, however clever a young lady of sixteen or seventeen might appear, that Garrick would disturb the arrangements of his theatre, where Mrs. Yates and Miss Young then divided the empire of tragedy, by inviting the town to witness the immature efforts of so youthful a candidate.

Soon after their marriage Mr. and Mrs. Siddons were performing at Cheltenham, where the latter attracted the notice of Lord Bence, afterwards created earl of Aylesbury. His lordship was so struck with her acting that he wrote to Garrick about her; and Garrick, who was not accustomed to think slightly of an opinion sealed with a coronet, sent the Rev. H. Bate to attend her performances, and report his opinion of them; unconscious, in all probability, that the Mrs. Siddons of the Cheltenham theatre was the Miss Kemble of Mrs. Greathead's family, upon whose claims to his patronage he had already personally decided. The result of this mission was such a report of the young actress as led to her appearance at Drury Lane, on Friday the 29th December, 1775.

The character she selected for her debut was that of Portia in the "Merchant of Venice," and she was announced as a young lady merely. Theatrical criticisms in those days were not manufactured in such abundance as they now are, though probably they were written with pretty much the same knowledge of the thing criticised. As a curiosity, rather than as a just estimate of what her performance was, we insert a notice of it, which has survived the general fate of such perishable commodities:—"On before us," says the critic, "tottered rather than walked a very pretty, delicate, fragile-looking young creature, dressed in a most unbecoming manner, a faded salmon-coloured sack and coat, and uncertain whereabouts to fix either her eyes or her feet. She spoke in a broken tremulous tone, and at the close of a sentence her words generally lapsed into a hurried whisper that was absolutely inaudible. After her first exit the buzzing comment round the pit ran generally, 'She is certainly very pretty; but then how awkward! and what a shocking dresser!' Towards the famous trial scene she became more collected, and delivered the great speech to Shylock with the most critical propriety, but still with a faintness of utterance which seemed the result rather of an internal physical weakness than a deficiency of spirit or feeling. Altogether, the impression made upon the

audience by this first effort was of the most negative description."

During the remainder of the season she performed several insignificant characters: among them, one in an operatic piece called "The Blackamoor Washed White," and another in Mrs. Cowley's comedy of "The Runaway." The former expired after the third representation, but the latter, having a run of seventeen nights, enabled Mrs. Siddons in some degree to familiarise herself with the gaze of a metropolitan audience. Two characters, and only two, were assigned to her which gave her an opportunity of appearing on the stage with Garrick himself; the one, Mrs. Strickland, in Hoadley's comedy of "The Suspicious Husband," Garrick playing Ranger; the other, Lady Anne, to his "Richard the Third." The latter she repeated twice, and the last time in the presence of royalty, the tragedy being performed on the 5th of June, 1776, by command of their majesties. Five days after, Garrick took his leave of the public in Don Felix.

Mr. Yates, the manager of the Birmingham theatre, offered the unsuccessful *débutante* an engagement, which she immediately accepted. There she played with Henderson (himself an unsuccessful seeker of metropolitan fame), who was so struck with her style of acting that he wrote immediately to Mr. Palmer, the manager of the Bath theatre, to which Henderson belonged at the time, urging him in the strongest terms to engage her. The Bath stage, however, was pre-occupied by a lady who played the same cast of characters. Palmer could not, therefore, comply with his friend's advice; but it was not lost upon him, for at Bath Mrs. Siddons afterwards made that impression which was the herald of her greatness when she returned to the boards of Drury Lane in 1782, and won from others the opinion which Henderson was the first to pronounce—viz. "that she had never had an equal, and never would have a superior."

Her range of characters at the principal provincial theatres during this period was tolerably expansive; but those in which she was considered to excel were Euphrasia, Alicia, Rosalind, Matilda, and Lady Townley. At Manchester one of her most applauded parts was Hamlet, a character she performed many years afterwards on the Dublin stage, though she could never be prevailed upon to play it in London.

It was a favourable, and a just maxim of Frederick of Prussia, that accident must first lift a man from the ground; but that, once raised, the vigour of his own wing can alone sustain him. Mrs. Siddons verified the truth of this maxim. Bath was undoubtedly a desirable station to her; but the theatre for sometime was sufficiently cool when she played, and Palmer troubled her only on his Thursday nights, when the cotillion balls carried off every body who could move to the rooms, and when, consequently, that eye, which ere long was to fascinate all ranks and ages, was frequently bent on vacancy. At last came Frederick's "accident." On one of these devoted Thursdays, there happened to be in the theatre persons not only of consummate taste, but, what is of much more consequence in such matters, persons whose taste carried with it the authority of station. Every body could then discern what nobody had been able to discover till it was discovered for him. Even the cotillions languished on the nights when Mrs. Siddons performed; and dancing was re-

nounced for the pleasure of weeping, sighing, trembling at the theatre.

It is not surprising that the fame which now gathered round her should have prompted the London managers to make proposals for securing her services; but it is surprising that the Bath manager should have suffered her to escape from him in the way he did; for it is stated by one of her biographers, upon unquestionable authority, that a very inconsiderable increase of salary would have induced her to relinquish all idea of appearing in London again, at least for many years. That increase, however, the manager hesitated to offer till it was too late. The fact was, seeing herself esteemed and followed by the first people at Bath, Mrs. Siddons had completely acquiesced in her situation there; the more so, probably, because of the distaste which her experiment on the London boards in 1775 had produced. The growing demands of her family, however, determined her to accept a proposal which would enable her to meet those demands with more comfort to herself than she could hope to do if she declined it.

When it was finally settled that she should enter into an engagement with the manager of Drury Lane (an engagement, it is said, mainly resulting from the influence of the late duchess of Devonshire with Sheridan), she invited her friends and admirers to her farewell performance on the Bath stage, and to receive from her three reasons for quitting them. The night came, and Mrs. Siddons recited a poetical address of her own writing, in which she supposes they would feel some astonishment at listening to verses the composition of one who had hitherto aspired no higher than to "repeat with decency the verses of others;" and some curiosity to know what the reasons were which she intended to submit to them. At length she produced her reasons,—leading on the stage her three children, and, as she pointed to them, exclaimed:—

"These are the moles that heave me from your side  
Where I was rooted—where I could have died!"

The appeal was irresistible, and the mother and the actress were alike gratified. On the 10th of October, 1782, Mrs. Siddons made her first appearance on the boards of Drury Lane, after an interval of seven years. Isabella, in Southerne's tragedy of that name, was the character she selected; and her performance, judging from the language of contemporary criticism, was even thus early cast in a mould which she never saw reason to alter, during the thirty years she continued to represent it.

It is unnecessary to add that her success was decisive. The public had never before beheld an actress whom nature had so prodigally gifted. She combined all the separate excellences of her predecessors and contemporaries, and added to their common stock her own exclusive endowments.

Between the 10th and 30th of October, Mrs. Siddons performed Isabella eight times, and during the season two and twenty. Her next character was Euphrasia, in the ponderous tragedy of "The Grecian Daughter;" and she displayed, as far as Murphy's frigid pen afforded her scope, those loftier attributes of regal greatness which shone forth so sublimely afterwards in her Lady Macbeth, Queen Catharine, and Lady Constance. Some surprise, it is said, was expressed upon her entrance the first night; for she appeared a perfectly different being from herself in Isabella. The settled sorrow that weighed down

the wife, the presumed widow of Biron, had given place to a mental and personal elasticity, obviously capable of efforts "above heroic."

The unprecedented attraction of Mrs. Siddons was met, on the part of the proprietors of Drury Lane, with suitable liberality. Her engagement, as to weekly salary, was upon an annual rise from 10*l*. This salary they did not then augment; but they allowed her two benefit nights, and relinquished on both the nightly charge, about 90*l*. Her success, too, was seconded by her own prudence. She launched into no unnecessary expenses, residing merely in respectable lodgings in the Strand, for the convenience of being near the theatre; and animated by the best inspiration,—a mother's feelings for her family,—prepared herself for a life of such exertion as mocks the toil of mere manual labour. It became, of course, the fashion to know her; and, for once, the fashionable world, in following the fashion, did honour to itself. Her door, at this time, saw more carriages daily before it than that of any other private residence in London.

We have mentioned that the Drury Lane manager allowed a second benefit night to Mrs. Siddons, on which occasion she selected the character of Zara, in Congreve's "Mourning Bride." This second benefit took place in the month of March 1783, and some notion may be formed of the extent to which Mrs. Siddons' attractions had reached, when we mention that it produced the sum of 650*l*.; for it must be remembered that the Drury Lane theatre of 1783 was not that enormous receptacle which it now is. Seven rows of the pit were laid into the boxes on the occasion, and Lady Spencer gave ninety guineas for her side box, while Lady Aylesbury sent 50*l*. for an upper box. It is amusing to add, as coincident almost with these evidences of the position Mrs. Siddons had taken in public estimation, that a poem entitled "Tragic Muse," written by the author of "The History of Modern Europe," (Russell,) was published about this time; and that the writer was gravely rebuked, by some prophetic reviewer, for "wasting his verse upon excellence that was in its nature fugitive, the meteor of the moment!"

No sooner, however, had Drury Lane closed, than she left London for Dublin, where her brother, John Kemble, was then playing, and who had signed an engagement for three years with the proprietors of Drury Lane. Her success here corresponded with that she had experienced in the metropolis, in spite of some strong predilections which the Dublin audience entertained in favour of Mrs. Crawford. It is said she carried away about 1100*l*. from Dublin, and at least 700*l*. from Cork.

Hitherto she had left Shakspeare untouched; and the first character she acted was selected, it is said, as affording some relief to her frame, really exhausted by the dreadful fatigues she had undergone, with no other intermission than was afforded by travelling from place to place. It was that of Isabella in "Measure for Measure," which she performed November 3rd, 1783, and repeated on the 5th by royal command, so desirous were their majesties of seeing her in any thing new. Her delineation of it was full of original genius, both as to conception and as to execution.

Having played Mrs. Beverley, in "The Gamester," (which gave her the first opportunity of acting with her brother, who sustained the part of Beverley,) and

established additional claims to her power over the heart, in depicting the woes of private life, she made her appearance on the 10th of December, 1783, in the character of Constance, by royal command.

It was during the year 1784 that Sir Joshua Reynolds painted his celebrated portrait of her as the Tragic Muse; the original of which is now in the splendid collection of the marquis of Westminster, and the duplicate at Dulwich college. The name of the great artist, and the date of the picture, were inscribed by him on the hem of the garment; the only instance, it is said, of his having affixed them to any production of his pencil. When Mrs. Siddons first saw the picture in its finished state, she went near to examine the pattern of this which appeared to be a curious classic embroidery (at that time much in fashion), and then perceived it contained the great painter's name, a circumstance which she noticed to Sir Joshua, who was present. "I could not lose the opportunity," he replied, "of my name going down to posterity on the hem of your garment." Burke, who inspected the progress of this fine and celebrated work, pronounced it "the noblest portrait he had ever seen of any age."

Mrs. Siddons' second season at Drury Lane closed on the 13th of May, with a sixth performance of *Belvidera*. She acted fifty-three times between the 8th of October and her last night; that is, allowing for the oratorios in Lent, once in every three nights of the company's performance. Her range of characters was as follows:—*Isabella*, *Belvidera*, *Lady Randolph*, *Shakspeare's Isabella* and *Thomson's Sigismunda*, *Euphrasia*, *Constance*, *Jane Shore*, the *Countess of Salisbury*, *Zara* in "*The Mourning Bride*," and *Calista*. During the summer recess she acted at *Edinburgh* eleven nights; and the distinction she met with in that capital was entitled to be ranked among her most flattering triumphs. It had not then, indeed, received from itself the high sounding title of the "*Modern Athens*;" but it was the centre of literature and science; and the supporters of the theatre were to be found among a class of persons infinitely more polished and intelligent than the mixed audiences of London. From *Edinburgh* she went to *Dublin* and *Cork*; but her health began to feel the effects of such incessant labour; and she was compelled to relinquish some of the engagements into which she had entered, in consequence of severe and even dangerous illness.

An injudicious attempt was made to introduce Mrs. Siddons in comedy—the more injudicious because wholly unnecessary; as at this time *Drury Lane* possessed the united attractions of *Miss Farren* and *Mrs. Jordan*. The characters she played were *Mrs. Lovemore*, in *Murphy's "Way to Keep Him;"* *Mrs. Oakley*, and *Lady Restless*, in "*All in the Wrong*;" and we believe one or two others. The flattering attentions paid by *George the Third* to this great actress were not confined to the public exhibition of her talents. She frequently enjoyed the honour of being with the royal family in their retired moments, both at *Buckingham House* and at *Windsor*. This enabled her to be among the first who discerned those symptoms of mental aberration which, in the year 1788, called for the solemn attention of the legislature; and the circumstance that confirmed, if it did not first awaken, her suspicions was singular.

His majesty, on all occasions, had expressed his gracious disposition to promote the interests of her-

self and her family: but on one occasion, at the period we are now speaking of, he put into her hands a sheet of paper subscribed with his name merely; intended, it may be presumed, to give her the opportunity of pledging the royal signature to any provision of a pecuniary nature which might be most agreeable to herself. This paper, with the discretion that was suited to the circumstance, and which was so characteristic of Mrs. Siddons herself, she immediately delivered to the queen.

On the 25th of November, 1788, Mrs. Siddons performed, for the first time, *Queen Catherine* in "*Henry the Eighth*," which was carefully revived by Mr. Kemble, then stage-manager, who was resolved to introduce those changes in scenery, dresses, the properties, &c., which constituted an era in the art. "*Henry VIII.*" was, accordingly, produced with such splendour and novelty that it became one of the most attractive pieces the stage had ever known. And here, as in *Lady Macbeth* (and, indeed, all her characters), we could run riot in quotation, to renew, for a moment, the exquisite gratification with which we listened to her noble delivery of innumerable passages. But our prescribed limits are rapidly narrowing themselves, and a volume might be filled with such a theme! One only observation, therefore, shall be obtruded, relating to the last scene in which Catherine appears. A Siddons alone could have invested that scene with the intense interest which she threw round it. Full as it is of Shakspeare's finest touches of tenderness and pathos, and deep as are the emotions which it excites in the reading, it requires extraordinary powers in the actress to make its quiet sorrow reach the hearts of an audience. Mrs. Siddons, however, wrung them to the quick; and silent tears, shed in sympathy for a sick and dying queen, killed by afflictions too sharp for long suffering, were the homage paid to her transcendent powers. Her whole appearance was a personification of that grief which digs its victim's grave; yet so resigned, so meek, so gentle, so full of conscious love and honour and virtue, unworthily requited! We can vividly recall her languid and dejected air, and almost fancy we hear the plaintive sadness of her voice as she uttered the passages in reply to *Capucius*, who entreats her to "take good comfort." All the yet lingering affections of the unjustly deserted wife,—all the natural yearnings of the mother's heart for the child she is about to leave,—were distressingly true to nature.

"This season, too," says her biographer, "she added *Volumnia* to her other characters from Shakspeare, and before the close of it appeared as *Britannia*. *Britannia*! In what? Mallet's '*Masque of Britannia*,' or Lillo's '*Masque of Britannia and Batavia*,' or Mr. Lediard's '*Opera of Britannia*,' or, lastly, *Sir W. Davenant's* and *Inigo Jones's 'Masque of Britannia Triumphant?'*—In none of these; but, in a promenade, concert, recitation, supper, and ball, given by the club at *Brookes's* to the ladies, in the *Opera House* (which was suitably fitted up for the occasion), in celebration of the king's recovery! It was even so. Mrs. Siddons, dressed as *Britannia*, recited an ode written by *Merry*, of *Della Cruscan* notoriety; and when she had done, sat down in the exact attitude of *Britannia*, as the lady appears on our copper coin. She even repeated the exhibition, on her benefit night, after performing *Juliet*, on the 11th of May. Surely nothing but an amiable desire to contribute her share.

in any way she could, towards the general fund of rejoicing at an event which she had personal feelings to gratify in commemorating, could have induced her to consent to a piece of mummery, for which any *figurante* on the stage had sufficient qualifications."

In the year 1792 the Drury Lane company played at the Opera House, while their theatre was rebuilding; and here, on the 26th of March, she first delighted the town with her recitation of Collins's "Ode on the Passions." The new theatre, however, was completed by the spring of 1794; and, on the 21st of April in that year, opened with the tragedy of "Macbeth," Mr. C. Kemble performing the character of Malcolm. "Mrs. Siddons," says one of her biographers, "on this first appearance in the new theatre, would have been more than human if she had not exulted. It was unquestionably the finest in Europe; and the conduct of it, and its main support, certainly in her own family. As to the property itself, I am very sure that they grasped at it in imagination. So devoted to politics as Mr. Sheridan seemed, it might look more than a remote probability that he would one day take office with his party, and that a theatre and its concerns must be resigned to the more urgent claims of official dignity and business. At such a time a sale might take place upon liberal and easy terms, and the influence of Mr. Sheridan upon the fashionable world continue a marked preference for a theatre of which he had been the proprietor, and was still the guardian." If these were the hopes of the Kemble family, they were destined to disappointment, not only then, but afterwards; for when, in the season of 1800-1, Mr. Kemble resumed the stage-management (which he had relinquished to Mr. Wroughton in disgust some years before), preparatory to a purchase of part of the property, in conjunction with Mrs. Siddons, obstacles presented themselves connected with Mr. Sheridan which were found to be insurmountable. The consequence was, that Mr. Kemble, his sister, and his brother, seceded to Covent Garden theatre; Mr. Kemble himself becoming a large proprietor of the concern.

For the last twenty years of her professional life Mrs. Siddons was like a successful conqueror, who consigns himself to comparative mediocrity by subduing all his enemies. So it was with her. She had achieved every thing that could be achieved. She left herself no fresh victories to gain, no new laurels to gather. To pursue our simile to a point, where in fact it is no simile at all, there was nothing remaining for her to do but to fight her battles again and again; to repeat every season her principal characters, and to delight afresh those who could never be weary of beholding her in them. Mrs. Siddons was less taciturn in society than was generally imagined by those who had only infrequent opportunities of seeing her. She sang many simple ballads with infinite taste; and, when in a very select circle, introduced a peculiarly dry humour into amusing trifles. Joanna Baillie says, "The effect she gave to the comic passages of Shakspeare was the most wonderful proof of her genius."

Many exaggerated stories have been related of her stately manner and theatrical elocution when off the stage. It was obviously impossible that a woman upon whom Nature had stamped loftiness of mien, could throw it wholly aside even on the most ordinary occasions; while some allowance was to be

made for the habitual assumption of characters that demanded solemnity of look, grandeur of action, and dignity of voice. Nature and art thus co-operating, and the impulses of art being nearly as constant as those of nature, it was to be expected that Mrs. Siddons in a room would be unlike other women: added to which, they who had received their first impressions of her on the stage, would find it very difficult to discard them altogether when they met her in private society.

Mrs. Siddons was fond of amusing her leisure hours with an art not often cultivated by females, that of statuary. It is supposed this predilection had some effect upon the simplicity and grace of her drapery on the stage, and the severity of her attitudes, by directing her attention, as it necessarily would, to the antique. Some busts, modelled by her, were long preserved at Guy's Cliff, the seat of Mrs. Greathead, with whom, it may be remembered, she was placed by her parents when about fifteen; but it is not mentioned whether they were the production of that or of a more mature age. She was the mother of five children, three daughters and two sons; one daughter and one son survived her. Cecilia Siddons had been the constant companion of her revered parent for years, and was with her in the last dying moments of her dissolution. Her second daughter, Maria, sunk into the grave at Bristol, on the 6th of October, 1798, the victim of that hopeless, but flattering disease, consumption; the victim, too, there is reason to believe, of an unfortunate attachment to the late president of the royal academy, Sir Thomas Lawrence. "She was," says Mr. Boaden, "one of the loveliest beings I have ever known. I can hardly bring myself to allow so much—but she was, perhaps, more beautiful even than her mother; or rather, perhaps, what the latter would have been, if, with every indulgence in her early years, she had possessed full leisure to cultivate her taste, and exercise her fancy, without any of those prodigious exertions which gave her at last an appearance of strength and energy not usually characteristic of English females."

In December 1802 Mrs. Siddons lost her father; and on the 24th of March following, her eldest daughter, the progress of whose malady was so rapid that she died before her mother's return from Ireland. This second blow weighed heavily upon her spirits. What she felt, indeed, is beautifully and pathetically expressed by herself in a correspondence that was given to the world under peculiar circumstances.

"The testimony of the wisdom of all ages," she observes in one of these letters, "from the foundation of the world to this day, is childishness and folly, if happiness be any thing more than a name, and I am assured our own experience will not enable us to refute the opinion. No, no; it is the inhabitant of a better world. Content, the offspring of moderation, is all we ought to aspire to here; and moderation will be our best and purest guide to that happiness to which she will most assuredly conduct us. If Mr. L. thinks himself unfortunate, let him look at me and be silent. The inscrutable ways of Providence! Two lovely creatures gone; and another is just arrived from school with all the dazzling, frightful sort of beauty that irradiated the countenance of Maria, and makes me shudder when I look at her. I feel myself like poor Niobe, gazing

ing to her bosom the last and youngest of her children; and, like her, look every moment for the vengeful arrow of destruction."

It was about this period that a separation took place between herself and Mr. Siddons. The exact causes of it are not known. The merits of Mr. Siddons as an actor were so thoroughly obscured by the blaze of glory which surrounded his wife, that it was considered incompatible with the interests of the family to allow him to continue on the stage. At one time he purchased into Sadler's Wells; and though for several seasons it turned out a profitable speculation, in the end he retired from it with loss. The same fate attended another undertaking, from which he had promised himself great advantages. These things tended, perhaps, to sour his disposition; and, in addition, he is said to have grown, latterly, somewhat impatient of the "crown matrimonial,"—that is, he was apt to consider himself neglected in society because of the greater attractions which centred in his wife. This feeling "unhappily produced," says Mr. Boaden, "in a most honourable and high-spirited man some inequalities of temper which occasionally seemed harsh to a woman conscious of the most unremitting diligence in her exertions and often endangering her health to secure, along with fame to herself, the present and future comforts of her family. Some expressions of her irritation upon such annoyances have been printed by the person to whom I have before alluded; and at length Mr. Siddons, after suitable arrangements as to the property, retired to Bath. But he retained, at all times, the sincerest regard for his incomparable lady, and proved it by the last solemn act of his existence." He died at Bath in 1808.

We can hardly feel surprised to find Mrs. Siddons (thus harassed with domestic sorrows) impatient for retirement; though still basking in the full sunshine of fame, and commanding the sources of increasing fortune. But her brother had now embarked 23,000*l.* in Covent Garden theatre; and her presence there was vitally important to him. She therefore determined to devote herself to his views in life, when her own were all closed. In the correspondence to which we have already referred, she thus alludes to this determination:—

"Alas! my dear friend, what have I here? Yet here, even here, I could be content to linger still in peace and calmness. Content is all I wish. But I must again enter into the bustle of the world. For though fame and fortune have given me all I wish; yet, while my presence and my exertions here may be useful to others, I do not think myself at liberty to give myself up to my own selfish gratifications." Again: "I shall leave this place (Banister's) on the 1<sup>st</sup> of next month (September, 1803), and will write again as soon as I can after I get to town. I shall have a great deal of business upon my hands, and upon my head and heart many imperious claims. I find it is utter folly in me to think that I am ever to live one day for myself, while these various claims, dear and tender as they must always be, exist: nothing but my brother could have induced me to gain to appear in public; but his interest and honour must always be most dear to me."

In the winter of 1806-7, Mrs. Siddons and Kemble commenced playing again. In little more than three months afterwards, however, the first stone of the new theatre was laid by the prince of

Wales, and on the 18th of September, 1809, the present magnificent edifice was opened with the tragedy of "Macbeth." But it passed in dumb show; for a theatrical conflict commenced that night as memorable in dramatic annals as Blenheim or Waterloo in military ones. Mrs. Siddons opened the new theatre, as we have said, on the 18th of September, 1809; and it was on the 24th of April, 1810, before she repeated *Lady Macbeth*. In the season of 1810-11 she performed nearly the whole of her characters; and never did she display greater dignity and force of mind. It would be absurd to say her autumn excited the tears of her April, when *Isabella*, her *Shore*, and her *Belvidera* were in their prime; but her *Constance*, her *Hermione*, her *Queen Catherine*, and her *Lady Macbeth*, were shorn of none of their splendour down to their latest repetition.

In 1812 she retired from the stage, and chose for her farewell part *Lady Macbeth*, which she performed on the 29th of June in that year. The occasion was distinguished by a homage to her genius which has no precedent in theatrical annals. When the scene of the murder shut in, a general movement was observed in the house—the remainder of the play was dismissed, and the audience lingered only till she delivered her short valedictory address. On that night, therefore, her professional life may be said to have terminated; for though she came forward on two or three subsequent occasions, between the years 1812 and 1817, purely to serve the interests of her brother, Mr. C. Kemble, she did not, like some performers, accept of any limited engagements afterwards to perform a certain number of characters.

In the month of April 1815 she lost her son, Henry Siddons, who died at Edinburgh, where he was the manager of the theatre. He played one or two seasons in London, but he inherited no portion of his mother's talents. It may be remarked that on the 8th of June, 1816, Mrs. Siddons consented to play *Lady Macbeth* to gratify the late Princess Charlotte. Her royal highness, however, when the night came, was too ill to attend. At first the managers thought of changing the play; but conceiving the public would be greatly disappointed at not seeing Mrs. Siddons, she readily complied with their wish, and performed the character.

After her retirement from the stage she gave a course of public readings from Shakspeare, at the Argyle Rooms, which were eagerly attended by the public. She also gave public readings of Milton, consisting chiefly of passages from "*Paradise Lost*." The latter years of Mrs. Siddons were passed in affluence, in comparatively good health, in domestic comfort, and in the society of those distinguished friends whom time had left her, or who successively filled up the chasms which time had made. She died on the 8th of June, 1831, at her house in Upper Baker Street, having nearly completed her seventy-sixth year.

SIDNEY, ALGERNON, a celebrated English republican and martyr to liberty, who was the second son of the earl of Leicester, by the daughter of the earl of Northumberland. He was born in 1622, and educated under the inspection of his father, whom he accompanied in his embassies to Denmark and France. He was also early trained to a military life, and served with some distinction under his brother, Lord Lisle, during the Irish rebellion. In 1643 both brothers returned to England, and joined the parlia-

ment. In 1645 Algernon was promoted by Fairfax to the colonelcy of a regiment of horse, and, after being present in several actions, was entrusted with the government of Chichester. He was then stationed in Ireland, but soon after returned to England, where he was thanked by parliament for his services, and made governor of Dover. When the high court of justice was formed for the trial of the king, he was nominated a member, but was neither present when the sentence was pronounced, nor signed the warrant for the execution. It appears, however, that he vindicated that measure, which has led to a supposition that, in withholding his signature, he only yielded to the influence of his father. A politician so inimical to the encroachments of authority was not likely to acquiesce in a usurpation, and he warmly opposed the designs of Cromwell. During the government both of the protector and his son Richard, he lived in retirement at Penshurst, where he is supposed to have composed his celebrated "Discourses on Government." When the return of the long parliament gave expectations of the establishment of a republic, he assumed a public character, and was nominated one of the council of state. He was soon after appointed a commissioner to mediate a peace between Denmark and Sweden, and while engaged in this embassy, the restoration took place. Conscious of the offence he had given to the royal party, he refused to return, and remained an exile for seventeen years; and, although occasionally assisted by his family, he found it difficult to support himself in conformity to his birth and rank. At length, in 1677, the influence of his father obtained leave for him to return, with a pardon for all offences. At the time of his return, parliament was urging the king to a war with France; and it was feared by the opposition that Charles II. would agree to it until he obtained the supplies, and would then squander them on his pleasures, or devote them to arbitrary purposes. The English patriots were therefore opposed to this war, and some of the leaders intrigued with the French ambassador, Barillon, to defeat the measure. It even appears, according to the Barillon papers, as given by Sir John Dalrymple, that the name of Sidney was among those who received pecuniary aid from France. The testimony thus afforded against a man of high character, and whose sacrifices to principle were notorious, has led to the suspicion of fabrication and interpolation.

The death of his father, soon after his return, led him openly to join in the opposition, and he consorted much with the duke of Monmouth and others who held views kindred or similar to his own. In the Rye House plot he was named as one of a council of six, who were to organize an insurrection in conjunction with the Scottish malcontents. It was, however, for his supposed share in the subordinate conspiracy for assassinating the king that he was arrested, with Lord William Russell and others. After the sacrifice of the latter, he was tried, as the next most obnoxious person, for high treason, before the hardened tool, Chief Justice Jeffreys, on the 21st of November, 1683. There was no direct evidence against him, except that of the disgrace to nobility, Lord Howard, while the law for high treason required two witnesses. To help this defect, the attorney-general had recourse to the expedient of producing passages from some "Discourses on Government," found in manuscript in his closet, which maintained

the lawfulness of resisting tyrants, and the preference of a free to an arbitrary government. Although there was no proof that these papers were in his own handwriting, in defiance both of law and common sense they were deemed equivalent to a second witness, and, in spite of his spirited defence, he was declared guilty. After his conviction, he sent, by his relation, the marquis of Halifax, a paper to be laid before the king, requesting his review of the whole matter, but it served only to delay his execution about a week. Hume acknowledges the illegality of his condemnation, for which he observes, "the jury were not blameable," but remarks, that an interference by the king might be regarded as an act "of heroic generosity, but could never be deemed an indispensable duty." Sidney was executed on Tower Hill on the 7th of December, 1678, when he delivered the sheet a paper, alleging the injustice of his condemnation, and concluding with a prayer for "the good of the cause." He suffered with all the firmness and constancy belonging to his character. One of the first acts of the revolution was to reverse his attainder, and the name of Algernon Sidney has since been held in great honour by the majority of those who maintain the fundamental principles of free government. Burnet speaks of him as of extraordinary courage, steady even to obstinacy, impatient of contradiction, and a decided enemy to monarchy and church government.

SIDNEY, SIR PHILIP, a clever writer, who lived in the reign of Elizabeth. He was descended from an ancient and honourable family, and from the excellence of his education, and his great personal bravery, stood very high in the opinion of his contemporaries. He became governor of Flushing, and general of the troops sent by the queen to assist the Dutch against the Spaniards. On the 22nd of September, 1586, being at the head of a detachment of the English troops, he surprised a convoy of the enemy marching towards Zutphen. An engagement took place, in which his party gained the victory, which was, however, dearly purchased by the loss of their brave commander, who received a wound of which he died a few days after. He was the author of several works, the principal of which was an "Arcadia."

SIEYES, EMANUEL JOSEPH, COUNT DE, a French ecclesiastic, who was born in May 1748 at Fréjus. He was vicar-general of the bishop of Coutances, when, in 1789, he was appointed deputy of the third estate of Paris in the estates-general. He was indebted for this appointment to his celebrated pamphlet, "Qu'est-ce que le tiers Etat?" which gave him great favour among the people. He contributed much to the union of the three estates, and first proposed to declare the chamber of deputies of the third estate a national assembly—a measure which defeated the revolution. He insisted on the removal of the troops, and advocated the celebrated oath in the tennis-court at Versailles. It was he, too, who proposed with so much warmth the abolition of the tithes, and who uttered the celebrated sentence, "You wish to be free, but you know not how to be just." He opposed the sanctioning of the veto, which was contended for by Mirabeau, and suggested the idea of dividing France into departments, cantons, and municipalities—a measure which contributed not a little to give stability to the revolution. He was very active in committees, labouring

to frame a constitution, but rarely spoke in public; for in 1789 he had declared himself unskilled in extempore debate, and determined not to appear in the tribune. Mirabeau then declared, in a full assembly, that the silence of Sièyes was a public calamity. In 1790 he proposed a law to the assembly for punishing offences of the press. At the same time he proposed the admission of juries on trials for these offences. In 1791 Sièyes was made a member of the directory of the department of Paris, and, about the same time, refused the bishopric of the capital, which he was solicited to take by the electoral assembly. Amid the zeal for republicanism which then prevailed he declared himself, in the "Moniteur," decidedly favourable to monarchy. "I prefer monarchy," said he, "not because I am fond of ancient usages; not from any superstitious love of royalty; I prefer it because to me it seems evident that the citizens have more real freedom in a monarchy than in a republic. But the best state is that in which all may quietly enjoy the greatest freedom possible."

When he was made a member of the convention he shunned distinction, in order to escape the storms which he saw were coming. At the time of the trial of Louis XVI. he was true to this system, and, on the occasion of the vote which decided the fate of that prince, "Yes," "No," and "Death," were the only words which were heard from his mouth. He had before maintained, without effect, that it was not proper for the assembly to unite the judicial with the legislative body. He remained comparatively in the back ground till 1795. Then he ascended the tribune, and expressed his abhorrence of the crimes of Robespierre, whom he had not dared to resist. He soon after became a member of the committee of public safety, was sent to Holland to conclude a treaty there with the new republic, and, on his return, had an important influence on the treaties with Prussia and Spain. In 1798 he went as ambassador to Berlin, and remained there till 1799, when he was made a member of the directory in place of Rewbel. The revolution of the 18th Brumaire was contrived by Sièyes in conjunction with Bonaparte, and in consequence of this he was appointed consul provisionally, with Napoleon and Roger Ducos. On the introduction of the new constitution he was made a member of the senate, and received the estate of Crosne, but as he did not take actual possession of it he received an indemnification. After the restoration he went back to the capital. On the return of Napoleon from Elba, Sièyes was made a member of the chamber of peers, but in 1816, by the royal decree against the regicides, he was banished from France.

SIMON, SAINT, an ancient French family, which claims to derive its origin through the counts of Vermandois, from Charlemagne. Louis de Rouvroy, duke de St. Simon, a peer of France, known as the author of some very curious memoirs, was born in 1675, and died in 1755. He was employed in several diplomatic missions, and was made one of the council of regency by the notorious regent, the duke of Orleans, after whose death he retired to his estates. His memoirs remained a long time in manuscript, and were afterwards published in a mutilated form, with many suppressions. The first complete edition appeared in Paris in 1829, under the title of "Mémoires Complètes et Authentiques du Duc de Saint Simon sur le Siècle de Louis XIV., et la Régence,

publiés pour la première Fois sur le Manuscrit original entièrement écrit de la Main de l'Auteur, par M. le Marquis de Saint Simon."

Claude Henri count de St. Simon, founder of the politico-philosophical-religious sect of St. Simonians, or of the New Christianity, which has recently attracted attention in France, was born in 1760. We know little of his youth; but he appears to have been early tinctured with a spirit of enthusiasm, as we are told that he caused himself to be called, every morning, with the words, "Get up, count; you have great things to accomplish." He was attached to the French auxiliary corps, which served in the United States in the last years of the revolutionary war of America, and soon after his return to France was promoted to a colonelcy. Previous to the breaking out of the French revolution, the count travelled in Holland and Spain; but he took no part in the great events of 1789. He died in 1825, the last thirty-four years of his life, if we may believe his own account, having been devoted to the objects of his mission, as the apostle of the New Christianity. His disciples are not very communicative in regard to the history of their founder, whose reputation appears not to have been always the best. In 1790 he entered into financial speculations, for the purpose, as we are told, of raising the funds necessary to aid his great projects. His partner not participating in his philanthropic views, St. Simon retired from the business at the expiration of seven years, and next applied himself to the study of the sciences. He took up his residence near the polytechnic school, formed an acquaintance with the professors, and attended their lectures. Three years were thus occupied with the study of inorganic nature, and the succeeding four years were spent in the study of organic bodies, for which purpose he lived near the medical school, conversed with the professors, heard their lectures, and kept open house and free table for men of science. A tour in Germany, England, and Italy, completed his "inventory of the philosophical treasures of Europe," and he now felt himself master of his ideas and ready to communicate them. His fortune, however, was exhausted, and his friends had deserted him. His "Introduction aux Travaux Scientifiques du 19e Siècle," contains an exposition of his philosophical views at this time.

After the restoration in 1814 his attention was turned to politics, and partly in conjunction with his disciple and adopted son Augustus Thierry and others, he wrote several works which show his political opinions. Among these are "De la Réorganisation de la Société Européenne," "Du Système Industrie," "Catéchisme des Industriels," "Discussions Politiques, Morales, et Philosophiques," and "Opinions Littéraires, Philosophiques, et Industrielles." Seven years had thus been spent in obtaining pecuniary resources, seven in collecting scientific materials, ten in effecting the reformation of philosophy, and ten that of politics; and St. Simon, reduced to extreme want by the exhaustion of his resources, and to despair by neglect and ill-success, attempted to shoot himself through the head. The ball grazed his forehead; but "his hour," say his pupils, after their master, "was not yet come; the philosopher and legislator becomes the prophet of a law of love; God raises him from the abyss, sheds over him a religious inspiration which animates, sanctifies, and

renews his whole being; a hymn of love is poured forth from that mutilated body; the divine man is manifested; the new Christianity is sent to the world; the kingdom of God is come upon earth." The "Nouveau Christianisme" is an exposition of St. Simon's religious notions. By this new religion, the principle of antagonism is done away; a universal church, a brotherhood of peace, unites all mankind, and sanctifies all. Science is holy; industry is holy; society is formed only of priests, savans, and labourers (industriels); government consists only of the chiefs of these three classes. The basis of the political system of the St. Simonians is a new mode of the distribution of property, for substituting the right of capacity for the right of inheritance. "Each one according to his capacity, each capacity according to its works," is the rule of this new right. All property becomes, at the death of the proprietor, the property of the church or society; all children receive a general education to a certain point till their capacities are ascertained, and then, chacun à sa capacité, each becomes a priest (or artist), savant, or industriel, as his talents point the way; and thus, whatever he acquires is the fruit of his own industry. There is nothing, however, like a distinct system developed in the writings of St. Simon or his disciples, but abundance of crude notions and vague speculations, of which we cannot attempt to give an account. See "Doctrine de St. Simon," and the numbers of the "Globe" and "Organisateur," the organs of one party, and of the "Revue Encyclopédique" (since the close of 1831), that of another party of St. Simonians. At the time of the death of the founder, this sect consisted of a small number of disciples, of whom Olinde Rodrigues was the principal, and who established the "Producteur," a monthly journal, as the organ of their views. This, however, was discontinued for want of funds, when the revolution of July gave a new impulse to the society. A great number of converts was made, funds collected, and the "Globe," a journal of reputation, passed into the hands of St. Simonian editors. Families were organized, churches built, schools constituted, and the hierarchy established, under *Enfantin* and *Bazard*, who were entitled *pères suprêmes*. But when the time came for the development of a regular system, schisms began to appear in the society. The most important of these took place in November, 1831. *Enfantin* and *Bazard* were at the head of two parties, *Rodrigues* of a third, and *Carnot* belonged to a fourth. These divisions were produced partly by questions of government and partly by differences of doctrine. One of the new doctrines, in which, however, all parties seem to agree, is, that man is not, as heretofore, alone to form the political being, but that man and woman together are to form the social individual. But, on this principle, *Enfantin* declares that the moral law can be revealed only by the coöperation of woman; and he, therefore, awaits the appearance of the woman who shall be called to complete the *couple révélateur*. The "Globe" and "Organisateur" are in the interest of *Enfantin*. The French government has left the sect to itself; but the courts have decided that St. Simonianism is not a religion,—the priests of the society having claimed exemption from military duty on the ground of their religious office.

**SIMONIDES**, a Greek lyric poet, who was born in the island of Cos about 557 B. C., and went to

Athens, where he became the favourite of *Hipparchus*, and a friend of *Anacreon* and *Theognis*. In Thessaly he was a welcome guest of the *Scopades*, whose victories at the public games he celebrated in song. According to a story related by *Cicero*, as he was once sitting at a feast with *Scopas*, having recited a hymn in praise of his patron, in which he dwelt much on the merits of the *Dioscouri*, *Scopas* told him that he could pay him only half of the poem promised for the hymn, and that he must get the rest from the *Dioscouri*, who had occupied so large a share of his praises. Soon after some one called him out of the house with the information that two youths wished to speak to him. On going out he found one person, and before he could return the hall fell in, burying the guests under its ruins. When the rubbish was removed, it being impossible to distinguish the bodies, disfigured by bruises, *Simonides* was enabled to determine them by recollecting the order in which they had sat. This led him to the plan of facilitating the recollection of events by certain artificial associations with places or things. Another wonderful escape of *Simonides* is related. Having once buried a body which he had found on the beach, as he was himself about to set sail, the spirit of the deceased warned him not to trust himself to the deceitful element. He complied with the warning and soon after received news of the loss of the vessel with all her crew. *Simonides* visited Athens several times, and is said to have conquered *Æschylus* in a poetical contest at the celebration of the victory of *Marathon*. During a residence in *Sparta* he sang the heroic death of *Leonidas* in several poems. An invitation from *Hiero*, king of *Syracuse*, induced him to go to *Sicily*, where he spent the rest of his days, and died 467 B. C. Of his numerous poems many fragments have come down to us, which are contained in *Brunck's "Analecta."* The ancients celebrate the grace, ease, and simplicity of his poems, but he is accused of avarice, and of having been the first to take pay for his writings.

**SIMPSON, THOMAS**, an eminent mathematician, who was the author of several able works; among those best known are, "A New Treatise on Fluxions," "A Treatise on the Nature and Laws of Chance," and his "Doctrine and Application of Fluxions." His death took place in May 1761.

**SIMPSON, ROBERT**, a distinguished mathematician of the last century, who for fifty years filled the mathematical chair in the university of *Glasgow*, during which period he maintained the highest reputation for geometrical science. He was the author of the "Loci of Apollonius Restored," and "A Treatise on Conic Sections." His death took place in October 1768.

**SINCLAIR, SIR JOHN**.—This eminent agricultural writer and rural economist was born at *Thurso* castle in 1754. He was educated at the universities of *Edinburgh*, *Glasgow*, and *Oxford*. Sir John was elected a member of parliament for *Caithness* in 1790 and sat in the house for more than thirty years. The space will not admit even of a bare enumeration of the works of this voluminous author; and it will suffice to say that they have been read with avidity for nearly half a century.

On the 15th of December, 1835, Sir John Sinclair was seized with his last illness, and he died on the 21st of that month, universally regretted.

**SKELTON, JOHN**, an English poet, who lived

in the latter part of the fifteenth century. He was a great enemy of Wolsey, and so far roused the resentment of that powerful prelate that an order was obtained for his apprehension, but he took sanctuary in Westminster, which afforded him protection till his death, which took place in 1528. His poems appeared in Chalmers's edition of "The English Poets."

SLEIDANNUS, JOHN, was born at Sleida, not far from Cologne, in 1536, and was one of the most distinguished publicists of his age. He studied law at Liege, Cologne, Louvain, Paris, and Orleans; was for some time in the service of King Francis I. of France, and went in 1542 to Strasburg. The princes of the Sinalcaldic league made him its historiographer. The corporation of Strasburg employed him on important missions, and appointed him, in 1542, professor of law. The protestants sent him, in 1545, to the king of England, and, at a later period, to the council of Trent, where he was much esteemed. He corresponded with the most distinguished and learned men of his time, and died at Strasburg in 1556. He acquired much reputation by his work "*De Statu Religionis et Reipublicæ Imper. Caroli V.*," folio, of which Professor Ranke says, in his "*Zur Kritik neuerer Geschichtschreiber*," "it is, throughout, documentary;" but he shows that it is necessary to weigh these documents and the sources of the writer's statements. Sleidannus was distinguished for knowledge of the subjects which he treats, for his smooth and elegant style, and for great impartiality, considering that he lived in the midst of the events which he describes, and was deeply interested in them.

SLOANE, SIR HANS, a celebrated naturalist and physician, who, by a testamentary bequest, laid the foundation of that important national foundation the British museum. He was born in 1660, at Killybegh, in the north of Ireland, but he was of Scottish extraction. He was educated for the medical profession, and came to London for the purpose of attending all the public lectures of anatomy, botany, and chemistry. His talents as a naturalist introduced him to the acquaintance of Boyle and Ray; and he communicated to them every curious or useful observation which he made. Having spent four years in London, he went to Paris and attended the hospitals, heard the lectures of Tournefort the botanist, of Du Verney the anatomist, and other eminent masters. Having obtained letters of recommendation from Tournefort, he went to Montpellier. He spent a year in collecting plants in this place, and then travelled through Languedoc for the same purpose. In 1684 he returned to London. He immediately transmitted to Mr. Ray a great variety of plants and seeds, which Ray described in his "*Historia Plantarum*," and shortly after he was chosen fellow of the royal society and of the college of physicians. But the hope of making new discoveries in natural productions induced him to take a voyage to Jamaica, as physician to Christopher duke of Albemarle, then governor of that island. His whole stay at Jamaica was scarce fifteen months, yet he brought together a great variety of plants.

He was chosen secretary to the royal society in 1693, and immediately revived the publication of the "*Philosophical Transactions*," which had been stopped for some time: he continued to be editor of them till 1712; and the volumes which were published in this period contain many papers written by

himself. The sense which the public entertained of his merit is shown by the following honours conferred upon him. He was created a baronet by George I., chosen a foreign member of the royal academy at Paris, president of the college of physicians, and president of the royal society on the death of Sir Isaac Newton. Having faithfully discharged the respective duties of the places he enjoyed and answered the high opinion which the public had conceived of him, he retired, at the age of eighty, to Chelsea, to enjoy in tranquillity the remains of a well-spent life. Here he continued to receive the visits of people of distinction, and of all learned foreigners; and admittance was never refused to the poor who came to consult him respecting their health. After a short illness of three days, he died on the 11th of January, 1752, in his ninety-first year. He was a governor of almost every hospital in or near London; to each he gave 100*l.* during his life, and at his death a sum more considerable. He laid the plan of a dispensatory, where the poor might be furnished with medicine; which, with the assistance of the college of physicians, was afterwards carried into execution. He gave the company of the apothecaries the entire freehold of their botanical garden at Chelsea, in the centre of which was placed a marble statue of him, admirably executed by Rysbrack. He did all he could to forward the establishment of the colony in Georgia in 1732, of the foundling hospital in 1739, and formed the plan for the bringing up the children. His cabinet, which he had taken so much pains to collect, he bequeathed to the public, on condition that the sum of 20,000*l.* should be paid to his family: which sum, though large, was not half the original cost, and scarce more than the intrinsic value of the gold and silver medals, the ores and precious stones, that were found in it. Besides these, there was his library, consisting of more than 50,000 volumes, illustrated with cuts, finely engraven and coloured, and a vast number of rare and curious books.

SMALRIDGE, GEORGE, an English prelate and writer, who was born at Lichfield in Staffordshire about 1666, and educated at Westminster school, where he distinguished himself by his classical attainments. In May 1682 he was elected from Westminster school to Christ Church, in Oxford; where in due time he took both the degrees in arts and divinity. He gave an early specimen of his learning by publishing, in 1687, "*Animadversions on a Work upon Church Government*," &c., printed that year at Oxford. He afterwards went into orders, and rose, through several preferments, to the bishopric of Bristol. Upon the accession of George I. he was appointed lord almoner to the king; but removed from that post for refusing, with Bishop Atterbury, to sign the declaration of the archbishop of Canterbury, and the bishops in and near London, against the rebellion in 1715. He died in 1719, and was interred at Christ Church.

Twelve of his "*Sermons*" were published in 1717, inscribed to the gentlemen of the vestry, and others who frequent the New Church, in Tothill Fields, Westminster; and after his death "*Sixty Sermons*" were published by his widow, who dedicated them to the princess of Wales.

SMART, CHRISTOPHER, a powerful English writer, who was born, in 1722, at Shipbourne, in Kent, and was placed at the grammar school in Dur-

ham, where his precocious talent obtained him the patronage of the duchess of Cleveland, who educated him at Pembroke college, Cambridge. A fellowship was conferred on him by his college in 1745. On his marriage, in 1753, having vacated his fellowship, he settled in London, and commenced author by profession; in which capacity he became a principal contributor to "The Old Woman's Magazine," and "The Universal Visitor," besides publishing a volume of original poems, "The Hilliad," &c. Poverty, however, overtook him; and his distresses, aided by intemperance, unsettled his intellects, and compelled his relations to place him for a while under personal restraint. His "Song to David," written in a mad-house, and partly with charcoal, on the walls of his cell, bears a melancholy attestation to the strength of his mental powers, even in their derangement. A temporary recovery restored him to liberty for a few years, which was terminated by a new confinement. During the interval, he gave to the world his translations of Horace's works, in prose and verse, and of those of Phædrus, in verse. He died of a liver complaint, within the rules of the king's bench prison, May 12, 1771.

**SMEATON, JOHN**, a celebrated civil engineer who was born near Leeds, in Yorkshire, in 1724. He early in life became a mathematical instrument maker, and carried on that business in Holborn, but he subsequently adopted the profession of an engineer. His principal undertaking was the erection of the Eddystone lighthouse in the English Channel. This vast undertaking was finished in 1759, and executed in such a manner as almost to bid defiance to the power of time and accident. Among his various other enterprises was the rendering of the river Calder navigable, the superintendence of the grand canal in Scotland, the Ramsgate harbour, and the water works at Greenwich and Deptford. He closed a long and useful life on the 8th of September, 1792. He was the author of several works all bearing on his own peculiar employment.

**SMITH, ADAM**, a distinguished writer on morals and politics, who was the only son of Adam Smith, controller of the customs at Kirkaldy, where he was born in June 1723, a few months after the death of his father. He received his early education at the school of Kirkaldy, whence he was removed, at the age of fourteen, to the university of Glasgow, where he remained until 1740, when he repaired to Baliol college, Oxford, as an exhibitor on Snell's foundation.

Quitting Oxford, and all views to the church, which had led him there, in 1748 he took up his abode at Edinburgh, and read some courses on rhetoric and polite literature, under the patronage of Lord Kames. In 1751 he obtained a more permanent provision by being elected professor of logic at Glasgow, and, the year following, of moral philosophy at the same university. He was now in a situation which perfectly agreed with his talents and inclination, and, both in matter and manner, his lectures were of the highest merit. Those on moral philosophy contained the rudiments of two of his most celebrated publications, of which the first, entitled "The Theory of Moral Sentiments," appeared in 1795, and was most favourably received. His moral theory is founded upon sympathy, which he makes the source of all our sentiments on the propriety or impropriety of actions. To this work he afterwards

added "An Essay on the Origin of Languages;" the elegance and acuteness displayed in these writings introduced him to several eminent persons, among others, to Mr. Charles Townshend, who engaged him, in 1763, to attend the duke of Buccleugh in his travels.

**SMITH, CHARLES**, an Irish topographical writer who was the author of "The Ancient and Present State of the County and City of Waterford" &c. He also wrote similar descriptions of nearly all the principal cities and counties of Ireland. His death took place in 1780.

**SMITH, CHARLOTTE**, a clever literary lady who was the author of several very popular works, among them we may mention "Marchmont," "The Old Manor House," "Celestina," and "Evelyn." All her works display considerable talent, but they are not without a good many faults. Her death took place in 1806.

**SMITH, JOHN THOMAS**.—This gentleman who was for many years keeper of the press in drawings in the British museum, was born in 1719. His father was a playfellow of Joseph Nollekens, and both learned drawing together at Shipley's school, then kept in the Strand. The friendship between Nollekens and Nath. Smith naturally introduced young Smith to the notice of that celebrated sculptor. Whilst a boy his intercourse was frequent with Nollekens, who often took him to walk with him in various parts of London, and seemed to feel a pleasure in pointing out curious vestiges and allusions to his notice, as well as showing him some remarkable sights of the time. Perhaps these communications gave the first impetus to that love for metropolitan antiquities which he entertained through life. Upon the death of his mother in 1779 young Smith was invited into the studio of Mr. Nollekens, who had seen and approved of some of his attempts in wax-modelling. At that time Nathaniel Smith was Nollekens's principal assistant, and there young Smith was employed in making drawings from his models of monuments, and in casting, and, finally, though with little talent, in carving. Whilst with Nollekens young Smith stood to him as a model, but left him after ten years. He then became a student in the royal academy, and was celebrated for his pen imitations of Rembrandt's and Ostade's etchings, and copied several of the small pictures of Gainsborough, by which he was kindly noticed.

Mr. Smith's first work was published in 1791, and was entitled, "Antiquities of London and Environs; by John Thomas Smith; dedicated to Sir James Winter Lake, Bart., F.S.A.; containing Views of Houses, Monuments, Statues, and other curious remains of antiquity, engraved from original subjects, and from original drawings communicated by several Members of the Society of Antiquaries." There was no letterpress description of these plates; but under the subjects were engraved copious remarks and references to the historical works of Pennant, Lysons, Stow, Ware, Camden, Maitland, &c.; the work was begun in January 1791. About this period it became a fashion to illustrate with prints the pleasant but unsatisfactory account of London by Mr. Pennant, and Mr. Smith's series of plates were a great acquisition to the collector.

In June 1797 Mr. Smith published "Remains of

Rural Scenery, with Etchings of Cottages from Nature; and Some Observations and Precepts relative to the Picturesque." In June 1807 Mr. Smith published "Antiquities of Westminster; the Old Palace, St. Stephen's Chapel, &c. &c., containing Engravings of Topographical Objects, of which many no longer exist." This work contains copies of MSS. which throw new and unexpected light on the ancient history of the arts in England.

The description of the plates was begun by John Sidney Hawkins, Esq., F.A.S., who wrote the preface and the first 144 pages, besides other portions, as enumerated in Mr. Smith's advertisement to the volume; but a dispute arising between these gentlemen, the work was completed by Mr. Smith. Mr. Hawkins wrote and published a pamphlet in answer to Mr. Smith's preface, which produced a "Vindication" by Mr. Smith. Before this "Vindication" was published a fire at Mr. Bensley's printing-office destroyed 400 copies of the work, with 5600 prints, 1000 of which were coloured and elaborately gilt by Mr. Smith and his wife. By this fire he sustained a severe loss, as the work was his entire property, having been published at his sole expense, aided by an unusually liberal subscription. Mr. Smith afterwards published sixty-two additional plates to his "Antiquities of Westminster," but without any description, or even a list of them.

"The Antiquities of London," &c., was followed by another work on the same subject, in a larger and moresplendid quarto, entitled, "Ancient Topography of London, embracing Specimens of Sacred, Public, and Domestic Architecture, from the earliest period to the time of the Great Fire in 1666. Intended as an Accompaniment to the celebrated works of Stow, Pennant, and others." This work was begun in October 1810, and completed in 1815, when the title was altered as follows:—"Ancient Topography of London; containing not only Views of Buildings which in many instances no longer exist, and for the most part were never before published; but some Account of Places and Customs either unknown or overlooked by the London Historians." Mr. Smith was soon after appointed keeper of the prints of the British museum. But in 1817 he published a work, on which he had been some time employed, entitled, "Vagabondiana; or, Anecdotes of Mendicant Wanderers through the Streets of London; with Portraits of the Most Remarkable, drawn from the Life, by Mr. John Thomas Smith, Keeper of the Prints in the British Museum." This work was preceded by an introduction by Mr. Smith's friend, Francis Douce, Esq.

Some few years after Mr. Smith published two volumes, entitled, "Nollekens and his Times; comprehending a Life of that celebrated Sculptor, and Memoirs of several Contemporary Artists, from the time of Roubiliac, Hogarth, and Reynolds, to that of Fuseli, Flaxman, and Blake." These volumes were highly seasoned with anecdotes of his venerable master, his wife, and their connexions, and bore evident marks of a disappointed legatee. But, amidst a mass of matter which should never have been suffered to see the light, they contain some interesting anecdotes of the artists of the last century. The publication passed through three editions.

Mr. Smith's last illness was but of one week's duration. He was fully conscious of his approach-

ing dissolution, and died in the possession of all his faculties, surrounded by his family, on the 8th of March, 1833.

SMITH, SIR JAMES EDWARD, a distinguished English physician and naturalist, who was born at Norwich in 1759. He studied medicine in Edinburgh, and, during his stay at the university there, he devoted all his leisure to the science of botany. He took his degree of M.D. at Leyden, and on his return published a work entitled "A Sketch of a Tour on the Continent." He subsequently settled in his native city, where he continued to reside till his death, making, however, an annual visit to London to deliver lectures at the royal and other metropolitan institutions. He received the honour of knighthood, in 1814, from George the Fourth, and died in March 1828. His principal works are entitled, "English Botany," "Natural History of the Lepidopterous Insects of Georgia," "Flora Britannica," and "The English Flora."

SMITH, JOHN, an English writer, who was for many years in the army. He left the military profession in 1797, and was shortly after member for East Looe, but resigned his seat on being appointed postmaster-general of Jamaica and the neighbouring island. He resided in the former island, discharging his official duties with benefit to every body except himself, until 1802, when he returned to England owing to ill health, and was shortly afterwards appointed by his early and steady friend, Mr. Canning, pay-master of the navy.

In 1813 Mr. Smith published, anonymously, an essay on architecture, entitled "Metrical Remarks on Modern Castles and Cottages, and Architecture in General;" and in 1819 he produced an octavo volume, with a preface on the structure and moral principles of the ancient Greek tragedy, entitled "The House of Atreus and the House of Laius," selected from the Greek tragedians, and freely translated into English verse. This gentleman's death took place in 1827.

SMITH, JOHN, a learned English divine, who was born in 1618 at Achurch, near Oundle, in Northamptonshire. He was educated at Emanuel college, Cambridge, where he had Dr. Whichcote, then fellow of that college, afterwards provost of King's, for his tutor. He took a bachelor of arts degree in 1640, and a master's in 1644, and the same year was chosen a fellow of Queen's college. He died in 1652. He wrote several treatises, which were published by Dr. John Worthington at Cambridge, 1660, under the title of "Select Discourses."

SMITH, ROBERT, an English divine and writer, who was born in 1689. After completing his education he entered holy orders, and obtained a good church living. His principal works were, "A System of Optics," and "Harmonics, or the Philosophy of Musical Sounds." He died in 1760.

SMITH, THOMAS, a learned English writer and divine, who was born in London in 1638, and admitted of Queen's college in Oxford, where he took the degrees in arts. In 1663 he was made master of the free-school joining to Magdalen college, and in 1666 elected fellow of that college, being then celebrated for his skill in oriental languages. He published a great many works, and enjoyed a high reputation for learning. In 1683 he took a doctor of divinity's degree, and the year after was nominated by

his college to the rectory of Stanlake, in the diocese of Oxford. In 1687 he was collated to a prebend in the church of Heyghbury, in Wilts. August 1688 he was deprived of his fellowship by Dr. Giffard, the catholic president of Magdalen college. He was restored in October following; but afterwards refusing to take the oaths to William and Mary, his fellowship was pronounced void in 1692. He died at London in May 1710.

He published four letters in Latin, which he afterwards translated into English, with the following title: "Remarks upon the Manners, Religion, and Government of the Turks; together with a Survey of the Seven Churches of Asia, as they now lie in their ruins; and a Brief Description of Constantinople," 1678. He wrote "De Græcæ Ecclesiæ Hodierno Statu Epistola;" which, with additions, he translated into English, and published with this title: "An Account of the Greek Church, as to its Doctrines and Rites of Worship; with several Historical Remarks interspersed, relating thereto. To which is added, an Account of the State of the Greek Church under Cyrillus Lucaris, Patriarch of Constantinople, with a relation of his sufferings and death," 1680. He also published a Latin life of Camden, which was prefixed to his edition of Camden's "Epistolæ," besides several other works.

SMITH, SIR THOMAS, a learned English writer and secretary of state in the reign of Edward VI. and Elizabeth, who was born at Walden, in Essex. He was sent to Queen's college, Cambridge, where he distinguished himself so much that he was appointed Henry VIII.'s scholar. In 1531 he was chosen fellow of his college; and about two years after appointed to read the public Greek lectures. In 1542 he was made regius professor of civil law in the university at Cambridge. He became likewise chancellor of the church of Ely.

Upon the accession of Edward VI. he removed from Cambridge into the duke of Somerset's family, where he was employed in matters of state by that nobleman, who was uncle and governor of the king, and protector of his realms. He was appointed master of requests to the duke, steward of the stanneries, provost of Eton, and dean of Carlisle. In 1548 he was advanced to be secretary of state, and knighted by his majesty; and, the same year, sent ambassador to Brussels, to the emperor's council there. He was connected about this time in the reformation of religion, and the redress of base coin; upon which last point he wrote a letter to the duke of Somerset. In 1549 this nobleman being brought into trouble, Sir Thomas Smith, who adhered faithfully to him, was involved in it, and was deprived of his place of secretary of state for a time, but soon after restored; and in 1551, still under that name, was appointed one of the ambassadors to France. After Mary came to the crown, he lost all his appointments, and was charged not to depart the kingdom; yet enjoyed great privileges. He was allowed a pension of 100*l.* per annum, and was highly favoured by Gardiner and Bonner. Upon the accession of Elizabeth he was employed in the settlement of religion, and in several important affairs of state. In 1562 he was sent ambassador to France, and continued there till 1566; he wrote, while he was in France, his work entitled "The Commonwealth of England," in Latin as well as English; which, though many copies of it were taken, does not appear to have been

published before 1621. He was sent to France twice afterwards as ambassador, and continued employed in state affairs till the time of his death which took place in 1577.

SMITH, WALTER, an English satirical writer who is principally known for his work entitled "The Merry Gestys of one called Edyth, the Lyeing Wyman which still livith." This narrative is founded on fact, and is a very curious and entertaining work.

SMOLLETT, TOBIAS, a writer of considerable reputation and varied powers, who was born in Dunbartonshire in 1721. He was the grandson of James Smollett of Bonhill, who gave him a moderate education, and then placed him with a surgeon at Glasgow. While there his grandfather died and left him entirely without support. This event took place in his nineteenth year, and young Smollett immediately set out for London in the hope of selling his tragedy entitled "The Regicide." This drama was written during the progress of his studies, but which though it evinces in particular passages the genius of the author, cannot be termed with justice a performance suited for the stage. Lord Lyttleton, a patron—Garrick and Lacy as managers—gave the youthful author some encouragement, which, perhaps, the sanguine temper of Smollett overrated; in the story of Mr. Melopoyne, where he gives the history of his attempts to bring "The Regicide" on the stage, the patron and the manager are not spared; and in "Peregrine Pickle," the personage of General Scrag, which occurs in the first edition only, is said to represent Lord Lyttleton.

Disappointed in the hopes he had founded on his theatrical attempt, Smollett accepted the situation of surgeon's mate on board of a ship of the line, on an expedition to Carthage, in 1741, of which he published a short account in "Roderick Random," and a longer narrative in a compendium of voyages published in 1751. But the term of our author's service in the navy was chiefly remarkable from his knowledge acquired, in that brief space, such intimate knowledge of our nautical world as enabled him to describe sailors with such truth and spirit of delineation, that from that time, whoever has undertaken the same task has seemed to copy more from Smollett than from nature. He quitted the navy, in disgust with the drudgery and with the despotic discipline. He left the service in the West Indies, and, after a residence of some time in the island of Jamaica, returned to England in 1746. It was at this time when, incensed at the severities exercised by the government's troops in the Highlands, to visit romantic regions he was a neighbour by birth, Smollett wrote the pathetic and patriotic verses entitled "The Tears of Caledonia."

Smollett, who felt his own powers, had recourse to his pen; and besides repeated attempts to get his tragedy acted, sent forth in 1746, "Aimee," and, in 1747, "Reproof," both poetical satires possessed of considerable merit, but which only increased the fate of the author as they increased the number of his personal enemies. Rich, the manager, was particularly satirized in "Reproof." Smollett also written for the Covent Garden theatre an opera called "Alceste," which was not acted, in consequence of some quarrel betwixt the author and manager, which Smollett thus avenged.

The necessity of Smollett brought him forth a pre-eminent character of a novelist. "Roderick

*Random* may be considered as an imitation of *Le Sage*, as the hero flits through almost every scene of public and private life, recording, as he paints his own adventures, the manners of the times, with all their various shades and diversities of colouring, but forming no connected plot or story, the several parts of which hold connexion with, or bear proportion to, each other. It was the second example of the minor romance, or English novel. Fielding had shortly before set the example in his *"Tom Jones,"* and a rival of almost equal eminence in 1748 brought forth *"The Adventures of Roderick Random,"* a work which was eagerly received by the public, and brought both reputation and profit to the author.

Having now the ear of the public, Smollett published by subscription his unfortunate tragedy, *"The Regicide,"* in order to shame those who had barred his access to the stage. The preface is filled with complaints which are neither just nor manly, and with strictures upon Garrick and Lyttleton, which amount almost to abuse. The merits of the piece by no means vindicate this extreme resentment on the part of the author, and of this Smollett himself became at length sensible.

*"Peregrine Pickle"* is supposed to have been written chiefly in Paris, and appeared in 1751. It was received by the public with great avidity, and a large impression dispersed, notwithstanding the efforts of certain booksellers and others, whom Smollett accuses of attempts to obstruct the sale, the book being published on account of the author himself. His irritable temper induced him to run hastily before the public with complaints which, howsoever well or ill grounded, the public has been at all times accustomed to hear with great indifference. Many professional authors, philosophers, and other public characters of the times, were also satirized with little restraint.

The merit of the work itself was a much greater victory over the author's enemies, if he really had such, than any which he could gain by personal altercation with unworthy opponents. Yet by many his second novel was not thought quite equal to his first. In truth, there occurs betwixt *"Roderick Random"* and *"Peregrine Pickle"* a difference which is often observed betwixt the first and second efforts of authors who have been successful in this line. *"Peregrine Pickle"* is more finished, more sedulously laboured into excellence, exhibits scenes of more accumulated interest, and presents a richer variety of character and adventure, than *"Roderick Random;"* but yet there is an ease and simplicity in the first novel which is not yet quite attained in the second, where the author has substituted splendour of colouring for simplicity of outline.

*"Peregrine Pickle"* did not, however, owe its success entirely to its intrinsic merit. The *"Memoirs of a Lady of Quality,"* a separate tale, thrust into the work, with which it has no sort of connexion, in the manner introduced by Cervantes, and followed by *Le Sage* and Fielding, added considerably to its immediate popularity. These memoirs, which are now regarded as a tiresome and unnecessary excrescence upon the main story, contain *"The History of Lady Vane,"* celebrated at that time for her beauty and her intrigues. Mr. M'Kercher, a character of a different description, was also introduced. He was remarkable for the benevolent quixotry with which he supported the pretensions of the

unfortunate Mr. Annesley, a claimant of the title and property of Anglesea.

The extreme license of some of the scenes described in this novel gave just offence to the thinking part of the public; and the work, in conformity to their just complaints, was much altered in the second edition. The preliminary advertisement has these words:—"It was the author's duty, as well as his interest, to oblige the public with this edition, which he has endeavoured to render less unworthy of their acceptance by retrenching the superfluities of the first, reforming its manners, and correcting its expression. Divers uninteresting incidents are wholly suppressed; some humorous scenes he has endeavoured to heighten; and he flatters himself that he has expunged every adventure, phrase, and insinuation that could be construed, by the most delicate reader, into a trespass upon the rules of decorum.

"He owns, with contrition, that in one or two instances he gave way too much to the suggestions of personal resentment, and represented characters, as they appeared to him at the time, through the exaggerated medium of prejudice. But he has, in this impression, endeavoured to make atonement for these extravagances. Howsoever he may have erred in point of judgment or discretion, he defies the whole world to prove that he was ever guilty of one act of malice, ingratitude, or dishonour. This declaration he may be permitted to make without incurring the imputation of vanity or presumption, considering the numerous shafts of envy, rancour, and revenge, that have lately, both in public and private, been levelled at his reputation."

In the year 1753 Dr. Smollett published *"The Adventures of Ferdinand Count Fathom,"* one of those works which seem to have been written for the purpose of showing how far humour and genius can go in painting a complete picture of human depravity. Smollett has made his own defence for the loathsome task which he has undertaken. "Let me not," says he, in the dedication, "be condemned for having chosen my principal character from the purloins of treachery and fraud, when I declare my purpose is to set him up as a beacon for the benefit of the inexperienced and unwary, who, from the perusal of these memoirs, may learn to avoid the manifold snares with which they are continually surrounded in the paths of life, while those who hesitate on the brink of iniquity may be terrified from plunging into that irremediable gulf, by surveying the deplorable fate of Ferdinand Count Fathom."

Smollett's next task was a new version of *"Don Quixote,"* to which he was encouraged by a liberal subscription. The work was inscribed to Don Ricardo Wall, principal secretary of state to his most catholic majesty, by whom the undertaking had been encouraged.

Having revisited the seat of his family, then possessed by his cousin, and spent a day or two at Glasgow, the scene of his early studies, Smollett next undertook the direction of the *"Critical Review,"* a work which was established under the patronage of the Tories and high-church party, and which was intended to maintain their principles in opposition to the *"Monthly Review,"* conducted according to the sentiments of Whigs and low-church men.

Smollett's taste and talents qualified him highly for periodical criticism, as well as the promptitude

of his wit, and the ready application which he could make of a large store of miscellaneous learning and acquired knowledge. But, on the other hand, he was always a hasty, and often a prejudiced judge; and, while he himself applied the critical scourge without mercy, he could not endure that those who felt his blows should either wince or complain under his chastisement. To murmur against his decrees was the sure way to incur further marks of his resentment, and thus his criticism deviated still farther from dispassionate discussion, as the passions of the reviewer and the author became excited into a clamorous contest of mutual rejoinder, recrimination, and abuse. Many petty squabbles, which occurred to tease and embitter the life of Smollett, and to diminish the respectability with which his talents must otherwise have invested him, had their origin in his situation as editor of the "Critical Review." He was engaged in one controversy with the notorious Shebbeare, in another with Dr. Grainger, the elegant author of the beautiful "Ode to Solitude," and in several disputes with persons of less celebrity.

But the most unlucky controversy in which his critical office involved our author was that with Admiral Knowles, who had published a pamphlet vindicating his own conduct in the secret expedition against Rochefort, which miscarried about that period. This defence was examined in the "Critical Review;" and Smollett, himself the author of the article, used the following intemperate expressions concerning Admiral Knowles:—"He is an admiral without conduct, an engineer without knowledge, an officer without resolution, and a man without veracity." The admiral commenced a prosecution against the printer of the "Review," declaring at the same time that he desired only to discover the author of the paragraph, and, should he prove a gentleman, to demand satisfaction of a different nature. This decoy, for such it proved, was the most effectual mode which could have been devised to draw the high-spirited Smollett within the danger of the law. When the court were about to pronounce judgment in the case, Smollett appeared and took the consequences upon himself, and Admiral Knowles redeemed the pledge he had given by enforcing judgment for a fine of 100*l.*, and obtaining a sentence against the defendant of three months' imprisonment.

About 1757 Smollett compiled and published, without his name, a useful and entertaining collection, entitled "A Compendium of Authentic and Entertaining Voyages, digested in a Chronological Series; the whole exhibiting a Clear View of the Customs, Manners, Religion, Government, Commerce, and Natural History of most Nations of the known World; illustrated with a Variety of genuine Charts, Maps, Plans, Heads," &c. This collection introduced to the British public several voyages which were otherwise little known, and contained, amongst other articles not before published, Smollett's own "Account of the Expedition to Carthage," of which he had given a short sketch in the "Adventures of Roderick Random."

In the same year, 1757, the farce or comedy of "The Reprisals, or the Tars of Old England," was written and acted to animate the people against the French, with whom we were then at war.

Garrick's generous conduct to Smollett upon this occasion fully obliterated all recollection of old differences. The manager allowed the author his be-

nefit on the sixth, instead of the ninth night of the piece, abated certain charges or advances usually made on such occasions, and himself performed Lusignan on the same evening, in order to fill the theatre.

In the course of 1760 and 1761 the "Adventures of Sir Lancelot Greaves" appeared, in detached portions, in various numbers of the "British Magazine, or Monthly Repository." Smollett appears to have executed his task with very little premeditation. During a part of the time he was residing at Paris, in Berwickshire, on a visit to the late George Home, Esq., and when post time drew near he used to retire for half an hour or an hour to prepare the necessary quantity of copy, as it is technically called, in the printing-house, which he never gave himself the trouble to correct, or even to read over. "Sir Lancelot Greaves" was published separately in 1761.

Smollett's next labour was to lend his aid in finishing that useful compendium, "The Modern Universal History," to which he contributed the histories of France, Italy, and Germany. In the year 1761 he published, in detached numbers, the "Continuation of the History of England," which he carried on until he brought the narrative down to 1765. The sale of this work was very extensive, and although Smollett acquired by both histories about 2000*l.*, which in those days was a large sum, yet the bookseller is said to have made 1000*l.* clear profit on the very day he made his bargain, by transferring it to a brother of the trade. This continuation, appended as it usually is to the "History of England" by Hume, forms a classical and standard work. It is not our present province to examine the particular merits of Smollett as a historian; but it cannot be denied that, as a clear and distinct narrative of facts, strongly and vigorously told, with a laudable regard to truth and impartiality, the continuation may vie with our best historical works. The author was incapable of being swayed by fear or favour, and where his judgment is influenced we can see that he was misled only by an honest belief in the truth of his own arguments. At the same time the continuation, like Smollett's original history, has the defects incident to hurried composition, and likewise those which naturally attach themselves to contemporary narrative. Smollett had no access to those hidden causes of events which time brings forth in the slow progress of ages; and his work is chiefly compiled from those documents of a public and general description which often contain rather the colourable pretexts which statesmen are pleased to assign for their actions than the real motives themselves. The English history, it is true, suffers less than those of other countries from this restriction of materials; for there are so many eyes upon our public proceedings, and they undergo such sifting discussion, both in and out of parliament, that the active motives of those in whose hands government is vested for the time become speedily suspected, even if they are not actually avowed or unveiled. Upon the whole, with all its faults and deficiencies, it may be long ere we have a better history of Britain, during this late period, than is to be found in the pages of Smollett.

Upon the accession of George III., and the commencement of Lord Bute's administration, Smollett was employed in the defence of the young monarch's government, in a weekly paper called "The Briton," which was soon silenced and driven out of

the field by the celebrated "North Briton," conducted by John Wilkes. Smollett had been on terms of kindness with this distinguished demagogue, and had twice applied to his friendship,—once for the kind purpose of obtaining the dismissal of Dr. Johnson's black servant, Francis Barber, from the navy, into which he had inconsiderately entered; and again, to mediate betwixt himself and Admiral Knowles, in the matter of the prosecution. Closer ties than these are readily dissolved before the fire of politics. The friends became political opponents; and Smollett, who had to plead an unpopular cause to unwilling auditors, and who, as a Scotchman, shared deeply and personally in that unpopularity, was compelled to give up the "Briton," more, it would seem, from lack of spirit in his patron Lord Bute, to sustain the contest any longer, than from any deficiency of zeal on his own part.

In 1763 Smollett lent his assistance, or at least his name, to a translation of Voltaire's works, and also to a compilation, entitled "The Present State of all Nations, containing a Geographical, Natural, Commercial, and Political History of all the Countries of the Known World."

About this time the only daughter of Smollett died, in the fifteenth year of her life, leaving her parents overwhelmed with the deepest sorrow. Ill health aided the effects of grief, and it was under these circumstances that Smollett undertook a journey to France and Italy, in which countries he resided from 1763 to 1766. Soon after his return he published his "Travels through France and Italy, containing Observations on Character, Customs, Religion, Government, Police, Commerce, Arts, and Antiquities, with a Particular Description of the Town, Territory, and Climate of Nice, to which is added, a Register of the Weather, kept during a Residence of Eighteen Months in that City."

Finding himself at liberty to resume his literary labours, Smollett published in 1769 the political satire called "The Adventures of an Atom," in which are satirized the several leaders of political parties. Smollett finished his literary labours by the publication of "The Expedition of Humphrey Clinker," which is justly considered as his best work. Meantime his disorder increased, and he closed his life on the 21st of October, 1771, after a long and painful illness. This event took place at Leghorn, where he had gone for the benefit of his health.

SNYDERS, SNEYDERS, or SNYERS, FRANCIS, an eminent painter of the Flemish school, who was born at Antwerp in 1579. Snyder, who is considered never to have been surpassed in his delineation of beasts, fish, hunting-parties, &c., was accustomed to work in concert with Rubens and Jordeans; and some of the most valuable paintings of that school are their joint productions. Many of his choice pieces are to be found in the collections at Munich, and Dresden, and in the Escorial. His death took place in 1657.

SOANE, JOHN, a celebrated English architect, who was born in 1756. His genius was fostered by Mr. Dance, and he was admitted a student of the royal academy. He obtained the prize for the best design of an original building, and in 1777 was sent to reside in Italy at the expense of the king. While in Italy he was elected a member of the imperial academy of Florence, and of the academy of arts at Parma. After his return to England, he

speedily acquired reputation, and was employed in many important works. He continued to enjoy the most perfect success till his death, which took place at his house in Leicester Square. His museum of

antiquities was remarkable for the number of rare and unique objects which it contained. One of the most celebrated was the sarcophagus, brought to this country by the enterprising traveller Belzoni. It is represented in the above engraving. We subjoin his autograph.

*John Soane*

SOCRATES.—A celebrated Greek philosopher, who was born about 469 B. C., at Aldpece, a village near Athens. He was preceptor to a wealthy Athenian's children, and was enabled to attend nearly all the lectures of the philosophers of that period. He thus laid the foundation for his own philosophy. All the precepts of this great philosopher were equally removed from excessive rigor and pernicious laxness. To his precepts was added his example, so superior to all reproach that Xenophon, his friend and disciple, in his "Memorabilia," says none ever saw him perform a vicious or unworthy action, and, at the close of his work, draws the following picture of him:—"All the friends of virtue who knew Socrates are still filled with sorrow for his loss, for they found him the best guide to virtue. He was so pious that he did nothing without the advice and consent of the gods; so just that he never injured, in any way, the happiness of any man, but, on the other hand, did the most important services to those who were connected with him. He was so temperate that he never preferred the agreeable to the useful; of so clear a mind that he never erred in the distinction of good and evil, and all by his own unaided strength. He was, besides, so able in his definitions and illustrations of these subjects, in his judgment of men, in confuting error and recommending virtue and uprightness, that I esteem him the best and the happiest of mortals." The last part of his life fell in that unhappy period when Athens had sunk into anarchy and despotism in consequence of the unfortunate result of the Peloponnesian war. Morality and justice are always disregarded when the government of a state is dissolved. This was the case in Athens. The domi-

nion of the thirty tyrants had indeed been overthrown by Thrasybulus; but, like the ocean after a storm, Athens was still unsettled, and, amid the general immorality, hatred, envy, and malice found opportunities to execute their purposes. Melitus, a young tragic poet of no merit, Lycon, a public orator, and Anytus, a tanner and politician, were the accusers of Socrates, and were listened to the more readily as he had offended the people by the freedom with which he had expressed his dislike of an ochlocrasy. The charges of introducing new gods, of denying the ancient divinities of the state, and of corrupting the youth, were brought, not before the Areopagus, but before the popular tribunal in the Heliea. The accusations were supported by perverted statements of the language of Socrates, by expressions detached from the connexion which modified them. But these, and the fact that the tyrant Critias, and the public enemy Alcibiades, were his disciples, were plainly not a valid cause for his condemnation.

Socrates, conscious of his moral dignity, disdained to make a laboured defence of his character. He neither feared death nor respected his judges. Moreover, he felt confident that a long life spent under the eye of the judges and the people was the strongest proof of his innocence. Briefly, and with a noble dignity, he showed the groundlessness of the charges and noticed his own deserts. Several of his blind and wicked judges took offence, and he was condemned by a majority of three voices. But when they left him to choose the mode of punishment, and Socrates declared that instead of deserving death he merited a place in the Prytaneum as a public benefactor, the furious populace, thinking themselves insulted by such a declaration, condemned him to drink poison. He consoled his afflicted friends, and reminded them that from the day of his birth nature had pronounced sentence of death upon him. Religious and moral feeling, and the heavenly power of a pure conscience, still triumphed within him. On the day when he was thrown into prison the sacred galley sailed from Athens for Delos, and, in conformity with an ancient law, the execution of the sentence was deferred till its return, thirty days—an important delay for the philosopher and his disciples. Every morning his friends assembled in his apartment, and he conversed with them as he had been wont to do. He encouraged them in the path of virtue, instructed them in the subjects of his investigations, and proved to them, by his own example, that obedience to his precepts produced real happiness. In his solitary hours he composed a hymn to Apollo, and versified several of the fables of Æsop. There was a striking contrast between the resignation of Socrates and the grief of his friends at the thought of their irreparable loss. We may well pardon them for the projects which they formed for his escape. Simmias of Thebes offered to bribe the keeper, but they could, of course, do nothing without the consent of Socrates; and, from his known principles, it was probable that he would not listen to their plan. But they determined to make the attempt. Crito, the old and tried friend of Socrates, undertook to persuade him to comply with their wishes. Early in the morning of the last day but one he visited him for this purpose. The good man was still asleep. Crito sat down softly by his bed and waited till he awoke. He then informed him of the unanimous request of his friends, urging

every motive which the peculiar circumstances of Socrates suggested, especially the care of his family, to persuade him, if possible, to save his life. Socrates permitted his friend to finish, and thanked him for this proof of his affection, but declared that flight was wholly irreconcilable with his principles. Plato's dialogue, entitled "*Crito*," records this conversation, and is one of the most pleasing performances of that great master. It inspires the most profound admiration of Socrates, who adhered to his lofty principles with unshaken firmness on the brink of the grave, and, notwithstanding the injustice of his condemnation, could not be persuaded to violate his duties as a citizen.

At length the fatal day dawned on which Socrates was to drink the poison. His family and friends assembled early to spend the last hours with him. Xanthippe, his wife, was much affected, and showed her grief by loud cries. Socrates made a sign to Crito to have her removed as he wished to spend his last moments in tranquillity. He then talked with his friends, first about his poem, then concerning suicide, and lastly concerning the immortality of the soul. He spent the greater part of the day in these elevated meditations. He spoke with such animation of the hopes inspired by his faith that his friends almost viewed him as a glorified spirit. The approach of twilight at length admonished him that the appointed hour had arrived. He asked for the cup, and when he took it in his hand his friends were so overcome with grief that they burst into tears and loud lamentations. Socrates alone was calm. He then drank the hemlock slowly, and consoled his friends as he walked up and down the apartment. When it became difficult for him to walk he laid down upon the couch, and before his heart ceased to beat, exclaimed, "My friends, we owe a cock (the emblem of life) to Æsculapius." After he had said these words he covered himself with his cloak and expired, in the seventieth year of his age. Soon after his death the Athenians acknowledged his innocence, and regarded the misfortunes of the state as a judgment for their injustice towards him. They revered his sentence, put Melitus to death, banished his other accusers, and caused a brazen statue to be erected to his memory by Lysippus.

**SOLON.**—One of the seven sages of Greece and the celebrated lawgiver of the Athenians. He stood so high in the opinion of his countrymen from his wisdom and integrity, that they invested him with the power of new modelling the laws and constitution of Athens. Having completed this difficult task, he withdrew from his native city and travelled into other countries. On his return he found that his relative Pisistratus aimed at the sovereignty of Athens, which, notwithstanding all the efforts of Solon, he obtained. The latter immediately left Athens, to which he never returned, but died at Cyprus at the age of eighty.

**SOLOMON,** was the son of David by Bathsheba, through whose influence he inherited the Jewish throne, in preference to his elder brothers. During a long and peaceful reign, he enjoyed the fruits of his father's labours. A youth surrounded with royal splendours inspired him with a sense of dignity, and he carried with him to the throne, which he ascended while young, with the cruelty of an eastern monarch, the wisdom which he had derived from the lessons of his father and his father's counsellors. To confirm his power, he caused his brother Adonijah, and some

discontented nobles, to be put to death, and formed alliances with foreign rulers. His remarkable judicial decisions, and his completion of the political institutions of David, showed a superiority of genius, which gained him the respect of the people. By the building of the temple, which, in magnitude, splendour, and beauty, exceeded any former work of architecture, he gave to the Hebrew worship a magnificence which bound the people more closely to their national rites. The wealth of Solomon accumulated by a prudent use of the treasures inherited from his father by successful commerce, through which he first made the Hebrews acquainted with navigation; by a careful administration of the royal revenues, which he caused to be collected by twelve governors; and by an increase of taxes,—enabled him to meet the expense of erecting the temple, building palaces, cities, and fortifications, and of supporting the extravagance of a luxurious court. But while, on the one hand, the prosperity of the people was promoted, and the arts and civilization were improved, on the other, an example of pernicious luxury, and of a gradual relaxation of the severity of the Mosaic religion, was exhibited.

Admiration of Solomon's wisdom and regal magnificence, which brought crowds of foreigners to his capital, and, among the rest, a queen of Sheba, easily drowned the few voices of discontent. His justice gained him the respect of his subjects; and an army stood at his command, consisting of 12,000 horsemen, armed in the Egyptian manner, and 1400 war-chariots, to overawe the Gentile tribes, which had been subjugated by David to the Jewish yoke, and were now forced to labour in the service of Solomon. Fortune long seemed to favour this great king; and Israel, in the fulness of its prosperity, scarcely perceived that he was continually becoming more despotic. Contrary to the laws of Moses, Solomon admitted foreign women into his numerous harem of 700 wives and 300 concubines; and, from love to these women, he was weak enough, in his old age, to permit them the free practice of their idolatrous worship, and even to take part in it himself. Still his adversaries, who, towards the close of his life, aimed at his throne, could effect nothing; but, after his death the discontent of the people broke out into open rebellion, and his feeble son Rehoboam could not prevent the division of the kingdom. The forty years' reign of Solomon, the last years of which were less glorious than the first, is still, however, celebrated among the Jews for its splendour and its happy tranquillity, as one of the brightest periods of their history. Throughout the East it is considered as a golden age. In fact Solomon belonged more to the East in general than to his own nation. His mode of thinking was freer than be seemed a Hebrew. The writings contained under his name in the Bible, though they may have been collected and arranged at a later period, are substantially the work of Solomon. They breathe a philosophical spirit, elevated above the prejudices of his nation. His Proverbs are rich in ingenious and sagacious observations. His Ecclesiastes, or Preacher, savours of the philosophy which men of the world, sated with a long course of pleasure, form from the results of their own experience. It teaches that nothing is permanent, and therefore we should hasten to enjoy present good, and that God is the source of all wisdom. The book entitled the wisdom of Solomon, though received

into the canon by the Roman catholic church, is rejected, as a pocryphal, by protestants. Solomon's wisdom and happiness have become proverbial; and the fables of the rabbins, and the heroic and erotic poems of the Persians and Arabians, speak of him as the romantic traditions of the Normans and Britons do of King Arthur, as a fabulous monarch, whose natural science, whose wise sayings and dark riddles, whose power and magnificence, are attributed to magic. According to these fictions, Solomon's ring was the talisman of his wisdom and power, and, like the temple of Solomon, in the mysteries of the free-masons and rosicrucians, has a deep, symbolical meaning.

SOLYMAN II., called the Lawgiver by his own subjects, and the Magnificent by the Christians. This monarch was the only son of Selim I., whom he succeeded in 1520. Three days previous to the death of his father, and at the same time when Charles V. was crowned at Aix-la-Chapelle, he was proclaimed sultan. He had not been educated in the usual manner of the Ottoman princes, but, on the contrary, had been initiated in all the secrets of state policy. His love of justice appeared at the very commencement of his reign, when he returned the property which his father had taken from individuals. He restored the authority of the courts of justice, which had been entirely destroyed, and selected governors and other officers from persons who possessed property and were honest. "I intend," said he, "that they should resemble the rivers which fertilize the countries through which they flow, not the streams which break down all they meet."

Gazeli Beg, the governor of Syria, had at first declared against Solyman, and had involved a part of Egypt in his revolt; but he was overcome by the generals of Solyman, who also destroyed the mamelukes in Egypt, and concluded an armistice with Persia.

Having thus secured himself from disturbance on the side of Syria and Egypt, he besieged and took Belgrade in 1521. In 1522 he resolved to besiege the island of Rhodes, which had been in the possession of the knights of St. John for many years. He wrote a haughty letter to the knights, in which he called upon them to surrender unless they wished to be put to the sword. The siege of Rhodes cost him many men; but at length the town, being reduced to extremity, was forced to surrender. The conqueror now turned his arms against Hungary, where he gained the battle of Mohatz in 1526. He afterwards took Buda, advanced to Vienna, and, in twenty days, made as many assaults upon this city, but was finally forced to raise the siege, with the loss of 80,000 men. In 1534 he marched towards the East, took possession of Tauria, but was defeated by Shah-Thomas; and in 1565 his army met with the same fate before Malta as formerly before Vienna. In 1566 he took possession of the island of Scio, and ended his life in the same year, at the siege of Sigeth, in Hungary, in the seventy-sixth year of his age, and four days before the taking of the fortress by the Turks.

Solyman's victorious arms made him equally dreaded in Europe and in Asia. His empire extended from Algiers to the Euphrates, and from the extremity of the Black Sea to the furthest limits of Greece and Epirus. His abilities were equally great for the conduct of affairs in peace and in war. As a general

he possessed a wonderful activity; his word was held sacred; he was a firm friend to justice, although his love for the sultana Roxalana, and her persuasions, prevailed upon him to put to death all his children by another sultana, to secure the succession to Selim her son. After the siege of Mohatz, by his orders, 1500 of the most distinguished prisoners were placed in a circle, and beheaded, in presence of the victorious army.

Solyman thought nothing impossible to be done which he commanded. When one of his generals sent him word that his orders to build a bridge over the Drave could not be executed, Solyman sent him a linen cord, with this answer:—"The sultan, thy master, commands thee, without consideration of the difficulties, to complete the bridge over the Drave: if thou doest it not, on his arrival he will have thee strangled with this cord, which announces to thee his supreme will."

Solyman used his unlimited power to establish order and security in his dominions. He divided them into districts, of which each was compelled to furnish a certain number of soldiers. The produce of a certain division of country in every province was reserved for the support of the troops; and he provided for every thing connected with military discipline and the equipment of soldiers with the greatest care. He introduced a system for the regulation of the finances in his empire; and, that the taxes might not be too oppressive, he was very exact in his expenses. He was the greatest of all the Ottoman emperors, and extended his power widely, by force of arms, in Asia and Europe. Under his government the Turks attained their highest glory; but this was gradually lost under his successors.

SOMERS, LORD JOHN, a distinguished lawyer and statesman, who was the son of an attorney at Worcester, where he was born in 1652. He was entered a gentleman commoner at Trinity college, Oxford, and, being destined for the legal profession, passed some time as clerk to a barrister, and, when called to the bar himself, evinced talents of a high order. His principles led him to oppose the measures of Charles II.; and, on the accession of James II., he continued a firm opposer of the court, and acquired great credit as one of the council for the seven bishops. He heartily concurred in the revolution, and sat as one of the representatives for Worcester in the convention parliament, summoned by the prince of Orange, and was one of the managers appointed by the commons to confer with the lords on the word *abdicate*. In 1689 he was knighted and made solicitor-general, in 1692 attorney-general, and lord-keeper of the great seal the following year, in which capacity he displayed equal ability, integrity, and gentleness. He was one of the first patrons of Addison, for whom he procured an allowance, to enable him to make the tour of Italy. In 1695 he was made lord high chancellor of England, and was raised to the peerage by the title of Lord Somers, Baron Evesham. Being now regarded as the head of the Whigs, he made great exertions to moderate the zeal of that party. After the death of William, Lord Somers spent his time in literary retirement, and was chosen president of the royal society. In 1706 he drew up a plan for effecting a union between England and Scotland, which was so much approved that Queen Anne appointed him one of the commissioners to carry it into execution.

Upon a change of ministry in 1708 he was nominated president of the council, but was again dismissed in 1710; and, in April 1716, was carried off by an apoplectic fit, at the age of sixty-four.

SOMERVILLE, WILLIAM, a minor poet, who was born in Warwickshire in 1692, and educated at Oxford. He early cultivated his talent for poetry, and inherited a considerable paternal estate, on which he chiefly lived, mingling an ardent attachment to the sports of the field with the studies of a man of letters. He was courteous, hospitable, convivial; but carelessness in pecuniary matters involved him in embarrassments, which preyed on his mind and produced habits which shortened his life. He died in 1742. As a poet, Somerville is chiefly known by his "Chase," a poem in blank verse, which maintains a respectable rank in the didactic and descriptive class. Another piece, connected with the same subject, is entitled "Field Sports." His "Hobbinol, or Rural Games," is a kind of mock heroic.

SOPHOCLES.—This immortal poet, who carried the Greek drama to perfection, was probably about twenty-five years younger than Æschylus, and fifteen years older than Euripides, whom, however, he survived. He was descended from a rich and noble family in Athens. The advantages of a fine person (though nature had denied him a good voice), and his brilliant genius, contributed to open a splendid career before him. Though the fame of Sophocles, as a poet, has eclipsed his reputation as a statesman, yet he is mentioned in the history of Athens as an archer, with Pericles and Thucydides, in the war against Samos, and his name is recorded among the priests of that city. His death, which happened in his ninety-fifth year, is so enveloped in obscurity, that by some he is said to have expired from excessive joy, in consequence of the unexpected success of one of his dramas at the Olympic games; and by others, to have closed his life during the recitation of his "Antigone," then just completed. In his eightieth year, an ungrateful son charged him before a judicial tribunal with being incompetent, from age, to manage his domestic affairs; but on his reading to the judges his "Œdipus at Colonus," which he had just written, the complaint was dismissed, and he was carried to his house in triumph. On his tomb was erected a marble statue of Bacchus, with the tragic mask of Antigone in his hand. Sophocles began his career as a lyric poet; but at the age of twenty he devoted himself to the drama, and became the rival of Æschylus, whom he surpassed in the popular favour. The first victory which he gained over his predecessor was brilliant; the first prize was awarded to him nineteen times; the second still oftener, but never the third. His reputation soon spread to foreign countries, and several princes invited him to their courts. But he remained faithful to his country. The Greek drama is seen in its perfection in his productions. Of his numerous plays, which some have estimated at 130, the following have come down to us; but these are all complex and masterly performances:—"The Ajax," "Electra," "Antigone," "King Œdipus," "Œdipus at Colonus," "The Trachinians," "Philoctetes." We will give a short sketch of their contents, remarking, by the way, that we can distinguish no trilogies and tetralogies, as in Æschylus; and that, according to the Scholiasts, he introduced the practice of attending for the prize with a single piece; so that the

distribution of the tragic part into trilogies (three parts or distinct pieces), to which a satirical piece was often appended (the whole being styled a "Tetralogy," almost wholly went out of use. Sophocles also first introduced a third actor, and limited the lyrical element, or chorus, which Æschylus frequently made the chief part of the tragedy. In "The Ajax" we see that hero, wounded in his honour by Ulysses, in the contest for the armour of Achilles, seized with frenzy; on recovering from which, as if blinded by the dreadful discovery, he destroyed his own life. "The Electra" belongs to the tragic scenes of the family of Pelops. It contains the murder of Clytemnestra, who, with her lover, Ægisthus, had assassinated her husband, Agamemnon, by the hand of her son Orestes, under the direction of his sister Electra. By the art of the poet, Electra, who would naturally appear as a subordinate character, is made the heroine of the action. In Antigone we see the highest triumph of female tenderness. Antigone, the wretched daughter of the wretched Œdipus, and guilty of no crime but that of attaching her own fate to that of her father, is the only being in Thebes who does not submit to Creon, the new sovereign. Her heroism is of the highest and most feminine character. Her brother Polynices, who was slain before Thebes in a single combat with his brother Eteocles, in which both fell, and whose burial had been prohibited by Creon, owed a grave to his sister. After performing this last office of affection with the tenderness of a woman, but an unshaken firmness, she goes her sad and solitary way to the cold stony bed prepared for her. According to Solger, the point of the tragedy consists, not in the elevation of the heroine, but in the conflict of divine and human laws. The king Œdipus, and Œdipus at Colonus, are parts of one story; and the tragic points in the history of Œdipus are thus exhibited in a terrific double picture. These tragedies are founded on the principle that man cannot escape his destiny, and that the profoundest wisdom only draws the cords of fate more tightly, till that almighty Power is appeased by voluntary penance and humiliation. In the former a dreadful mystery is suddenly revealed, while the wretched victim trembles to behold the unwelcome light. The unconscious parricide and husband of his mother, as one veil after another falls away, hurries back to the darkness which has been removed from around him, by tearing out his eyes, and flees into miserable exile. The counterpart of this moving picture is drawn in "The Œdipus at Colonus," weighed down by guilt and age. The darker lines of the horrible event are now softened by time. His crime has been expiated by long sufferings. In the grove of the avenging goddesses, by whom the whole dreadful tissue had been woven, his wretched wanderings end. Œdipus finds at Colonus, near the walls of Athens, in the solitary abode of the Furies, rest and a grave.

"The Trachinians" is founded on the history of Hercules; Dejanira, in the excess of her love, becomes the murderer of the hero, who is taken, as it were, in the snares of fate itself, like Agamemnon, only that, in the latter case, the victim is more innocent than Hercules, and in the former the murderer is more guiltless than Clytemnestra. Philoctetes, the heir of the weapons of Hercules, languished for years on the desolate Lemnos, where he had been deserted by the ungrateful Greeks during a magic

slumber, which, after every attack of pain, gave him some relief. But fate at length pities him and compels his enemies to search for him, as it was decreed that, without the bow of Hercules, Troy could not be taken. This exposes him to new sufferings. Neoptolemus, the generous son of Achilles, is appointed to rob him of his quiver, and thus compel the defenceless Philoctetes to go against Troy. But the frank and honest Neoptolemus is incapable of carrying on such a design; and Hercules now appears bringing reconciliation, promising health, and persuading Philoctetes to pardon the ingratitude of the Greeks and to comply with their request.

The distinguishing characteristic of the Greek drama is simplicity. Thence its precision and perfection of form; thence its little external ornament, the accuracy with which the characters are defined, the finish of the colouring, the keeping of the whole, and the perfection of the versification. The unities of time and place are strictly observed; the plot is seldom intricate, but is skilfully contrived, and the diction is lofty and pure. The beautiful, rather than the strange and awful, as in Æschylus,—than the tender, as in Euripides,—is its predominant feature. In all these qualities Sophocles excelled, and was therefore the finest model of Grecian poetry. The characters of Sophocles are undoubtedly the most perfect, distinct, and individual that can be drawn, and at the same time arrayed in all the charms of ideal representation. His choruses have always been celebrated as the finest productions of dramatic poetry. No tragic poet, in ancient or modern days, has written with so much elevation and purity of style. The versification of Sophocles stands alone in dignity and elegance, and his iambics are acknowledged to be the purest and most regular.

SOUBISE, CHARLES DE ROHAN, PRINCE DE, marshal of France, a French nobleman who was born in 1715, and at the beginning of the seven years' war was, perhaps, the richest nobleman in France. Without military talents, but merely as the favourite of Pompadour, he received the command of a separate division, which, however, was subordinate to the main army under Marshal d'Estrées—a circumstance which deeply wounded his pride. In the summer of 1757, at which time he was lieutenant-general, he separated from the main army, and joined the imperial forces, with the purpose of delivering Saxony from the Prussians. Having reached Gotha, he allowed himself to be surprised by the Prussian general, who occupied the place intended for Soubise at a feast in the ducal palace. Confiding in his superior numbers, Soubise next attempted to surround Frederic in his camp at Rossbach, but was suddenly attacked on the flank, and his troops were entirely routed. The loss of this battle, and the general ridicule which followed it, did not prevent his being again placed in command in 1758, when he was more successful, by the aid of the duke of Broglie, who was associated with him. He received the marshal's staff in reward for his services. After the peace he continued for some time in the cabinet, and died in 1787.

SOULT, JEAN DE DIEU, duke of Dalmatia, marshal and peer of France. This celebrated officer of Napoleon was born in 1769 at St. Amand, entered early into the army as a private soldier, and became a subaltern in 1790. He was adjutant in the division of Lefebvre, on the Moselle, in the campaigns of

1794 and 1795, and was a warm partisan of the revolutionary measures of that epoch. He was appointed general of brigade in 1796, and was subsequently raised to the rank of general of division: as such he served with the army of Italy, and was entrusted with the military command of Turin. He afterwards made the campaign of 1799, with the army destined to combat the Austro-Russian forces, and was shut up, with Messina, in Genoa, where he was wounded and made prisoner in a sortie. The battle of Marengo gave him an opportunity of returning home. On the elevation of Bonaparte to the chief consulate, the proofs of courage and ability which Soult had shown, occasioned his being appointed to command a corps of observation in the kingdom of Naples. In 1803 he was named commandant of the corps at St. Omer's, and afterwards marshal of France, on the establishment of the imperial dignity. In 1805 he commanded one of the divisions of the grand army destined to act in Austria. At the battle of Austerlitz he commanded the centre of the army, and contributed, by a very vigorous attack, to the success of that day. He distinguished himself, also, at the battles of Jena and Eylau. On the peace of Tilsit he was appointed to a command in Spain; and, on the 10th of November, 1808, he attacked the army of Estremadura, put the Spaniards to rout, and seized on Burgos and Santander. He was charged to observe the movements of Sir John Moore at Salamanca; and he pursued the English to Corunna. Marshal Soult was afterwards sent into Portugal, where, at first, he obtained some success; but was compelled to make a precipitate retreat, with the loss of his artillery and baggage. Joseph Bonaparte having lost the battle of Talavera, Marshal Soult marched, in conjunction with Ney and Mortier, to his succour; and on their approach Lord Wellington retired into Portugal. At this time he was appointed major-general of the French armies in Spain; and it was under his advice and direction that Joseph Bonaparte gained the battle of Ocaña, on the 19th of November, 1809.

He was next charged with the conquest of Andalusia, and, in consequence, forced the passages of the Sierra Morena, and marched on Seville, of which he took possession. After the battle of Salamanca he evacuated Andalusia; and the French armies, with the exception of that of Marshal Suchet, were concentrated at Burgos. Soult was now recalled, in order to be sent into Germany; he was, however, soon summoned back. The loss of the battle of Vittoria having exposed the frontiers of France, the marshal was sent to Bayonne to take the command of the remnant of the routed French corps. He speedily organized a formidable force, with which he twice endeavoured to deliver Pampeluna; but the allies advanced into the French territory, and Soult was obliged to retire upon Tarbes, in order to cover Toulouse. At this time he published a proclamation, in which he showed great zeal in the cause of Napoleon. Arrived at Toulouse, a bloody battle ensued, which led to the surrender of that city to the allies. On the restoration of the Bourbons, the king confided to Soult the command of the thirteenth military division, in the government of Brittany. In December 1814 he was made minister of war. On the landing of Napoleon, the suspicions of the court obliged him to retire from his post; but it was not till commanded by the emperor that he presented

himself at the Tuileries. He was then raised to the peerage, and appointed to high military command. He fought at Fleurus and Waterloo, and, on the entrance of the allies into the capital of France, retired with the army beyond the Loire, and was comprised in the ordonnance of the 24th of July. On his banishment, he published a memoir, with the view of refuting the charge of treason, brought against him for adhering to Napoleon on his return. In 1819 he was included in the amnesty, and his military distinctions were restored in 1821. Marshal Soult was not recalled to the chamber of peers until 1827, when he was one of seventy-six created by the ordinance of the fifth of November in that year. As this creation was declared null, after the revolution of 1830, he was again named peer by the new king; and, in November of that year, was created minister of war, which post he continued to retain during several changes of ministry.

SOUTH, ROBERT, a celebrated divine of the church of England, who was born at Hackney, in 1633, and educated at Westminster school and Christ Church, Oxford. In 1654 he addressed a copy of Latin verses to Cromwell, on the conclusion of peace with the Dutch; and the following year produced a poem entitled "*Musica Incantans*." In 1660 he was chosen public orator of the university of Oxford; and soon after was nominated domestic chaplain to Lord Clarendon, then lord chancellor. In 1663 he became a prebendary of Westminster, was admitted D.D., and obtained a living in Wales. On the disgrace of his patron, he was made chaplain to the duke of York.

In 1670 he was installed canon of Christ Church; and, in 1676, he went to Poland as chaplain to the English ambassador, Lawrence Hyde. On his return home in 1678 he was presented to the rectory of Islip, in Oxfordshire. In the latter part of the seventeenth century Dr. South commenced a controversy with Dr. Sherlock relative to the doctrine of the Trinity. Both disputants professed to be orthodox sons of the church, their difference relating to the mode of explaining the doctrine in question. Dr. South died in 1716. He possessed an abundant share of wit and humour, which he not unfrequently displayed in his most serious compositions.

SOUTHCOTT, JOHANNA, a singular fanatic, whose extravagant pretensions attracted a numerous band of converts in London and its vicinity, said to have, at one period, amounted to upwards of 100,000. She was born in the west of England, about the year 1750, of parents in very humble life, and, being carried away by a heated imagination, gave herself out as the woman spoken of in the book of *Revelations*. In this capacity she, for awhile, carried on a lucrative trade in the sale of seals, which were, under certain conditions, to secure the salvation of the purchasers. A disorder subsequently giving her the outward appearance of pregnancy, after she had passed her grand climacteric, she announced herself as the mother of the promised Shiloh, whose speedy advent she predicted. The faith of her followers, among whom were several clergymen of the established church, rose to enthusiasm. A cradle of the most expensive materials, and highly decorated, was prepared by expectant votaries at a fashionable upholsterer's, and every preparation made for the reception of the miraculous babe that superstition and credulity could induce. About the close of the year 1814, however,

the prophetess began to have her misgivings during some comparatively lucid intervals, in which she declared that, "if she was deceived, she had, at all events, been the sport of some spirit, either good or evil;" and the 27th December in that year, death put an end to both her hopes and fears. With her followers, however, it was otherwise; and though for a time confounded by her decease, which they could scarcely believe to be real, her speedy resurrection was confidently anticipated. In this persuasion many lived and died, nor is her sect yet extinct; but, within a short period, several families of her disciples were living together in the neighbourhood of Chatham, in Kent, remarkable for the length of their beards and the general singularity of their appearance. The body of Johanna underwent an anatomical investigation after her death, when the extraordinary appearance of her shape was accounted for upon medical principles; and her remains were conveyed for interment, under a fictitious name, to the burying-ground attached to the chapel in St. John's Wood.

**SOUTHERN, THOMAS**, a dramatic poet, who was born at Dublin in 1660, and educated there at Trinity college. In 1678 he came to London, with the view of making the law his profession, and entered himself to the Middle Temple, but soon abandoned the study, and dedicated his time to the cultivation of his muse. His first dramatic effort was a tragedy, entitled "The Persian Prince, or the Loyal Brother," founded on the story of "Shah Thamas." It was first performed in 1682, and, besides raising the author's reputation, procured him the favour of the duke of York, to whom he had paid his court in it. On the accession of James to the throne, Southern went into the army, and rose to the command of a company, in which he served during Monmouth's rebellion. Another of his tragedies, "The Spartan Dame," written in 1687, was acted in 1721. From his period he continued to produce, occasionally, comedies as well as tragedies: in the former style of composition, however, he was far from being successful; but some of his tragedies yet keep possession of the stage. His death took place in May 1746.

**SPALLANZANI, LAZARUS**, an eminent naturalist, born at Scandiano, in Italy, in 1729, studied at Reggio and at Bologna, under Laura Bassi, the celebrated female professor of physics in that place. Being nominated professor of natural philosophy at Pavia, he devoted himself to experimental researches, which he pursued for many years with assiduity, and published, in Italian, various works on physiology, which made his name known through Europe. In 1779 he travelled through the Swiss cantons; in 1785 he made a voyage to Constantinople, Corfu, and Cerigo, and in 1788 journeyed through the Two Sicilies and part of the Appennines, to collect volcanic products for the museum at Pavia. His celebrated natural philosopher died of apoplexy in 1799. Among the numerous writings of Spallanzani are, "Experiments on Animal Reproduction;" "On Infusory Animalcules;" "On the Phenomena of Circulation;" "On Animal and Vegetable Physics;" "Travels in the Two Sicilies;" "On the Transpiration of Plants."

**SPANGENBERG, AUGUSTUS GOTTLIEB**, Moravian bishop, who was born at Klettenberg, in Germany, in 1784, became a student of law at Jena, and in 1826 doctor of philosophy. The following year he formed an acquaintance with Count Zin-

zendorff, founder of the sect of Moravians or Herrnhutters, of whom he became a follower, and was sent on a mission to the West Indies and North America. In 1744 he was elected bishop of the Moravians, and sent again to America as superintendent of all the establishments of the brethren among the English and savage nations. On the death of Zinzendorff in 1760, he was called to the supreme council of the Herrnhutters, and in 1764 was appointed general inspector of the establishments in Upper Lusatia. In 1789 he became president of the general directory, and died at Berthelsdorf, near Herrnhutt, in 1792.

**SPARRMAN, ANDREW**, a Swedish naturalist and traveller, born about 1747, and studied medicine at Upsal, where his attention to natural history attracted the notice of Linnæus. In 1765 he made a voyage to China. On his return he described the animals and vegetables which he had discovered; and, to continue his researches, went to the Cape of Good Hope in 1772. Dr. Foster and his son visiting the Cape with Captain Cook, he joined them in the voyage round the world, and returned in 1775 to Africa, undertook a journey into the interior, and, after penetrating to the distance of 350 leagues from the Cape, he returned to that settlement in April 1776, bringing a copious collection of African plants and animals. The same year he returned to his native country. In 1787 he engaged in an abortive attempt to explore the interior of Africa, and returned home in 1788. He died at Stockholm in 1820. He was the author of several works, among which is an account of his voyage to the Cape of Good Hope, and travels in Africa, written in Swedish, and published in German at Berlin, and in English at London, 1785.

**SPARTACUS**, a Thracian gladiator, who was the chief instigator of the servile war or revolt of the slaves in Italy. He had been compelled, like other barbarians, to serve in the Roman army, from which he had deserted, and, at the head of a body of chosen companions, had carried on a partisan war against the conquerors. Being made prisoner, Spartacus was sold as a slave, and his strength and size caused him to be reserved as a gladiator. He was placed in a gladiatorial school at Capua, with 200 other Thracian, German, and Gaulish slaves, among whom a conspiracy was formed for effecting their escape. Their plot was discovered; but a small body, under Spartacus, broke out, and, having procured arms, and gained some advantages over the Roman forces sent against them, they were soon joined by the slaves and peasantry of the neighbourhood, and their numbers amounted to 10,000 men. By the courage and skill of Spartacus, several considerable battles were gained; but his authority was insufficient to restrain the ferocity and licentiousness of his followers, and the cities of the south of Italy were pillaged with the most revolting atrocities. In a few months Spartacus found himself at the head of 60,000 men; and the consuls were now sent with two legions against the revolted slaves. Mutual jealousies divided the leaders of the latter, and the Gauls and Germans formed a separate body under their own leaders, while the Thracians and Lucanians adhered to Spartacus. The former were defeated; but Spartacus skilfully covered their retreat, and successfully defeated the two consuls. Flushed with success, his followers demanded to be led against Rome; and the city trembled before the servile

forces. In this crisis, Licinius Crassus, who was afterwards a triumvir, was placed at the head of the army. His lieutenant, Mummius, whom he despatched with two legions to watch the motions of the enemy, was defeated by a superior force, and slain. Crassus, after having made an example of the defeated legions, by executing every tenth man, surrounded Spartacus, near Rhegium, with a ditch six miles in length. Spartacus broke through the enemy by night; but Crassus, who did not doubt that he would march upon Rome, pursued him, and defeated a considerable part of his forces, who had abandoned their general from disaffection. Spartacus now retreated, but his followers compelled him to lead them against the Romans. His soldiers fought with a courage deserving success; but they were overcome, after an obstinate conflict, and Spartacus himself fell fighting on his knees, upon a heap of his slain enemies. According to the Roman statements, 60,000 rebels fell in this battle, 6000 were made prisoners, and crucified on the Appian way. A considerable number escaped, and continued the war, but were finally destroyed by Pompey.

SPELMAN, SIR HENRY, a celebrated English antiquary and philologist, born in 1562. He was sent at the age of fifteen to Trinity college, Cambridge, and entered as a law student at Lincoln's Inn; but he seems to have paid but little attention to legal science at this period, and within three years he settled on his estate in the country. At length embarrassments, partly arising from a numerous family, aroused him to the exertion of his talents. He went to Ireland in 1607, as member of a board of commissioners for settling the titles to lands and manors in that kingdom; and he was afterwards employed to investigate the subject of the exaction of fees by the civil and ecclesiastical courts. On this occasion he drew up his treatise "*De Sepultura*," in which he demonstrated the flagrant abuses which had occurred to his notice. His services were rewarded with the honour of knighthood. In 1612 he settled in London, devoting his leisure to the study of juridical antiquities of his native country. Having purchased the lands which had belonged to two suppressed monasteries, and meeting with obstacles to the quiet enjoyment of the property, he began to entertain scruples of conscience relative to the alienation of church lands, and wrote on the subject his work entitled "*De Non Temerandis Ecclesiis*." On the revival of the society of antiquaries in 1614, Sir H. Spelman became a member, and produced a discourse concerning the original of the four law-terms of the year. In his researches into legal archæology, he found it necessary to study the Saxon language; and this led to the composition of his great work, the "*Archæological Glossary*." He printed a specimen in 1621, and in 1626 appeared the first part, entitled "*Archæologus in Modum Glossarii ad Rem Antiquam Posteriores*." Before he had completed the glossary he engaged in preparing a history of English councils, of which the first part, to the Norman conquest, appeared in 1639; and two additional volumes were subsequently published, partly from the papers of Spelman, by Sir W. Dugdale. In 1639, likewise, appeared his last work, entitled the "*History of Tenures by Knight's Service in England*." His death took place in 1641, and his body was interred in Westminster Abbey. Besides the works already noticed, he was the author of a "*History of the Civil*

Affairs of the Kingdom from the Conquest to the Grant of Magna Charta;" "*A Treatise concerning Tithes*," a "*History of Sacrilege*," "*Aspilogia*," &c.

SPEED, JOHN, an English antiquary, who was born in Cheshire about 1555, and was brought up to the business of a tailor. He became a member of the company of Merchant Tailors in London, in which situation he was noticed by Sir Fulk Greville, who enabled him to leave his mechanical employment and devote himself to the study of English history and antiquities. His first work was entitled "*The Theatre of the Empire of Great Britain*." This was followed by his "*History of Great Britain under the Conquest of the Romans, Saxons, Danes, and Normans*," &c. He was also the author of "*A Class of Witnesses on the Genealogies of Scripture*." He died in 1629.

SPENCE, JOSEPH, an English critic, who was born in 1698, and received his education at Oxford, where he obtained a fellowship. In 1727 appeared his "*Essay on Pope's Translation of the Odyssey*," which led to an intimate friendship with the poet. In 1728 he was elected professor of poetry at Oxford; and he afterwards travelled abroad with the earl of Lincoln. On his return, he obtained a living in Buckinghamshire, and in 1754 was promoted to a prebendal stall in Durham cathedral. After the death of his friend Mr. Rudge, in 1763, he resided much with the widow of that gentleman, who usually spent the summer months at Weybridge, in Surrey. On the morning of the 20th August, 1768, Mr. Spence was found by a servant lying on his face in a shallow piece of water, into which it appeared that he had fallen, and, being unable to extricate himself, he was unfortunately drowned. His principal work is entitled "*Polymetis, or an Enquiry into the Agreement between the Works of the Roman Poets and the Remains of Ancient Artists*."

SPENSER, EDMUND, a celebrated English poet, who was born in London, near the Tower, about 1553. It is not known where he received his early education, but he was admitted as a sizar of Pembroke Hall, Cambridge, in 1569, and graduated M. A. in 1576. On leaving the university, he took up his residence with some relations in the north of England, probably as a tutor, where he unsuccessfully wooed a lady, whom he records in his "*Shepherd's Calendar*," under the name of Rosaline, which was his first publication, and appeared in 1576. The year preceding he had been advised by his friend Gabriel Harvey to remove to London, where he was introduced to Sir Philip Sidney, to whom he dedicated the "*Shepherd's Calendar*." In 1580 he accompanied Lord Grey de Wilton, lord lieutenant of Ireland, as his secretary. He returned, in 1582, with Lord Grey, who, in conjunction with the earl of Leicester and Sir Philip Sidney, procured for him, in 1586, a grant of 3028 acres in the county of

Cork, out of the forfeited lands of the earl of Desmond; on which, however, by the terms of the gift,

he was obliged to become resident. He accordingly fixed his residence at Kilcolman, in the county of Cork, a view of which is given in the above engraving, where he was visited by Sir Walter Raleigh, who became his patron in lieu of Sir Philip Sidney, then deceased, and whom he celebrates under the title of "The Shepherd of the Ocean." He was then engaged in the composition of "The Faery Queen," of which he had written the first three books. With these he accompanied Raleigh, the next year, to England, where they were published, with a dedication to Queen Elizabeth and an introductory letter to Raleigh, explaining the nature of the poem. Raleigh also gained him the favour of the queen, who rewarded his poetry and dedication with a pension of 50*l.* per annum. In 1591 he returned to Ireland; and, the succeeding year, his rising reputation induced his bookseller to collect and print his smaller poems. He then passed an interval of two or three years in Ireland, where, in 1594, he married, being then in his forty-first year. His happiness was disquieted by the disturbances excited by the earl of Tyrone, which were probably the cause of his revisiting England the following year. Here he printed some poems, and drew up his view of the state of Ireland; which, in consequence, it is supposed, of the severity of some of its suggestions, lay in MS. until printed, in 1633, by Sir James Ware, who bestows much applause on the information and judgment displayed in it. In 1596 he published a new edition of his "Faery Queen," with three additional books. Of the remaining six, which were to complete the original design, two imperfect cantos "Of Mutabilitie" only have been recovered, which were introduced into the folio edition of 1609, as a part of the last book, entitled "The Legend of Constancy." There has been much controversy in respect to the presumed loss of the remainder of the six books on the poet's flight from Ireland: the most probable conclusion from the investigation is, that they were never finished, but that some parts of them were lost on that melancholy occasion.

In 1597 he returned to Ireland, and, in September 1598, was recommended to the sheriff of Cork. The rebellion of Tyrone, however, took place in October, and with such fury as to compel Spenser and his family to quit Kilcolman in so much confusion that an infant child was left behind, and burnt with his house. The unfortunate poet arrived

in England with a heart broken by these misfortunes, and died the 16th of the following January, 1599, in the forty-sixth year of his age. It is asserted that he terminated his life in great distress; but it has been contended that the poverty referred to by Camden and several of his poetical contemporaries, applies rather to his loss of property generally than to absolute personal suffering. This inference seems the more probable as he was interred in Westminster Abbey at the expense of the earl of Essex, who would scarcely have allowed the man to starve whom he thus honoured. A monument was afterwards erected over his remains by the celebrated Anne, countess of Dorset. Of the personal character of Spenser there is no direct testimony; but the friendships which he formed are favourable to its respectability, which is also to be implied from the purity, devotion, and exalted morality of his writings. Neither, although he paid assiduous court to the great, was he guilty of the mean adulation so common in his time, except, indeed, to Queen Elizabeth, by whom, both as a sovereign and a woman, it was levied as a kind of tax. As a poet, although his minor works contain many beauties, Spenser will be judged chiefly from the "Faery Queen," the predominant excellencies of which are imagery, feeling, and melody of versification. With all its defects, it furnishes admirable examples of the noblest graces of poetry, sublimity, pathos, unrivalled fertility of conception, and exquisite vividness of description. Its great length and want of interest, as a fable, added to the real and affected obsolescence of the language, may, indeed, deter readers in general from a complete perusal; but it will always be resorted to by the genuine lovers of poetry as a rich store-house of invention. The stanza which Spenser has adopted in the "Faery Queen" is usually called the Spenserian, either because he invented it, or was the first to apply it to extensive use. It consists of a strophe of eight decasyllabic verses, and an Alexandrine, and has a three-fold rhyme—the first and third verses forming one, the second, fourth, fifth, and seventh another, and the sixth, eighth, and ninth, the third. It is susceptible of great variety of expression, and admits equally of the most different kinds of composition—the droll or pathetic, descriptive or sentimental, tender or satirical.

STANHOPE, CHARLES, the third earl, was born in 1753. He received the early part of his education at Eton, and finished it at Geneva, where his genius led him to pay a close attention to mathematics; and such was his progress that he obtained a prize from the society of Stockholm for a memoir on the pendulum. In 1774 he stood candidate for Westminster without success, but was introduced by the earl of Shelburne into parliament as a member for the borough of Wycombe, which he represented until 1786, when the death of his father called him to the house of peers. He was one of the many English politicians who regarded with pleasure the dawn of the French revolution; but, what was much more extraordinary in a peer by birth, he openly avowed republican sentiments, and went so far as to lay by the external ornaments of the peerage. He was also a frequent speaker against the war; and, although singular in many of his opinions, a strong vein of sense and humour often qualified his statements of peculiar views. As a man of science he

*Brief à-la-mode*," which was acted in 1702 with considerable success. Through the recommendation of Addison, he was appointed, in the beginning of the reign of Anne, to the post of writer to "The London Gazette." His comedy of "The Tender Husband" appeared in 1703, and his "Lying Lover" in 1704. In 1709 he began the periodical paper so celebrated under the title of "The Tatler," which included a portion of the information of a common newspaper, but, in raciness of humour, and vivacity and urbanity of tone, was not, perhaps, exceeded by the most celebrated of its successors. As it sided with the existing ministry, and was extensively circulated, its projector was appointed one of the commissioners of the stamp duties. In 1711 "The Tatler" was succeeded by the still more celebrated "Spectator," in which the assistance of Addison and other eminent writers was more regular than in its predecessor, although Steele, as before, supported the chief burden. The "Spectator" terminating, he commenced "The Guardian" in 1713, and also produced a political periodical, called "The Englishman," with several other political pieces of temporary celebrity. His object was now to obtain a seat in parliament, for which purpose he resigned his place in the stamp office and a pension. He was accordingly elected for Stockbridge, but was soon after expelled the house for an alleged libel in the last number of "The Englishman," and in another paper called "The Crisis." His expulsion being purely the result of ministerial resentment, he regained favour on the accession of George I., and received the appointments of surveyor of the royal stables and governor of the king's comedians, and was knighted. He also again entered the house of commons as member for Boroughbridge, and received 500*l.* from Sir Robert Walpole for special services.

On the suppression of the rebellion of 1715 he was appointed one of the commissioners for the forfeited estates in Scotland, when he busied himself in an abortive scheme for a union between the churches of England and Scotland. Devoid of all prudential attention to economy, although he married two wives successively with respectable fortunes, he was uniformly embarrassed in his circumstances. Always engaged in some scheme or other, few or none of

his theatrical patent, in consequence of his opposition to the peerage bill. He appealed to the public in a paper called "The Theatre," and in 1720 honourably distinguished himself against the celebrated South Sea scheme. He was restored the following year to his authority over Drury Lane theatre, and soon after wrote his comedy of "The Conscious Lovers," on a hint from Terence, first acted in 1722, and dedicated to the king, who rewarded the author with 500*l.* His pecuniary difficulties, however, increasing, he retired to a seat in Wales, where a paralytic stroke impaired his understanding, and finally terminated his life in 1729.

*Rich<sup>d</sup> Steele*

STEEVENS, GEORGE, a dramatic critic and biographer, who was born at Stepney, where his father, an East India director, resided, and received his education at Cambridge. In 1766 he published twenty of the plays of Shakspeare, with notes. The skill which he displayed as a commentator induced Dr. Johnson to take him as his coadjutor in his edition of the works of the great dramatist. A new edition of the Shakspeare of Johnson and Steevens appeared in 1785; and in 1793 Mr. Steevens produced an enlarged and improved edition of the same work, in fifteen volumes. He was one of the contributors to Nichols's "Biographical Anecdotes of Hogarth;" and he also assisted in the "Biographia Dramatica." His death took place at Hampstead in 1800.

STEWART, DUGALD.—This learned Scottish writer was born in 1753, and was the son of Dr. Matthew Stewart, professor of mathematics in the university of Edinburgh. He was educated at the high school, and admitted, at the age of thirteen, as a student in the college, under the tuition of Dr. Blair and Dr. Ferguson. Such was the progress he made that, at the age of eighteen, he was appointed to read lectures for his father, which he continued to do till the death of the latter. In 1780 he received a number of pupils into his house, and in 1783 visited the continent in company with the marquis of Lothian. When Dr. Ferguson was sent to North America on a mission, Mr. Stewart taught his class in moral philosophy during his absence; and in 1785, when the professor resigned, Mr. Stewart was chosen to fill his chair, in which he continued many years with great reputation. His "Elements of the Philosophy of the Human Mind," was succeeded by "Outlines of Moral Philosophy, for the Use of Students;" Dr. Adam Smith's "Essays on Philosophical Subjects, with an Account of the Life and Writings of the Author;" "An Account of the Life and Writings of Dr. Robertson;" "An Account of the Life and Writings of Dr. Thomas Reid." The memoirs of Smith, Reid, and Robertson were afterwards collected into one volume, with additional notes. In the election of a mathematical professor of the university of Edinburgh, Mr. Stewart was reflected on for his conduct to the successful candidate, and he therefore published a statement of facts relative to that election. In 1796 he again took a num-

which succeeded, he wasted his regular income in the anticipation of a greater, until absolute distress was the consequence. A scheme for bringing fish to market alive, in particular, involved him in much embarrassment, which was heightened by the loss of

ber of pupils under his care; and, besides adding a course of lectures on political economy to the usual courses of his chair, he repeatedly supplied the place of his colleagues in case of illness or absence. In 1806 he accompanied his friend, the earl of Lauderdale, on his mission to Paris, and in 1810 relinquished his professorship, and retired to Kinneil House, about twenty miles from Edinburgh, where he continued to reside till his death, which took place in June 1828. His publications subsequently to his removal were philosophical essays; "Dissertation on the Progress of Metaphysical and Ethical Philosophy," prefixed to the supplement to the "Encyclopædia Britannica;" a second volume of "The Philosophy of the Human Mind," with a continuation; and "The Philosophy of the Active and Moral Powers," which appeared in 1828.

*Edward Steward*

STILLINGFLEET, EDWARD, a celebrated bishop of Worcester, who was born in 1635, and received his education at St. John's college, Cambridge, where he was elected, in 1653, to the first fellowship that became vacant after he had taken his bachelor's degree. His chief work, "Origines Sacrae, or a Rational Account of Natural and Revealed Religion," is esteemed for the erudition which it displays. It was followed by a treatise "On the Origin and Nature of Protestantism." Having distinguished himself by the prominent part which he took previous to the revolution, against the establishment of the Romish church in England, he was elevated to the see of Worcester by William III. Besides the writings enumerated, he was the author of an appendix to Tillotson's "Rule of Faith," "The Unreasonableness of Separation," and "Origines Britannicae, or Antiquities of the Churches in Britain." A short time before his death, Bishop Stillingfleet engaged in a controversy with Locke, respecting some part of that philosopher's writings, which he conceived had a leaning towards materialism. His death took place in 1699. His works have been collected and published entire, in six folio volumes.

STOW, JOHN, an English historian and antiquary, who was born about 1525 in London. His father, a tailor, brought him up to his own business; but his mind early took a bent towards antiquarian researches. About the year 1560 he formed the design of composing the annals of English history, for the completion of which he quitted his trade. For the purpose of examining records, charters, and other documents, he travelled on foot to several public establishments, and purchased old books, manuscripts, and parchments, until he had made a valuable collection. Being thought to be favourable to the ancient religion, an information was laid against him in 1568, as a suspicious person, who possessed many dangerous books. The bishop of London accordingly ordered an investigation of his study, in which, of course, were found many popish books amongst the rest; but the result has not been recorded. Two years afterwards, an unnatural brother, having defrauded him of his goods, sought to take away his life by preferring 140 articles against him, before the ecclesiastical commission; but he was acquitted. He had previously printed his first work, entitled "A

Summarie of the Englyshe Chronicles," compiled at the instance of Dudley, afterwards earl of Leicester, which was published in 1565, and afterwards continued by Edmond Howes, who printed several editions.

He contributed to the improvement of the second edition of Holinshead in 1587, and gave corrections and notes to two editions of Chaucer. At length, in 1598, appeared his "Survey of London," the work on which he had been so long employed, and which came to a second edition during his lifetime. He was very anxious to publish his large chronicle or history of England, but lived only to print an abstract of it, entitled "Flores Historiarum, or Annals of England." From his papers Howes published a folio volume, entitled "Stow's Chronicle," which does not, however, contain the whole of the larger work which he had left transcribed for the press, and which is said to have fallen into the possession of Sir Symonds Dewes. A license was granted him by James I. "to repair to churches or other places, to receive the charitable benevolence of well-disposed people," in the seventy-eighth year of his age. He died, afflicted by poverty and disease, in 1605, at the age of eighty. "Stow's Survey" has run through six editions, the last in 1754, with considerable additions, and a continuation of the useful lists.

STRABO, a distinguished Greek geographer who was born at Amasia, in Cappadocia, about A. D. 64. He studied rhetoric and the Aristotelian philosophy, and afterwards embraced the stoic doctrines. He travelled through Greece, Italy, Egypt, and Asia, endeavouring to obtain the most accurate information in regard to the geography, statistics, and political conditions of the countries which he visited. The

time of his death is unknown. His great geographical work, in seventeen books, contains a full account of the manners and governments of different people: his materials were derived from his own observations and inquiries, or from the geographical works of Hecateus, Artemidorus, Eudoxius, and Eratosthenes, now lost, and the writings of historians and poets. His work is invaluable to us.

**STRAFFORD, SIR THOMAS WENTWORTH, EARL OF**, an eminent English statesman, who was born in London in 1593, and entered of St. John's college, Cambridge. After leaving the university he travelled, and on his return received the honour of knighthood. The death of his father in 1614 gave him possession of a large fortune; and he was soon after appointed *custos rotulorum* of the west riding of Yorkshire, in lieu of Sir John Saville. In 1622 he lost his first wife, of the noble family of Clifford, and in 1625 married Arabella, second daughter of Holles, earl of Clare. On the convening of the new parliament, in the same year, he was one of the six popular members who were prevented serving their country in that assembly by being appointed sheriffs for their respective counties. He submitted to this arbitrary act in silence; and soon after the duke of Buckingham, alarmed at the measures taken against him in parliament, made him overtures which proved ineffectual, and the favourite revenged himself by obliging him to restore his office of *custos rotulorum* to Sir John Saville.

As he had now proved the strength of his abilities, high terms were offered him by the court, which he finally accepted; and in 1628 he was created Baron Wentworth, and some months afterwards a viscount and privy counsellor, and, on the resignation of Lord Scrope, nominated president of the north. The assassination of Buckingham soon after freed him from a powerful enemy at court, and he became so influential in the king's councils that his powers in the four northern counties, over which he presided, became enormous; and his commission contained fifty-eight instructions, of which scarcely one did not exceed or violate the common law. Having assiduously cultivated the friendship of Archbishop Laud, he was selected by that prelate to proceed to Ireland as lord deputy in 1632. He greatly improved the state of the country, both as regarded law, revenue, and trade (the manufacture of linen being of his own creation); but at the same time nothing could be more arbitrary than his system of government, it being his boast that he had rendered the king as absolute in Ireland "as any prince in the whole world could be." On the first symptoms of resistance to the royal authority he counselled the strongest measures; and after the failure of the king's first expedition against Scotland he was sent for from Ireland and created earl of Strafford and knight of the Garter. He returned with the full title of lord lieutenant, with a view to gain subsidies and troops, in which he fully succeeded; and, again repairing to England, took the command in the north, but found himself obliged to retire before the Scottish army, and retreat to York. Charles was now by his necessities obliged to call the long parliament; on which Strafford, aware of the enmity which he had inspired among the popular leaders, wished to return to his government; but the king, hoping that his great talents would be serviceable,

encouraged him by a solemn promise that "not a hair of his head should be touched by parliament."

Strafford's apprehensions were well founded. The very first movement of the party opposed to arbitrary power was to impeach him of high treason, with which charge Pym appeared at the bar of the house of lords on the 18th of November, 1640. The articles of impeachment, at the first nine in number, were afterwards increased to twenty-eight, the object of which was to convict him of an attempt to subvert the fundamental laws of the country. As in the case of Laud, it was easy to prove that he acted as a friend and promoter of arbitrary measures, but not to substantiate any particular fact to justify a capital charge. Although treated with the extreme of legal rigour and debarred the assistance of counsel, his own great abilities and force of mind supplied every deficiency; "And never man," says Whitelock, the chairman of the impeaching committee, "acted such a part, on such a theatre, with more wisdom, consistency, and eloquence, or with greater reason, judgment, and temper." His defence, indeed, was so strong that the original impeachment was deserted for the unjustifiable proceedings of a bill of attainder. The bill passed by a great majority; and so great was the animosity borne towards him that the house of lords was intimidated into compliance. The king, who had imprudently endeavoured to stop the bill by his personal interference, had not sufficient firmness to redeem the pledge of safety which he had previously given, but yielded to the advice of his counsellors, backed by a letter from Strafford himself, who urged him, for his own safety, to ratify the bill. This act has the semblance of being truly heroical; yet it is probable that he did not think that the king would have been swayed by it, since, being assured of the fatal truth, he lifted his eyes to heaven, and, with his hand on his heart, exclaimed, "Put not your trust in princes, nor in the sons of men; for in them there is no salvation." His conduct from this time to his execution was in the highest degree composed and noble. At the scaffold he addressed the people, expressing entire resignation to his fate, and asserting the good intention of his actions, however misrepresented. He fell in the forty-ninth year of his age, lamented by some, admired by more, and leaving behind a memorable, but certainly not an unspotted name. The parliament, not long after his death, mitigated his sentence as regarded his children; and in the succeeding reign his attainder was reversed. He married three times, and by his second wife left an only son and several daughters.

**STRUTT, JOSEPH**, an English antiquary, who was born in 1749, at Springfield in Essex, and was articled to an engraver, and obtained the gold and silver medals of the royal academy. He published in 1773 his work entitled "The Regal and Ecclesiastical Antiquities of England," containing representations of the English monarchs from Edward the Confessor to Henry VIII. This was followed by "Horda Angel Cynnau, or a Complete View of the Manners, Customs, Arms, Habits, &c., of the English, from the arrival of the Saxons to the times of Henry VIII.," &c. In 1777 and 1778 he published a "Chronicle of England," which he meant to extend to six volumes, but dropped the design for want of

SWEDENBORG, EMANUEL, the most celebrated mystic of the eighteenth century. He was born at Stockholm in 1688. Educated by his father Jasper Swedberg, bishop of West Gothland, in the severe doctrines of Lutheranism which prevailed in Sweden, his ardent and imaginative mind soon took a religious turn. His studies embraced theology, philosophy, mathematics, and the natural sciences. His first poetical efforts appeared in 1710 at Skara, under the title of "*Carmina Miscellanea*." The period from 1710 to 1714 he spent in scientific travels through England, Holland, France, and Germany, and visited the universities of those countries. He then returned to Upsal, and published his "*Dædalus Hyperboreus*," six numbers, containing experiments and observations in mathematics and philosophy. He had several interviews with Charles XII., who in 1716 appointed him assessor in the mining college. The invention of a rolling machine, by means of which he conveyed a shallop, two galleys, and four large boats (which Charles XII. used in 1718 to transport cannon to the siege of Frederickshall), five leagues over mountains and valleys, from Strömstadt to Idefjäl, and his treatises on algebra, the value of money, the revolutions of the planets, and on tides, gained for him the favour of the government. Queen Ulrica raised him to the rank of nobility in 1719, upon which occasion his name was changed from Swedberg to Swedenborg. In the discharge of the duties of his office he visited in 1720 the Swedish mines, and in 1721 the Saxon, and wrote some valuable treatises on them. He likewise made similar journeys to the mines of Austria and Hungary. A collection of his works on philosophy and mineralogy was published in 1734, and attracted much attention among the scholars of Europe. He was chosen a member of the academies of Upsal and Petersburg. The academy at Stockholm had already elected him an honorary member in 1729. He increased his stock of knowledge by new travels to France and Italy in 1738. The "*(Economia Regni Animalis)*," which he published after his return in 1740, contains the application of the system of nature, unfolded in his philosophical works, to the animal creation. The principle of a necessary emanation of all things from a central power is the basis of this system, which is ingeniously unfolded, and illustrates the extent of the author's reading. But the works of Swedenborg are much too extensive for us even to enumerate, and it may be enough to say that they have long excited the attention of the most learned men in modern times. He died at London in 1772.

SWIFT, JONATHAN, an eminent English writer. He was born in 1667, and received a good education, but suffered considerably under pecuniary difficulties till he was taken under the protection of the earl of Berkeley. In 1701 he took his doctor's degree, and in the same year first entered on the stage as a political writer, by a pamphlet in behalf of the ministers, entitled, "*Contests and Dissensions between the Nobles and Commons of Athens and Rome*," a work of no great force. In 1704 he published, anonymously, his famous "*Tale of a Tub*," of which, although he would never own it, he is the undoubted author. This piece of humour, while it advanced his reputation as a wit, did him no small injury as a divine, being deemed light and indecorous by the functionaries of the church. "*The Battle of the*

*Books*," appended to the "*Tale of a Tub*," is a burlesque comparison between ancient and modern authors, in which he exercises his satire against Dryden and Bentley. In 1708 appeared his "*Sentiments of a Church of England Man in respect to Religion and Government*," "*Letter concerning the Sacramental Test*," "*Argument for the Abolition of Christianity*," and "*Predictions for the year 1708*, by Isaac Bickerstaff, Esq." In 1710, being engaged by the Irish prelacy to obtain a remission of the first-fruits and twentieths payable by the Irish clergy to the crown, he was introduced to Harley, afterwards earl of Oxford, and to Secretary St. John, subsequently Lord Bolingbroke. He gained the confidence of these leaders, and took a leading share in the famous Tory periodical entitled "*The Examiner*."

The dissensions between Oxford and Bolingbroke, whom he in vain attempted to reconcile, and the death of the queen, which soon followed, put an end to his prospects, and condemned him to an unwilling residence for life in a country which he disliked. He accordingly returned to Dublin, and introduced a meritorious reform into the chapter of St. Patrick's, over which he obtained an authority never before possessed in his station. In 1716 he was privately married to Miss Johnson; but the ceremony was attended with no acknowledgment which could gratify the feelings of the victim of his pride and cruelty. The ascendancy which he acquired over Miss Hester Vanhomrigh, another accomplished female, was attended with circumstances still more censurable. He became acquainted with this lady in London in 1712; and as she possessed, with a large fortune, a taste for literature, Swift took pleasure in affording her instruction. This affair terminated fatally; for, discovering his secret union with Stella, the unfortunate lady never recovered the shock, but died fourteen months after in 1723. She previously cancelled a will she had made in his favour, and left it in charge to her executors (one of whom was Bishop Berkeley) to publish all the correspondence between herself and Swift, which, however, never appeared. After residing some time in Ireland, without attending to public affairs, he was roused, by the illiberal manner in which Ireland was governed, to publish "*A Proposal for the Universal Use of Irish Manufactures*," which rendered him very popular.

On the death of George I. he paid his court to the new king and queen. But he was disappointed; and the death of Stella about this time, who had been long languishing in a state of decline, completed his chagrin. When her health was ruined he offered to acknowledge her as his wife, but she replied, "*It is too late*." He allowed her to make a will in her maiden name, in which she consigned her property to charitable uses. From the death of this injured female his life became much retired, and the austerity of his temper increased. He continued, however, for some years to exercise both his patriotic and his splenetic feelings in various effusions of prose and verse, and was earnest in his exertions to better the condition of the wretched poor of Ireland, in addition to which endeavours he dedicated a third of his income to charity. Some of his most striking poems were written about this time, including his celebrated "*Verses on his Own Death*," formed on one of the maxims of Rochefoucault. He kept little company at this advanced period but with inferiors, whom he could treat as he pleased, and especially

knot of females, who were always ready to administer the most obsequious flattery. In 1736 he had an attack of deafness and giddiness. The fate which, owing to his constitutional infirmities, he had always feared, at length reached him; the faculties of his mind decayed before his body, and a gradual decay of reason settled into absolute idiocy early in 1742. He died in 1745, in his seventy-eighth year.

SYDENHAM, THOMAS, a celebrated English physician, who was born in Dorsetshire in 1624, and in 1648 took the degree of bachelor of medicine at Oxford. He subsequently commenced practice as a physician at Westminster, and speedily attained great reputation. From 1660 to 1670 he held the first place in his profession, though it was not till the latter part of his career that he became a licentiate of

the college. Being a great sufferer from the gout, he was unable in the latter part of his life to go much from home; but he continued to benefit society by his writings and advice till near the time of his decease in 1689. Dr. Sydenham's improvements form an era in the history of medicine. He first applied himself to an attentive observation of the phenomena of diseases, founding his practice on the obvious indications of nature, rather than on prevalent theories drawn from the principles of chemistry or mathematics.

TALMA, FRANCOIS JOSEPH.—This great tragic actor was born at Paris in 1763, but passed his youth in England, where his father practised as a dentist. He was sent to Paris to complete his studies; and his taste for the theatre was awakened by the dramatic masterpieces and the performances of distinguished actors which he there witnessed. The susceptibility of his temperament showed itself early. While he was at school, he and some of his companions performed a tragedy, in which he had to describe the last moments of a friend condemned to death by his father; the situation affected him so powerfully that he burst into a flood of tears, which continued to flow for some hours after the conclusion of the piece. After his return to London, Talma associated himself with some other young men, for the purpose of representing French plays, and displayed such brilliant powers as to attract the notice

of distinguished individuals, who urged him to appear on the London boards. But circumstances led him to Paris, where he entered the royal school for declamation, and soon after made his *début* at the Theatre Français in the character of Seide in Voltaire's "Mahomet." He was received with applause, and from this moment devoted himself with zeal and perseverance to the study of his art. He sought the society of distinguished literati and artists, studied history for the purpose of becoming acquainted with the manners and customs of nations, and the characters of remarkable individuals, and made himself master of the attitudes, costumes, expression, and drapery of the ancient statues. Talma rendered an important service to the French stage by introducing a reform in the costume. The revolution which now broke out under his eyes, with all its scenes of violence and passion, its displays of exalted virtue, and its excesses of cruelty, contributed to develop his peculiar talent. Chenier's tragedy of "Charles IX., or St. Bartholomew's," was brought forward at this time, and Talma studied the character of Charles in history, and his person in medals and portraits, and exhibited them with such truth and life that his reputation as the first French tragedian was established beyond dispute. He died in 1826.

TARTINI, GIUSEPPE, an Italian musician and composer, a native of Pirano, in the province of Istria, who was born in 1692. His father gave him an expensive education, with the view of qualifying him to follow the law as his profession, and had him also instructed in all the accomplishments of a gentleman. Among them music was not forgotten, but it was not till a secret marriage alienated from him the affections of his friends that he thought of making it conducive to his support. An ecclesiastic, connected with the family, procured him a situation in the orchestra of his convent, where an accident discovering his retreat, matters were at length accommodated, and he was enabled to settle with his wife at Venice. Here the example of the celebrated Veracini excited in him the strongest emulation; and he is said to have retired to Ancona for the sole purpose of being able to practise on the violin in greater tranquillity than circumstances allowed him to enjoy at Venice. After seven years' practice he obtained the situation of leader of the orchestra in the cathedral of St. Anthony at Padua. In this capacity he continued to act till death, with increasing reputation, and declining, from devotion to his patron saint, many advantageous offers both from Paris and London. A singular story is told respecting one of his most celebrated compositions. Besides his musical compositions, Tartini was the author of several treatises on the science. His death took place at Padua in 1770.

TASSO, BERNARDO, a distinguished epic and lyric poet, whose fame has, however, been eclipsed by that of his son Torquato. He was born at Bergamo, in 1493, and was of an ancient and noble family. His education was conducted with great care; and he not only cultivated the lighter literature, but devoted himself to the study of politics. He had already become known as a poet throughout Italy, when Guido Rangone, general of the pope, and a patron of learning, took him into his service, and employed him in managing the most difficult negotiations with Clement VII. at Rome, and Francis I. in France. Bernardo subsequently entered into the service of

Renata, duchess of Ferrara, but soon left her court, and went first to Padua and then to Venice. Here he published a collection of his poems, which gave him a place among the first of living poets. Ferrante Sanseverino, prince of Salerno, engaged him in his service, in 1531, as secretary, on honourable and advantageous terms. When the prince followed Charles V. to Tunis, in a galley equipped at his own cost, Tasso accompanied him, and, after his return, was sent on public business to Spain. In 1539 he married the rich and beautiful Porzia de' Rossi, and retired, with the consent of the prince, to Sorrento, where he lived till 1547. In 1563 the duke of Mantua engaged him in his service, and appointed him governor of Ostiglia, where he died in 1569. His remains were interred at Mantua under a handsome monument erected by the duke, with the inscription, "Ossa Bernardi Tassi;" but his son Torquato afterwards removed them to Ferrara. His chief work, "Armida," a romantic epic, displays much talent and art: in the expression of the tender passions, in his descriptions of nature, in vivid delineations of adventures and battles, all the ornaments of poetry are happily introduced.

TASSO, TORQUATO.—This poet, celebrated for his immortal works, as well as his unhappy fate, was born in the year 1544 at Sorrento. His talents early and rapidly developed themselves. From his seventh to his tenth year he attended the schools of the Jesuits in Naples, and learned the Latin and Greek languages thoroughly. He then accompanied his father to Rome, where, under his superintendence, he continued his studies with equal success for two years. He then went to Bergamo, and six months after to Pesaro, where his father had met with a favourable reception from the duke of Urbino. Here he shared the instruction of the duke's son. His favourite studies were philosophy and poetry; but he also devoted himself to mathematics and chivalrous exercises. When his father resided at Venice, he remained there with him for a year, and then went, at the age of thirteen years, to Padua, with the intention of studying law. But his genius drew him irresistibly to poetry, and, at the age of seventeen years, he came out with an epic poem in twelve cantos, which he dedicated to the cardinal Ludovico of Este. Italy received this with universal applause. His father consented, after a long opposition, that he should relinquish the study of the law. Torquato now devoted himself with redoubled zeal to literary and philosophical studies, and, with this view, accepted an invitation to Bologna. Here he commenced the execution of a plan of an epic poem, which he had already formed in Padua—the conquest of Jerusalem under the command of Godfrey of Bouillon. But, in the midst of these occupations, he was unexpectedly disturbed. He was falsely accused as the author of a satirical poem in circulation, and was subjected to a judicial examination. This induced him to leave Bologna. He went to Modena, and then accepted the invitation of the friend of his youth, the young Scipio Gonzaga, who had founded an academy in Padua, and wished to see Tasso at the head of it. He studied with great assiduity the philosophy of Aristotle, but still more that of Plato, towards whom he felt himself drawn by the cords of sympathy. Meanwhile, he did not lose sight of his epic poem. How intently the theory of this species of poem occupied him may be seen by the three dia-

logues which he then composed on the subject. The cardinal Ludovico of Este appointed him a gentleman of his court, and wished that he should be present in Ferrara at the nuptials of his brother Alphonso with an archduchess of Austria. Tasso went, in October 1565, and attended the splendid *fêtes* with which those nuptials were celebrated. The sisters of the duke, Lucretia and Leonora, both indeed no longer young, but beautiful and lovely, gave the poet their friendship; in particular the latter, who presented him to Alphonso. This prince, who knew that Tasso wished to celebrate the conquest of Jerusalem in an epic poem, received him in a most flattering manner, and warmly encouraged his undertaking, so that the poet returned to his labour, which had been interrupted during two years, and determined to dedicate his work to the duke Alphonso, and to raise in it a monument to the fame of the ducal house, from which he then enjoyed such distinguished favour. For a short time only he left Ferrara to visit Padua, Milan, Pavia, and Mantua, where he saw his father. He returned with increased celebrity. The heart of Tasso was much affected by the unexpected death of his father; but neither this misfortune, nor other distractions, prevented him from labouring every day on his poem, of which he had finished eight cantos, when he travelled in the suite of the cardinal of Este to France, in 1571. Here he was received with distinction by Charles IX., as well as by the whole court. The poet Ronsard was his friend; and they communicated to each other their poetical labours. In the mean time Tasso may have expressed himself too freely and unguardedly concerning some subjects which then occupied the minds of all: he lost the favour of the cardinal, and, in consequence, appears to have been involved in some embarrassments, and finally departed for Italy. He returned to Rome, and soon entered, according to his wishes, into the service of the duke Alphonso, by the mediation of the princess of Urbino, Lucretia of Este, and the princess Leonora. The conditions were favourable and honourable, and left him in possession of entire freedom. But hardly had he applied himself again to the work, which the world expected with impatience, when the death of the duchess again interrupted his labours. Alphonso soon after made a journey to Rome, and Tasso took advantage of the leisure thus afforded him to compose his "Aminto," the plan of which had been for a long time in his mind.

The representation of an idyl in dialogue, written by Agostino degl'Argenti, at which he had been present six years before, in Ferrara, had delighted him, and suggested to him the idea of a similar work, which he now completed in two months, and which far surpassed all that Italy then possessed of this kind. From this dramatic performance the opera may be considered to have taken its rise. The duke was most agreeably surprised, on his return, by this performance, and ordered the representation of it to be made with the greatest splendour. Tasso's consideration and favour with the duke increased; but his good fortune excited the envy of many, who continually meditated his ruin. The princess of Urbino wishing to become acquainted with the poem which was the subject of general admiration, Tasso paid her a visit at Pesaro, where the old prince Guidobaldo, as well as his son and daughter-in-law, received him in a very flattering manner. For several months he lived in the charming castle of Durante, in

the most intimate friendship with Lucretia, who willingly listened to the verses in which he immortalized her. With rich presents he returned to Ferrara, and occupied himself again with his epic poem, which he once more reluctantly discontinued, to accompany the duke to Venice, whither the latter went to meet King Henry III., who had just exchanged the throne of Poland for that of France, and who was now invited to visit Ferrara. This journey took place in the hottest season of the year, and brought on the poet a fever, which continued a long time and interrupted all his labours. During his convalescence, he finished, in the early part of the year 1575, his "Goffredo"—the fruit of so much exertion, and the source of such great misfortunes to him. But he wished, before publishing it, to obtain the judgment of his friends; and their discordant opinions perplexed and agitated him to such a degree as to occasion another burning fever, from which, however, he soon recovered. He immediately examined his work anew, in order to retouch or alter it in particular places. The duke treated him with redoubled attention and distinction. Tasso accompanied him on his journeys of pleasure to Belriguardo, and Lucretia, who had separated from her husband, and had returned to her brother, wished to have the poet always with her.

It was with difficulty that he obtained, under these circumstances, in November 1575, permission to go to Rome, in order to subject his poem to a new and thorough examination. Here he was well received, in particular by his friend Scipio di Gonzaga. By him he was presented to the cardinal Ferdinand de' Medici (brother, and afterwards successor, of the grand-duke of Tuscany), who, knowing that the poet was no longer pleased with Ferrara, proposed to him the service of the grand-duke. Tasso, however, declined, from a feeling of gratitude towards the house of Este. He therefore soon returned to Ferrara, where, not long after, arrived the young and beautiful countess Leonora Sanvitale, wife of the count of Scandiano, a lady whom Tasso ardently admired, and whom he has celebrated in his poems. She also, on her part, was not insensible to his friendship; and the duke about this time conferred upon him the vacant office of historiographer to the house of Este: thus, to his misfortune, he found himself bound more closely to Ferrara; and the hatred of his rivals and enemies was increased. He was greatly troubled by the information that his poem had been printed in a city of Italy, as it did not appear to him sufficiently finished for the press, and as he saw himself, also, by this means, deprived of the advantages which he had hoped for from the labour of so many years. This and other troubles, partly real, partly imaginary, increased his melancholy: he believed himself persecuted by his enemies, calumniated, accused. In this state of mind, one evening, in the apartment of the duchess of Urbino, he drew his sword against one of her servants. This induced the duke to arrest him, and confine him in a house near the palace; but upon his entreaty he restored him to liberty, and merely desired that he would put himself under the care of a physician. A cure appeared to be effected, and the duke took him on a journey of pleasure to Belriguardo, in order to console and divert him, after he had caused the grand inquisitor to satisfy some scruples of conscience which had arisen in Tasso's mind, on account of doubts upon religious subjects.

But all this care was not sufficient to restore the poet's peace, and the duke at last saw himself under the necessity of letting him return, according to his desire, to the Franciscans in Ferrara. His situation became continually worse: he imagined himself surrounded by perils, gave himself the most painful reproaches, and at last, in a state of mental disorder, took advantage of a moment when he was not watched, and, destitute of every thing, without even his manuscripts, made his escape on the 20th of July, 1577. He hastened to his sister Cornelia, who lived in a state of widowhood at Sorrento, in Naples, and who received him most tenderly. By her care he at last began to grow composed. He repented of his precipitate flight, and presented to the duke and princess a petition that he might be restored to his place, but particularly to their favour. He, indeed, went back to Ferrara; but his old malady soon returned, and he escaped a second time. In vain did he seek shelter in Mantua, Padua, and Venice; at the court of Urbino he first met with a worthy reception. But notwithstanding all the friendship and care with which he was treated, his melancholy acquired new strength: he thought himself not secure; and, while he fled from imaginary dangers, he rushed upon real ones. He went at last to Turin. Here a friend recognised him, extricated him from his embarrassments, and presented him to the marquis Filippo d'Este, who received him in a very friendly and liberal manner. The archbishop of Turin, an old friend of Bernardo Tasso, introduced him to Duke Charles Emanuel, who received him under the same conditions as those on which he had lived in Ferrara. Once more the unhappy Tasso took courage, and bright sparks shone through the gloomy mist which had veiled his mind, and which but too soon resumed the ascendancy. He longed to be once more in Ferrara, and thought that the nuptials of the duke with Margareta Gonzaga would be the most suitable time for his appearance there. He went, but was bitterly disappointed. He was received on every side with indifference, even with mockery and contempt: neither the duke nor the princess admitted him to their presence; and he poured forth loud invectives against Alphonso and the whole court. The duke, instead of bestowing pity upon the unfortunate poet, commanded that he should be placed in St. Anne's hospital, and confined there as a madman. A new affliction to him was the information that his poem had appeared in print at Venice in a very mutilated condition. This first edition was quickly followed in different places by others, of which every successive one surpassed the preceding in correctness and completeness. Thus, in six months, six editions of the "Jerusalem Delivered" were printed. The printers and publishers enriched themselves, while the unhappy poet languished in close imprisonment, sick and forgotten. It was not till two years after that he was allowed by the duke, in consequence of his repeated entreaties, several apartments, instead of his prison-like abode. Here he enjoyed greater freedom, received visits from friends and strangers, and was permitted, from time to time, accompanied only by one person, to walk out, and to visit some society or place of amusement. The duke even once sent for Tasso at a time when some French and Italian noblemen were with him: he received him with kindness, and promised him a speedy release.

At length Alphonso was softened, and, at the most

urgent entreaties, yielded up the person of the poet, after an imprisonment of more than seven years, to his brother-in-law Vincenzo Gonzaga, prince of Mantua, who promised to keep such a watch over him that Alphonso should have nothing to fear from him. In Mantua Tasso met with the most friendly and honourable reception, but his malady had taken too deep root to leave him entirely. He, nevertheless, resumed his literary labours: he completed, among other things, "Floridante," which had been commenced by his father, and published it with a dedication to the duke of Mantua and Bologna. He also recomposed his tragedy "Torrismondo." In the next year he enjoyed the happiness of visiting Bergamo, where his appearance was celebrated by the whole city. The death of the duke of Mantua recalled him to that city. His son and successor manifested towards the poet the same kindness, but not the same friendship and confidence. Tasso began to be discontented with his residence in Mantua. He received an honourable invitation to be professor in the academy at Genoa, but was prevented by his sickness from accepting it. He then formed the resolution of going to Rome. Here he was so well received, not only by Scipio Gonzaga, but also by several cardinals, that he again entertained new hopes; but nothing was effected, and he repaired in 1588 to Naples for the purpose of recovering the confiscated fortune of his parents. Here he occupied himself with a recomposition of his "Jerusalem Delivered," in order to purge it from the faults which he perceived in it, as well as from the praises bestowed in it upon the house of Este. From Naples he returned to Rome, and finding there also occasion for discontent, he accepted the invitation of the grand-duke of Florence. He repaired, in consequence of urgent entreaties, to Mantua, to visit the duke Vincenzo Gonzaga; and it would have been well for him to have remained here if his continually declining health had not made him desirous to go to Naples. At the invitation of his friends he went thither in January 1592, and took up his abode with his patron, the prince Conca. The completion of "Jerusalem Conquered" was his first employment, and was almost concluded when he became suspicious that the prince wished to take possession of his manuscripts. He communicated his apprehension to his friend Manso, who, with the consent of the duke, and without any violation of gratitude or friendship, received him into his house, which was most charmingly situated on the sea-coast. In the mean time Hippolitus Aldobrandini had ascended the papal chair as Clement VIII. Tasso had congratulated his former patron upon this event, as he had before done Urban VII., in an excellent canzone, and was at last obliged to comply with the repeated invitation of the pope to come to Rome. The pope, as well as both his nephews, in particular the cardinal Cintio Aldobrandini, paid him the most delicate and friendly attentions. Tasso, from gratitude, dedicated to the latter his "Jerusalem Conquered;" and the return of his malady alone induced him to leave Rome and again to return to Naples. Here he passed four months very happily in the circle of his friends. Meanwhile, Cintio, in order to draw him back to Rome, had procured for him from the pope the honour of a solemn coronation in the Capitol. At this news Tasso set off for Rome, where he arrived in November 1594, and was received with great distinc-

tion. The pope overwhelmed him with praises, and said to him, "I give to you the laurel, that it may receive as much honour from you as it has conferred upon those who have had it before you." The solemnity was, however, delayed till the spring in order to give it the greater splendour. During the winter Tasso's health failed more and more: he felt his end approaching, and ordered himself to be carried into the monastery of St. Onofrio, where he died, April 25, 1595, the very day which had been appointed for his coronation. We annex his autograph.

*Tory. Tasso.*

TAYLOR, JOHN, usually called the "Water Poet," from his being a waterman, was born in Gloucester, about 1580. He was taken young to London, and apprenticed to a waterman. He was at the taking of Cadiz, under the earl of Essex, in 1596, and afterwards visited Germany and Scotland. At home he was many years collector for the lieutenant of the Tower of London, of his fees of the wines from all the ships which brought them up the Thames. When the civil wars broke out he retired to Oxford, where he kept a common victualling-house, and wrote pasquinades upon the Roundheads. He afterwards kept a public-house at Westminster. He died in 1654, aged seventy-four. His works are published under the title of "All the Works of John Taylor, the Water Poet, being Sixty and Three in Number, collected into One Volume by the Author, with sundry new Additions, corrected, revised, and newly imprinted."

TAYLOR, JEREMY, an eminent divine and prelate of the Irish church, was born in the year 1613, at Cambridge, where his father was a barber. He was educated at Perse's free school in his native place, and entered in 1626 a sizar in Caius college, where he continued until he had graduated master of arts. Entering into orders, he occasionally lectured for a friend at St. Paul's cathedral, where he attracted the attention of Archbishop Laud, who procured him a fellowship of All Souls college, Oxford, and in 1640 obtained for him the rectory of Uppingham. In 1642 he was created doctor of divinity at Oxford, at which time he was chaplain in ordinary to Charles I. After the parliament proved victorious, his living being sequestered, he retired into Wales, where he was kindly received by the earl of Carbery, under whose protection he was allowed to exercise his ministry and keep a school. In this obscure situation he wrote those copious and fervent discourses, whose fertility of composition, eloquence of expression, and comprehensiveness of thought, have rendered him one of the first writers in the English language. The death of three sons within a short period rendered a change of place necessary for the restoration of his tranquillity; and he removed to London, and officiated, not without danger, to private congregations of royalists. At length he accepted an invitation from Lord Conway to reside at his seat in Ireland, where he remained until the restoration, when he was elevated to the Irish see of Down and Connor, with the administration of that of

Dromore. He was also made a privy counsellor for Ireland, and chosen vice-chancellor of the university of Dublin. He conducted himself on his advancement with all the attention to his duties, public and private, which had ever distinguished him in humble situations. Piety, humility, and charity, were his leading characteristics; and on his death, at Lisburne, in 1667, he left but very moderate fortunes to his three daughters.

**TAYLOR, JOHN, LL. D.**, a distinguished scholar and critic, the son of a barber at Shrewsbury. He received the rudiments of education at the grammar school of his native town, and was entered of St. John's college, Cambridge, of which he became a fellow in 1730. In 1732 he was appointed librarian of the university, which office he soon after quitted for that of registrar. He published an edition of *Lysias* in 1739, and in 1742 became a member of Doctors' Commons. Two years afterwards he was made chancellor of Lincoln; and in 1751, entering into orders, was presented to the living of Lawford, in Essex. He published, in 1755, "*Elements of Civil Law*." He died in 1760, after having just completed an edition of *Demosthenes*, in two volumes.

**TAYLOR, THOMAS**, well known by the title of the "*Platonist*," was born in London, of obscure parents, in 1758, and at the age of nine years was placed at St. Paul's school, it being intended to educate him as a dissenting minister. Disgusted, however, with the manner in which the dead languages are taught, he prevailed on his father to relinquish this plan. He was then only twelve years old; yet he became deeply enamoured of a Miss Morton, who afterwards gave him her hand. While at home, Ward's "*Young Mathematician's Guide*" inspired him with a love of mathematics, and, though his father was adverse to the study, the youth soon contrived to become a proficient in his favourite science. When he was fifteen he was placed under an uncle, at Sheerness, who was an officer of the dock-yard—a situation irksome in its nature, and rendered more so by the tyranny of his uncle. After enduring it for three years he became pupil to a dissenting preacher, with the view of entering into the church. At this period he also renewed his acquaintance with Miss Morton, to whom he was secretly married. Their secret was, however, betrayed, and they were thrown upon the world with scarcely sufficient resources to prevent them from starving. At length Mr. Taylor obtained employment as usher to a school at Paddington, which, as it kept him absent from his wife, he exchanged for that of a clerk in a banking-house in the city. Still his pecuniary means were so limited that in the course of the day he could not obtain a proper quantity of food, and he often fell senseless on the floor when he reached his home. At length his circumstances were somewhat amended.

Having made himself master of the works of Aristotle, he passed on to those of Plato, and the commentators on Plato's philosophical writings. After he had been nearly six years in the banking-house, the failure of his health, and the nature of his occupation, determined him to procure some more eligible mode of living. An attempt to construct a perpetual lamp made him advantageously known to several eminent persons, who enabled him to emancipate himself from the drudgery of the banking-house. The munificence of a private individual, Mr. William Meredith, now put it in his power to publish a trans-

lation of the works of Plato and the Platonic commentators. Mr. Taylor also laboured for the booksellers; but the remuneration which he received from them was inadequate to his toil. For his translation of "*Pausanias*" he was paid only 60*l*. If we contemplate the numerous obstacles which opposed his progress, it is impossible not to admire the steady perseverance with which he pursued his course; and it is little to the credit of England, that a man of such powers of mind, and such extensive learning, should so long have been left to struggle through the world with no other patronage than that of a few private individuals.

**TAYLOR, JANE**, an amiable and accomplished female writer, who was born in 1783, in London. Her father was a highly respectable artist. While quite young, she gave evident indications of poetic talent. Mr. Taylor became, in 1792, pastor of a dissenting congregation at Colchester, whither he carried his daughters, and taught them his own art of engraving. In the intervals between these pursuits, Miss Taylor committed the effusions of her genius to writing, and contributed to "*The Minor's Pocket-Book*," a small publication, in which her first work, "*The Beggar Boy*," appeared in 1804. From this period until 1813 she continued to publish, occasionally, miscellaneous pieces in verse, of which the principal are, "*Original Poems for Infant Minds*," "*Rhymes for the Nursery*," and some verses in "*The Associate Minstrels*." A prose composition of higher pretensions, which appeared in 1815, under the name of "*Display*," met with much success. Her last and principal work consists of "*Essays in Rhyme on Morals and Manners*," didactic poems, written with much elegance and feeling. This amiable and intellectual female died of a pulmonary complaint in April 1823.

**TELL, WILLIAM**, a distinguished Swiss patriot, who was born in the canton of Uri. His parents were in humble circumstances, and Tell having offended Gesler, the Austrian governor, he was condemned to fire at a mark placed on the head of his own son. This he succeeded in doing, and afterwards killed Gesler, while riding near Kussnacht,

which led to the establishment of Swiss independence in 1308. A chapel was afterwards erected to mark the spot where Tell effected his escape from Gesler; and it is represented in the above engraving.

**TEMPLE, SIR WILLIAM**, an eminent statesman, who was born in London in 1628. At the age

of seventeen he was entered of Emanuel college, Cambridge, under the tuition of Cudworth, and in his twenty-fifth year commenced his travels, and passed six years in France, Holland, Flanders, and Germany. He returned in 1654, and, not choosing to accept any office under Cromwell, occupied himself in the study of history and philosophy. On the restoration he was chosen a member of the Irish government, when he acted with great independence; and in 1661 he was returned representative for the county of Carlow. The following year he was nominated one of the commissioners from the Irish parliament to the king, and removed to London. Declining all employment out of the line of diplomacy, he was disregarded until the breaking out of the Dutch war, when he was employed in a secret mission to the bishop of Munster. This he executed so much to the satisfaction of the ministers that, in the following year, he was appointed resident at Brussels, and received the patent of a baronetcy. In conjunction with De Witt he concluded the treaty between England, Holland, and Sweden (February 1668), with a view to oblige France to restore her conquests in the Netherlands. He also attended as ambassador extraordinary and mediator, when peace was concluded between France and Spain, at Aix-la-Chapelle, and subsequently resided at the Hague as ambassador, cultivated a close intimacy with De Witt, and became familiar with the prince of Orange, afterwards William III., then only in his eighteenth year. As a statesman, he was opposed to the exclusion of the duke of York. Disgusted by Charles's dissolution of the parliament in 1681 without the advice of his council, he declined the offer of being again returned for the university, and retired from public life altogether. He died at Moor Park, Surrey, in January 1700, in his seventy-second year.

TENIERS, DAVID, the name of two of the most celebrated artists of the Flemish school of painting. They were both natives of Antwerp, in which city the elder was born in 1582. Having studied under Rubens, he went to Rome and remained there six years. On his return to his native country he occupied himself principally in the delineation of fairs, shops, rustic sports, and drinking parties, which he exhibited with such truth, humour, and originality, that he may be considered the founder of a style of painting which his son afterwards brought to perfection. His pictures are mostly small. The elder Teniers died in 1649.—His son, born in 1610, imitated the style and expression of his father, whom he much excelled in correctness and finish. He confined himself principally to the same subjects of low humour in his original pieces. The wonderful exactness with which he copied the productions of others, deceived even the best judges of the age, and acquired him the appellation of the "ape of painting." Leopold, archduke of Austria, made him one of the gentlemen of his bed-chamber. He died in 1694.

TERENCE, TERENCE, or PUBLIUS TERENTIUS AFER.—This celebrated Roman comic writer was born in Africa about 194 B. C., and, while a child, was bought by Publius Terentius Lucanus, a Roman senator, who took him to Rome and gave him a good education. His master having emancipated him, the young African now assumed the name of his benefactor, and soon acquired reputation and friends by the talents which he displayed in his comedies. Lælius and Scipio Africanus admitted him into their in-

timacy, and some accounts aver that they assisted him in the composition of his plays. About the year 161 he went to Greece, probably for the purpose of collecting new materials for the theatre. While on his return to Italy he suffered shipwreck, and either perished in the waves or died soon after. Of his dramatic works, six comedies alone are extant: "The Adrian" (acted at Rome, B. C. 167); "The Eunuch" (performed 161); "Heautontimoroumenos, or the Self-Tormentor;" "The Adelphi," his last piece, brought out in Rome the year before his death; "Phormio, or the Parasite," and "Hecyra, or the Step-Mother." The comedies of Terence were much admired by the cultivated Romans, and were likewise esteemed for their prudential maxims and moral sentences. If we compare him with his contemporaries, he will be found to have been much in advance of them in point of style. His language is pure; but, in originality of imagination, he is inferior to the Greeks and his predecessor Plautus. Most of his plays are little more than translations from the Greek; but he is valuable to us on this very account, as giving us an idea of his model, Menander. His characters have much truth of nature, but they are often superficial. His plots are usually simple: greedy courtesans, trickish slaves, miserly fathers, and prodigal sons, are the chief persons of his drama, and a marriage his ordinary *dénouement*.

THEMISTOCLES, a Grecian commander, was born at Athens, and early displayed a remarkable energy of mind. He paid little regard to morals and to the fine arts, which formed the chief objects of attention in the education of the Athenians, but eagerly studied the political sciences. Love of glory was his ruling passion. After the victory at Marathon he was observed to be peculiarly thoughtful; and, on being asked the reason, he replied, "The trophies of Miltiades will not let me sleep." His conduct was marked by many extravagances and excesses; and in order to acquire notoriety, he exhibited public spectacles, and exceeded his means in his expenditures. The Athenians were at that time divided into two parties, the aristocratical and the democratical. Themistocles courted the favour of the latter, while Aristides was connected with the former. His suppleness, and his ability in the administration of public affairs, soon gained him great reputation; but his fame was less pure than that of Aristides, and his patriotism was weaker than his ambition. Although the Persians had been repulsed by their defeat at Marathon, Themistocles foresaw that they would, nevertheless, renew the war; and he prevailed upon the Athenians to apply the product of their silver mines, which had previously been distributed among the citizens, to the augmentation of their navy. During the exile of Aristides, Themistocles enjoyed the greatest influence in Athens. Three years afterwards Xerxes renewed the preparations for the subjugation of Greece, and summoned the Greeks to submit to him. According to Plutarch, Themistocles instigated the Athenians to put to death the Grecian interpreter who bore this message; but, according to Herodotus, it was at the time of the first Persian invasion that an act of this kind was committed. Themistocles exhorted the Greeks to forget their domestic divisions, and to unite in opposition to their common enemy. He prevailed upon Epicydes, whose nomination to the post of commander in chief had been procured by intrigue, to resign that place for a

sum of money, and obtained his own appointment to the command. His advice to occupy the pass of Thermopylæ was, however, neglected, and Bœotia was soon entirely overrun by the enemy, who immediately began to advance upon Athens. In this emergency, Themistocles, supported by the reply of the Delphic oracle, which had been consulted at his suggestion, proposed that the Athenians should convey their women and children to places of security, abandon their city to the Persians, and that all who were capable of bearing arms should take to their ships. This proposition was acceded to, and all the exiles, among whom was Aristides, were recalled. The latter now gave his support to his former rival. The command of the allied fleet, though consisting chiefly of Athenian ships, was entrusted to Eurybiades, a Spartan. The latter, rendered insolent by his elevation, threatened to strike Themistocles in consequence of some expression which fell from him, while consulting concerning the plan of operations:—"Strike, but hear," replied Themistocles, calmly; and Eurybiades listened to his arguments and adopted his proposition. The consequence of this measure was the battle of Salamis, in which the Persian fleet was almost totally destroyed, and Greece was saved. The chief glory of this victory is due to Themistocles, who, before and during the battle, displayed not less valour than prudence and genius for command. He now advised the allies to sail to the Hellespont and destroy the bridge of boats which Xerxes had constructed there, in order to intercept the retreat of the Persians. His advice was not followed from fear of the consequences of driving an enemy, still formidable by his numbers, to despair. Themistocles, however, sent word to Xerxes that the Greeks meditated the destruction of the bridge, and thus hastened his retreat out of Greece.

While Themistocles was thus acquiring the gratitude of his country, he drew upon himself the hatred of the Spartans, not only on account of the deception which he had practised upon them, but also by his obstructing their project to place themselves at the head of the Grecian states. They had proposed that all of those states which had not taken part in the Persian war should be excluded from the Amphictyonic council. Themistocles perceived that this measure, by excluding Thebes, Argos, and other powerful cities, from the Grecian confederacy, would give Sparta the ascendancy. He succeeded in preventing its adoption; and the Lacedæmonians therefore leagued themselves with his enemies in Athens to effect his overthrow. His own manners were by no means calculated to conciliate his enemies, and he was banished from Athens by the ostracism. While in exile at Argos, Pausanias, the Spartan, communicated to him a plot against the freedom of Greece, in the hope that Themistocles, under existing circumstances, would be induced to favour it. But he rejected the proposition, without, however, betraying Pausanias, after whose death the letters of Themistocles were found, which proved that the subject had been discussed between them. The Lacedæmonians accordingly accused him to the Athenians of being an accomplice in the conspiracy; and he was summoned by the latter to answer for his conduct in the presence of the Grecian states. Fearing the result of such an investigation, Themistocles retired to Corcyra, to the inhabitants of which he had rendered important services. Not feeling secure here, he

withdrew to Epirus, and afterwards sought the protection of Admetus, king of the Molossians, whom he had formerly offended. To assure himself a friendly reception he seized an opportunity to throw himself upon his knees before the household gods of Admetus, with the king's son in his arms. But the vengeance of the Spartans pursued him even here. They threatened to make war upon Admetus if he should continue to protect the traitor, as they termed Themistocles. Admetus therefore supplied him with money and sent him to a port on the Ægean sea, whence, after several adventures, he reached Asia in safety, and finally arrived at the Persian court. A price of 200 talents had been set on his head by the king, Artaxerxes Longimanus; but he procured access to Artaxerxes, and received himself the 200 talents which had been offered for his head, with the promise of greater rewards in case he would give information concerning the state of Greece. The discourse which he is said to have addressed to the king on this occasion, and the letter to Artaxerxes which is attributed to him, are undoubtedly spurious. He asked for time to learn the Persian language; and in the space of a year he was able to appear at the royal court like a native. His address and talents gained him the favour of Artaxerxes, and he was treated with the greatest distinction. The close of his life is enveloped in obscurity. Plutarch relates that, an insurrection having been excited in Egypt against the Persian government by the intrigues of the Athenians, Artaxerxes prepared to send an army against Greece, and called upon Themistocles to fulfil his previous promises of assistance; and that, to avoid bearing arms against his country, Themistocles, after having sacrificed to the gods, and bade his friends farewell, took poison at Magnesia.

THEOBALD, LOUIS, a miscellaneous writer, who was the author of various works, critical, poetical, and dramatic, but merits remembrance only as a commentator on Shakspeare, being the first who properly referred to the books and learning of this great dramatist's time. After publishing, in 1726, a work entitled "Shakspeare Restored," he gave an edition of that author, which immediately followed the publication of that of Pope, from whom, although in correspondence with him, he concealed his design, hence his place as the hero of the "Dunciad." Besides twenty dramatic pieces written by himself, he produced on the stage, in 1720, a tragedy entitled "The Double Falsehood," which he attributed to Shakspeare, but which, in the opinion of Dr. Farmer, belongs to Shirley. He died in 1744.

THEOCRITUS, a pastoral poet, who was born at Syracuse, and flourished about 260 B. C. Having gone to Egypt, he was treated with much distinction by Ptolemy Lagus and Ptolemy Philadelphus, he afterwards returned to Syracuse, where he is said to have been put to death by Hiero II., on account of some offensive expressions. We have under his name thirty idyls, or pastoral poems, of which, however, several are probably by other authors. Although he is one of the oldest idyllic poets whose works are known to us, he is not to be considered the first who wrote in this manner, which originated and was carried to perfection, in Sicily. Most of his idyls have a dramatic form, and consist of alternate responses of musical shepherds.

THEOPHRASTUS, a native of Eresus, in the island of Lesbos, who became celebrated as a philosopher.

ralist and philosopher. He was born 371 B. C., and studied at Athens, in the school of Plato, and afterwards under his rival Aristotle, of whom he was the favourite pupil and successor. His original name was Tyrtamus, which his master, in admiration of his genius and eloquence, exchanged for that of Euphrastus, or the fine speaker, and afterwards for that of Theophrastus, or the divine orator, by which he is familiarly known. On the departure of Aristotle from Athens, after the judicial murder of Socrates, he became the head of the Peripatetic school of philosophy, where two thousand students are said to have attended his lectures. His fame extended to foreign countries; kings and princes solicited his friendship; and he was treated with particular attention by Cassander, the sovereign of Macedon, and Ptolemy Lagus, king of Egypt. Theophrastus composed a multitude of books, dialectic, moral, metaphysical, and physical—the titles of 200 being specified by Diogenes Laertius. About twenty of these have escaped the ravages of time, among which are his “Natural History of Stones, of Plants, of the Winds,” &c.; and his “Characters, or Ethic Portraits,” by far the most celebrated of all his productions, and the model of numerous imitators, including the moral satirist La Bruyere. He died about 286 B. C., and, consequently, if the preceding date of his birth be correct, he must have been but eighty-five at the time of his decease, though some state him to have survived to the age of a hundred and seven.

THOMAS, ANTOINE LEONARD, an ingenious French writer, who was born at Clermont, in Auvergne, in 1732, was placed in his tenth year at the college of Duplessis in Paris, where he soon distinguished himself, and at the age of fifteen obtained a prize. Although designed for the law, his inclination led him to the cultivation of polite literature, and he became professor at the college of Beauvais. In 1776 he was employed as secretary to the duke of Praslin, minister of foreign affairs, afterwards held the same post in the service of the duke of Orleans, and died at Chateau d'Oullins in 1785. Thomas was a man of generous and elevated feelings, and an excellent writer. The best known of his works are his “Eloges, or Eulogies of Distinguished Men,” several of which obtained the prize of the academy. They are in general characterized by vigorous eloquence, boldness of thought, and a warm zeal for the interests of humanity, virtue, and knowledge; but they are not always free from exaggeration of style and expression, and too great an effort after effect. The best of his eulogies are those on Descartes, Sully, Marshal Saxe, and the dauphin. His “*Essai sur les Eloges*” acquired him much reputation on account of its brilliant imagery, strong and just thought, and interesting views of ancient and modern orators.

THOMSON, JAMES, a distinguished British poet, who was born in 1700, at Ednam, near Kelso, in Scotland, being one of the nine children of the minister of that place. He was sent to the school of Jedburgh, where he early discovered a propensity to poetry, which drew the attention of the neighbouring gentry. He was removed to the university of Edinburgh, and induced, by the wishes of his friends, to study divinity; but he soon gave up theological studies, and paid an exclusive attention to literature. After acting some time as a private tutor to Lord

Binning, he quitted the university and came to London, where his “Winter” was purchased by Millar for a very trifling consideration, and published in 1726 with a dedication to Sir Spencer Compton. Its merits, however, were not discovered until it accidentally caught the eye of Mr. Whately, who brought it into general notice. It led to the author's introduction to Pope. In 1727 he published his “Summer,” which he addressed to Bubb Doddington, his “Poem to the Memory of Sir Isaac Newton,” his “Britannia,” and in 1728 his “Spring,” and in 1730 his “Autumn.” He had previously brought on the stage his tragedy of “Sophonisba;” and not long after he was selected as the travelling associate of Mr. Talbot, with whom he visited the continent. On his return he was rewarded with the post of secretary of briefs by the lord chancellor Talbot, which was nearly a sinecure. About this time he published his poem of “Liberty,” with the cool reception of which he was much disappointed. Soon after, the death of Lord Chancellor Talbot vacated Thomson's office, and Lord Hardwick, who succeeded to the seals, gave it to another. An introduction to Frederic prince of Wales produced him a pension from that prince of 100*l.* per annum. In 1738 he produced a second tragedy, entitled “Agamemnon,” which was coldly received, and a third, entitled “Edward and Eleanor.” In 1740 he composed the masque of “Alfred,” in conjunction with Mallet; but which of them wrote the song, since

become national, of “Rule Britannia,” has not been ascertained. In 1745 his most successful tragedy, entitled “Tancred and Sigismunda,” was brought out and warmly applauded. The following year produced his “Castle of Indolence.” He now obtained the place of surveyor-general of the Leeward islands, but soon after died of a cold caught on the Thames, in the forty-eighth year of his age. He was buried at Richmond, and a monument was erected to him in Westminster Abbey in 1762, with the profits of an edition of his works. It is represented in the above engraving.

THOU, JAMES AUGUSTUS DE, an eminent magistrate and historian, born at Paris in 1553. At ten years of age he was placed in the college of Burgundy and designed for the church, but was afterwards sent to Orleans for the study of the civil law,

the remainder of the life of Augustus he acted with great prudence and ability, concluding a war with the Germans in such a manner as to merit a triumph. After the defeat of Varus and his legions he was also sent to check the progress of the victorious Germans, and acted in that war with equal spirit and prudence. On the death of Augustus he succeeded, without opposition, to the sovereignty of the empire, which, however, with his characteristic dissimulation, he affected to decline, until repeatedly solicited by the servile senate. The new reign was disquieted by dangerous mutinies in the armies posted in Pannonia and on the Rhine, which were, however, suppressed by the exertions of the two princes, Germanicus and Drusus. Tacitus records the events of this reign, including the suspicious death of Germanicus, the detestable administration of Sejanus, the poisoning of Drusus, with all the extraordinary mixture of tyranny with occasional wisdom and good sense which distinguished the conduct of Tiberius, until his dissolute retirement to the isle of Caprea, in the bay of Naples, never to return to Rome. On the death of Livia, the only restraint upon his actions, and those of the detestable Sejanus, was removed, and the destruction of the widow and family of Germanicus followed. At length the infamous favourite, extending his views to the empire itself, Tiberius, informed of his machinations, prepared to encounter him with his favourite weapon, dissimulation. Although fully resolved upon his destruction, he accumulated honours upon him, declared him his partner in the consulate, and, after long playing with his credulity, and that of the senate, who thought him in greater favour than ever, he artfully prepared for his arrest. Sejanus fell deservedly and unpitied; but many innocent persons shared in his destruction, in consequence of the suspicion and cruelty of Tiberius, which now exceeded all limits. The remainder of the reign of this tyrant is little more than a disgusting narrative of servility on the one hand, and of despotic ferocity on the other. That he himself endured as much misery as he inflicted, is evident from the following commencement of one of his letters to the senate: "What I shall write to you, conscript fathers, or what I shall not write, or why I should write at all, may the gods and goddesses plague me more than I feel daily that they are doing, if I can tell." What mental torture, observes Tacitus, in reference to this passage, which could extort such a confession! In the midst, however, of all this tyranny, he often exhibited gleams of strong sense, and of a judicious attention to the public welfare—a remark which holds good in every part of his anomalous reign. Having at length reached an advanced age, Caius Caligula, the son of Germanicus, his grandson by adoption, and Gemellus, the son of Drusus, his grandson by nature, became objects of interest. Caius, however, who had reached the age of twenty-five, and who held the popular favour as a paternal inheritance, was at length declared his successor. Acting the hypocrite to the last, he disguised his increasing debility as much as he was able, even affecting to join in the sports and exercises of the soldiers of his guard. At length, leaving his favourite island, the scene of the most disgusting debaucheries, he stopped at a country house near the promontory of Misenum, where he sunk into a lethargy, in which he appeared dead; and Caligula was preparing, with a numerous escort, to take pos-

session of the empire, when his sudden revival threw them into consternation. At this critical instant, Macro, the pretorian prefect, caused him to be suffocated with pillows. Thus expired the emperor Tiberius, in the seventy-eighth year of his age and twenty-third of his reign, universally execrated.

TIBULLIUS, ALBIUS, a Roman poet of the golden age of Roman literature. Of his life nothing is known but that he belonged to the equestrian order. The year 711 after the building of Rome is generally taken as the year of his birth. He died, without having held any public office, in the flower of his age. We possess, of his writings, a collection of elegies, in four books, of which, however, the fourth contains several pieces of doubtful origin. These poems are among the most perfect of their kind which have come down to us from classical antiquity. Their moral tone, however, is that of a reckless voluptuary.

TICKELL, THOMAS, an ingenious writer in prose and verse, and the intimate friend of Addison. He was born in 1686, and received his education at Oxford, where he obtained a fellowship in his twenty-fifth year. While at the university, an elegant copy of verses, addressed by him to Addison, on his opera of "Rosamond," introduced him to the acquaintance of that accomplished scholar, who induced him to lay aside his previous intention of taking orders, appointed him his under-secretary of state, and, on his death, bequeathed to him the publication of his works. In 1724 Mr. Tickell obtained the situation of secretary to the lords justices of Ireland. As an author, he takes a prominent rank among the minor English poets; his versification especially, in its ease and harmony, being inferior perhaps to that of no one, except Dryden and Pope. His death took place at Bath in 1740.

TILLOCH, ALEXANDER.—This celebrated individual was the son of a tobacconist of Glasgow. He was born in 1759, and was intended by his father to follow his own business, and taken into his warehouse; but a strong bias towards mechanical and scientific pursuits soon diverted his attention from commercial pursuits. In 1736, a jeweller of Edinburgh, named Ged, had devised the art of printing from plates, and produced an edition of Sallust so printed; but the art was undervalued, and perished with him. Dr. Tilloch revived it, and carried it to the state of practical utility which it now exhibits, having himself again made the discovery without any previous acquaintance with Ged's attempts. In this new process, Mr. Foulis of Glasgow, a printer, joined him; and a patent in their names was taken out both in England and Scotland. Circumstances, however, induced them to lay aside the business for a time; and it never was renewed by them as a speculation. In 1787 Dr. Tilloch removed to London, and purchased "The Star," an evening paper, which he continued to edit till within four years of his death. In June 1797 he projected and established the "Philosophical Magazine," sixty-five volumes of which are now before the public; and only fifteen days before his death he had obtained a patent for an improvement on the steam-engine. The last work which he was engaged to superintend was the "Mechanic's Oracle," published in numbers at the Caxton press. He died in 1825.

TILLOTSON, JOHN, an English prelate, who was born in 1630. His father, a strict Calvinist,

brought up his son in the same principles, and sent him a pensioner to Clare hall, Cambridge, of which he was elected a fellow in 1651. It is not known when he entered into orders, but his first sermon which appeared in print is dated 1661, at which time he was still among the presbyterians. When the act of uniformity passed, in the following year, he submitted to it, and, becoming celebrated for his pulpit oratory, was chosen preacher to the society of Lincoln's Inn. In 1666 he took the degree of D. D., and was made king's chaplain, and presented to a prebend of Canterbury. When Charles II., in 1672, issued a declaration for liberty of conscience, for the purpose of favouring the Roman catholics, he preached strongly against it, but was, nevertheless, advanced to the deanery of Canterbury, and soon after presented to a prebend in St. Paul's. On the accomplishment of the revolution, he was taken into favour by King William; and, in 1689, he was appointed clerk of the closet to that sovereign, and subsequently permitted to exchange the deanery of Canterbury for that of St. Paul's. On the refusal of Archbishop Sancroft to take the oaths to the new government, he was appointed to exercise the archiepiscopal jurisdiction during the suspension of that prelate; and, in 1691, after exhibiting the greatest reluctance, he was induced to accept the archbishopric itself. He now exerted himself to advance the respectability of the church, and, among other things, wished to correct the evils arising from non-residence. He was, however, counteracted in all his endeavours, by the most perverse opposition, which rendered his high station a scene of much more disgust than gratification, and soon after died of a paralytic stroke in 1694. He left his widow nothing but the copyright of his sermons. Dr. Tillotson was open, sincere, benevolent, and forgiving; and although, in some points, too compliant, and liable to the charge of inconsistency, his intentions seem to have been pure and disinterested. His sermons maintain a place among the most popular of that class of compositions in the English language, displaying great copiousness of thought and expression, and abounding in passages which strongly impress the mind.

TINDAL, WILLIAM, also named Hitchens, a martyr to the reformation, who was born in 1500, near the borders of Wales, and was educated at Oxford, where he imbibed the doctrines of Luther. Bearing an excellent character for morals and diligence, he was admitted a canon of Wolsey's new college of Christ Church, but his principles becoming known, he was subsequently ejected. He then withdrew to Cambridge, where he took a degree, and soon after went to reside as tutor in Gloucestershire. While in this capacity he translated Erasmus's "*Enchiridion Militis Christiani*" into English; but, in consequence of his opinions, articles were preferred against him before the chancellor of the diocese, and he received a reprimand. He then accepted of a retreat in the house of an alderman of London, where he employed himself in preparing an English version of the New Testament. England not being a place where such a work could with safety be effected, he proceeded to Antwerp, where he completed his work, which was printed in that city in 1526 without a name. The greater part was sent to England, which produced great alarm among the church dignitaries; and the prelates Warham and Tunstall collected all they could seize or purchase, and committed them to

the flames. The money received by the sale of the first edition in this way enabled Tindal to print another edition, in conjunction with Miles Coverdale. He also translated the pentateuch, and subsequently Jonas, which formed the whole of his labours on the Scriptures, although others have been ascribed to him. He then returned to Antwerp, where he took up his residence with an English merchant. Henry VIII. employed a man of the name of Phillips to betray Tindal to the emperor's procurator; and in 1536 he was brought to trial upon the emperor's decree at Augsburg, where he was condemned to the stake, which sentence he quietly endured, being first strangled and then burnt. His last words were, "Lord, open the king of England's eyes!" Tindal's translation of the Scriptures is highly esteemed for perspicuity and noble simplicity of idiom.

TINTORETTO, the surname of a Venetian historical painter, Giacomo Robusti, who was born at Venice in 1512, and died in 1594. Tintoretto studied under Titian, who was so jealous of his powers that he dismissed him from his school. He therefore pursued his studies without any director, and endeavoured to unite his master's colouring with the design of Michael Angelo—a union which is observable in his best pieces. But he executed his works with so much haste that he remained far inferior to both of those great masters. His manner of painting was bold, with strong lights opposed by deep shadows; his pencil was wonderfully firm and free; his disposition good; his execution easy, and his touch lively and full of spirit. His portrait by himself is in the Louvre, and there are many of his paintings in Germany, Spain, France, and England.

TITIAN, TIZIANO VERCELLI, one of the most distinguished of the great Italian painters, was born at Capo del Cadore, in the Alps of Friuli, in 1480. His early indication of talent for the arts of design induced his parents to place him under Sebastiano Zuccati of Trevigi, and subsequently under Giovanni Bellini of Venice. He soon made an extraordinary proficiency, and attained so exact an imitation of his master's style that their works could scarcely be distinguished. This style, however, was stiff and dry, so that when the young artist had seen the performances of Giorgione, which were of a more free and elegant character, he quitted his former master, and soon, by his facility, excited envy in his new one. At the same time he by no means neglected other branches of study, but made so great a progress under proper instructors that at the age of twenty-three he was celebrated as one of the most promising poets of the day. With great judgment, however, he devoted himself to the pursuit for which he felt the most decided predilection, and attained to great perfection in landscape, portrait, and history. He was particularly remarkable for his accurate observation and faithful imitation of nature, as regards the tones and shades of colouring; his taste in design was less conspicuous; and it is in portraits and landscapes that he is deemed unrivalled. Indeed, in the opinion of Mr. Fuseli, he is to be regarded as the father of portrait painting, as relates to resemblance, character, grace, and tasteful costume.

His principal residence was at Venice, though he occasionally accepted invitations from princes to their courts. At Ferrara he executed the portraits of the duke and duchess, also that of Ariosto, then a resi-

dent there. He was sent for to Rome by Cardinal Farnese, and attended Charles V. at Bologna, who was so pleased with the portrait which he made of him that he conferred on him the order of knighthood, and granted him a pension, which was afterwards augmented by Philip II. Most of the princes and leading men of the day were ambitious of being painted by him, so that his pictures are doubly valuable as portraits of eminent individuals, and for beauty of execution. He resided some time both in Spain and Germany; but his home was Venice, where he lived in great splendour, and maintained the rank due to his genius. He retained the spirit and vigour of youth to the advanced age of ninety-six, and then died of the plague in 1576.

**TOOKE, JOHN HORNE.**—This celebrated politician was born in Westminster in 1736. His father was a poulterer, who had acquired considerable property. John, the third son, was educated both at Westminster and Eton, whence he was removed to St. John's college, Cambridge. In 1736 he had entered himself of the Inner Temple; but, at the request of his family, he consented to be ordained, and was inducted to the chapelry of New Brentford, which his father had purchased for him. Three years afterwards, he accompanied, as travelling tutor, the son of Mr. Elwes, of Berkshire, in a tour to France. On his return he took a warm share in politics, in behalf of Wilkes, to whom, on a second visit to Paris, he was personally introduced. When he returned to England, he resumed his clerical functions, and obtained some distinction in the pulpit, until the return of Wilkes plunged him again into politics. He was the principal founder of the society for supporting the Bill of Rights; and, in 1770 and 1771, a public altercation took place between Messrs. Wilkes and Horne, on account of the attempts made by the former to render the society instrumental to the discharge of his private debts. It was through his means that two printers of the newspapers were, in 1771, induced to violate the orders of the house of commons by publishing their debates, which brought on those proceedings which terminated in the defeat of the house, and the unopposed practice of such publications ever since.

The same year also witnessed his contest with Junius, in which, in the general opinion, he came off victor. In 1773 he resigned his clerical gown, and shut himself up in retirement, with a view to study for the bar; and it was by affording legal advice to Mr. Tooke of Purley, in his opposition to an enclosure bill, and defeating the same by a boldness of stratagem peculiarly in character, that he acquired the good will, and ultimately shared in the fortune, of that gentleman. He was a warm opponent of the American war, and was prosecuted for sedition, for the wording of a resolution by which the constitutional society voted 100*l.* to the widows and children of the Americans who fell in the battle of Lexington. For this obnoxious paragraph he was tried at Guildhall in 1777, on which occasion he defended himself with his characteristic spirit and acuteness, but was sentenced to a year's imprisonment and a fine of 200*l.* In 1779, after having fully prepared for the bar, he applied for admission to the society of the Inner Temple, and was refused, on the ground that he was still a priest, and ineligible—a decision which destroyed all his future views in this profession. In 1780 he published a keen review of Lord North's

administration, in a pamphlet entitled "*Facts*," and, in 1782 a "*Letter on Parliamentary Reform*," with a sketch of a plan, which did not embrace the principle of universal suffrage. About this time he became the avowed friend of Mr. Pitt, then also favourable to parliamentary reform, and a vehement opponent to Mr. Fox, for his coalition with Lord North. In 1786 he appeared in a character more important to his lasting reputation than that of a subordinate politician, by the publication of an octavo volume, entitled "*Epea Pteroenta, or the Diversions of Purley*," which he afterwards extended to two volumes quarto. This celebrated work contains those ideas concerning grammar and the formation of words, of which the germ had appeared in a letter to Mr. Dunning some years before. The knowledge of language and logical acuteness which he displayed in this performance raised him to a high rank as a philologist.

In 1788 he published "*Two Pair of Portraits*," the figures in which were the two Pitts and the two Foxes of the past and present generation, the preference being given to the Pitts. In 1790 he offered himself as a candidate for Westminster in opposition to Mr. Fox and Lord Hood, when he distinguished himself by a strong vein of humour in his daily addresses to the populace; and, although he failed, he received 1700 votes without solicitation or corruption. In the year 1794 he was apprehended and committed to the Tower on a charge of high treason, founded on the presumed objects of the corresponding societies to overthrow the constitution. His trial, with that of the other parties accused at the same time, holds a conspicuous place in the historical annals of a period rendered so remarkable by the excitement produced by the French revolution. The trial of Mr. Tooke, although made interesting by the ease, self-possession, and acuteness displayed by the accused, was deprived of much political importance by the previous acquittal of Hardy ensuring his own. From this time, however, he was more cautious in his company, and seems to have declined the visits of persons of violent characters and principles at Wimbledon. After the death of Mr. Tooke of Purley, he had taken his name in consequence of inheriting a portion of his fortune. In 1796 he again offered himself for Westminster and failed: and in 1801 he accepted a seat for Old Sarum on the nomination of Lord Camelford. In 1805 he published a second part of "*The Diversions of Purley*," which is chiefly dedicated to etymology, and adjectives, and participles, and their formation; but also abounded, like the former, with various satirical strictures on literary characters of note. He died at Wimbledon in 1812, in his seventy-seventh year.

**TOURNEFORT, JOSEPH PITTON DE**, an eminent French botanist, who was born at Aix, in Provence, in 1656, and was educated at the Jesuits' college in that city. His passion for botany disclosed itself at an early age, so that in a short time he had made himself acquainted with all the plants in the vicinity. Though destined for the church, he continued his botanical researches by stealth, and, encouraged by an uncle, who was an eminent physician, applied to the study of anatomy and chemistry. In 1677, being left by the death of his father to pursue his own inclinations, he determined to adopt the medical profession, and for that purpose repaired in 1679 to Montpellier. In 1683 he was appointed professor of botany to the garden of plants at Paris, and soon

after visited Spain, Portugal, England, and Holland. In 1691 he was elected a member of the academy of sciences, and in 1694 published his first work, entitled "*Elémens de Botanique*." The method established by Tournefort was founded upon the varieties of the petals of flowers taken in conjunction with the fruit. It became rapidly popular by its facility and elegance, although imperfections were pointed out in it by Ray. Tournefort continued his studies with success till his death, which took place in 1708.

TRAJAN, a celebrated Roman emperor, who was born at Italica. He was raised to the rank of Cæsar by the emperor Nerva and he peaceably ascended the throne A.D. 97. He was a great patron of literature and science, and has left some splendid architectural monuments, of which the most celebrated is the triumphal arch at Benevento represented beneath.

Trajan died in his sixty-fourth year, after a reign of nearly twenty years.

TURGOT, ANNE ROBERT JACQUES, a patriotic and enlightened French minister, son of the president of the grand council, who was born at Paris in 1727, and in his youth gave himself up to the study of theology at the Sorbonne. At the age of twenty-four he commenced a translation of Virgil's *Georgics*, and soon after attaching himself to Quesnay and the economists, quitted the Sorbonne in order to accompany De Gournay, intendant of commerce, in his travels. On his return he was himself appointed intendant of Limoges, which post he occupied for twelve years, and was long remembered, with gratitude, for his wise, salutary, and benevolent reforms and regulations. When raised to the post of comptroller-general of the finances in 1774, he gave a wider extent to the principles of amelioration. He moderated the duties on articles of the first necessity without loss to the revenue; freed commerce from many fetters, and encouraged industry by enlarging the rights of individuals, and abolishing the exclusive privileges of companies and corporations. He also formed a project for commuting the feudal rights, for rendering salt an article of free merchandise, and for reforming the royal household. His reward for these useful and benevolent views was opposition and ridicule. He was, however, able to carry into effect some very important improvements; but, as he endeavoured to control the nobility, resist the clergy,

and restrain the license assumed by the officers of the crown, they all united against him. The result was his dismissal from office in 1776, from which period he lived a retired and studious life until his death in 1781, at the age of fifty-four.

TYTLER, ALEXANDER FRASER, LORD WOODHOUSELEE, one of the senators of the college of justice in Scotland. He was born at Edinburgh in 1747, and died in 1813. He published the "*Decisions of the Court of Session*" in the form of a Dictionary; and, having been elected professor of history at Edinburgh, he printed, in 1783, "*Outlines of a Course of Lectures on Universal History*," which was followed by his popular work "*Elements of General History, Ancient and Modern*." Among the other works of Lord Woodhouselee are "*Memoirs of Lord Kames*," containing sketches of the progress of literature in Scotland in the eighteenth century, with a supplement, and an "*Essay on the Life of Petrarch*." *Memoirs of his life*, by Alison, were published in the "*Transactions of the Royal Society of Edinburgh*."

URQUHART, SIR THOMAS, a Scottish writer, who is principally known as the translator of "*Babelais*." He was a cavalier officer of Charles II., and was present at the battle of Worcester. Respecting this event he published a work entitled "*The Discovery of a most rare Jewel, found in the kennel of Worcester Streets the day after the Fight, and six before the Autumnal Equinox, Anno 1651, serving in this place to frontal a Vindication of the Honour of Scotland from that infamy whereunto the Rigid Presbyterian Party of that Nation out of their covetousness and ambition most dissembledly had involved it*." Besides this work he published several others of considerable merit.

USHER, JAMES.—This celebrated prelate was born at Dublin in 1580. After the death of his father, who was one of the six clerks in chancery, he gave up the paternal estate to his younger brother and devoted himself to the church; entered Trinity college, and studied the writings of the fathers and the schoolmen, whence he compiled a systematic body of extracts; and in 1601 took holy orders, and was appointed afternoon preacher at Christ Church, Dublin. Soon after he visited England to purchase books for Trinity college library, and became acquainted with many learned men. His talents, and the favour of his sovereign, James I., successively procured him the professorship of divinity at Trinity college; in 1607 the office of chancellor of St. Patrick's; the bishopric of Meath in 1620; the post of privy counsellor in 1623; and the following year the primacy of Ireland. His notions of church government verging towards presbyterianism, his common took advantage of this to destroy his credit with James I.; but his undeviating support of the royal supremacy saved him from suffering by their machinations, and he enjoyed to the last the esteem of King James. He endeavoured to prevent Charles I. from sacrificing Lord Strafford, whom Usher attended in prison and at his execution. He adhered to the king's interest during the civil war, and witnessed the execution of his master. The scene had such an effect on him that he fainted, and he commemorated the event by an anniversary celebration of funeral rites. After that event he experienced civility and flattering promises from Cromwell, but the latter were not fulfilled. He died in 1656, and the protector

ordered that he should be interred in Westminster Abbey. His principal works are the "Annals of the Old and New Testament," and "Britannicarum Ecclesiarum Antiquitates," and "A Body of Divinity," compiled surreptitiously from his sermons and notes.

**VAILLANT, JOHN FOI**, a celebrated French writer, who was born at Beauvais in France in 1632. Having early devoted his attention to the study of numismatics, he spent much of his time in collecting medals and antiquities. Among his numerous publications we may mention his work entitled "Numismata Imperatorum Romanorum Præstantiora a Julio Cæsare ad Posthumum et Tyrannos." His death took place in 1706, after having endured a long captivity in Algiers, which he described in a very interesting volume, published after his death.

**VAILLANT, SEBASTIAN**, a distinguished French botanist, who was born in 1669. He was director of the Royal Garden at Paris, which he enriched with some valuable plants. He died of an asthma in 1722. His "Botanicon Parisiense" was published by Boerhaave in 1727, and it was much improved by Dr. Sherard, who prefixed a Latin letter illustrative of his connexion with the work.

**VANBRUGH, SIR JOHN**, a dramatist and architect, who was descended from a Flemish family. He was born in England about 1672, and entered into the army, but early in life he became a writer for the stage. In 1697 his comedy, "The Relapse," was represented; and in the following year he produced "The Provoked Wife," and "Æsop," afterwards altered by Garrick. When Betterton and Congreve obtained a patent for erecting a theatre in the Haymarket, which was opened in 1707, they were joined by Vanbrugh, who wrote for this house his comedy, "The Confederacy," the most witty as well as the most licentious of his productions, which long kept possession of the stage. "The Provoked Husband, or the Journey to London," which he left imperfect at his death, was completed by Colley Cibber. As an architect, Vanbrugh was selected to build the residence for the duke of Marlborough, Blenheim House, and that structure, as well as Castle-Howard, affords proof of skill and genius. He obtained in 1704 the office of Clarencieux king-at-arms, and in 1714 he received the honour of knighthood. He was also appointed comptroller of the board of works, and surveyor of Greenwich hospital. His death occurred March 26, 1726.

**VANCOUVER, GEORGE**, a modern circumnavigator and captain in the British navy. He served as a midshipman under Captain Cook; and a voyage of discovery, to ascertain the existence of any navigable communication between the North Pacific and North Atlantic oceans being determined on, he was appointed to command it. Of this voyage Captain Vancouver compiled an account, under the title of "Voyage of Discovery to the North Pacific Ocean, and Round the World, in the Year 1790," which was nearly ready for the press when the author died, in 1798.

**VANDYCK, ANTHONY**, a celebrated portrait painter, who was born at Antwerp in 1598 or 1599. His father was a painter on glass, and his mother was skilled in embroidering landscapes and figures. Henry van Palen was his first instructor. This artist had studied long in Italy, and united good draw-

ing with lively colouring, so that Vandyck acquired from the beginning a good style, and soon excelled his fellow pupils. Rubens now received him into his school, and entrusted to his execution several large pictures from his own sketches. A battle of the Amazons, and the cartoons for the tapestry containing the history of Decius Mus, obtained him the full confidence and esteem of his master; and he soon became his assistant rather than his scholar. His own inclination, and the jealousy of Rubens, determined him to devote himself exclusively to portrait painting. It has been said that Rubens, from mere jealousy, wished to remove his rival scholar, and advised him to go to Italy; but it is well known that he gave this advice to his most promising pupils in general. He first painted three more pictures, an *Ecce Homo*, a Christ on the Mount of Olives, and the Wife of Rubens, for his instructor; for which Rubens gave him a fine white horse, and sent him to Italy with letters of recommendation. A few miles from Brussels, in the village of Savelthem, the young artist became enamoured of a peasant's daughter, so that he remained there a long time, and executed two altar-pieces for the village church. In one of them the object of his love was represented as a Madonna, and in the other he appeared as St. Martin on the horse of Rubens. His residence there becoming known, Rubens used every inducement to rekindle the flame of ambition in the bosom of the young man. He succeeded. Vandyck tore himself away, and hastened to Italy. He first directed his course to Venice, made Titian and Paul Veronese his models, and acquired their splendour and richness of colouring. His money was spent, and he removed to Genoa, where he painted several portraits, and gained a large sum. He now undertook a journey to Rome, where he was patronised by the cardinal Guido Bentivoglio, whose portrait he painted with the most complete success. This, and the portraits of Sir J. Shirley and his lady, residing there, excited so much admiration that the envy of the other artists compelled him to return to Genoa, where he executed many portraits as well as historical pictures, and always adopted the brilliant style of Titian. He visited Florence, Turin, and Sicily, where he resided for some time. But the plague finally drove him out of Sicily, and he finished the celebrated altar-piece for Palermo in Genoa.

After his reputation was thus spread throughout Italy he returned to his own country. Here he painted many historical pictures and altar-pieces. Of the latter the most celebrated are the St. Augustine at Antwerp, and the Crucifixion at Courtray. Rubens is said to have offered him his eldest daughter in marriage; but Vandyck refused her, because his earlier love for her mother (Helena, the second wife of Rubens) was not yet wholly extinguished. He soon after accepted the invitation of the prince of Orange, Frederic of Nassau, to visit his court at the Hague. He painted portraits of this prince, his wife and children, with so much success that all the principal personages of the court were eager to obtain his services. He then visited London and Paris, but soon returned to Antwerp. A Crucifixion and a Birth of Christ, which he painted for Dendermonde, are among his finest works. Charles I., having seen one of his portraits, immediately ordered him to be invited to return to England. This invitation

the painter would have declined, but for the urgency of his friend Sir K. Digby. On his arrival he was introduced by him to the king, who put upon his neck a gold chain, with his own miniature richly set with diamonds, and bestowed upon him the honour of knighthood, a considerable annuity, and a summer and winter residence. Vandyck rewarded this generosity by unceasing diligence; he enriched England with his masterpieces, and executed, besides a multitude of portraits, several mythological and historical paintings. His love of splendour was displayed in the magnificence of his house. His table was frequented by the princes and ladies of the first rank, and his entertainments excelled all others in splendour and luxury. In this way he consumed his property, his strength, and his health. His lucrative occupation, however, might have repaired the loss of the first, if he had not engaged in the pursuit of the philosopher's stone. The duke of Buckingham endeavoured to restore him again to activity, by uniting him in marriage with the beautiful Maria Ruthven, daughter of the Scotch Lord Gowry. Vandyck visited his native city with her, and went thence to Paris, where he hoped to be employed to paint the gallery of the Louvre; but, as the work had been already committed to Poussin, he soon returned to England. Though infirm and exhausted, he proposed to the king to paint the walls of the banqueting house with the history and procession of the order of the Garter, promising to make the cartoons. Before the work was completed he was surprised by death, in the forty-second year of his age. This event took place in 1641.

**VANE, SIR HENRY.**—This military commander was a conspicuous character in the time of Charles I. and the commonwealth. He was born about 1612, and was educated at Westminster school, whence he was removed to Magdalen college, Oxford. He then proceeded to Geneva, from which he returned much indisposed towards the English liturgy and church government. He was instrumental in procuring the condemnation of Lord Strafford, and he also carried up to the lords the articles of impeachment against Archbishop Laud. He likewise acted as one of the parliamentary commissioners at the treaty of Uxbridge in 1645; and at the negotiations in the Isle of Wight in 1648, was an opposer of the terms of peace. He had, however, no immediate concern in the king's trial or death, but was one of the council of state appointed to supreme power after that event. In 1651 he was appointed a commissioner to be sent into Scotland, in order to introduce the English government there. After the restoration of the long parliament, he was nominated one of the committee of safety, when he strenuously exerted himself to establish a republican government, until the restoration put an end to all further contest. On this event he had considered himself in no danger; but he was, notwithstanding, arrested and committed to the Tower as a person whom it was dangerous to allow to be at large. The convention parliament petitioned in favour of him and Lambert, and the king promised that his life should be spared. Charles II. violated his word, and Sir Henry was brought to trial for high treason. Although accused only for transactions that occurred after the king's death, he was found guilty, notwithstanding a defence of great vigour and ability, in which he pleaded that, if complying with the existing government was a crime, all

the nation had been equally criminal. He further observed, that he had, in every change, adhered to the commons as the root of all lawful authority. His trial took place in June 1662, and on the 14th of the same month he was beheaded on Tower Hill, when he acted with great composure and resolution. He began to address the people at the scaffold in justification of his conduct, but was interrupted by drums and trumpets. His theological writings display an astonishing power, but are in a high degree mystical, and often unintelligible. Among them are, "The Retired Man's Meditations," "The Face of the Times," and his "Meditations on Life, Government, Friendship, Enemies, Death, &c."

**VARRO, MARCUS TERENCE**, one of the most learned men and prolific writers of ancient Rome. He was born 116 B. C., and served, in his youth, in the army, and, at a latter period, obtained the dignity of tribune, with other public offices. Varro was the intimate friend of Cicero, and was banished by Antony, but returned to Rome under Augustus, and died there at the age of eighty-nine years, with the reputation of being the most learned Roman, or at least the most learned critic, of his time. The number of his writings, chiefly on language, history, and philosophy, is stated to have amounted to about 500, of which only two have come down to us, a treatise upon agriculture, entitled "*De Re Rustica*," in three books, which is contained in the collection, "*Scriptores Rei Rusticæ*," and fragments of a treatise on the Latin language called "*De Lingua Latina*," which treats principally of etymology and analogy. Good editions of the latter appeared at Dort in 1613, and at Berlin in 1826.

**VAUBAN, SEBASTIAN LE PRESTRE, SEIGNEUR DE**, marshal of France, one of the greatest engineers which that country has produced. He was descended of an ancient and noble family of Nivernois, and born in 1633. He rose to the highest military rank by his merit and services, and was made governor of the citadel of Lisle in 1668, and commissioner general of fortifications in 1678. He took Luxemburg in 1684, and was present in 1688 at the siege and capture of Philipsburg, Mannheim, and Frankendal, under the dauphin. He was made marshal of France in 1703, and died at Paris in 1707, aged seventy-four. His works consist of a treatise entitled "*La Dixme Royale*," and a vast collection of manuscripts, in twelve volumes, which he calls "*Mes Oisivetés*," containing his ideas, reflections, and projects for the advantage of France.

**VERE, EDWARD**, earl of Oxford, one of the literary courtiers of Queen Elizabeth. He was descended from one of the most ancient families of the English nobility, his father being the sixteenth peer who had held the title, which became extinct in the reign of Queen Anne. He was born about 1540, and received an education suitable to his rank. He held the office of lord high chamberlain, and sat as such at the trial of the queen of Scots, and subsequently at those of the earls of Arundel, Essex, and Southampton. Specimens of his talents as a poet are preserved in the "*Paradyse of Daintie Devyces*." His personal character seems to have been by no means favourable. He had a quarrel with Sir Philip Sidney, which did him no credit; and he is said to have illtreated his wife, who was the daughter of Lord Burleigh. His death took place in 1604.

**VERNON, EDWARD**, a distinguished English

admiral, who was descended from a Staffordshire family, but born in Westminster in 1684. He adopted the naval profession in opposition to the wishes of his father, who held the post of secretary of state to William III. He first went to sea with Admiral Hopson, and in 1704 served under Sir George Rooke at the battle of Malaga. He was also employed on many other occasions, and gradually arrived at the rank of vice-admiral. Admiral Vernon had the honour of giving his name to the seat of General Washington, at that time in possession of his brother, who had served under the admiral. During the rebellion in 1745 he was employed in defending the coasts of Kent and Sussex, but on account of his opposition to the ministry he was subsequently superseded and even struck off the list of admirals. His death took place in 1757.

VINCENT, JOHN JERVIS EARL OF, ST., a distinguished naval commander, who was descended from a respectable family in Staffordshire. He was born in 1734, and at the age of fourteen entered the navy. In 1760 he obtained the rank of post-captain, and commanded the *Foudroyant* in the action between Admiral Keppel and the French fleet in July 1778. In 1782 he took the *Pegasse* of seventy-four guns, for which exploit he received the red riband. In 1794 he received the command of a squadron equipped for the West Indies, and reduced Martinico, Guadaloupe, and St. Lucia. On the 14th of February, 1797, being in command of the Mediterranean fleet of fifteen sail, he defeated twenty-seven Spanish ships of the line off Cape St. Vincent, the south-west point of Portugal, and was raised to the English peerage by the titles of Baron Jervis and earl of St. Vincent, with a pension of 3000*l.* a year. In 1799 he was created admiral, and in 1801 became first lord of the admiralty, and in 1821 admiral of the fleet. Lord St. Vincent was a man of a strong mind, unbending in regard to discipline and reform, and of high gallantry and genius in his profession. He died in 1823, in his eighty-ninth year.

VINCENT, WILLIAM, a distinguished critic and divine, who was born in London in 1739, and educated at Cambridge, where he obtained a fellowship. In 1762 he became an usher at Westminster, and nine years after second master. He took the degree of doctor of divinity, and was appointed chaplain in ordinary to the king. In 1788 he became head master at Westminster, where he continued to preside till 1801, when he was made a prebend of Westminster; and two years after he succeeded to the deanery. Dean Vincent is principally known by his "Commentary on Arrian's Voyage of Nearchus," and his "Periplus of the Erythrean Sea," republished together under the title of the "Commerce and Navigation of the Ancients in the Indian Ocean." He died in December 1815.

VINCI, LEONARDO DA.—This celebrated artist was at the head of the Florentine school of painting. He was born in the village of Vinci, near Florence, between 1444 and 1452. He was the natural son of a notary named Pietro. Even in his earliest youth he devoted himself to a great variety of studies—painting, sculpture, anatomy, architecture, geometry, mechanics, poetry, and music. He soon surpassed his master, the painter and sculptor, Andrea del Verrochio; and in 1482 the duke of Milan, Ludovico Maria Sforza, took him into his service. Leonardo founded an academy of design, which would have

been still more beneficial in its results but for the fall of the house of Sforza. In 1499 he returned to Florence, where he was employed to paint one of the walls of the great council-room. On this occasion, having Michael Angelo for a competitor, he made a

cartoon—which is one of his most celebrated works—commemorating a victory of the Florentines, under their chief Niccolo Piccinio: a group of horsemen in the piece, struggling around a standard, was particularly admired. This cartoon is now known only by a copy. When Leo X. ascended the papal throne in 1513, Leonardo went, in the suite of Julian, duke of Medici, to Rome, but left this city in 1516, and went to France, whither he had been invited by Francis I. His reason for leaving Rome probably was, that the rivalry of Michael Angelo followed him even there, or that Raphael was already entrusted with the execution of the great works in the Vatican. On account of his advanced age he did little or nothing in France, and in 1519 he died in the arms of the king, when attempting to rise from his bed on the occasion of a visit from him.

VIRGIL, PUBLIUS VIRGILIUS MARO, the most distinguished epic, didactic, and pastoral poet of ancient Rome. He was born at Andes, a little village near Mantua, in the year 70 B. C. If we are to suppose that Virgil describes himself under the character of Tityrus in his first eclogue, he was thirty years of age when he went to Rome for the first time, to obtain the restoration of his farm, which had been taken possession of by the soldiers of Octavius and Antony, after the close of the war against the republicans. He was here presented, by Pollio or some other friend, to Augustus, and gained the favour of Mæcenas, through whose intercession he obtained the restitution of his property. But on his attempting to take possession of it, the new occupants resisted him, and threatened his life; and it was not until after a second journey to Rome, and repeated efforts, that he finally succeeded in his object. About this time he wrote several eclogues, the tenth and last of which is ascribed to the thirty-third or thirty-fourth year of his age. His *Georgics* (poems on agriculture), which he undertook at the suggestion

of Mæcenas, are said by grammarians to have been begun in his thirty-fourth year. He is said to have spent seven years upon this work, which was principally composed at Naples; but these accounts of him are not well authenticated. It is certain that the *Æneid* is his last work. Virgil was now in high favour with Augustus, with whom he kept up a familiar correspondence. After completing the plan of his great epic he retired to Greece, with the design of accomplishing it there at his leisure. But Augustus having arrived at Athens, on his return from the East, Virgil determined to accompany him home. At Megara, however, he fell sick; and, his disease becoming aggravated on the journey, he died at Brundisium, or, according to some, at Tarentum, in the fifty-second year of his age, B.C. 19. His body was carried to Naples, in compliance with his directions, and there interred in the Puteolan way.

**VIRGIL, POLYDORE**, an historical writer of the sixteenth century, who was born at Urbino, in Italy. One of his first productions was a collection of Latin poems, which was followed, in 1499, by his work "*De Rerum Inventoribus*," which has been often republished. Pope Alexander VI. sent him to England, as collector of the tribute called Peter's pence; and he was the last person who held that office in this country previously to the reformation under Henry VIII. That prince bestowed on him the archdeaconry of Wells, and several other benefices in the church; and, at the request of Henry, he composed a general "*History of England*," from the earliest ages to his own time. This work, which is written in Latin, considered as the production of a foreigner, is highly creditable to his talents; but his reputation has suffered in some degree from the charge of having destroyed memoirs and records which he made use of in his undertaking. "*The History of Polydore*" has passed through several editions. He quitted England in the reign of Edward VI., and, going to Italy, died at Urbino in 1555. Besides the works noticed, he was the author of a "*Treatise on Prodigies*."

**VIRTUE, GEORGE**, an eminent engraver and antiquary, who was born in London in 1684. After completing his preparatory studies he commenced business for himself, and rose rapidly in his profession. He obtained the patronage of Sir Godfrey Kneller and many other distinguished persons, who employed him to a very considerable extent. He also engaged in antiquarian and biographical pursuits, and accompanied several noblemen in their tours through various parts of the kingdom. He was also employed in making engravings for Rapin's "*History of England*," and many other works of a similar description. His death took place in 1756.

**VISCONTI, JOHN BAPTIST ANTHONY**, an Italian antiquary, born at Vernazza in Genoa, in 1722, and educated at Rome by an uncle, who was a painter, and who designed his nephew for the same profession. But the latter preferred the study of antiquities, and, that he might be at liberty to follow his inclination, purchased the office of apostolic notary. He became connected with the celebrated Winckelmann, whom he succeeded in 1768 in the station of prefect or commissary of antiquities at Rome; and Clement XIV., on his elevation to the pontifical throne the following year, having formed the design of founding a new museum in the Vatican, the execution of the plan was entrusted to Visconti,

who superintended the researches for ancient monuments carried on at Rome under popes Clement XIV. and Pius VI. His death took place in 1784. He was appointed editor of the "*Museum Pio-Clementinum*," but the text accompanying the engravings of that work was written by his son, who was very celebrated as an archæologist and antiquary.

**VOLNEY, CONSTANTINE**, a celebrated French writer, who was born in 1755. He travelled in the early part of his life through Egypt and Syria, and he subsequently wrote an account of this journey, in a work entitled "*Voyage en Syrie en Egypte*." This work was followed by his "*Les Ruines, ou Méditations sur les Révolutions de Empires*." Volney was a republican by principle, and was always an ardent defender of the rights of the nation. Napoleon made him a senator, and after the restoration of the Bourbons he was designated a member of the chamber of peers. His death took place after a short illness in 1820. He was the author of several valuable works, besides those already mentioned.

**VOLTAIRE, MARIE FRANCIS AROUET DE**.—This celebrated French writer was born in 1694, and was educated by his father for the profession of

the law, to which, however, he had an unconquerable aversion. His first work of any note was his tragedy of "*Œdipe*," which was so well received that his father allowed him to give up all thoughts

of becoming a lawyer. About 1720 he went to Brussels with Madam de Rupelmonde. The celebrated Rousseau being then in that city, the two poets met, and soon conceived an unconquerable aversion for each other. Voltaire said one day to Rousseau, who was showing him "An Ode to Posterity," "This is a letter which will never reach the place of its address." This led to a war between the two authors, who entertained a mutual jealousy of each other. Voltaire, on his return to Paris, produced in 1722 his tragedy of "Mariamne," without success. His "Artemira" had experienced the same fate in 1720. These mortifications, joined to those which were occasioned by his free principles, his sentiments on religion, and the warmth of his temper, induced him to visit England, where he printed his "Henriade." King George I., and particularly the princess of Wales (afterwards Queen Caroline), distinguished him by their protection, and obtained for him a great number of subscriptions. This laid the foundation of a fortune, which was afterwards considerably increased by the sale of his writings, by the munificence of princes, by commerce, by a habit of regularity, and by an economy bordering on avarice, which he did not shake off till near the end of his life.

In 1730 he published "Brutus," the most nervous of all his tragedies, which was more applauded by the judges of good writing than by the spectators. The first wits of the time, Fontenelle, La Motte, and others, advised him to give up the drama as not being his proper forte. He answered them by publishing "Zara," the most affecting, perhaps, of all his tragedies. His "Lettres Philosophiques," abounding in bold expressions and indecent witticisms against religion, having been burned by a decree of the parliament of Paris, and a warrant being issued for apprehending the author in 1733, Voltaire very prudently withdrew, and was sheltered by the marchioness du Chatelet in her castle of Cirey, on the borders of Champagne and Lorraine, who entered with him on the study of the "System" of Leibnitz, and the "Principia" of Newton. A gallery was built in which Voltaire formed a good collection of natural history, and made a great many experiments on light and electricity. He laboured in the mean time on his "Elements of the Newtonian Philosophy," then totally unknown in France, and which the numerous admirers of Des Cartes were very little desirous should be known. In the midst of these philosophical pursuits he produced the tragedy of "Alzira." He was now in the meridian of his age and genius, as was evident from the tragedy of "Mahomet," first acted in 1741; but it was represented to the procureur général as a performance offensive to religion, and the author, by order of Cardinal Fleury, withdrew it from the stage. "Merope," played two years after, in 1743, gave an idea of a species of tragedy of which few models have existed. He now became a favourite at court through the interest of Madame d'Etoile, afterwards marchioness of Pompadour. Being employed in preparing the festivities that were celebrated on the marriage of the dauphin, he attained additional honours by composing "The Princess of Navarre." He was appointed a gentleman of the bed-chamber in ordinary and historiographer of France. He had frequently attempted to gain admittance into the academy of sciences, but could not obtain his wish till 1746, when he was the

first who broke through the absurd custom of filling an inaugural speech with the fulsome adulation of Richelieu; an example soon followed by other academicians. From the satires occasioned by this innovation he felt so much uneasiness that he was glad to retire with the marchioness du Chatelet to Luneville, in the neighbourhood of King Stanislaus. The marchioness dying in 1749 Voltaire returned to Paris, where his stay was but short. Though he had many admirers he was perpetually complaining of a cabal combined to deprive him of that glory of which he was insatiable. He imagined he should find in a foreign country a greater degree of applause, tranquillity, and reward, and augment at the same time both his fortune and reputation, which were already very considerable. The king of Prussia, who had repeatedly invited him to his court, attached him at last to his person by a pension of 22,000 livres and the hope of farther favour. From the particular respect that was paid to him his time was now spent in the most agreeable manner; his apartments were under those of the king, whom he was allowed to visit at stated hours, to read with him the best works of either ancient or modern authors, and to assist his majesty in the literary productions by which he relieved the cares of government. But this happiness was soon at an end, and Voltaire saw to his mortification when it was too late, that, where a man is sufficiently rich to be master of himself, neither his liberty, his family, nor his country, should be sacrificed for a pension. A dispute which our poet had with Maupertuis, the president of the academy at Berlin, was followed by disgrace.

Having regained his liberty, he endeavoured to negotiate a return to Paris; but this he was not able to accomplish. He was resident for about a year at Colwar, whence retiring to Geneva, he purchased a beautiful villa near that city, where he enjoyed the homage of the Genevans, and of occasional travellers; and for a short time was charmed with his agreeable retirement, which the quarrels that agitated the little republic of Geneva compelled him soon to quit. He was accused of privately fomenting the disputes, of leaning towards the prevailing party, and laughing at both. Compelled to abandon Les Delices (which was the name of his country-house), he fixed himself in France, within a league of Geneva, in Le Pays de Gex, an almost savage desert, which he had the satisfaction of fertilizing. He erected a church, which is represented beneath. The village of

Ferney, which contained not above fifty inhabitants, became by his means a colony of 1200 persons, suc-

cessfully employed for themselves and for the state. Numbers of artists, particularly watchmakers, established their manufactures under the auspices of Voltaire, and exported their wares to Russia, Spain, Germany, Holland, and Italy. He rendered his solitude still more illustrious by inviting thither the great niece of the celebrated Corneille, and by preserving from ignominy and oppression Sirven and the family of Calas, whose estates he caused to be restored. Men in power, dreading the force of his pen, endeavoured to secure his esteem. This homage, and some generous actions, which he himself occasionally took care to proclaim, either for to reach posterity, or to please the curious, contributed as much to extend his reputation as the marks of esteem and bounty he had received from sovereign princes. The king of Prussia, with whom he still maintained an uninterrupted correspondence, had his statue made in porcelain, and sent to him, with the word "Immortali" engraven on its base. The empress of Russia sent him a present of some magnificent furs, and a box turned by her own hands, with his portrait set in diamonds. These distinctions did not prevent his sighs for Paris. Overloaded with glory and wealth, he was not happy, because he never could content himself with what he possessed. At length, in the beginning of 1778, he determined to exchange the tranquillity of Ferney for the incense and bustle of the capital, where he met with the most flattering reception. Such honours were decreed him by the academies as till then had been unknown; he was crowned in a full theatre, and distinguished by the public with the strongest enthusiasm. But the fatigue of visits and attendance at theatrical representations, the change of regimen and mode of living, inflamed his blood, already too much disordered. On his arrival he had a violent hæmorrhage, which greatly impaired his health. Some days before his last illness the idea of approaching death tormented him. On his arrival at Paris he said "he was come to seek glory and death." At last, not being able to obtain sleep, he took a large dose of opium, which deprived him of his senses, and he died on the 30th of May, 1778, and was buried at Sellices, a Benedictine abbey between Nogent and Troyes. Many accounts have been published respecting his behaviour when in the nearer view of death. Some of these are so contradictory that it is difficult to attain the exact truth. His infidel friends, and others, took every pains to represent that he died as he had lived, a hardened infidel and a blasphemer; but they have not been credited, and it is more generally believed that he was visited on this awful occasion with the remorse of a man, whose whole life had been a continued attempt to erect vice and immorality on the ruins of revealed religion. The mareschal de Richelieu is said to have fled from the bed-side, declaring it to be a sight too terrible to be sustained; and Tronchin, the physician, asserted that the furies of Orestes could give but a faint idea of those of Voltaire.

WAKE, WILLIAM, a celebrated English prelate, who was born in Dorsetshire in 1637, and received his education at Oxford. Having entered holy orders he rose rapidly in the church, and in 1705 was raised to the episcopal bench as bishop of Lincoln. After having presided over that diocese for several years he was created archbishop of Canterbury. He was the author of several controversial works; one

of the most celebrated was his "Reply to Bossuet's Exposition of the Doctrines of the Catholic Church." This eminent prelate died on the 24th of January, 1735.

WAKEFIELD, GILBERT, an English scholar and critic, who was born in 1756, and received his education at Jesus college, Cambridge. After the completion of his studies he entered holy orders, and obtained a curacy, but left it after his marriage, when he accepted the office of classical tutor to the dissenting academy at Warrington. While there he published "A New Translation of the Gospel of St. Matthew, with Notes, Critical, Philological, and Explanatory." He subsequently published "A Translation of the New Testament, with Notes, Explanatory and Critical," and "Evidences of Christianity;" the latter work was in answer to Paine's "Age of Reason." These works were followed by translations from several of the old Greek writers. He was also distinguished as a political writer, and was imprisoned for two years in Dorchester gaol for "A Reply to Some Parts of the Bishop of Llandaff's Letter to the People of Great Britain." His death took place in 1801.

WAKEFIELD, ROBERT, an eminent oriental and biblical scholar of the sixteenth century. He was Hebrew professor at Oxford, having previously filled the same office at Louvaine. His principal works are entitled "Syntagma Hebræorum," and "A Paraphrase on the Book of Ecclesiastes." His death took place in 1537.

WALES, WILLIAM, an eminent English astronomer and mathematician, who was born in 1734. He accompanied Captain Cook in his two first voyages round the globe, of which he kept a journal, afterwards printed under the title of "Astronomical Observations in the Southern Hemisphere." He afterwards published "An Enquiry into the Population of England and Wales," and several other works of a similar description. His death took place in 1798.

WALKER, ADAM, a celebrated lecturer and writer, who was born in Westmoreland in 1731, and although taken from school at a very early age, yet the bent of his mind was very easily perceived. He employed all his leisure in making mechanical models; and, having procured a few books, built himself a hut in a copse wood for the purpose of carrying on his studies. He afterwards accepted the place of usher in a school in the North Riding of Yorkshire, and then obtained the mastership of a grammar school at Macclesfield. In this town he also engaged in business, but failed. He then directed his attention to astronomy, and for years was a successful lecturer on that subject in all the principal towns in England. He finally took up his residence in London, and delivered public lectures in the metropolis during the Lent season, which were very popular, and, generally speaking, well attended. His death took place in February 1821. His principal works are, "A System of Familiar Philosophy," "A Treatise on Geography and the Use of the Globes," and several other works of a similar description.

WALKER, SIR EDMUND, an English hero who lived in the early part of the seventeenth century. He was strongly attached to the cause of Charles I., who knighted him after the battle of Edgehill on account of the great bravery which he displayed on that occasion. When Charles II. as-

ended the throne, Sir Edmund Walker was made Garter king-at-arms. He was the author of "An Account of the Celebration of St. George's Day at Windsor, in 1674"; also, of "Acts of Knights of the Garter in the Civil Wars," "Historical Discourses," and several other works. His death took place in 1677.

WALKER, JOHN, a philological writer who was born at Friern Barnet, Herts, in 1732. He is known as the author of several useful elementary works, such as "The Rhetorical Grammar," "A Pronouncing Dictionary," "Elements of Elocution," and "A Rhyming Dictionary." His death took place in August 1807.

WALKER, WILLIAM, a learned English divine who was born in the seventeenth century, and studied at Trinity college, Cambridge. He presided for many years over a school at Grantham, where he had Sir Isaac Newton for a pupil. He was the author of "An Explanation of Lily's Latin Grammar," "A Dictionary of Latin Idioms," a work "On Rhetoric," &c. His death took place in 1684.

WALLACE, WILLIAM. — This distinguished warrior was born about the middle of the reign of Alexander III., but the exact year is not known. Wallace belonged neither to the class of the high feudal nobility nor to the free tenants or yeomanry, but to that middle rank, which, by the proud barons, who esteemed themselves the companions of kings, was considered nearer to the condition of their vassals than to an equality with themselves. It was this portion of the nobility who, during the whole period of Wallace's career, opposed and thwarted him with feelings of mingled pride and fear; who compelled him to be what he undoubtedly was, the champion of the people, the liberator of his country, by means of the lower classes of his countrymen, when the selfishness and venality of most of the great lords had consented to deliver it into the hands of a foreign power. But, although unconnected with this corrupted class, Wallace was born in a rank which ensured him a martial education; and the condition of his father entitled him, if not to claim an equality, yet certainly to associate with the proudest of the land.

His youth is said to have been passed chiefly under the care of his uncle, an ecclesiastic, who was settled at Dunipace, near Stirling, and who appears to have been animated with the strongest feelings of independence. From Dunipace, there is a tradition that Wallace removed to Kilspindy, a village in the rich district called the Carse of Gowrie, and that he thence was sent to Dundee, where he received such instruction as the limited education of those rude times could afford him. It was here, also, according to the same authority, that he became first acquainted with John Blair, who was afterwards a Benedictine monk; Blair was of like age with Wallace, and the two youths formed a lasting attachment to each other. When he became celebrated, Wallace chose his early friend for his chaplain; and it is a subject of deep regret that a Latin life of his master and patron, which was written by Blair, has, with the exception of a few fragments, been lost or destroyed. At one or other of these places, all of which were visited by Edward, in his triumphant progress through the country subsequent to the battle of Falkirk, it is probable that Wallace saw the conqueror. His father, Sir Malcolm Wallace, upon the first publica-

tion of the orders for all to come in and take their oaths of allegiance to the English monarch, had fled from Elderslie into the mountainous district of the Lennox, accompanied by his eldest son; and it is generally believed that he was not long afterwards slain in an encounter with the English at Kyle, in Ayrshire. His mother, meanwhile, had taken refuge with her father's relations; and Wallace, now advancing into manhood, found himself driven from his paternal home, an object of suspicion to the government, and avoided by those cautious and timid friends who regarded Scotland as lost, and preferred the quiet security of servitude to the desperate chances of insurrection.

Over all this his mind, pent up in a silent restraint, which, for a season, he was compelled to observe, brooded and rankled in secret; but an event now took place which settled his destiny, and drove him into open rebellion. It appears that he had formed an attachment to a beautiful woman who resided in the town of Lanark, and that, in passing through the streets of that burgh, well armed, and somewhat richly dressed, he was recognised by a troop of English soldiers, who surrounded and insulted him. Wallace, at first, would have prudently got clear of their insolence, but a contemptuous stroke which one of them made against his sword, provoked him to draw, and the culprit was laid dead at his feet. A tumult now arose, and, almost overpowered by numbers, he escaped with difficulty into the house of his mistress, and through it, by a back passage, into the neighbouring woods. For this ready aid, the unfortunate girl was seized next day, by William de Heslope, the English sheriff, and, with inhuman cruelty, condemned and executed. But Wallace's revenge, when he heard of her unmerited fate, was as rapid as it was stern. That very night he collected thirty faithful and powerful partisans, who, entering the town when all were in their beds, reached the sheriff's lodging in silence. It was a room or loft, constructed, like most of the buildings of those times, of wood, and communicating with the street by a high stair. Up this Wallace rushed at midnight, and, beating down the door, presented himself in full armour, and with his naked weapon, before the affrighted officer, who asked him whence he came, or who he was? "I am William Wallace," he replied, "whose life you sought yesterday; and now thou shalt answer me for my poor maiden's death." With these words, he seized his naked victim by the throat, and, passing his sword through his body, cast the bleeding wretch down the stair into the street, where he was immediately slain. He then collected his soldiers, and, as the stir and tumult arose, drew off through the streets into the woods which surrounded the town.

Merited as this revenge was then considered by all who smarted under the yoke of the English, it was justly pronounced by the government an audacious murder, and not only drew after it the usual consequences of proscription and outlawry, but incited to an immediate and eager pursuit. Wallace, however, was intimately acquainted with the country, and found little difficulty in defeating every effort for his apprehension. It was from this period that we must date his systematic and determined resistance to England; for the same incident which convinced him that there must for ever be an irreparable breach between him and the government which he had

outraged, awakened a feeling of his own strength, gave an energetic consistency to his future life, and concentrated his love of liberty and his animosity against his oppressors into one deep and continuous principle. "It was from this time, therefore," says an ancient historian, "that all who were of bitter mind, and who had become weary of the servitude which was imposed by the domination of the English, flocked to this brave man like bees to their swarm, and he became their leader."

We cannot, however, trace this brave man through all his struggles for the liberty of his father land, as a history of Wallace's achievements would in fact be a military history of Scotland till the time of his death, which occurred on the 23rd of August, 1305. He was executed in Smithfield. The head was immediately placed upon London bridge, and his quarters distributed through the country. The right arm was sent to Newcastle, the left arm to Berwick, the right leg to Perth, and the left to Aberdeen. "They hewed his body," says Langtoft, "into four quarters, which were hung up in four towns, as a warning to all who, like him, raised their standard against their lord, that their mangled remains would be gazed upon, instead of the gonfanons and banners which they had once so proudly displayed."

WALLER, EDMUND, a talented English poet, who was born in March 1605, at Coleshill in Hertfordshire, and was educated at Cambridge. He began to exercise his poetical talent as early as the year 1623, as appears from his verses in his work, "Upon the danger his Majesty (being Prince) escaped in the Road of St. Andero; for there Prince Charles returning from Spain that year had like to have been cast away." It is not known at what time he married his first lady; but he was a widower before he was five and twenty, when he entertained a passion for Sacharissa, which was a fictitious name for Lady Dorothy Sidney, daughter to the earl of Leicester, and afterwards wife to the earl of Sunderland.

He was returned burgess for Amondesham in the parliament which met in April 1640. An intermission of parliaments having displeased the nation, Waller was one of the first who condemned the measures of the court. In 1642 he was one of the commissioners appointed by the parliament to present their propositions of peace to the king at Oxford. In 1643 he was deeply engaged in a design to reduce the city of London and the Tower to the service of the king; of which Whitelock has given the following account:—"June 1643," says he, "began the arraignment of Waller, Tomkyns, Challoner, and others, conspiring to surprise the city militia and some members of parliament, and to let in the king's forces to surprise the city and dissolve the parliament. Waller, a very ingenious man, was the principal actor and contriver of this plot, which was in design when he and the other commissioners were at Oxford with the parliament's propositions; and that, being then known to the king, occasioned him to speak these words to Waller, when he kissed his hand,—'though you are the last, yet you are not the worst, nor the least in favour.'"

"When he was examined touching this plot, he was asked, whether Selden, Pierpoint, Whitelocke, and others by name, were acquainted with it? He answered, that they were not; but that he did come one evening to Selden's study, where Pierpoint and Whitelocke then were with Selden, on purpose to

impart it to them all; and speaking of such a thing in general terms, those gentlemen did so inveigh against such thing as treachery and baseness, and that which might be the occasion of shedding much blood, that he said he durst not, for the awe and respect which he had for Selden and the rest, communicate any of the particulars to them, but was almost disheartened himself to proceed in it. They were all upon their trials condemned; Tomkyns and Challoner only were hanged; Waller had a reprieve from General Essex, and after a year's imprisonment paid a fine of 10,000*l.* and was pardoned." The earl of Clarendon has given a particular account of this plot, and also of Mr. Waller's behaviour after it was discovered; who, upon his being taken up, says, "he was so confounded with fear and apprehension, that he confessed whatever he had said, heard, thought, or seen; all that he knew of himself, and all that he suspected of others, without concealing any person of what degree or quality soever, or any discourse that he had ever, upon any occasion, entertained with them." He afterwards tells us, that "Mr. Waller, though confessedly the most guilty, after he had, with incredible dissimulation, acted such remorse of conscience, that his trial was put off out of Christian compassion, till he might recover his understanding; and, by drawing visitants to himself of the most powerful ministers of all factions, had, by his liberality and penitence, by his receiving vulgar and vile sayings from them with humility and reverence, as clearer convictions and informations than in his life he had ever had, and by distributing great sums to them for their prayers and ghostly counsel, so satisfied them, that they satisfied others: was brought at his suit to the house of commons' bar, where, being a man very powerful in language, and who, by what he spoke, and in the manner of speaking it, exceedingly captivated the good will and benevolence of his hearers, he delivered an oration, to which, in truth, he does as much owe the keeping his head as Catiline did the loss of his to those of Tully."

After he had saved himself from the consequences of this plot, he went to France, where he continued several years. Upon his return to England he joined Cromwell. He wrote a panegyric upon Cromwell in 1654, as he did a poem upon his death in 1658. At the restoration he was treated kindly by Charles II. He sat in several parliaments after the restoration, and continued in the full vigour of his genius to the end of his life. He died of a dropsy in 1667, and was interred in the churchyard of Beconsfield, where a monument is erected to his memory.

WALLIS, JOHN, an eminent English mathematician, who was born at Ashford, in Kent, in 1616. In 1632 he was sent to Emanuel college, Cambridge, where he had, among others, Mr. Whichcote for his tutor; and took the degrees in art, a bachelor's in 1637, a master in 1640. About the same time he went into orders and was chosen fellow of Queen's college, there being no vacancy in his own. He kept his fellowship till it was vacated by his marriage, but quitted the college to be chaplain to Sir Richard Darley, whose seat was at Bustercumb in Yorkshire. After he had lived in this family about a year he removed to that of Lady Vere's, with whom he continued two years.

In 1643 he published "Truth Tryed, or Animal versions on the Lord Brooke's Treatise, called 'The

Nature of 'Truth,' &c.," calling himself "a minister in London," probably of St Gabriel, Fenchurch, the sequestration of which had been granted to him. In 1644 he was chosen one of the scribes or secretaries to the assembly of divines at Westminster. Academic studies being much interrupted by the civil wars in both the universities, the learned among them came to London, and formed assemblies there. Wallis belonged to one of these, and this society was the origin of the royal society. The Savilian professor of geometry at Oxford being ejected by the parliamentary visitors in 1649, Wallis was appointed to succeed him in that place; and accordingly removed from London to Oxford, and, having entered himself of Exeter college, was admitted master of arts there the same year. He opened his lectures on the last day of October with an inaugural speech in Latin, which was afterwards printed. In 1650 he published "Some Animadversions on a book of Mr. Baxter, intitled, 'Aphorisms of Justification and the Covenant;'" and, in 1653, "A Grammar of the English Tongue, for the use of foreigners," in Latin. In the work entitled "De Loquela," he states that "he has philosophically considered the formation of all sounds used in articulate speech, as well of our own as of any other language that he knew; by what organs, and in what position, each sound was formed; with the nice distinctions of each, which in some letters of the same organ are very subtle: so that by such organs, such position, the breath issuing from the lungs will form such sounds, whether the person do or do not hear himself speak." Pursuing these reflections, he was led to think it possible that a deaf person might be taught to speak by being directed so to apply the organs of speech as the sound of each letter required, which children learn by imitation and frequent attempts rather than by art.

In May 1654 he took the degree of doctor in divinity. In 1655, Hobbes having printed his treatise "De Corpore Philosophico," Dr. Wallis the same year wrote a confutation of it in Latin, which so much provoked Hobbes that in 1656 he published it in English, with the addition of what he called "Six Lessons to the Professors of Mathematics in Oxford." Upon this Dr. Wallis wrote an answer in English, entitled "Due Correction for Mr. Hobbes, or School-Discipline for not saying his Lessons right 1656;" to which Mr. Hobbes replied in a pamphlet, entitled "Marks of the Absurd Geometry, Rural Language, Scottish Church Politics, and Barbarisms of John Wallis, &c., 1657."

Upon the restoration he met with great respect, the king thinking favourably of him on account of some services done to his royal father and himself; and the lord chancellor Clarendon, and Sir Edward Nicholas, secretary of state, being his friends. He was therefore not only made king's chaplain, but confirmed also in his places of Savilian professor and keeper of the archives. In 1661 he was appointed one of the divines who were empowered to review "The Book of Common Prayer;" and afterwards complied with the terms of the act of uniformity, continuing a steady conformist to the church of England till his death. He was one of the first members of the royal society, and kept a constant correspondence with it by letters and papers—many of which are published in the "Transactions" of that society.

In 1676 he gave an edition of "Archimedis Syracusani Arenarius et Dimensio Circuli;" and in 1682

he published, from the manuscripts, "Claudii Ptolemæi Opus Harmonicum," in Greek, with a Latin version and notes, to which he afterwards added, "Appendix de veterum Harmonica ad hodiernam comparata, &c." He died on the 8th of October, 1703, in his eighty-eighth year, and was buried in St. Mary's church at Oxford, where a monument is erected to his memory.

WALPOLE, SIR ROBERT, earl of Orford.—This celebrated statesman was born at Houghton in Norfolk, on the 6th of September, 1674, and educated on the foundation at Eton school, from which he was elected to King's college, Cambridge, and admitted 1681; but, succeeding to the family estate by the death of his elder brother, he resigned his fellowship. In 1700 he was chosen member of parliament for King's Lynn, and represented that borough in several succeeding parliaments. In 1705 he was nominated one of the council to Prince George of Denmark, lord high admiral of England; in 1707 appointed secretary at war, and in 1709 treasurer of the navy. In 1710, upon the change of the ministry, he was removed from all his posts, and held no place afterwards during the queen's reign. In 1711 he was voted by the house of commons guilty of a high breach of trust and notorious corruption in his office of secretary at war, and it was resolved that he should be committed to the Tower and expelled the house. Upon a candid review of this affair there does not appear sufficient proof to justify the severity used towards him; and, perhaps, his attachment to the Marlborough ministry, and his great influence in the house, owing to his popular eloquence, were the true causes of his censure and imprisonment, as they had before been of his advancement. All the Whigs, however, on this occasion considered him as a kind of martyr in their cause.

The borough of Lynn re-elected him, and though the house declared the election void, yet they persisted in the choice. In the well-known debate relating to Steele for publishing "The Crisis," he distinguished himself in behalf of liberty and added to the popularity he had before acquired. The schism-bill too soon after gave him an opportunity of exerting his eloquence and of appearing in the character of the champion of civil and religious liberty. On the death of the queen a revolution of politics took place, and the Whig party prevailed both at court and in the senate. Walpole had before recommended himself to the house of Hanover by his zeal for its cause when the commons considered the state of the nation with regard to the protestant succession; and he had now the honour of procuring the assurance of the fidelity of the house to the new king, which attended the address of condolence and congratulation. It is therefore not a matter of surprise that his promotion took place soon after the king's arrival; and that in a few days he was appointed receiver and paymaster-general of all the guards and garrisons, and of all the other land forces in Great Britain, paymaster of the royal hospital at Chelsea, and also a privy counsellor. On the opening of a new parliament a committee of secrecy was chosen, to enquire into the conduct of the late ministry, of which Walpole was appointed chairman: and, by his management, articles of impeachment were read against the earl of Oxford, Lord Bolingbroke, the Duke of Ormond, and the earl of Strafford. The eminent service he was thought to have done the

nation and the crown by the vigorous prosecution of those ministers, who were deemed the chief instruments of the peace, was rewarded by the extraordinary promotions of first commissioner of the treasury and chancellor and under treasurer of the exchequer.

It was not long before he acquired full ministerial power, being appointed first lord commissioner of the treasury and chancellor of the exchequer; and when the king went abroad in 1723, he was nominated one of the lords justices for the administration of government, and was sworn sole secretary of state. About this time he received another distinguished mark of the royal favour; his eldest son, then on his travels, being created a peer by the title of Baron Walpole of Walpole. In 1725 he was made knight of the Bath, and the year after knight of the Garter. The measures of his administration during the long time he remained prime or rather sole minister, have been often canvassed with all the severity of critical enquiry. Though he had been called "the father of corruption," which, however, he was not, but certainly a great improver of it, and is said to have boasted that he knew every man's price; yet, in 1742, the opposition prevailed, and he was not any longer able to carry a majority in the house of commons. He then resigned all his places, but he was soon after created earl of Orford, and most of his friends and dependents continued in their places. The king also granted him a pension of 4000*l.*, in consideration of his long and faithful services. The remainder of his life he spent in tranquillity and retirement, and died in 1745.

**WALPOLE, HORACE**, earl of Orford.—This celebrated literary nobleman was the youngest son of Sir Robert Walpole, and was born in 1718. He studied at Cambridge, and set out on a tour through nearly all the continental cities. On his return he entered parliament, and was remarkable for consistency in his politics, always adhering to the Whig party. He spent the principal part of his time at his favourite residence at Strawberry Hill. His principal works are, "*Ædes Walpoliana*," "*Catalogue of Royal and Noble Authors*," "*The Castle of Otranto*," "*Historic Doubts on the Life and Reign of King Richard III.*," and "*Anecdotes of Painting*." His death took place in March 1797.

**WALSH, WILLIAM**, an English critic and poet, who was the son of Joseph Walsh, of Abberley at Worcestershire, and was born about 1663. He became a gentleman commoner of Wadham college at Oxford in 1678, but left the university without a degree, and pursued his studies in London and at home. He became, in Dryden's opinion, "the best critic in the nation," and he was not merely a critic or a scholar. He was also a member of parliament,

and a courtier, knight of the shire for his native county in several parliaments; in another the representative of Richmond in Yorkshire, and a gentleman of the horse to Queen Anne under the duke of Somerset. Some of his verses show him to have been a zealous friend to the revolution, but his political ardour did not abate his reverence or kindness for Dryden, to whom he gave a dissertation on Virgil's Pastorals. In 1705 he commenced a correspondence with Pope. These letters are written upon the pastoral comedy of the Italians, and those pastorals which Pope was then preparing to publish. Pope always retained a grateful memory of Walsh's notice, and mentioned him in one of his latter pieces among those that had encouraged his juvenile studies.

"— Granville the polite,  
And knowing Walsh, would tell me I could write."

In his "*Essay on Criticism*" he had given him more splendid praise, and, in the opinion of his learned commentator, sacrificed a little of his judgment to his gratitude. The time of his death is not certain.

**WALSINGHAM SIR FRANCIS**, a celebrated statesman, who lived in the reign of Queen Elizabeth. He was born at Chislehurst, in Kent, of an ancient and honourable family, and spent some time at King's college, Cambridge; but, to complete his education, travelled for some time and acquired various languages and great accomplishments. These soon recommended him to Cecil; and under him he was employed in many important affairs of state. He resided as ambassador in France, during the civil wars in that kingdom, and in 1570 he was sent a second time there in the same capacity. His negotiations and dispatches during that embassy were collected by Sir Dudley Digges, and published in 1655, under the title of "*The Complete Ambassador* or, two Treatises of the intended Marriage of Queen Elizabeth, of glorious Memory; comprised in Letters of Negotiation of Sir Francis Walsingham, her Resident in France. Together with the Answers of the Lord Burleigh, the Earl of Leicester, Sir Thomas Smith, and others. Wherein, as in a clear Mirror, may be seen the Faces of the two Courts of England and France, as they then stood; with many remarkable Passages of State, not at all mentioned in any History."

In 1573 he was appointed one of the principal secretaries of state and sworn a privy-counsellor. He now devoted himself entirely to the service of his country and his queen, and by his vigilance and address preserved her crown from conspiracy. "To him," says Dr. Lloyd, "mens' faces spoke as well as their tongues, and their countenances were indexes of their hearts. He would so beset men with questions, and draw them on, that they discovered themselves whether they answered or were silent. He maintained fifty-three agents, and eighteen spies in foreign courts; and for two pistoles and under, had all the private papers in Europe." He was at first a favourer of the puritan party, to whom he offered, in the queen's name, that, provided they would conform in other points, the three ceremonies of kneeling at the communion, wearing the surplice, and making the sign of the cross in baptism should be laid aside. But they replying to these concessions in the language of Moses, "that they would not leave so much as a hoof behind," he therefore withdrew in a great measure from them. He was sent on an embassy

to the Netherlands in 1578, and in 1581 went a third time as ambassador to France, to treat respecting a marriage between Queen Elizabeth and the duke of Anjou, and to conclude a league, offensive and defensive, between both kingdoms. In 1583 he was despatched into Scotland to secure their young and inexperienced king from evil counsellors. "He could," as Lloyd says, "as well fit the humour of King James with passages out of Xenophon, Thucydides, Plutarch, or Tacitus, as he could that of Henry king of France with Rabelais' conceits, or the Dutch with mechanical discourses." Every attempt to promote the trade and navigation of England was encouraged by this statesman. Hakluyt particularly in making discoveries, and Gilbert in settling in Newfoundland, had his patronage and assistance. He founded a divinity lecture at Oxford, and provided a library for King's college, Cambridge. Besides his other employments, he was chancellor of the duchy of Lancaster and of the Garter; yet he died so poor in 1589, that, on account of his debts, he was buried privately by night in St Paul's church, without any funeral solemnity.

WALTON, BRIAN, a learned English bishop, who was born at Cleaveland, in the north riding of Yorkshire, in 1600. He entered first of Magdalen, and then of Peter House college, Cambridge, where he took a master of arts degree in 1623. He subsequently became rector of St. Martin's Orgar in London, and of Sandon in Essex; to the latter of which he was admitted in 1635. In 1639 he was made doctor of divinity, at which time he was prebendary of St. Paul's and chaplain to the king. He possessed also another branch of knowledge, which made him very acceptable to the clergy: he was well versed in the English laws, especially those which related to the patrimony and liberties of the church. During the controversy between the clergy and inhabitants of the city of London about the tithes of rent, he was a very industrious and active partisan of the former. Upon the breaking out of the civil war he was summoned by the house of commons as a delinquent, and was sequestered from his living of St. Martin's Orgar, and was compelled to leave London; but whether he went to Oxford directly, or to his living of Sandon in Essex, is not known. In 1645 he was incorporated in the university of Oxford, and it was there that he formed the plan of publishing the Polyglott Bible; and upon the ruin of the king's cause he retired to the house of Dr. Fuller, his father-in-law, who resided in London, where, though frequently disturbed by the prevailing party, he lived to complete the "Biblia Polyglotta," which was published in 1657, in six volumes folio. In this great work, as far as relates to the correcting of it at the press, and the collating of copies, he had the assist-

ance of several learned persons of that period. The prolegomena and appendix to it were attacked in 1659 by Dr. John Owen, in "Considerations," &c., who was answered the same year by Dr. Walton in a work under the title of "The Considerator Considered; or a Brief View of Certain Considerations upon the 'Biblia Polyglotta,' the Prolegomena and Appendix. Wherein, among other things, the Certainty, Integrity, and the Divine Authority of the Original Text is defended against the Consequences of Atheists, Papists, Anti-Scripturists, &c., inferred from the Various Readings and Novelty of the Hebrew Points, by the Author of the said Considerations. The 'Biblia Polyglotta' and Translations therein exhibited, with the Various Readings, Prolegomena, and Appendix, Vindicated from his Aspersions and Calumnies; and the Questions about the Punctuation of the Hebrew Text, the Various Readings, and the Ancient Hebrew Character, briefly Handled."

After the restoration he had the honour of presenting the Polyglott Bible to Charles II., who made him chaplain in ordinary, and soon after promoted him to the bishopric of Chester. In September 1661 he went to take possession of his see, and was received by a body of gentry, clergy, militia, both of the city and country. This was on the 10th of September, and on the 11th he was installed with much ceremony; "a day," says Wood, "not to be forgotten by all the true sons of the church of England." The distinction, however, which attended Bishop Walton, though it appears to have been great, was short-lived; for, on his return to London, he died at his house in Aldersgate Street, on the 29th of the following November, and was interred in St. Paul's cathedral, where a monument was erected to his memory. He published, in 1665, "Introductio ad Lectionem Linguarum Orientalium."

WALTON, ISAAC.—This celebrated angler was born at Stafford in August 1593. His first settlement in London, as a shopkeeper, was in the Royal Exchange, Cornhill. In this situation he could scarcely be said to have had elbow room, for the shops over the Exchange were but seven feet and a half long and five wide. Here, however, he carried on his trade till the year 1624, when "he dwelt on the north side of Fleet Street, in a house two doors west of the end of Chancery Lane, and abutting on a messuage known by the sign of the Harrow." About 1643 he left London, and appears to have retired altogether from business. While he continued in London his favourite recreation was angling, in which he was the greatest proficient of his time; and, indeed, so great was his skill and experience in that art that there is scarcely any writer on the subject since his time who has not made the rules and practice of Walton the foundation of his work. It is therefore with consistency that Langbaine calls him "the common father of all anglers." The river that he seems mostly to have frequented for this purpose was the Lea, which has its source above Ware in Hertfordshire, and falls into the Thames a little below Blackwall.

In 1653 he published his "Complete Angler, or Contemplative Man's Recreation." This work came into the world attended with encomiastic verses by several writers of that period. The second edition came out in 1655, the third in 1664, the fourth in 1668, and the fifth in 1676.

About two years after the restoration Walton

wrote the life of Richard Hooker, author of the "Ecclesiastical Polity." He was induced to undertake this work by his friend Dr. Gilbert Sheldon, afterwards archbishop of Canterbury, who was an angler. Bishop King, in a letter to the author, says of this life, "I have often seen Mr. Hooker with my father, who was afterwards bishop of London, from whom and others at that time I have heard of the most material passages which you relate in the history of his life." Sir William Dugdale, speaking of the posthumous books of the "Ecclesiastical Polity," refers the reader "to that seasonable historical discourse lately compiled and published, with great judgment and integrity, by that much-deserving person, Mr. Isaac Walton."

The life of Mr. George Herbert was first published in 1670. Walton professes himself to have been a stranger as to the person of Herbert; and though he assures us his life of him was a freewill-offering, it abounds with curious information, and is no way inferior to the former. Two of these lives, viz. those of Hooker and Herbert, we are told, were written under the roof of Walton's good friend and patron, Dr. George Morley, bishop of Winchester; which particular seems to agree with Wood's account, that, "after his quitting London, he lived mostly in the families of the eminent clergy of that time." "The Complete Angler" having, in the space of twenty-three years, gone through four editions, Walton, in the year 1676, and in the eighty-third year of his age, was preparing a fifth, with additions, for the press, when Mr. Cotton wrote a second part of that work. It seems Mr. Cotton submitted the manuscript to Walton's perusal, who returned it with his approbation and a few marginal strictures, and in that year they were published together. Mr. Cotton's book had the title of "The Complete Angler; being instructions how to angle for a trout or grayling, in a clear stream, part II.," and it has since been received as a second part of Walton's book. In the title-page is a cypher composed of the initial letters of both their names; which cypher, Mr. Cotton states, he had cut in stone and set up over a fishing-house that he had erected near his dwelling on the bank of the little river Dove, which divides the counties of Stafford and Derby.

Mr. Cotton's book is a judicious supplement to Walton's, for it must not be concealed that Walton, though he was so expert an angler, knew but little of fly-fishing; and indeed he is so ingenuous as to confess that the greater part of what he has said on that subject was communicated to him by Thomas Barker, and not the result of his own experience. And as Cotton lived in a country where fly-fishing was, and is, almost the only practice, he had not only the means of acquiring, but actually possessed more skill in the art, as also in the method of making flies, than most men of his time. Walton was now in his eighty-third year,—an age which, to use his own words, "might have procured him a writ of ease, and secured him from all further trouble in that kind," when he undertook to write the life of Bishop Sanderson, which was published, with several of the bishop's works and a sermon of Hooker's, in 1677. This work, far from being deficient in any of those excellencies that distinguish the former lives, which were written at a much earlier part of the author's life, abounds with the evidences of a vigorous imagination, a sound judgment, and a memory

unimpaired by age; and for the nervous sentiments and pious simplicity displayed in this work, let the concluding paragraph, pointed out by Dr. Johnson, be considered as a specimen:—"Thus this pattern of meekness and primitive innocence changed this for a better life. It is now too late to wish that mine may be like his, for I am in the eighty-fifth year of my age, and God knows it hath not; but I most humbly beseech Almighty God that my death may: and I do earnestly beg, that if any reader shall receive any satisfaction from this very plain, and a true relation, he will be so charitable as to say Amen." In 1683, when he was ninety years old, Walton published "Thealma and Clearchus, a pastoral history, in smooth and easy verse, written long since by John Chalkhil, Esq., an acquaintance and friend of Edmund Spenser." He lived but a very short time after the publication of this poem, for he ended his days on the 15th of December, 1683.

WARBURTON, WILLIAM, a learned English prelate, who was born at Newark-upon-Trent in 1676. He was educated for the legal profession, but, not finding it adapted to his taste, he abandoned it, and in 1723 took deacon's orders in the church. In 1724 his first work, consisting of translations from Cæsar, Pliny, Claudian, and others, appeared, under

the title of "Miscellaneous Translations in Prose and Verse, from Roman Poets, Orators, and Historians." It is dedicated to his early patron, Sir Robert Sutton, and appears to have laid the foundation of his first ecclesiastical preferment. About 1726 he came to London, and was introduced to Concanen, and several others of Pope's enemies. In 1727 his second work, entitled "A Critical and Philosophical Enquiry into the Causes of Prodiges and Miracles, as related by Historians," &c., was published, and was also dedicated to Sir Robert Sutton, and on the 25th of April, 1728, he had the honour to be in the king's list of masters of arts, created at Cambridge on his majesty's visit to that university. In June, the same year, he was presented by Sir Robert Sutton to the rectory of Burnt Broughton, in the diocese of Lincoln; a living worth 200*l.* a year, which he retained till his death, at which he spent a considerable part of his life in studious retirement, devoted entirely to letters, and there planned, and in part executed, some of his most important works. Several years

elapsed, after obtaining this preferment, before Mr. Warburton appeared again in the world as a writer. In 1736 he exhibited a plan of a new edition of Velleius Paterculus, which he printed in the "Bibliothèque Britannique, ou Histoire des Ouvrages des Savans de la Grande Bretagne, pour les Mois Juillet, Aout, et Septembre, 1736. A la Haye." The design never was completed. Dr. Middleton, in a letter to him, dated April 1737, returns him thanks for his letters as well as the journal, "which," says he, "came to my hands soon after the date of my last. I had before seen the force of your critical genius very successfully employed on Shakspeare, but did not know you had ever tried it on the Latin authors. I am pleased with several of your emendations, and transcribed them into the margin of my editions, though not equally with them all. It is a laudable and liberal amusement to try now and then in our reading the success of a conjecture; but in the present state of the generality of the old writers, it can hardly be thought a study fit to employ a life upon, at least not worthy, I am sure, of your talents and industry, which, instead of trifling on words, seem calculated rather to correct the opinions and manners of the world." These sentiments of his friend appear to have had their due weight; for, from that time, the intended edition was laid aside, and never afterwards resumed. In 1736 appeared his celebrated work under the title of "The Alliance between Church and State; or the Necessity and Equity of an Established Religion and a Test-law, demonstrated from the Essence and End of Civil Society, upon the Fundamental Principles of the Law of Nature and Nations," in three parts: the first treating of a civil and religious society, the second of an established church, and the third of a test law. At the end was announced the plan of "The Divine Legation of Moses." The first volume of that work was published in January, 1737-8, under the title of "The Divine Legation of Moses Demonstrated on the Principles of a Religious Deist, from the Omission of the Doctrine of a Future State of Rewards and Punishments in the Jewish Dispensation. In six books. By William Warburton, M. A., Author of 'The Alliance between Church and State.'" This work produced several answers, and so much abuse from the authors of "The Weekly Miscellany," that in less than two months he was obliged to defend himself in "A Vindication of the Author of 'The Divine Legation of Moses' from the Aspersions of the Country Clergyman's Letter in 'The Weekly Miscellany' of February 14, 1737-8." Mr. Warburton's merit had now attracted the notice of the heir-apparent to the crown, in whose immediate service we find him in June 1738, when he published "Faith Working by Charity to Christian Edification; a Sermon Preached at the Last Episcopal Visitation for Confirmation in the Diocese of Lincoln; with a Preface, shewing the Reasons of its publication, and a Postscript, occasioned by some Letters Lately Published in 'The Weekly Miscellany.'" By William Warburton, M. A., Chaplain to his Royal Highness the Prince of Wales." A second edition of "The Divine Legation" also appeared in November 1738. In 1741 the second volume of "The Divine Legation," in two parts, containing books IV., V., VI., was published; as also a second edition of the "Alliance between Church and State." In 1742 he printed a sermon which had been preached at the Abbey church, on the 24th of

October, for the benefit of Mr. Allen's favourite charity, the general hospital, or infirmary. To this sermon, which was published at the request of the governors, was added "A Short Account of the Nature, Rise, and Progress, of the General Infirmary at Bath." In this year also he printed "A Dissertation on the Origin of Books of Chivalry," at the end of Jarvis's preface to "A Translation of Don Quixote," which Pope tells him he had not got over two paragraphs of, before he cried out, "Aut Erasmus, aut Diabolus." "I knew you," adds he, "as certainly as the ancients did the gods, by the first pace and the very gait. I have not a moment to express myself in, but could not omit this, which delighted me so much." In 1742 Mr. Warburton published "A Critical and Philosophical Commentary on Mr. Pope's 'Essay on Man,' in which is contained a Vindication of the said Essay from the Misrepresentations of Mr. de Resnel, the French Translator, and of Mr. de Crousaz, Professor of Philosophy and Mathematics in the Academy of Lausanne, the Commentator." It was at this period, when Mr. Warburton had the entire confidence of Pope, that he advised him to complete "The Dunciad," by changing the hero and adding to it a fourth book. This was accordingly executed in 1742, and published early in 1743, quarto, with notes by Warburton, who, in consequence of it, received his share of the satire which Cibber liberally bestowed on both Pope and his annotator. In the latter end of the same year he published complete editions of the "Essay on Man," and the "Essay on Criticism;" and, from the specimen which he there exhibited of his abilities, it may be presumed Pope determined to commit the publication of those works which he should leave to Mr. Warburton's care. At Pope's desire he, about this time, revised and corrected the "Essay on Homer," as it now stands in the last edition of that translation. The publication of "The Dunciad" was the last service which Warburton rendered Pope in his lifetime.

After a lingering and tedious illness, the event of which had been long foreseen, that poet died on the 30th of May, 1744, and by his will, dated the 12th of the preceding December, bequeathed to Mr. Warburton one half of his library, and the property of all such of his works already printed as he had not otherwise disposed of or alienated, and all the profits which should arise from any edition to be printed after his death, but at the same time directed that they should be published without any future alterations. In 1744 his assistance to Dr. Z. Grey was handsomely acknowledged in the preface to "Hudibras." "The Divine Legation of Moses" had now been published some time, and various answers and objections to it had started up from different quarters. In this year, 1744, Mr. Warburton turned his attention to these attacks on his favourite work, and defended himself in a manner which, if it did not prove him to be possessed of much humility or diffidence, at least demonstrated that he knew how to wield the weapons of controversy with the hand of a master. His first defence now appeared under the title of "Remarks on Several Occasional Reflections, in Answer to the Rev. Dr. Middleton, Dr. Pococke, the Master of the Charter House, Dr. Richard Grey, and others; serving to Explain and Justify Divers Passages in 'The Divine Legation' objected to by those Learned Writers; to which is added, A General Review of the Argument of 'The Divine Legation,' as far as it

is yet advanced: Wherein is considered the Relation the Several Parts bear to each other, and the Whole; together with an Appendix in Answer to a late Pamphlet entitled 'An Examination of Mr. W——'s Second Proposition," octavo. And this was followed next year by "Remarks on Several Occasional Reflections, in Answer to the Rev. Drs. Stebbing and Sykes, serving to Explain and Justify the Two Dissertations in 'The Divine Legation' concerning the Command to Abraham to offer up his Son, and the Nature of the Jewish Theocracy objected to by those Learned Writers. Part II. and last." Both these are couched in those terms of confident superiority which marked almost every performance that fell from his pen during the remainder of his life. At this period the kingdom was in great alarm on account of the rebellion breaking out in Scotland. Those who wished well to the then established government found it necessary to exert every effort which could be used against the invading enemy. The clergy were not wanting on their part, and no one did more service than Mr. Warburton, who printed three sermons at this important crisis. 1. "A Faithful Portrait of Popery, by which it is seen to be the Reverse of Christianity as it is the Destruction of Morality, Piety, and Civil Liberty. A Sermon Preached at St. James's Church, Westminster, Oct. 1745." 2. "A Sermon occasioned by the Present Unnatural Rebellion, &c., preached in Mr. Allen's Chapel at Prior Park, near Bath, Nov. 1745, and published at his request." 3. "The Nature of National Offences truly stated. A Sermon preached on the General Fast-Day, Dec. 18th, 1745." In April 1746 he was unanimously called by the society of Lincoln's Inn to be their preacher. In November he published "A Sermon preached on the Thanksgiving appointed to be observed the 9th of October, for the Suppression of the Late Unnatural Rebellion." In 1747 appeared his edition of "Shakspeare" and his "Preface to Clarissa," and in the same year he published "A Letter from an Author to a Member of Parliament concerning Literary Property," also "A Preface to Mrs. Cockburn's Remarks upon the Principles and Reasonings of Dr. Rutherford's 'Essay on the Nature and Obligations of Virtue,'" &c., and "A Preface to a Critical Enquiry into the Opinions and Practice of the Ancient Philosophers concerning the Nature of a Future State, and their Method of Teaching by Double Doctrine." In 1748 a third edition of "The Alliance between Church and State, corrected and enlarged." In 1749 a very extraordinary attack was made on the moral character of Pope from a quarter whence it could be the least expected. His "guide, philosopher, and friend," Lord Bolingbroke, published a book which he had formerly lent Pope in MS. The preface to this work, written by Mallet, contained an accusation of Mr. Pope's having clandestinely printed an edition of his lordship's performance without his leave or knowledge. A defence of the poet soon after made its appearance, which was universally ascribed to Warburton, and was afterwards owned by him. It was called "A Letter to the Editor of Letters on the Spirit of Patriotism, the Idea of a Patriot King, and the State of Parties, occasioned by the Editor's Advertisement," which soon after produced another pamphlet. About this time the publication of Dr. Middleton's "Enquiry concerning the Miraculous Powers" gave rise to a controversy, which was managed with great warmth and asperity on

both sides, and not much to the credit of either party. On this occasion Mr. Warburton published an excellent work, written with a degree of candour and temper, which, we are sorry to say, he did not always exercise. The title of it was "Julian; or, a Discourse concerning the Earthquake and Fiery Eruption which defeated the Emperor's attempt to Rebuild the Temple at Jerusalem, 1750." A second edition, with additions, appeared in 1751, in which year he gave the public his edition of "Mr. Pope's Works, with Notes," and in the same year printed "An Answer to a Letter to Dr. Middleton, inserted in a Pamphlet entitled, 'The Argument of the Divine Legation fairly stated,'" &c., and "An Account of the Prophecies of Evans, the Welch Prophet in the last century," the latter of which afterwards subjected him to much ridicule. In 1753 Mr. Warburton published the first volume of a course of sermons preached at Lincoln's Inn, entitled "The Principles of Natural and Revealed Religion occasionally Opened and Explained;" and this, in the subsequent year, was followed by a second. After the public had been some time promised Lord Bolingbroke's works, they were about this time printed. The known abilities of this nobleman had created apprehensions in the minds of many people of the pernicious effects of his doctrines, and nothing but the appearance of his whole force could have convinced his friends how little there was to be dreaded from arguments against religion so weakly supported. The personal enmity which had been excited many years before between the peer and Mr. Warburton had caused the former to direct much of his reasoning against two works of the latter. Many answers were soon published, but none with more acuteness and solidity than "A View of Lord Bolingbroke's Philosophy in Two Letters to a Friend, 1754." The third and fourth letters were published in 1753, with another edition of the two former; and in the same year a smaller edition of the whole, which, though published without a name, was universally ascribed to Mr. Warburton, and afterwards publicly owned by him. At this advanced period of his life that pre-eminence which his abilities might have claimed, and which had hitherto been withheld, seemed to be approaching towards him. In 1754 he was appointed one of his majesty's chaplains in ordinary, and in the following year was presented to a prebend in the cathedral of Durham. About the same time the degree of D.D. was conferred on him by Dr. Herring, then archbishop of Canterbury; and a new impression of "The Divine Legation" having been called for, he printed a fourth edition of the first part of it, corrected and enlarged, divided into two volumes, with a dedication to the earl of Hardwicke; and in 1756 "Natural and Civil Events the Instruments of God's Moral Government, a Sermon preached on the Last Public Fast-Day at Lincoln's Inn Chapel." In 1757 a pamphlet was published, called "Remarks on Mr. David Hume's 'Essay on the Natural History of Religion,'" which is said to have been composed of marginal observations made by Dr. Warburton on reading Mr. Hume's book, and which gave so much offence to the author animadverted upon, that he thought it of importance enough to deserve particular mention in the short account of his life. In the same year Dr. Warburton was advanced to the deanery of Bristol, and in 1758 re-published the second part of "The Divine Legation," divided into two

parts, with a dedication to the earl of Mansfield. At the latter end of the following year Dr. Warburton received the honour of being dignified with the mitre, and promoted to the vacant see of Gloucester. He was consecrated on the 20th of January, 1760, and on the 30th of the same month preached before the house of lords. In the next year he printed "A Rational Account of the Nature and End of the Sacrament of the Lord's Supper," 12mo. In 1762 he published "The Doctrine of Grace; or, the Office and Operations of the Holy Spirit Vindicated from the Insults of Infidelity and the Abuses of Fanaticism;" and in the succeeding year drew upon himself much censure from the popular party on account of his complaint in the house of lords against Mr. Wilkes for putting his name to certain notes on the infamous "Essay on Woman." In 1776 he gave a new edition of "The Alliance between Church and State," and "A Sermon preached before the Incorporated Society for the Propagation of the Gospel in Foreign Parts, at the Anniversary Meeting in the Parish Church of St. Mary-le-Bow, on Friday, February 21st." The next year produced a third volume of his Sermons, dedicated to Lady Mansfield; and with this, and a single sermon preached at St. Lawrence, Jewry, on Thursday in 1767, before his royal highness, Edward, duke of York, president, and the governors of the London Hospital, &c., he closed his literary labours. His faculties continued unimpaired for some time after this period; and in 1769 he gave considerable assistance to Mr. Ruffhead in his "Life of Mr. Pope." He also transferred 500*l.* to Lord Mansfield, Judge Wilmot, and Mr. Charles Yorke, upon trust, to found a lecture in the form of a course of sermons, to prove the truth of revealed religion in general, and of the Christian in particular, from the completion of the prophecies in the Old and New Testament which relate to the Christian church, especially to the apostacy of papal Rome.

To this foundation we owe the admirable introductory letters of Bishop Hurd, and the well-adapted continuation of bishops Halifax and Bagot, and Dr. Aphthorp. It is a melancholy reflection, that a life spent in the constant pursuit of knowledge frequently terminates in the loss of those powers, the cultivation and improvement of which are attended to with too strict and unabated a degree of ardour. This was in some degree the misfortune of Dr. Warburton. Like Swift and the great duke of Marlborough, he gradually sunk into a situation in which it was a fatigue to him to enter into general conversation. There were, however, a few old and valuable friends, in whose company, even to the last, his mental faculties were exerted in their wonted force; and at such times he would appear cheerful for several hours, and on the departure of his friends retreat, as it were, within himself. This melancholy habit was aggravated by the loss of his only son, who died of consumption but a short time before the bishop himself died in the eighty-first year of his age.

Dr Johnson's character of Dr. Warburton is too remarkable to be omitted. "About this time, 1738, Warburton began to make his appearance in the first ranks of learning. He was a man of vigorous faculties, a mind fervid and vehement, supplied by incessant and unlimited enquiry, with wonderful extent and variety of knowledge, which yet had not

oppressed his imagination, nor clouded his perspicacity. To every work he brought a memory full fraught, together with a fancy fertile of original combinations; and at once exerted the powers of the scholar, the reasoner, and the wit. But his knowledge was too multifarious to be always exact, and his pursuits were too eager to be always cautious. His abilities gave him a haughty confidence, which he disdained to conceal or mollify; and his impatience of opposition disposed him to treat his adversaries with such contemptuous superiority as made his readers commonly his enemies, and excited against the advocate the wishes of some who favoured the cause. He seems to have adopted the Roman emperor's determination, '*oderint dum metuant*;' he used no allurements of gentle language, but wished to compel rather than persuade. His style is copious without selection, and forcible without neatness; he took the words that presented themselves: his diction is coarse and impure, and his sentences are unmeasured. He had, in the early part of his life, pleased himself with the notice of inferior wits, and corresponded with the enemies of Pope. A letter was produced, when he had perhaps himself forgotten it, in which he tells Concanen, 'Dryden I observe borrows for want of leisure, and Pope for want of genius; Milton out of pride, and Addison out of modesty.' And when Theobald published Shakspeare, in opposition to Pope, the best notes were supplied by Warburton. But the time was now come when Warburton was to change his opinion, and Pope was to find a defender in him who had contributed so much to the exaltation of his rival. From this time Pope lived in the closest intimacy with his commentator, and amply rewarded his kindness and his zeal; for he introduced him to Mr. Murray (now Earl Mansfield), by whose interest he became preacher at Lincoln's Inn, and to Mr. Allen, who gave him his niece and his estate, and by consequence a bishopric: when he died, he left him the property of his works; a legacy which may be reasonably estimated at 4000*l.*"

WARE, SIR JAMES, a celebrated antiquary and historian of Ireland, who was the son of Sir James Ware, secretary to two of the lord deputies of Ireland, and afterwards auditor general of that kingdom. He was born at Dublin in 1604, and educated at Trinity college, Dublin, where he took the degrees in arts. In 1629 he was knighted, and in 1632 he became, upon the death of his father, auditor general of Ireland. In 1639 he was made one of the privy council in Ireland, and, when the rebellion broke out there, suffered much in his estate. In 1644, the marquis of Ormond, lord lieutenant of the kingdom, sent him with two lords to Charles I., who was then at Oxford, about affairs of importance; which being concluded to their minds, they returned; but in their return were taken on the seas by a parliament ship, and all committed prisoners to the Tower of London, where they were detained eleven months. Afterwards Sir James returned to Dublin, continued there for some time, and was one of the hostages for the delivery of that city to Colonel Michael Jones, for the parliament of England; but Jones, thinking it not safe, on account of his great attachment to the king, that he should remain there, commanded him to depart. By virtue of his pass he travelled into France, where he continued a year and half, mostly at Caen, sometimes at Paris. In 1651 he left that country, came into England, and, settling in London, com-

posed several works. Upon the restoration of Charles II. he returned to Ireland, and was restored to his places of auditor general and privy counsellor. He died at Dublin, December 1st. 1666. His works are numerous, and relate principally to the history and antiquities of Ireland.

WARTON, THOMAS, a celebrated English writer, who was born, in 1728, at Barenstoke, in Hampshire. He was early sent to Winchester, after which he was admitted a student of Trinity college, Oxford, took the degree of master of arts in 1750, and of bachelor of divinity in 1767, but did not obtain the dignified situation of master of his college on its becoming vacant in 1776; to which he was allowed, from his literary talents, to have some claim, though he continued to reside in it to the time of his death. He applied himself early in life to the cultivation of his poetical talents, as is evident from the period at which he ushered his several productions into the world.

He published five pastoral eclogues in 1745, the scenes of which are supposed to allude to the situation of the distressed peasants in the German war. These eclogues have not appeared in any collection of his works, from which it is conjectured that the manuscript copy of them has been lost. In 1747 he published "The Pleasures of Melancholy," written in 1745, reprinted in "Dodsley's Collection;" also a poem, written at Oxford, the preceding year, entitled "The Progress of Discontent," and first printed in "The Student;" which was followed by "Newmarket," a satire, published in 1750, reprinted in "Pearch's Collection," and again in "Dodsley's Collection."

It will be remembered by those who may revert to past transactions, that at the time of the rebellion in 1745 the members of the university of Oxford discovered an attachment to Tory, if not to Jacobite principles; and that, soon after its suppression, the zeal of several of the students of one of the colleges incurred the resentment of the friends of the Hanoverian succession, which brought on a prosecution in the court of King's Bench, and affixed a stigma on the character of the vice-chancellor and several of the heads of houses. During the prevalence of party rancour and animosity, which, at that time, engrossed the public attention, Mr. Mason published his "Isis, an Elegy;" in which, after many eulogiums on the celebrated scholars she once had to boast, she deplores the principles and conduct of her degenerate sons.

— "Madly bold  
To freedom's foes internal orgies hold."

To Mason's elegy, highly and deservedly applauded at the time of its publication, Warton replied in his "Triumph of Isis, an Elegy," equally entitled to general approbation, and particularly his eulogium on Dr. King, which is remarkably bold and animated. The poem was reprinted in "Pearch's Collection." It is mentioned, to the honour of the contending poets, Mason and Warton, though these works were acknowledged to be equal if not superior to any of their other productions, each of them, as if by mutual consent, omitted the insertion of his last mentioned poem, when their respective works were first collected into a volume.

Warton, in 1751, published "An Ode for Music, performed at the theatre, Oxford, July 2, 1751, being

the day appointed by the late lord Crew, bishop of Durham, for the commemoration of the benefactors of the university." In this ode, "Minerva," after having assisted Queen Bonduca in a battle, is feigned to request drink of the river Isis; and, in reward of the favour, to promise that her banks shall become the seat of learning and the pride of Britain. This was followed in 1753 by the "Union, or Select Scots and English Poems."

The same year he produced his observations on the "Faery Queen of Spenser;" which, having afterwards corrected and enlarged, he published, in two volumes, in 1762.

Some time before he seems to have taken orders and to have become fellow of his college; for, in his notes on Dr. Johnson's letter, preserved by Mr. Boswell, he mentions his design of publishing a volume of "Observations on the best of Spenser's works," being prevented by his taking pupils. "I am grieved of your hinderance in your Spenserian design," Dr. Johnson writes him in November, 1754, "yet I would not have it delayed."

It is said, that at the instance of Warton, Dr. Johnson, in February 1755, obtained the degree of master of arts, by diploma from the university of Oxford, which was considered as an honour of great importance in gracing the title page of his dictionary that made its appearance soon after. In 1756 he published a pamphlet entitled "The Observer Observed," in octavo; and had the honour of being elected by the university, poetry professor, which office he retained the usual term of ten years. When Dr. Johnson, in 1758, commenced his periodical work, "The Idler," Warton gave his assistance and contributed to it. He also produced the same year, "Inscriptiones Metricarum Delectus, Accedunt Notulae," and wrote "A Panegyric on Ale," printed in "Dodsley's Collection." About this time he published "A Description of the City, College, and Cathedral of Winchester, exhibiting a complete and comprehensive detail of their antiquities and present state," octavo, without date or name.

In 1760 he contributed "The Life of Sir Thomas Pope," to the fifth volume of "The Biographia Britannica." The year following he published "The Life and Literary Remains of Ralph Bathurst, M. D., Dean of Wells, and President of Trinity College, Oxford."

In 1761 he contributed to the "Oxford Collection of Verses," a poem on the death of George II., addressed to Mr. Secretary Pitt, earl of Chatham, and verses on the marriage of the king, and on the birth of the prince of Wales, 1762. About 1762 he published "A Companion to the Guide, and a Guide to the Companion, being a Supplement to all the Accounts of Oxford hitherto published," without a date, a burlesque on Oxford guides and companions. His next publication was "The Oxford Sausage, or Select Poetical Pieces, written by the most celebrated Wits of the University of Oxford."

His first clerical preferment was in 1768, when he was presented with the vicarage of Shalfeld, in Wiltshire. In 1771 he published an improved account of "The Life of Sir Thomas Pope, Founder of Trinity College," chiefly compiled from original evidence, with an appendix of papers never before published.

The care, attention, and research, which he exercised in forming an accurate detail of the particulars

incidents in the life of that munificent patron of learning, the founder of Trinity college, will be perpetual mementos of his gratitude and assiduity; but it cannot but be lamented that he was urged by his situation and connexions to employ his thoughts on a subject on which the efforts of the most exalted genius could stamp no real value. His increasing reputation, however, added to the number of his patrons; and in the same year he was presented by the earl of Lichfield to the rectory of Kiddington, in Oxfordshire, and elected a fellow of the society of antiquaries.

In 1771 appeared the first volume of his "*History of English Poetry, from the Close of the Eleventh to the Commencement of the Eighteenth Century; to which are prefixed Two Dissertations on the Origin of Romantic Fiction in Europe, and on the Introduction of Learning into England.*" The second volume appeared in 1778, and the third, which is brought down to the commencement of the reign of Queen Elizabeth in 1781. To the third volume is prefixed a third dissertation "*On the Gesta Romanorum.*" The fourth and last volume was announced, as "*speedily to be published,*" at the end of his edition of Milton's smaller poems, in 1785; and, it is said, a considerable portion of it was actually printed off at the time of his death. A contemporary writer, of some ability but less candour, has undertaken to point out a few errors and inaccuracies in these volumes, in a pamphlet entitled "*Observations on the Three First Volumes of the History of English Poetry, in a Familiar Epistle to the Author,*" 4to.; but from a vindication of Warton, that appeared in various communications in "*The Gentleman's Magazine*" for 1782 and 1783, it was evident that this writer had exaggerated the defects most illiberally, and justly incurred the censure of acrimonious criticism.

In 1777 he collected his poems into a volume, containing miscellaneous pieces, odes, and sonnets. In this collection he omitted his "*Pastoral Eclogues;*" the "*Triumph of Isis,*" "*Newmarket, a Satire,*" "*The Progress of Discontent,*" &c.

Warton, as was expected from his situation as poetry professor in the university of Oxford, engaged in the controversy which took place in 1782 respecting the poems, which were attributed by some to Rowley and by others to Chatterton, and published "*An Enquiry into the Authenticity of the Poems attributed to Thomas Rowley; in which the Arguments of the Dean of Exeter and Mr. Bryant are examined.*" In this enquiry he espoused the cause of Chatterton, and offered such cogent arguments in support of the claim of the latter as carried conviction to every liberal and unprejudiced mind. The same year he was promoted to the living of Hill Farance, in Somersetshire, and produced his "*Verses on Sir Joshua Reynolds's Painted Window at New College, Oxford.*" Warton's honours and preferments seemed to increase in rapid succession, as in 1785 he was elected Camden professor of ancient history, on the resignation of Dr. Scott, and the same year appointed poet laureate, on the death of Whitehead.

In the course of this year he produced a very learned and elaborate work, entitled "*Poems on Several Occasions, English, Latin, Italian; with Translations by John Milton, viz. Lycidas, L'Allegro, Il Penseroso, Arcades, Comus, Odes, Sonnets, Miscellanies, English Psalms, Elegiarum Liber, Epigrammatum Liber, Sylvarum Liber, with Notes, Critical*

and Explanatory, and other Illustrations, 8vo. 1785." A second edition, with corrections and improvements, appeared after his death, in 1790. The chief purpose of the notes is to explain Milton's allusions, to illustrate or to vindicate his beauties, to point out his imitations, both of others and of himself, to elucidate his obsolete diction, and by the adduction and juxtaposition of parallels, universally gleaned both from his poetry and his prose, to ascertain his favourite words, and to show the peculiarities of his phraseology. In this arduous undertaking our author was assisted by his brother, who enriched and illustrated his commentary by many appropriate annotations and remarks.

In May 1790, after having been some time confined by a severe fit of the gout, the symptoms abated, and he was thought in a fair way of recovery, appeared remarkably cheerful, and supped and passed the evening in the room set apart for the professors and fellows. Between the hours of ten and eleven he sunk in his chair; his surrounding friends thought him only dosing, but on their approach they found that he was struck with the palsy, and quite dead on one side. He was immediately conveyed to his chamber, and continued insensible till his death, on Friday, in the sixty-second year of his age. His remains were interred in the chapel of Trinity college, with all the honours due to his official character.

The year after his death a new edition of his poetical works was printed, including the pieces which had been omitted in the former of 1777, and the new year and birth-day odes for 1786, 1787, and 1788. They were afterwards reprinted from the edition of 1791, with his birth-day odes for 1789 and 1790, and sonnets in imitation of Shakspeare, omitted in former editions.

The character of Warton is thus described in a contemporary publication:—"To his friends he was endeared by his simple, open, and friendly manners; to the university of Oxford by his long residence and many services; and to the public by the valuable additions which have been made by his talents to English poetry, antiquities, and criticism. His mind was more fraught with wit and mirth than his outward appearance promised. His person was unwieldy and ponderous, and his countenance somewhat inert, but the fascination of his converse was wonderful. He was the delight of the jovial Attic board, anniversaries, music meetings, &c., and possessed beyond most men the art of communicating variety to the dull sameness of an Oxford life. With eminent abilities and scholastic accomplishments he united those conciliatory talents, that amiable sociability of manners, which could, to the claim of respect for the author, add that of esteem for the man. He was a liberal scholar, an agreeable companion, a warm philanthropist, a disinterested Christian, and an amiable man." "His social qualities," says a writer in the "*Gentleman's Magazine*" for 1790, "had long endeared him to the members of his own society, among whom he constantly resided. The brilliancy of his wit, the solidity of his judgment, and the affability of his temper, gave to all who had the happiness of his acquaintance the most pungent regret for his irreparable loss. His literary productions have rendered him peculiarly eminent as an annotator, a biographer, an antiquary, and a poet; and he may be deservedly considered as the ornament, not only of the university, but of the literary

world at large. Such, indeed, was the vigour of his mind, the classical purity of his taste, and the extent and variety of his learning, that his memory will be for ever revered as a profound scholar and a man of true genius. Learning must deplore him as one of her best and most valuable ornaments."

We cannot close the life of this poet without giving a specimen of his style as a poet. It is from his ode "On the Approach of Summer:"—

"Thee, April blithe, as long of yore,  
Bermuda's lawns he frolick'd o'er,  
With musky nectar-trickling wing  
(In the new world's first dawning spring),  
To gather balm of choicest dews,  
And patterns fair of various hues,  
With which to paint, in changeful dye,  
The youthful earth's embroidery;  
To cull the essence of rich smells  
In which to dip his new-horn bells:  
Thee, as he skim'd with pinions fleet,  
He found an infant, smiling sweet:  
Where a tall citron's shade embrown'd  
The soft lap of the fragrant ground.  
There on an amaranthine bed  
Thee with rare nectarine juice he fed;  
Till soon, beneath his forming care,  
You bloom'd a goddess debonair;  
And then he gave the blessed isle  
Aye to be sway'd beneath thy smile;  
There plac'd thy green and grassy shrine,  
With myrtle bower'd and jessamine;  
And to thy care the task assign'd  
With quick'ning hand, and nurture kind,  
His roseat infant-births to rear,  
Till Autumn's mellowing reign appear.  
Haste thee, nymph! and, hand in hand,  
With thee lead a buxom band;  
Bring fantastic-footed Joy,  
With Sport, that yellow-tressed boy.  
Leisure, that through the balmy sky  
Chases a crimson butterfly.  
Bring Health that loves in early dawn  
To meet the milk-maid on the lawn;  
Bring Pleasure, rural nymph, and Peace,  
Meek, cottage-loving shepherdess!  
And that sweet stripling, Zephyr, bring,  
Light, and for ever on the wing.  
Bring the dear muse, that loves to lean  
On river-margins, mossy green.  
But who is she that bears thy train,  
Pacing light the velvet plain?  
The pale pink binds her auburn hair;  
Her tresses flow with pastoral air;  
'Tis May, the grace—confest she stands  
By branch of hawthorn in her hands!  
Lo! near her trip the lightsome dews,  
Their wings all ting'd in Iris-hues;  
With whom the pow'rs of Flora play,  
And paint with pansies all the way.  
Oft when thy season, sweetest queen,  
Has dress'd the groves in liv'ry green;  
When in each fair and fertile field  
Beauty begins her bower to build;  
While evening, veil'd in shadowa brown,  
Puts her matron-mantle on,  
And mists in spreading streams convey  
More fresh the fumes of new-shorn hay;  
Then, goddess, guide my pilgrim feet  
Contemplation hoar to meet,  
As slow he winds, in museful mood,  
Near the rush'd marge of Cherwell's flood;  
Or o'er old Avon's magic edge,  
Whence Shakspeare cull'd the spiky sedge,  
All playful yet, in years unripe,  
To frame a shrill and simple pipe.  
There, through the dusk but dimly seen,  
Sweet ev'ning objects intervene:  
His wattled cotes the shepherd plants,  
Beneath her elm the milk-maid chanted;  
The woodman, speeding home, awhile  
Rests him at a shady stile."

WASHINGTON, GEORGE.—This celebrated North American was born in February 1732, in Westmoreland county, Virginia. He received but a limited education, but at the age of nineteen he was appointed one of the adjutants-general of his native state, with the additional rank of major soon afterwards. The plenipotentiaries who framed the treaty of Aix la Chapelle, by leaving the boundaries of the

British and French territories in North America unfixed, had sown the seeds of a new war at the moment when they concluded a peace. The limits of Canada and Louisiana furnished a motive, or a pretext, for one of the most successful but one of the most bloody and wasteful wars in which Great Britain had ever been engaged. In the disputes which arose between the French and English officers on this subject, Major Washington was employed by the governor of Virginia in a negotiation with the French governor of Fort du Quesne (now Pittsburgh), who threatened the English frontiers with a body of French and their Indian allies. He succeeded in averting the invasion; but hostilities becoming inevitable, he was in the following year appointed lieutenant-colonel of a regiment raised by the colony for its own defence, to the command of which he soon after succeeded.

At the breaking out of the revolutionary war in America he joined the cause of independence. To detail his conduct in the years which followed would be to relate the history of the American war. It may be said generally, that within a very short period after the declaration of independence the affairs of America were in a condition so desperate, that perhaps nothing but the peculiar character of Washington's genius could have retrieved them. Activity is the policy of invaders, and in the field of battle the superiority of a disciplined army is displayed. But delay was the wisdom of a country defended by undisciplined soldiers against an enemy who must be more exhausted by time than he could be weakened by defeat. It required the consummate prudence, the calm wisdom, the inflexible firmness, the moderate and well-balanced temper of Washington, to embrace such a plan of policy, and to persevere in it; to resist the temptations of enterprise; to fix the confidence of his soldiers without the attraction of victory; to support the spirit of the army and the people amidst those slow and cautious plans of defensive warfare which are more dispiriting than defeat itself; to restrain his own ambition and the impetuosity of his troops; to endure temporary obscurity for the salvation of his country, and for the attainment of solid and immortal glory; and to suffer even temporary reproach and obloquy, supported by the approbation of his own conscience and the applause of that small number of wise men whose praise is an earnest of the admiration and gratitude of posterity. Victorious generals easily acquire the confidence of their army. Theirs, however, is a confidence in the fortune of their general. That of Washington's was a confidence in his wisdom. Victory gives spirit to cowards, and even the agitations of defeat sometimes impart a courage of despair. Courage is inspired by success, and it may be stimulated to desperate exertion even by calamity, but it is generally palsied by inactivity. A system of cautious defence is the severest trial of human fortitude. By this test the firmness of Washington was tried. It must not, however, be concealed that some of the British commanders gave him advantages which he surely did not expect; and it has been thought that more than once they had it in their power to annihilate his army, merely by following up their victories. The issue of the contest is, however, well known.

The conclusion of the American war permitted Washington to return to those domestic scenes from which nothing but a sense of duty seems to have had

the power to draw him. But he was not allowed long to enjoy this privacy. One of their own writers tells us that the whole system of paper money was a system of public and private frauds. In this state of things, which threatened the dissolution of morality and government, good men saw the necessity of concentrating and invigorating the supreme authority. Under the influence of this conviction a convention of delegates was assembled at Philadelphia, which strengthened the bands of the federal union, and bestowed on congress those powers which were necessary for the purposes of good government. Washington was the president of this convention, as he, in three years after, was elected president of the United States of America, under what was called "The New Constitution," though it ought to have been called a reform of the republican government, as that republican government itself was only a reform of the ancient colonial constitution under the British crown. None of these changes extended so far as an attempt to new-model the whole social and political system.

Events occurred during his chief magistracy which convulsed the whole political world, and which tried most severely his moderation and prudence. The French revolution took place. Both friends and enemies have agreed in stating that Washington, from the beginning of that revolution, had no great confidence in its beneficial operation. He must indeed have desired the abolition of despotism, but he is not to be called the enemy of liberty if he dreaded the substitution of a more oppressive despotism. It is extremely probable that his wary and practical understanding, instructed by the experience of popular commotions, augured little good from the daring speculations of inexperienced visionaries. The progress of the French revolution was not adapted to cure his distrust. But whatever might be his private feelings of repugnance and horror, his public conduct was influenced only by his public duties. As a virtuous man he must have abhorred the system of crimes which was established in France. But as the first magistrate of the American commonwealth, he was bound only to consider how far the interest and safety of the people whom he governed were affected by the conduct of France. He saw that it was wise and necessary for America to preserve a good understanding and a beneficial intercourse with that great country, in whatever manner she was governed, as long as she abstained from committing injury against the United States. Guided by this just and simple principle, uninfluenced by the abhorrence of crimes which he felt, he received Mr. Genet, the minister of the French republic, and was soon shocked by the outrages which that minister committed, or instigated, or countenanced, against the American government. The conduct of Washington was a model of firm and dignified moderation. Insults were offered to his authority in official papers, in anonymous libels by incendiary declaimers, and by tumultuous meetings. The law of nations was trampled under foot. His confidential ministers were seduced to betray him, and the deluded populace were so inflamed by the arts of their enemies that they broke out into insurrection. No vexation, however galling, could disturb the tranquillity of his mind, or make him deviate from the policy which his situation prescribed. With a more confirmed authority, and at the head of a longer established govern-

ment, he might perhaps have thought greater vigour justifiable. But in his circumstances he was sensible that the nerves of authority were not strong enough to bear being strained. Persuasion, always the most desirable instrument of government, was in his case the safest; yet he never over-passed the line which separates concession from meanness. He reached the utmost limits of moderation without being betrayed into pusillanimity. During this turbulent period he was re-elected to the office of president of the United States, which he held from April 1789 till September 1796.

The resignation of Washington in 1796 was certainly a measure of prudence, but it may be doubted whether it was beneficial for his country, in the then unsettled state of public affairs. When he retired, he published a valedictory address to his countrymen, as he had before done when he quitted the command of the army in 1783. In these compositions the whole heart and soul of Washington are laid open. Other state papers have, perhaps, shown more spirit and dignity, more eloquence, greater force of genius, and a more enlarged comprehension of mind; but none ever displayed more simplicity and ingenuousness, more moderation and sobriety, more good sense, more prudence, more honesty, more earnest affection for his country and for mankind, more profound reverence for virtue and religion, more ardent wishes for the happiness of his fellow-creatures, and more just and rational views of the means which alone can effectually promote that happiness.

From his resignation till the month of July 1798, he lived in retirement at Mount Vernon. At this latter period it became necessary for the United States to arm. They had endured, with a patience of which there is no example in the history of states, all the contumely and wrong which successive administrations in France had heaped upon them, and the United States resolved to arm by land and sea. The command of the army was bestowed on General Washington, which he accepted. In this office he continued during the short period of his life which still remained. On Thursday, the 12th December, 1799, he was seized with an inflammation in his throat, which became considerably worse the next day; and of which, notwithstanding the efforts of his physicians, he died on Saturday, the 14th December, 1799, in the sixty-eighth year of his age, and in the twenty-third year of the independence of the United States, of which he may be considered as the founder.

WATSON, RICHARD, an English prelate, who was a native of Westmoreland, where he was born in 1737. He was educated at Trinity college, Cambridge, and subsequently entered holy orders. He paid great attention to the science of chemistry, which he much improved. His rise in the church was not rapid till the death of Dr. Shipley, when he was raised to the bishopric of St. Asaph. He was the author of several valuable theological works, one of which was his celebrated "Apology for the Bible." His death took place, at his beautiful seat of Calgarth Park, in July 1816.

WATT, JAMES.—This great improver of the steam engine commenced his career in humble life. He was born at Greenock in 1736, and brought up to the occupation of a mathematical instrument maker. After making many important improvements in machinery he in 1774 quitted Glasgow, where he had previously resided, and settled in the

neighbourhood of Birmingham, where he entered into partnership with Mr. Boulton. After acquiring an immense fortune, and receiving many distinguished honorary distinctions, he died in 1819. The people of this country have not been ungrateful to the memory of the great improver of the steam engine. A bronze statue has been erected by subscription at Glasgow; another, of white marble, has been placed in the Hunterian museum in the same large commercial town; and a third, also of white marble, was executed by Chantrey for Westminster Abbey.

**WATTS, ISAAC.**—This celebrated divine was born on the 7th of July, 1674, at Southampton, where his father kept a boarding school. He was the eldest of nine children, and was from his infancy distinguished for his love of theological learning. In 1690 he was sent to the academy of Mr. Rowe in London, where he remained till he was twenty years of age. After this he left the academy, and spent two years in study and devotion at the house of his father, who had the happiness indulged to few parents, of living to see his son eminent for literature and venerable for piety.

He then passed some time with Sir John Hartopp as domestic tutor to his son, and in that time particularly devoted himself to the study of the Scriptures; and being chosen assistant to Dr. Chauncey, preached the first time on the birth-day that completed his twenty-fourth year. In about three years after he succeeded Dr. Chauncey, but, soon after his entrance on his charge, he was seized by a dangerous illness, from which he was with difficulty recovered.

This illness drew the attention of Sir Thomas Abney, who received him into his house; where, with a constancy of friendship and uniformity of conduct not often to be found, he was treated for thirty-six years with all the kindness that friendship could prompt, and all the attention that respect could dictate. Sir Thomas died about eight years afterwards, but he continued with the lady and her daughters to the end of his life. From the time of his reception into this family his life was only varied by successive publications.

He was one of the first authors that taught the

dissenters to court attention by the graces of language. Whatever they had among them before, whether of learning or acuteness, was commonly obscured and blunted by coarseness and inelegance of style. He showed them that zeal and purity might be expressed and enforced by polished diction. He continued to the end of his life the teacher of a congregation, and no reader of his works can doubt his fidelity or diligence.

In 1728 he received from Edinburgh and Aberdeen an unsolicited diploma, by which he became a doctor of divinity. After this event he continued many years to study and to preach, and to do good by his instruction and example; till at last the infirmities of age disabled him from the more laborious part of his ministerial functions, and being no longer capable of public duty, he offered to remit the salary appendant to it; but his congregation would not accept the resignation.

By degrees his weakness increased, and at last confined him to his chamber and his bed, where he expired, without pain, in November 1748, in the seventy-fifth year of his age.

The works of Dr. Watts were, sometime after his death, published in six volumes. The principal of them are his "Logic" and "Improvement of the Mind;" but, in point of popularity, his Psalms and Hymns far exceed the others.

**WEBBE, SAMUEL**, a distinguished musician, who was born in 1740. He was originally apprenticed to a cabinet-maker, but, when he had completed his apprenticeship, turned his attention entirely to music, which profession he followed to the time of his death in 1816.

**WEBER, CARL MARIA VON.**—This distinguished musician was born in Holstein at the close of 1786. His father, who was a man of property, gave him a good education, and he studied music under Heuschkel. He made some improvements in lithography, which for a time took his attention from music, but he returned to it with new ardour in 1800.

From 1813 to 1816 he was director of the opera at Prague. His labours in that capacity are represented to have been unceasing; he found confusion and mismanagement; he left order and regularity. Whilst there he composed an opera called "*Preciosa, or the Gipsy Girl*," and his great cantata, "*Kampf und Sieg*" (Battle and Victory), in honour of the battle of Waterloo. In 1821 he obtained the permission of his sovereign to produce the celebrated "*Der Freischutz*" at Berlin, where it was accordingly performed for the first time on the 21st of June in that year. The reception it met with was the most enthusiastic that can be imagined. Since the production of Mozart's "*Zauberflöte*," no German opera has obtained such universal applause. Vienna, Dresden, Munich, and Stutgard, soon ratified the decision of the Berlin audience, and Weber was at once elevated above all his German contemporaries. The proud eminence which he had so ardently sought, and for which he had so laboriously, so indefatigably studied, was at last obtained; the musical reputation of his country was vindicated, and his genius achieved the distinction it so richly merited.

His next opera was "*Euryanthe*," which was produced at Vienna, on the 25th of October, 1823. The success it met with on its first representation was certainly not commensurate with the reputation

he had obtained. The great success of "Der Freischütz" on the continent, induced the proprietors of the English Opera house to produce it upon their stage during the summer of 1824, when it was received with a success which must be fresh in the recollection of every one. It was performed night after night during the greater part of the season, and upon the opening of the winter theatres was produced at both of them. The proprietors of Covent Garden theatre, anxious to secure a musician of such unquestionable ability, invited him to visit England, and compose an opera for the English stage. The offer was accepted; and early in the year 1826, although then labouring under a severe pulmonary affection, he arrived in London to fulfil his engagement. His first public appearance was on the 9th of March, when he met with a reception which did honour as well to the "mighty master" as to the people who had been delighted by the efforts of his genius. The modest and unassuming Weber shrunk from the enthusiastic plaudits with which he was received, and endeavoured to transfer to the performers the unanimous and overwhelming approbation which the audience intended for himself.

On the 12th of April, the new opera, which he had written expressly for performance in this country, was produced at Covent Garden theatre, Weber himself presiding in the orchestra. The plot is founded upon an old French romance, the incidents of which furnished Wieland, the German poet, with the foundation of his poem "Oberon," which is also the title given to the new opera. This opera closed Weber's labours, with the exception of a song from Moore's "Lalla Rookh," commencing, "From Chindara's warbling fount I come;" to which he composed the music for Miss Stephens. The disorder under which he laboured upon his arrival in England continued to increase, aided perhaps by the variations of our climate, and the excitement of composition; both of which, without doubt, operated very perniciously upon a frame already debilitated. He became anxious to return to his native country, in which he had left his wife and two children; and though his friends were apprehensive that a removal was impossible, Wednesday, the 7th of June, was fixed for the attempt. The prospect of a return home seemed to animate him, and his continued cheerfulness banished the thought of any immediate danger; but Providence had destined that a foreign country should be honoured with the custody of his remains. On Friday, the 3rd of June, 1826, the symptoms of his disorder assumed somewhat of an alarming appearance; he was obliged to keep his room, but still immediate dissolution was not apprehended. On Sunday evening, the 5th, he was left at eleven o'clock, in good spirits, and at seven the next morning was found dead upon his pillow, his head resting upon his hand, as though he had passed from life without a struggle.

WEDGWOOD, JOSIAH, a manufacturer of pottery, who materially improved the art in this country. He was born in 1730, and obtained his first patent about thirty-six years afterwards. He built a village called Etruria, in Staffordshire, where he carried on his business and produced the most costly works of art. Mr. Wedgwood died January 3rd, 1795.

WEEVER, JOHN, an industrious antiquary, who was born in 1576, and educated at Cambridge. He

is principally known by his work on "Ancient Funeral Monuments." Mr. Weever died in 1632.

WELLS, EDWARD, a theological writer, who was born at Corsham, in Wiltshire, in 1662. He was educated at Westminster, and ultimately proceeded to Oxford, where he obtained the rank of D.D. Having been presented with the living of Cotesbach, he entered warmly into controversial divinity; but his work "On the Geography of the Holy Scriptures" has been most admired. He died in 1727.

WERNER, ABRAHAM GOTTLÖB, a celebrated German mineralogist, who was born in 1750. He early in life published a work on the external characters of minerals, which he made the basis of a new system, and in 1780 produced a translation of Cronstadt's "Mineralogy." From this period he was incessantly engaged in natural history pursuits till the time of his death, which occurred in 1817.

WESLEY, JOHN.—This celebrated founder of the most numerous division of the English methodists, was born on the 17th of June, 1703. He was the second son of the Rev. Samuel Wesley, rector of Epworth in Lincolnshire. Although his father was a man of considerable literary attainments, being known to the public as the author of various works in verse, it was to his mother, a woman of a much more zealous and active character than her husband, that Wesley was chiefly indebted for his early education, and probably also for the seeds of many of his distinguished mental habits. After receiving a systematic elementary tuition from his mother, John Wesley was sent to the Charter House, from whence he removed, at the usual time, to Christ Church college, Oxford. Here he distinguished himself greatly by his diligence and success as a student, showing from the first, in the distribution of his time, the same punctual and persevering regard to method by means of which he mainly achieved all the greater objects of his life. The reading of some religious works, and especially of Law's "Serious Call," awakened in him a strong spirit of religious fervour; and he formed that association with a number of his college acquaintances, of similar views and feelings, to which, from the punctilious regularity of the members in their devotions and general demeanour, the epithet of "methodists" was given as a name of reproach by the wits of the university. As has happened in other cases, the objects of the intended satire were much too earnest in the views they had adopted to feel or to regard any point of ridicule which it might be supposed to possess, and frankly adopted the nickname thus bestowed upon them by their opponents as their proper designation. Among their number, besides Wesley, was the afterwards equally celebrated George Whitefield. We cannot here attempt to pursue minutely the remainder of the course of Wesley's busy life. Suffice it to say, that having commenced his public labours as a religious teacher in the newly-formed colony of Georgia in America, in the year 1735, he pursued for some time a course of almost constant journeying and preaching among the Indians.

During his voyage to Georgia he had met with a company of Moravians, with whose behaviour he was greatly delighted, and on his return to England he met with a new company who had just arrived from Germany. From them he seems to have learned some of his peculiar doctrines, particularly instantaneous conversion, and assurance of pardon for sin.

These discoveries made him desirous to go to the fountain-head of such, and accordingly he went to Germany and visited the settlements of the Moravians. In 1738 he returned to London and began with great diligence to preach the doctrine which he had just learned. In his "Journals" he records the whole progress of his ministry. Great success attended his preaching, and yet some are said to have been "born again" in a higher sense, and some only in a lower. But in this anomalous spirit he was called on to assist Mr. Whitefield, who had begun his career of field-preaching at Bristol, and was now about to return to Georgia. Mr. Wesley trod in Whitefield's irregular steps at Bristol; though he confesses that he had been so tenacious of decency and order that he should have thought the saving of souls almost a sin if not done in a church.

The multitudes which attended the preaching of Wesley were great, though not so great as those which had flocked to Whitefield; but the sudden impressions, loud cries, and groans of the hearers, were far greater than any thing we find recorded in the life of Whitefield. It was in the neighbourhood of Bristol that the first regular society of methodists was formed, in May 1739, and laid the foundation of that unlimited power which Wesley afterwards exercised over the whole sect. The direction of the building at Kingswood was first committed by him to eleven seoffees of his own nomination. But for various reasons urged by his friends, this arrangement was changed. One of those reasons, he says himself, "was enough, viz. that such seoffees would always have it in their power to controul me, and if I preached not as they liked, to turn me out of the room I had built." He therefore took the whole management into his own hands; and this precedent he ever after followed, so that from time to time the whole of the numerous meeting-houses belonging to the methodists were either vested in him, or in trustees who were bound to admit him and such other preachers as he should appoint into the pulpits. Whitefield was one of those who advised this plan in the case of the Kingswood meeting, and was himself afterwards excluded from this very pulpit. Whitefield and Wesley had run their course together in amity, but on the return of the former from America, in 1741, a breach took place between them, both of them having now become more decided in their principles. Whitefield was a Calvinist, and Wesley an Arminian. "You and I," said Whitefield, "preach a different gospel;" and after some unavailing struggles, principally on the part of their friends, to bring about a reconciliation, they finally parted, and from this time formed two sects, different in their form as well as principles, for Whitefield seems to have trusted entirely to the power of his doctrines to bring congregations and make converts, while Wesley had already begun and soon perfected a gigantic system of connexion of which his personal influence was the sole mover.

There are few parts of Mr. Wesley's system that have been more admired as a trick of human policy than his perpetually changing the situations of his preachers, that they might neither, by a longer stay, become more agreeable, or disagreeable to their flock, than the great mover of all wished. The people felt this as a gratification of their love of variety; but it had a more important object, in perpetuating the power of the founder. The first of these conferences

was held in 1744, and Mr. Wesley lived to preside at forty-seven of them. In order to form the numerous societies of which the methodists consist, Mr. Wesley's labours as a preacher are without precedent. During the fifty years which compose his itinerant life, he travelled about 4,500 miles every year, one year with another, which amount, in the above space of time, to 225,000 miles. It had been impossible for him to perform this almost incredible degree of labour without great punctuality and care in the management of his time. He had stated hours for every purpose, and his only relaxation was a change of employment. For fifty-two years, or upwards, he generally delivered two, frequently three or four, sermons in a day. But calculating at two sermons a day, and allowing, as one of his biographers has done, fifty annually for extraordinary occasions, the whole number during this period will be 40,560. At first it has been supposed that Mr. Wesley's intention was to revive a religious spirit with the aid of regular clergymen; but he soon found it impossible to find a number sufficient for the extensive design he had formed. He therefore, although at first with some reluctance, employed laymen to preach, who soon became numerous enough to carry on his purpose. Ordination he long hesitated to grant, but at length the importunities of his coadjutors overcame his scruples, and he consented to give orders in imitation of the church of England. There were, however, but few things in which he gave way during what may be termed his reign. His most elaborate and impartial biographer, Dr. Whitehead, allows, that "During the time that Mr. Wesley, strictly and properly speaking, governed the societies, his power was absolute. There were no rights, no privileges, no offices of power or influence, but what were created or sanctioned by him; nor could any persons hold them except during his pleasure. The whole system of methodism, like a great and complicated machine, was formed under his direction, and his will gave motion to all its parts, and turned it this way or that, as he thought proper." To Mr. Wesley's other labours we may add his many controversial tracts against the Bishops Lavington and Warburton, Drs. Middleton, Free, and Taylor, Hall, Toplady, &c. and his other works, on various subjects of divinity, ecclesiastical history, sermons, biography, &c., which were printed together in 1774. These and his other labours he continued to almost the last of a very long life. He died at his house in the City Road on the 2nd of March, 1791, in the eighty-eighth year of his age.

WEST, BENJAMIN, a distinguished American painter, who was born in 1738. In his seventh year he delineated a portrait of a sleeping child, and was soon enabled to copy almost all the natural objects that surrounded him. At the age of sixteen young West practised the art of portraiture professionally, and met with full employment. His prices were two guineas and a half per head, and five guineas for half-lengths; but he did not confine himself entirely to these, for he copied a St. Ignatius. The Trial of Susannah, an original work, was also undertaken by him, and in this, as in the Death of Socrates, the principal figures were carefully copied from living models. Young West now determined to visit the classical shores of Italy, in order to extend his views, promote his taste, and obtain a knowledge of all that had been effected by the great masters.

He accordingly embarked in 1760 on board a vessel destined for Leghorn, after which he immediately proceeded to Rome, which he entered on the 10th of July, 1760.

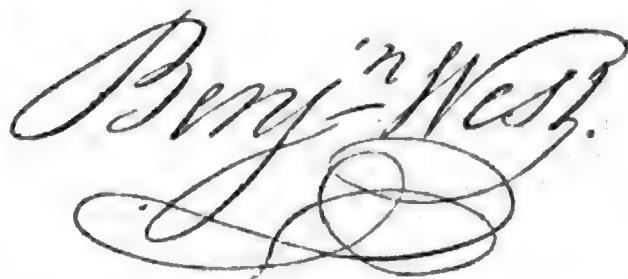

Having passed through Savoy into France he resided some time in Paris. Mr. West at length arrived in England on the 20th of August, 1763, and here, after due consideration, he determined to settle. His first excursion was to Hampton Court; and he afterwards inspected the collections of art at Stourhead, Fonthill, and Wilton House. On his return he visited Sir Joshua Reynolds; and he also formed an acquaintance with Mr. Richard Wilson, the celebrated landscape painter.

Mr. West soon acquired the patronage of his majesty George III., and he was frequently invited to spend the evening at Buckingham House, where he generally remained, conversing on the best means of promoting the study of the fine arts in this kingdom. It was in these conversations that the plan of the royal academy was first canvassed and digested. When the scheme was fully concocted Reynolds was declared president, and the whole completed on the 10th of December, 1768. The approbation which Regulus received at the first exhibition, gratified the royal patron in no small degree, who now determined to give Mr. West still further marks of his princely encouragement. Accordingly he commanded him to paint another picture, the subject of which was Hamilcar making his son Hannibal swear implacable enmity against the Romans. Mr. West had now finished his *Death of Wolfe*, and was the first painter of his time who exhibited modern heroes in coats, breeches, and cocked hats. On the death of Sir Joshua Reynolds in 1791, Mr. West was unanimously elected president of the royal academy, a choice immediately confirmed by the king. His first discourse was merely complimentary, but he afterwards delivered several orations on the principles of painting and sculpture, of embellishments and architecture, on the taste of the ancients, on the errors of the moderns, and on composition in general.

During the peace of Amiens the president visited Paris, for the express purpose of contemplating the noble series of statues and pictures contained in the splendid galleries of the Louvre. On this occasion he obtained a distinguished reception, not only from the French artists, but the French government. The honours paid to Mr. West in France appear to have given umbrage in England, and Mr. Wyatt, at the next election, was seated in the president's chair; but in due time our worthy and respectable artist was restored to his former seat in the academy, with the approbation of all. Another affair of still greater moment occurred in 1801, when the court was at Weymouth; for the queen sent him directions by Mr. Wyatt, to suspend all the pictures then painting for his majesty's chapel at Windsor until further orders. He was thus, in a single moment, deprived of that honourable provision which was to support his declining years, as well as to dignify his increasing fame. A very able letter, addressed, but never delivered, to the king, was now written; he, however, soon found means to obtain a private audience at Windsor, on the conclusion of which his majesty was most graciously pleased to say,—“Go on with your work, West; go on with the pictures, and I will take care of you.” This proved his last personal intercourse with the monarch; and he con-

tinued to execute the pictures, and receive the usual quarterly payments, until his majesty's final superannuation, when, without any previous intimation, he was informed that these pecuniary resources had been stopped.

Having thus lost the royal patronage the president determined to appeal to the public; and the appeal was not made in vain. The several large pictures now painted by him were exhibited with great éclat, and proved highly productive. The British institution presented him with a sum of three thousand guineas for the celebrated composition of *Christ Healing the Sick*, while a copy, gratuitously transmitted by him to the hospital at Philadelphia, actually enabled the committee to enlarge the building for the reception of no less than thirty additional patients. The death of Mrs. West, on the 10th of December, 1817, proved a melancholy event in the life of our artist. After an union of more than half a century she was snatched away, at a period when his own health began to decline, and death itself was but too truly anticipated by his friends at no very distant period. Accordingly, on the 10th of March, 1820, this great painter expired, without a struggle, at his house in Newman Street. His body was afterwards transferred to one of the saloons of the royal academy, and interred, with great funeral pomp, in St. Paul's cathedral. This ceremony was rendered more august, not only by the presence of nearly all the academicians and students, but also by the attendance of some of the most distinguished individuals in the kingdom. :

WHARTON, HENRY, an English divine of great abilities, who was born in 1664, at Worstead, in Norfolk. He was educated by his father. In 1679 he was admitted into Caius college, Cambridge, where he took a bachelor of arts degree in 1683, and resided in the college till 1686, when he left it and went to Dr. Cave, whom he assisted in compiling his “*Historia Literaria*.” In 1687 he was ordained deacon, and the same year was made master of arts. In 1688 he distinguished himself by publishing “*A Treatise of the Celibacy of the Clergy*, wherein its Rise and Progress are historically considered.” The same year he was presented by Archbishop Sancroft with a licence to preach through the whole province of Canterbury. The vicarage of Minster, in the isle of Thanet, in the meantime became vacant, and afterwards the rectory of Chart-ham, to both of which he was collated in 1689. In 1692 he published “*A Defence of Pluralities* ;” and the same year was printed, in two volumes, folio, his “*Anglia Sacra, sive Collectio Historiarum, partim Antiquitatis partim recenter Scriptarum, de Archiepiscopis et Episcopis Angliæ, a Prima Fidei Christianæ Susceptione ad Annum MDXL*.” In 1693 he published “*Bedæ Venerabilis Opera quædam Theologica, nunc pri-*

mun edita; nec non Historica antea semel edita;" and the same year, "A Specimen of Some Errors and Defects in the 'History of the Reformation of the Church of England, written by Gilbert Burnet.'" In the answer to this, addressed by way of letter to the bishop of Lichfield and Coventry, Dr. Burnet observes that, "he had not seen any one thing relating to his history which had pleased him so much as this specimen. It is plain," says he, "that here is a writer who has considered those times and that matter with much application, and that he is a master of this subject. He has the art of writing skilfully; and, how much soever he may be wanting in a Christian temper, and in the decency that one who owns himself of our communion owed to the station I hold in it, yet, in other respects he seems to be a very valuable man, so valuable that I cannot, without a very sensible regret, see such parts and such industry like to be soured and spoiled with so ill a temper." The summer before he died he went to Bath, and found some benefit from the waters there; but, on his return to Canterbury, he died in March 1694.

WHISTON, WILLIAM, an English divine and geologist, who was born in 1667. He was educated at Cambridge, and in 1696 produced his "Theory of the Earth;" and four years afterwards was appointed professor of mathematics; but he was ultimately expelled for holding heterodox notions. Besides a variety of original productions, he published a translation of Josephus. This eccentric scholar died in 1752.

WHITAKER, THOMAS DUNHAM, a learned antiquary, who was born in 1759. He early in life devoted himself to topographical pursuits, and published many works in that branch of literature. His "History of Yorkshire" is most admired. Dr. Whitaker died in 1821.

WHITAKER, JOHN, an English divine and antiquary, who was born in 1735. He published a "History of Manchester," and other works of a similar character; but his "Mary, Queen of Scots," published in 1787, excited the most attention. He died in 1808.

WHITE, HENRY KIRKE, a clever English poet, who was born in 1785, and originally intended for a mechanical trade, but some friends having discovered his high poetical genius, he received the rudiments of a good education, and was ultimately articled to an attorney. In 1803 he published a volume of poems, and in the following year went to Cambridge. He frequently at this time studied fourteen hours a day; the progress which he made in twelve months was indeed astonishing; for when he went to Cambridge he soon became as much distinguished for his classical knowledge as his genius; but the seeds of death were in him, and the place to which he had so long looked with hope, served unhappily as a hot-house to ripen them. During his first term one of the university scholarships became vacant, and Henry, young as he was in college, and almost self-taught, was advised by those who were best able to estimate his chance of success, to offer himself as a competitor for it. He passed the whole term in preparing for this, but his strength sunk under the intenseness of his studies, and he was compelled to decline; and this was not the only misfortune. The general college examination came on; he was utterly unprepared to meet it, and believed that a failure here would have ruined his prospects for ever. He had only about a fortnight to read what other men had been the whole

term reading. Once more he exerted himself beyond what his shattered health could bear; the disorder returned, and he went to his tutor, Mr. Catton, with tears in his eyes, and told him that he could not go into the hall to be examined. Mr. Catton, however, thought his success here of so much importance that he exhorted him, with all possible earnestness, to hold out the six days of the examination. Strong medicines were given him to enable him to support it, and he was pronounced the first man of his year. But life was the price which he was to pay for such honours as this. As he succeeded in gaining approbation he became farther stimulated to studious exertions far beyond his strength, and when he returned to college in 1806 he was no longer a subject for medicine. His mind also was worn out, and it was the opinion of his medical attendants, that, if he had recovered, his intellect would have been affected. In this state he died, October 19th, 1806, in the twenty-first year of his age.

WHITE, GILBERT, a distinguished divine, who is best known by his "Natural History of Selborne," a work of great merit, and for which there is a continually increasing demand. He was born in 1730, and, after a close attention to the duties of his station as a clergyman for many years, died at a mature age in 1793.

WHITEFIELD, GEORGE. — This celebrated preacher was the founder of the Calvinistic methodists. He was born at Gloucester in 1714, and received the rudiments of his education in his native town, where his mother kept an inn. At the age of eighteen he was sent to Oxford, and while there, became acquainted with the Wesleys, and joined the society they had formed, which procured them the name of methodists. Like them, Whitefield, who had been of a serious turn in his early days, began now to live by rule, and to improve every moment of his time. He received the communion every Sunday, visited the sick and the prisoners in gaol, and reached the poor; and he shared in the obloquy which this conduct brought upon his brethren. In the mean time he became a prey to melancholy, which was augmented by excessive bodily austerities; and at last, in consequence of reading some mystic writers, he was led to imagine that the best method he could take, was to shut himself up in his study till he had perfectly mortified his own will, and was enabled to do good without any mixture of corrupt motives. From this, however, he recovered, returned to society, and, we may suppose, was not neglectful of his studies; for when only twenty-one years of age he was sent for by Dr. Benson, bishop of Gloucester, who told him that though he had purposed to ordain none under twenty-three, yet he should reckon it his duty to ordain him whenever he applied. He was accordingly admitted to deacon's orders at Gloucester, in June 1736, and the Sunday following preached his first sermon in the church of St. Mary de Crypt.

The week following he returned to Oxford, and took his bachelor's degree in arts, soon after which he was invited to London to officiate at the chapel of the Tower. He preached also at various other places, and while here letters came from the Wesleys at Georgia, which made him desirous to join them, but he was not yet quite clear as to this being his duty. He afterwards supplied a curacy at Dummer, in Hampshire, and being at length convinced that it was his duty to go to Georgia, he went in 1737 to take leave

of his friends in Gloucester, and then set out for London. On the last of December he set sail, and arrived at Savannah in May 1738, where he remained until August. One of the earliest plans which occupied his attention, was the projection of an orphan-house, for which he determined to raise contributions in England, and accordingly embarked in September, and landed at Limerick in Ireland. There he was received kindly by Bishop Burscough, Dr. Delany, Bishop Rundle, and Archbishop Bolton. In the beginning of December he arrived in London, where the trustees of the colony of Georgia expressed their satisfaction at the accounts sent to them of his conduct, and presented him to the living of Savannah (though he insisted upon having no salary), and granted him five hundred acres of land for his intended orphan-house, to collect money for which, together with taking orders, were the chief motives of his returning to England so soon. In the beginning of January 1739 he was ordained at Christ Church, Oxford, by Bishop Benson, and on the following Sunday resumed his preaching in London; and now the vast crowds which attended first suggested to him the thought of preaching in the open air; but he did not begin the practice until he went to Bristol, when, finding the churches denied to him, he preached on a hill at Kingswood to the colliers, and after he had repeated this three or four times, his congregation is said to have amounted to near twenty thousand. That any human voice could be heard by such a number is improbable, but that in time he was enabled to civilize the greater part of these colliers has never been denied. After this he preached often in the open air in the vicinity of London, particularly in Moorfields and on Kennington Common, and made excursions into various parts of the country, where he received contributions for his orphan-house in Georgia.

In August he embarked again for America, and landed in Pennsylvania in October. Afterwards he went through that province, the Jerseys, New York, and back again to Maryland, Virginia, North and South Carolina, preaching everywhere to immense congregations, and in the beginning of January 1740 arrived at Savannah, where he founded, and in a great measure established, his orphan-house by the name of Bethesda. He then took another extensive tour through America, and returned to England in March 1741. On his arrival he found it necessary to separate from Wesley, whose Arminian sentiments he disapproved of; and he now, with the help of some colleagues, began to form distinct societies of persons who held Calvinistic sentiments. This produced in a short time a new house at Kingswood, and the two tabernacles in Moorfields and Tottenham Court Road, which were supplied by himself and certain lay-preachers. He visited also many parts of England, where similar societies were established, and went to Scotland, where he preached in all the principal towns. In August 1744 he embarked again for America, whence he returned in July 1748.

The limits of this article will not allow us to follow Whitefield through the whole of his peregrinations in England, Scotland, Ireland, and America. His last great movement was his seventh voyage to Georgia, where he exhausted his strength in his painful labours, and died of a fit of the asthma, at Newbury Port in New England, in 1770, in the fifty-sixth year of his age.

WHITEHEAD, PAUL, an English poet, who was

born in 1710. The first work which he published of importance was entitled "The State Dunces." This was followed by a satirical poem entitled "Manners," after which appeared "Honour," and the "Gymnasiad." His death took place in 1777.

WHITELOCKE, BULSTRODE, a learned English lawyer and politician, who was born in August 1605, in London, and received the early part of his education at Merchant Taylors' school; after which he entered St. John's college, Oxford. He left the university without taking his degree and went to the Middle Temple, where he soon distinguished himself by his rapid acquirement of a knowledge of the law. In the beginning of the long parliament he was chosen a Burgess for Marlow, in Bucks, and was appointed chairman of the committee for drawing up the charge against the earl of Strafford, and one of the managers against him at his trial. In May 1642 he was appointed one of the deputy-lieutenants of Buckinghamshire, and he was afterwards named one of the commissioners to treat respecting peace with the king at Oxford. In 1645 he was appointed one of the commissioners for the admiralty; and being then suspected of holding intelligence with the king's party, he was for some time in great danger, but soon freed himself from suspicion. Shortly after he was made one of the four commissioners of the great seal; and in October attorney of the duchy of Lancaster, and king's serjeant, which latter title he refused to accept. December the 26th, 1648, he retired into the country that he might not have any hand in the king's trial; "it being contrary to his judgment," as he himself declared in the house. But he was appointed one of the three commissioners of the new great seal of the commonwealth of England, and was elected one of the thirty persons for the council of state. In June he was made high steward of the city of Oxford, and in July was constituted keeper of the king's library and medals, which he had before prevented from being sold. "Being informed," says he, "of a design in some, to have them sold and transported beyond sea, which I thought would be a dishonour and damage to our nation, and to all scholars therein, and fearing that in other hands they might be more subject to embezzling, and being willing to preserve them for public use, I did accept of the trouble of being library-keeper at St. James's, and therein was encouraged and much persuaded to it by Mr. Selden, who swore, that if I did not undertake the charge of them, all those rare monuments of antiquity, those choice books and manuscripts, would be lost; and there were not the like of them, except only in the Vatican, in any other library in Christendom." In 1653 he was sent as ambassador to Sweden. He returned in July 1654, and in August was made one of the commissioners of the exchequer; for in his absence an alteration having been made in the chancery, he refused at his return to continue commissioner of the great seal. January 1656 he was chosen speaker of the house of commons *pro tempore*, upon the indisposition of him who was lately chosen; and the year following summoned by the protector to sit in the other house by the name of Bulstrode Lord Whitelocke. In 1659 he was made president of the council of state, one of the committee of safety, and keeper of the great seal *pro tempore*. The same year he retired in the country, fearing to be sent to the Tower by some powerful members of the parliament; and at his departure left the great seal with

his wife, who delivered it to Lenthal the speaker. From that time till his death he lived in retirement at Chilton in Wiltshire, where he died in 1676.

The first edition of his "Memorials of the English Affairs: or, an historical account of what passed from the beginning of the reign of King Charles the First to King Charles the Second, his happy restoration; containing the public transactions civil and military, together with the private consultations and secrets of the cabinet," was published in 1682, and the second with many additions, and a better index, in 1732. Besides this work he also wrote "Memorials of the English Affairs from the supposed expedition of Brute to this island, to the end of the reign of King James the First."

**WICLIFFE, JOHN.**—This learned English reformer was born in a village bearing his family name in the north riding of Yorkshire. At the age of seventeen he was a commoner of Queen's college, Oxford, when he removed to Merton college. Wicliffe devoted himself to the study of the scriptures; by which he was shocked at the corruptions prevailing in the church, and when only thirty-two years of age he published his treatise, "The Last Age of the Church." In 1359 he was distinguished at Oxford, as the object of the enmity of the friars, by his public censures on their delinquencies.

Wicliffe was rewarded for having defended the university and Baliol college against the friars, A.D. 1361, with the living of Fillingham, in Lincoln, and the office of warden. Four years later he accepted the same office, in connexion with Canterbury Hall, from Simon Islep, then archbishop of Canterbury. Islep being succeeded five years after by Simon Langham, a patron of the friars, Wicliffe was ejected from his wardenship, and to obtain redress he appealed to the pope; but the decision of his holiness was delayed four years, and then it confirmed the proceeding of Langham. Though deprived of his wardenship, Wicliffe was no personal loser, for he was made professor of divinity. His elevation to the chair of theology in the leading university of the kingdom, opened an important field for the diffusion of his opinions, and rendered the year 1372 a memorable period in his history. Vaughan refers to his "Exposition of the Decalogue," published about this time, as affording a beautiful exhibition of "the theological opinions, and of the devotional feeling, which the reformer brought to the discharge of his duties as divinity professor." Disputes had been carried on for two centuries between the successors of our first William and the Roman pontiffs, to determine the limits of the monarchical and pontifical power with respect to the persons and property of the English clergy and people. It was in the sixteenth year of Edward III. that the recently elected pontiff, Clement VI., declared the next two vacancies in the Anglican church, amounting to the annual value of 2000 marks, to be, by provision, the property of two among his cardinals. Edward complained to his holiness, "that the custom of provisors had transferred the property designed for the support of religion to the hands of men who neither dwelt in the country nor understood its language, and who was alike unable and unwilling to discharge the duties of their office."

The English parliament, in 1373, renewed their complaints of the papal provisions, as increasingly oppressive; and Pope Gregory XI. made some trifling

concessions, but they were not satisfactory. Inquiry being made as to the number of alien benefices in the English church, delegates were chosen by the parliament to convey once more their remonstrances to the pontiff. Wicliffe's name stands second in this commission. Two years were spent on this business at Bruges, where the duke of Lancaster was ambassador from the English court; but very little good resulted from this protracted conference with the papal diplomatists. He was, however, rewarded for his public services by the prebend of Aust Westbury, and with the rectory of Lutterworth; and now he attacked the papacy, publicly declaring that the pope had no right to exercise authority in foreign states, and that he was that "man of sin," that "son of perdition," predicted by the apostle Paul, impiously "sitting in the temple of God showing himself that he is God." These opinions he constantly preached, appealing to the Scriptures in proof of his assertions; and he propagated the same sentiments by the ministry of his itinerant disciples. Wicliffe was accused of heresy, and Sudbury, archbishop of Canterbury, and Courtney, bishop of London, were required to arrest and imprison him. But the duke of Lancaster, regent of the kingdom for his father, afforded him protection. Sudbury, therefore, summoned him to appear before himself and Courtney, at St. Paul's, London. Wicliffe obeyed, accompanied by his protectors, the duke of Lancaster, and Lord Percy, the earl marshal; but, being commanded by the bishop of London to stand during his trial, the marshal insisted on his having a seat, when a fierce altercation arose between the prelates and the nobles. Wicliffe was then cited before the bishops at Lambeth, where they were forbidden to condemn him by a peremptory message from the queen-mother. Two anti-popes contending at this time, no "infallible" commission could be obtained against the daring reformer, and he improved his leisure by writing a treatise on the "Truth of the Scriptures" and translated both the Old and New Testament into the English tongue.

Wicliffe withdrew to his pastoral charge at Lutterworth in 1382; and "our great reformer," as Dr.

Southey remarks, "undaunted in his retirement, and faithful to the last, still wielded his pen; and when Urban VI. endeavoured to raise men and money here for a crusade against the rival pope, he wrote against the wickedness of exciting war in Christendom upon a dispute between two false priests, insisting that the pope was plainly Antichrist." Urban summoned him to Rome to answer for his offence, but the palsy rendered him incapable of the journey; and a second attack, which seized him in his church, proved fatal on the 31st of December, 1384.

The chair in which this great reformer died is represented in the engraving on the previous page. It is still preserved in Lutterworth church, together with the pulpit from which he was accustomed to preach, and several other relics of this great and good man.

WIFFEN, JEREMIAH HOLME, a clever poet, who belonged to the society of friends. But few particulars have been preserved of his life, and it may be enough to state that his first poetical effusions appeared in a volume entitled "Poems by Three Friends." Mr. Wiffen's "Tasso" is, however, his most celebrated work, and he continued his literary labours till the time of his death, which occurred in May 1836.

WILBERFORCE, WILLIAM, a political writer, celebrated for his endeavours to procure the abolition of the slave trade. He was born in 1759, and educated at Cambridge, after which he made a tour of the continent. On his return to this country he obtained a seat in parliament, where he early distinguished himself by his forcible oratory. At the particular request of Mr. Clarkson, Mr. Wilberforce was first induced to interest himself on the subject of slavery, and after a thorough investigation of the subject he consented to belong to a society which had been established with the view of carrying the benevolent object of Clarkson into effect. Having also undertaken to bring the matter before the house of commons, he gave notice of that intention soon after the meeting of parliament in 1787. This was the first public notice taken of the subject; Mr. Fox, at the same time, observed, that it had been his intention to introduce the question for the consideration of parliament. In consequence of Mr. Wilberforce's notice, a great many petitions were presented to parliament from the universities of Cambridge, Glasgow, and Aberdeen; from the society of quakers; from the counties of Huntingdon, Leicester, Stafford, Northampton, Hertford, Middlesex, and Cambridge; from the cities of Bristol and Norwich; from the town of Birmingham, and from various other places, demanding the abolition of the slave trade.

In May 1789 Mr. Wilberforce, after a speech not more distinguished for eloquence and energy than for sound reasoning, moved twelve propositions; the substance of which was, that the number of slaves annually imported from Africa into the British West Indies amounted to 38,000. They further entered into the probable demerits of the persons sold to slavery; the effects of the practice on the inhabitants of Africa, and the valuable and important commerce with that country which might be substituted for the slave trade. They stated the injury sustained by the British seamen, and the fatal consequences to the

slaves that attended the transportation; they stated the causes of the mortality of the negroes; enumerated the different items of calculation respecting the increase of population in Jamaica and Barbadoes, and concluded with declaring that it appeared that no considerable inconvenience would result from discontinuing the further importation. These propositions were ably supported by Mr. Pitt, Mr. Fox, Mr. Burke, and, in short, by all the eloquence in the house of commons; and, although the opposition to them was violent, the question in their favour was carried without a division.

The fate of this question excited a lively interest in the people at large, and no fewer than 508 petitions, from all parts of the country, were laid on the table of the house of commons. On the 2nd of April, 1792, this undaunted and unwearied champion of the rights of humanity renewed his attack upon the slave trade. In 1797 Mr. Wilberforce published "An Apology for the Christian Sabbath," and also a work entitled "A Practical View of the Prevailing Religious System of Professed Christians in the Higher and Middle Classes of this Country, contrasted with Real Christianity," which has had a very extensive circulation. In 1823 Mr. Wilberforce published "An Appeal to the Religion, Justice, and Humanity of the Inhabitants of the British Empire, in behalf of the Negro Slaves in the West Indies." He was the writer of an introductory essay to Witherpoon's "Treatises on Justification and Regeneration," in a series of Christian authors, published at Glasgow; and he also made many communications to the "Christian Observer."

Mr. Wilberforce was staying at Bath when symptoms of increasing debility awakened the anxiety of his family, and he was brought to London for further medical advice. After some time, however, he appeared to rally; and arrangements were made for his removing to East Farleigh on the morrow, when his peaceful departure took place. He died on the 29th of July, 1833.

WILDENOW, CHARLES LOUIS, a German botanist, who was born in 1765. He was appointed professor of natural history at Berlin in 1801, where he formed a fine zoological cabinet. Wildenow died in 1812. His "Species Plantarum" is a very valuable work.

WILKES, JOHN, a political character, who had a temporary celebrity towards the close of the last century. He was born in 1727, and in 1757 obtained a seat for the borough of Aylesbury. Mr. Wilkes first acquired political celebrity by his periodical paper entitled "The North Briton," for which he was prosecuted, and ultimately committed to the King's Bench prison. From the time of his first election for Middlesex in March 1768, through the whole of 1769, and even far into 1772, he was the sole unrivalled political idol of the people.

In November 1769 he brought an action at law, which had been prevented by his absence abroad, against Lord Halifax, for false imprisonment and the seizure of his papers, and obtained a verdict of 4000*l*. On the 17th of April, 1770, he was discharged from his imprisonment. On the 24th he was sworn as alderman of the ward of Farringdon Without. It was, however, soon discovered that there was a difference of opinion in many points between him and several of his former friends. On the 8th of October,

1772, Mr. Wilkes was by the livery elected one of the persons to be selected for lord mayor, but was not chosen by the court of aldermen; and the same circumstance happened the succeeding year. On the third year (1774) he was again elected in the same manner, and approved by the court of aldermen. October 20 he was again elected member for the county of Middlesex, and was permitted to take his seat without molestation. The popularity which he had hitherto enjoyed was now to suffer some diminution. In the beginning of 1776 Sir Stephen Theodore Jansen resigned the office of chamberlain, and Mr. Wilkes was a candidate to succeed him; when, notwithstanding every exertion in his favour, and every art employed, he lost his election, and Mr. Alderman Hopkins was chosen by a majority of 177. He made another effort in the succeeding year with equal ill success; and on a third attempt, in 1778, was again rejected, having only 287 votes against 1216. His situation at this time was truly melancholy; his interest in the city appeared to be lost; a motion to pay his debts had been rejected in the common council; he was involved in difficulties of various kinds; his creditors were clamorous; and such of his property which could be ascertained, and amongst the rest his books, had been taken in execution: those who formerly supported him were become cold to his solicitations, and languid in their exertions; and the clouds of adversity seemed to gather round him on every side, without a ray of light to cheer him. While in this forlorn state, Mr. Hopkins died in 1779, and Mr. Wilkes at length obtained an establishment, which, profiting by experience, rendered the remainder of his life easy and comfortable. On the 1st of December he was chosen chamberlain by a majority of 1972 votes, and continued to fill the office with credit to himself, and to the satisfaction of his constituents, during the rest of his life, in spite of some feeble attempts at opposition to him. Mr. Wilkes died December 26th, 1797.

**WILKIE, WILLIAM**, a Scottish poet of some celebrity, who was born at the commencement of the last century, and was for some years a minister of the church of Scotland. In 1753 he published the "Epigoniad," which was his principal work. Dr. Wilkie died in 1772.

**WILKINS, JOHN**, a clever but somewhat eccentric English bishop, who was born in 1614. He was educated at Oxford, and in 1668 was made bishop of Chester. His first literary work was entitled "The Discovery of a New World," in which he introduced a discourse on the possibility of flying to the moon. His "Mathematical Magic" appeared in 1648, and he continued to employ himself in literary pursuits of a minor character till his death in 1672.

**WILLAN, ROBERT**, a physician and medical writer, who was born in 1757, and educated in the principles of the society of friends. After having acquired considerable practice as a physician, he commenced lecturer, in which he was very successful till his death in 1812. Dr. Willan's "Treatise on Cutaneous Diseases" is a very celebrated and valuable work.

**WILLIAM I.**, surnamed the Conqueror, king of England and duke of Normandy. He was the natural son of Robert duke of Normandy, and as his father had no legitimate son, he caused the states of the duchy to swear allegiance to him as his heir.

Robert died in 1035, but the guardian of the young duke could not prevent the king of France from overrunning the territories of William. On his assuming the reins of government, his vigour and ability soon repelled these aggressions, and reduced both the king of France and his own rebellious barons to submission. He subsequently undertook the conquest of England, in which undertaking he succeeded. After the complete subjugation of the country, he was crowned on Christmas-day 1066. It was the policy of this monarch, as far as he could, to subjugate the minds of the English people, and, if possible, to change even their language and manners. He had the French tongue spoken at court, and the law proceedings carried on in the same language. In 1087 William commenced a war with France, he died on his arrival at St. Gervais, near Rouen, in the sixty-third year of his age.

**WILLIAM II.**, king of England, was the son of the preceding monarch, and born in 1060. He was crowned at Westminster in 1087, and by plotting against Robert materially extended his sway in Normandy. He was a great promoter of the useful arts and especially architecture. William lost his life while hunting in New Forest in 1100. It occurred through Tyrrel, a French gentleman, having discharged an arrow at a stag, which, accidentally striking the king, caused his immediate death.

**WILLIAM III.**, king of England.—This monarch came to the throne February 12th, 1688, and, after a brief struggle with James in Ireland, acquired, in conjunction with Mary, the undisputed possession of these realms. But little of moment occurred during his reign. He was more indebted to steady perseverance than to peculiar talents for his high military reputation. He possessed natural courage, energy of mind, and firmness in the execution of his plans. In person he was ungraceful, his manner cold and repulsive, and his temper silent and unsocial. He recommended the practice of virtue by his example, but it had little effect on men who were corrupted by the licentiousness of the former reigns. In error for the intrigues which he entered into to depose his uncle and father-in-law, a late historian says, "As William's heart seems to have been as dead as the sympathetic feelings as his soul was insensible to the charms of literature and the beauties of the elegant arts, it is possible that, while he was guiding the great political system, he might be led by the illusions of ambition, under the appearance of principle, to think the ties of blood and the right of inheritance as necessary sacrifices to the welfare of Europe, and the interests of the reformed religion in England, at least, was obliged to him for supporting her cause in a grand struggle for liberty and Protestant succession. But she has dearly paid for those blessings, by being involved in destructive reign wars, partly indeed rendered necessary by the supineness of her two preceding reigns, but in which she ought naturally to have had no concern; by the introduction of the infamous practice of corrupting parliaments, in order to engage them to support those wars; and by their unavoidable consequence a grievous national debt, which, daily accumulating and augmenting the weight of government, threatens us with the worst of evils." William expired in the palace at Kensington on the 8th of March, in the fifty-second year of his age. After the body

in some days in state, it was interred in Henry VII.'s chapel, Westminster Abbey.

WILLIAM IV., king of England, was the third son of George the Third. He was born on the 21st of August, 1765, and so early as 1778 was entered as midshipman on board the *Prince George*, a ninety-eight gun ship, commanded by Admiral Digby. The young prince was placed on a level, in every particular of duty and discipline, with his fellow-midshipmen. He served in the engagement between Rodney and the Spanish admiral, Don Juan de Langara; he was in action at the subsequent capture of a French man-of-war, and three other vessels; and served, during a great portion of the residue of his time as a midshipman, in the West Indies, and off Nova Scotia and Canada.

Having served his full time as a midshipman he was promoted in the ordinary manner, and for several years commanded the *Pegasus* frigate. On the 20th of May, 1799, he was created duke of Clarence and St. Andrew's, and earl of Munster. He shortly afterwards took his seat in the house of lords, and frequently spoke in defence of the war with revolutionized France. In 1790 he became rear-admiral of the blue; but, notwithstanding his gallantry, his intimate acquaintance with naval tactics, and his notoriety as a strict disciplinarian, he was not permitted to gratify his ardent inclination to engage in active service.

On the 11th of July, 1818, he was united at Kew Palace to Adelaide Louisa Theresa Caroline Amelia, daughter of the duke of Saxe Cobourg Meinengen, and, after having spent a few days in retirement at St. James's Palace, they proceeded to Hanover. Long before his marriage, his majesty had formed a connexion with the fascinating Mrs. Jordan, the fruits of which were several children, who all received the strongest proofs of affection on the part of their royal parent and her majesty Queen Adelaide.

At the latter end of the year 1819 their majesties set out on their return from Hanover to England; and just before the close of 1820 she became the mother of a child (the princess Elizabeth), who died in her infancy. On three other occasions, twice in 1819, and again in 1821, her majesty was prematurely confined.

On the death of his brother, Frederick Augustus, in 1827, his majesty being rendered by that circumstance heir-presumptive to the crown, obtained an additional parliamentary grant, which raised his income to nearly 40,000*l.* per annum. In the course of the same year he was appointed lord high admiral. When the duke of Wellington became premier some objections were made to the expense of his progresses, in consequence of which his majesty thought proper to resign. The zeal with which, in 1829, he advocated the cause of the catholics insured him a continuance of that popularity which he had obtained while in office, up to the period of his elder brother's

demise. His majesty ascended the throne 26th June, 1830, and during his short reign devoted himself assiduously to the duties of his station. King William IV. died June 20th, 1837.

WILLIAM OF WYKEHAM.—This English prelate was born at Wykeham, in Hampshire, about 1324. He received his education through the kindness of Nicholas Uvedale, a neighbouring landholder, and in his twenty-second or twenty-third year was received into the service of Edward III., at first, for the purpose of superintending the buildings then going on at Windsor Castle. Such, however, were the prudence, assiduity, and intelligence displayed by Wykeham, that he gradually advanced in the favour and confidence of the king, until, after having passed through some inferior employments, he was made in the year 1366, in the forty-second year of his age, bishop of Winchester and lord high chancellor of England.

The latter office, however, Wykeham did not long retain. Soon after his appointment to his bishopric he retired to the charge and superintendence of his diocese; and, although in the troubles and disturbances which occurred in the latter days of Edward III., in the reign of Richard II., and the early part of the reign of Henry IV., Wykeham was often called upon to take a share in public affairs, and never undertook them without credit to himself and advantage to the nation, yet he rather wished to devote himself to the duties of his episcopal office, and to the execution of the great design which he was anxiously revolving in his mind. This design was the creation of his two colleges, of Winchester, and New college, Oxford.

To this great work Wykeham devoted himself for many years. That the benefits of his design might not be suspended until the necessary buildings were completed, he secured, in the intermediate time, the best instructions that he could procure for his seventy scholars at Winchester, and seventy at Oxford. And, at length, the two fabrics were finished with a magnificence of design, which might have been expected from a founder eminently skilled, as Wykeham was, in architecture. They were each about six years in building. The college at Oxford was opened and entered on with great solemnity, on the 14th of April, 1386; that at Winchester, on the 28th of March, 1393.

But, although only one individual was found completely to emulate Wykeham, the example of his munificence was not altogether lost. One of the youths, whom he himself placed in his school, was Henry Chicheley; who afterwards became archbishop of Canterbury, and founded All Souls' college in Oxford. His school at Winchester was also taught by William of Wainfleet, who, in the course of time, attained the highest honours in church and state, and became the founder of Magdalen college in the same university.

Wykeham lived to see his foundations flourishing in reputation and usefulness. It was his principle not to leave his benefactions to take effect after his death. He expressly said, that he resolved to execute his designs during his life, that he might see with his own eyes their practical operation, and apply to them such securities and improvements as experience might show to him to be useful. On the same principle he executed in his life-time various other works, which might have immortalized any

other man. He repaired his castles, he rebuilt churches, he made public roads; but his greatest work in architecture was the re-construction of the entire nave of his cathedral at Winchester, which remains to the present time a monument of his genius, and exhibits one of our finest specimens of the pointed style of building prevalent in his age. William of Wykeham died in the year 1404, in his eightieth year, full of age and honours; leaving an example that cannot easily be paralleled, of principles directed by consummate prudence and judgment, and animated by unbounded generosity.

**WILLIAMS, DANIEL**, a dissenting clergyman of some distinction, who was born in 1644, and entered on the ministry about 1663. After the revolution Mr. Williams was not only frequently consulted by King William concerning Irish affairs, but often regarded at court on behalf of several who fled from Ireland, and were capable of being of service to government. He received great acknowledgments and thanks upon this account, when, in 1700, he went to settle some affairs relative to his estate in that kingdom. After preaching for some time occasionally in London he became pastor of a numerous congregation at Hand Alley in Bishopsgate Street in 1688, and upon the death of the celebrated Richard Baxter in 1691, by whom he was greatly esteemed, he succeeded him as one of those who preached the merchants' lecture at Pinner's Hall, Broad Street. But it was not long before the frequent clashing in the discourses of these lectures caused a division. Mr. Williams had preached warmly against some antinomian tenets, which giving offence to many persons, a design was formed to exclude him from the lecture. Upon this he, with Dr. Bates, Mr. Howe, and Mr. Alsop, &c. retired and established another lecture at Salter's Hall, at the same day and hour.

Dr. Williams died, after a short illness, January 26, 1715-16. He appears to have been a man of very considerable abilities, and having acquired an independent fortune, had great weight both as a member of the dissenting interest and as a politician in general. The bulk of his estate he bequeathed to a great variety of charities. He also ordered a convenient building to be purchased, or erected, for the reception of his own library, and the curious collection of Dr. Bates, which he purchased for that purpose, at the expense of between five and six hundred pounds. Accordingly, a considerable number of years after his death, a building was erected by subscription among the opulent dissenters, in Redcross Street, Cripplegate, where the doctor's books were deposited.

**WILLIS, THOMAS**, an English physician, who was born in 1621, and the author of a great many works which are now but little read. He was Sedleian professor of natural philosophy, and one of the first members of the royal society, to which he was a liberal contributor. He died in 1675.

**WILLIS, BROWNE**.—This ingenious antiquary was born at Blandford in 1682, and in 1785 he published his "Notitia Parliamentaria; or An History of the Counties, Cities, and Boroughs in England and Wales." In 1717 he published, without his name, a kind of abridgment of "The Whole Duty of Man," "for the benefit of the poorer sort." In the same year, "A Survey of the Cathedral Church of St. David's, and the Edifices belonging to it, as they

stood in the year 1715." In 1718 and 1719, "An History of the Mitred Parliamentary Abbies and Conventual Cathedral Churches." In 1719, 20, and 21, "Surveys of the Cathedral Churches of Llandaff, St. Asaph, and Bangor, &c." This led to his greatest and most important work, "Survey of the Cathedrals of England, with the Parochiale Anglicanum, illustrated with draughts of the cathedrals." These volumes contain the history of the cathedrals of York, Durham, Carlisle, Chester, Man, Leicester, Hereford, Worcester, Gloucester, Bristol, Lincoln, Ely, Oxford, and Peterborough. Mr. Willis died in 1760.

**WILSON, RICHARD**, an eminent English landscape painter, who was [the son of a clergyman, residing in Montgomeryshire, where young Wilson was born in 1714. After receiving a good classical education he was sent to London, and commenced studying the art of painting. He rose to great eminence as a landscape painter, and has justly been termed "The English Claude." He, however, eventually fell into great distress, and died neglected on the 14th of May, 1782.

**WINSLOW, JAMES BENJAMIN**.—This celebrated anatomist was born in 1669 at Odense, in the Danish island of Funen. He commenced the study of theology, which he relinquished for medicine, and eventually rose high in that profession. He took the degree of M. D. in France in 1701, and subsequently became professor of anatomy in the academy of sciences. His death took place in 1760 at a very advanced age. He was the author of several works of considerable merit, one of the principal is entitled "Exposition Anatomique de la Structure du Corps Humain." This is considered a standard work on the branch of science to which it relates.

**WITHERING, WILLIAM**, a botanical writer who was born in 1741. In 1776 he published the first edition of his "Botanical Arrangement," a work which, at that time, could be considered as little more than a mere translation from Linnæus of such genera and species of plants as are indigenous in Great Britain, and in which Ray's "Synopsis Methodica Stirpium Britannicarum," and Hudson's "Flora Anglica," could not fail to afford him great assistance. But, in the course of the two other editions of it, the Arrangement was so much improved and enlarged to become, in a great measure, an original work: and certainly, as a national Flora, it must be allowed to be a very elaborate and complete performance. It is, however, did not engross all our author's attention; many of his leisure hours he devoted to chemistry and mineralogy. In 1793 he translated Berzelius's "Sciagraphia Regni Mineralis," under the title of "Outlines of Mineralogy." Dr. Withering died in 1799.

**WOLCOT, JOHN**, a satirical poet and writer, who was born in Devonshire in 1738. He was educated at Kingsbridge, in his native county, after which he came to London, and in 1767 was made M. D. The distinction, however, was obtained at a Scottish university. He then went to Jamaica, but not succeeding in his profession he entered holy orders, and obtained a rectory in that island. On the death of his uncle, who left him some property, he returned to his own country and resumed his original profession. He also at this period became distinguished by his satirical compositions which he published under the name of "Peter Pindar." We need hardly say that

they were much more conspicuous for wit than either truth or consideration. His death took place in 1819, in the eighty-first year of his age.

**WOLLASTON, WILLIAM**, a distinguished natural philosopher, who was born in 1766, and studied at Caius college, Cambridge. He was intended for the medical profession, but not meeting with the success which he had anticipated he relinquished it entirely. He subsequently became distinguished for discoveries in science, which were productive both of profit and fame. The process for procuring platina in a malleable state is said to have brought him more than 30,000*l.* His death took place in 1828.

**WOLLASTON, WILLIAM**, an eminent writer on theology and ethics, who was born in 1681. His principal work, and indeed the one on which his fame rests, is his treatise, entitled "The Religion of Nature Deleniated." His death took place in 1724.

**WOLSEY, THOMAS**.—This distinguished cardinal was the son of a butcher at Ipswich, and born in 1471. He was educated at Magdalen college, where he made a very rapid progress in scholastic learning. Wolsey's first ecclesiastical preferment was the rectory of Lymington, and in 1503 the pope granted him a dispensation to hold two benefices. He was introduced to Henry VIII. by Fox, bishop of Winchester; and he was successively made almoner to the king, a privy councillor, and reporter of the proceedings of the Star-chamber; rector of Tootington, canon of Windsor, registrar of the order of the Garter, and dean of York. From these he passed on to become dean of Hereford and precentor of St. Paul's, both of which he resigned on being preferred to the bishopric of Lincoln. The same year he was promoted to the archbishopric of York, and created cardinal of St. Cecilia.

Wolsey's influence was now courted by the pope, who had made him a cardinal, and in 1516 his legate in England, with powers not inferior to his own, and by the king of Spain, who granted him a pension of 3000 livres, while the duchy of Milan bestowed on him a yearly grant of 10,000 ducats. On the resignation of Archbishop Warham he was appointed lord high chancellor. In 1518 he attended Queen Catherine to Oxford, and intimated to the university his intention of founding lectures on theology, civil law, physic

philosophy, mathematics, rhetoric, Greek, and Latin; and in the following year three of these, viz. for Greek, Latin, and rhetoric, were founded and endowed with ample salaries, and read in the hall of Corpus Christi college.

In 1514 Wolsey began to build the palace at Hampton Court, and having finished it, with all its sumptuous furniture, in 1528 he presented it to the king, who, in return, gave him the palace of Richmond for a residence. In this last mentioned year he acceded to the bishopric of Winchester by the death of Fox, and resigned that of Durham. To Winchester, however, he never went. That reverse of fortune which has exhibited him as an example of terror to the ambitious, was now approaching, and was accelerated by events, the consequences of which he foresaw without the power of averting them. Henry was now agitated by a passion not to be controuled by the counsels of statesmen, and when the cardinal, whom he had appointed to forward his divorce from Queen Catherine and his marriage with Anne Boleyn, appeared tardily to adhere to forms, or scrupulously to interpose advice, he determined to make him feel the weight of his resentment. It happened, unfortunately for the cardinal, that both the queen and her rival were his enemies, the queen from a suspicion that she never had a cordial friend in him, and Anne from a knowledge that he had secretly endeavoured to prevent her match with the king. But a minute detail of these transactions and intrigues belongs to history, in which they occupy a large space. It may suffice here to notice that the cardinal's ruin, when once determined, was effected in the most sudden and rigorous manner, and probably without his previous knowledge of the violent measures that were to be taken. On the first day of term, October 9, 1529, while he was opening the court of Chancery at Westminster, the attorney-general indicted him in the court of King's Bench, on the statute of provisors, 16 Richard II., for procuring a bull from Rome appointing him legate, contrary to the statute, by which he had incurred a *præmunire*, and forfeited all his goods to the king, and might be imprisoned. Before he could give in any reply to this indictment, the king sent to demand the great seal from him, which was given to Sir Thomas More. He was then ordered to leave York Place, a palace which had for some centuries been the residence of the archbishops of York, and which he had adorned with furniture of great value and magnificence. Wolsey's enemies at court, who appear to have influenced the king beyond his usual arbitrary disposition, dreaded Wolsey's being so near his majesty, and prevailed on him to order him to reside in his archbishopric. In obedience to this mandate, which was softened by another gracious message from Henry, he first went to the archbishop's seat at Southwell, and about the end of September fixed his residence at Cawood Castle, which he began to repair, and was acquiring popularity by his hospitable manners and bounty, when his capricious master was persuaded to arrest him for high treason, and order him to be conducted to London. Accordingly, on the 1st of November he set out, but on the road he was seized with a disorder of the dysenteric kind, brought on by fatigue and anxiety, which put a period to his life at Leicester Abbey, in the fifty-ninth year of his age.

**WOOD, ANTHONY**, an English antiquary, who was born at Oxford in 1632, and after having taken

the degree of M.A., he in 1674 published "*Historia et Antiquitates Universitatis Oxoniensis*," but he is best known by his "*Athenæ Oxoniensis*." Mr. Wood died at Oxford in 1695.

WOODWARD, JOHN, a natural philosopher, who acquired some celebrity at the beginning of the last century. He paid particular attention to geology, and published an "*Essay towards a Natural History of the Earth*." He died at Gresham college in 1728.

WOOLLETT, WILLIAM, an eminent modern engraver, who was born in 1735. He was apprenticed to Mr. Tinney, and rose rapidly to the highest walks in his profession, which he pursued till his death in 1785.

WOOLSTON, THOMAS, a controversial divine of the last century. He first appeared as an author in 1705, when he published "*The Old Apology of the Truth for the Christian Religion against the Jews and Gentiles Revived*." The design of this work, which is an octavo of nearly 400 pages, is to prove that all the actions of Moses were typical of Christ, and to show that some of the fathers did not think them real, but typical relations of what was to come. This allegorical way of interpreting the scriptures of the Old Testament our author is said to have adopted from Origen, whose works, however, he must have studied very injudiciously. In 1723 and 1724 came out his four "*Free Gifts to the Clergy*," and his own answer to them, in five separate pamphlets; in which he attacks the clergy with the greatest contempt, and, as it would appear, without any provocation.

The "*Four Free Gifts*" were scarcely published when, the controversy with Collins going on at this time, Mr. Woolston, under pretence of acting the part of an impartial inquirer, published his "*Moderator between an Infidel and Apostate*," and two "*Supplements to the Moderator*." In these pieces he pursued his allegorical scheme to the exclusion of the letter. In 1727, 1728, 1729, and 1730, were published his "*Six Discourses on the Miracles of Christ*," and his two defences of them. While some supposed this author not in earnest, but meaning to subvert Christianity under a pretence of defending it, others believed him disordered, and not perfectly in his right mind; and many circumstances concurred to persuade to the latter of these opinions. He died in 1733.

WOTTON, EDWARD, a celebrated physician, who was born in 1492. He received a diploma from Padua, and was for many years physician to Henry VIII. He died in 1555. We subjoin his autograph.

WOTTON, SIR HENRY, a distinguished writer and politician, who was born in 1568, and studied at the university of Oxford. He was employed by James I. in many diplomatic affairs of importance. As a reward for his attention to state affairs he was made provost of Eton college, where he remained, though in embarrassed circumstances, till his death, which took place in 1639. He was the author of "*The State of Christendom*," "*Elements of Architecture*," and several other works.

WORCESTER, EDWARD SOMERSET, MARQUIS OF.—This nobleman was celebrated for his scientific studies and his losses during the war of Charles I. In 1663 he published a book entitled "*The Scantlings of One Hundred Inventions*." In this he gave an account of his invention of the steam engine. He was, however, considered by his contemporaries as a visionary.

The marquis of Worcester, at the commencement of the civil wars, possessed a splendid castellated edifice, which was nearly destroyed by the parliamentary forces, who caused the destruction of more than 300,000*l.* worth of property. The remains of the castle are exhibited beneath.

The marquis died in poverty and neglect in 1667. We subjoin his autograph.

WREN, CHRISTOPHER.—This distinguished English architect was born in 1632, and after acquiring a good knowledge of the learned languages, was sent to Wadham college, Oxford, where his remarkable proficiency in the mathematics soon made him known to various persons of distinction and influence. Young as he was at this time he was one of the original members of the club which was formed at Oxford in 1648 for philosophical discussion and experiments, and which eventually gave rise to the royal society. In 1657 he was chosen professor of astronomy at Gresham college, and on the Restoration was appointed to the Savilian professorship of astronomy at Oxford. It was very soon after this that he was first called upon to exercise his genius in architecture (a study, however, which had previously engaged a good deal of his attention) by being appointed assistant to the surveyor-general. This led to Wren's employment on the work on which his popular fame principally rests, the re-building of the cathedral of St. Paul's after the great fire. The erection of this noble edifice occupied him for thirty-five years; but neither prevented him from designing, during the same period, and superintending the completion of many other buildings, nor even interrupted his pen

suit of the most abstract branches of science. Wren was created LL.D. by the university of Oxford in 1661, and was knighted in 1674. In 1680 he was elected to the presidency of the royal society, and in 1685 he entered parliament as representative of the borough of Plympton. While superintending the erection of the cathedral of St. Paul's all the salary that Wren received was only 200*l.* a year. He was also used in other respects by the commissioners with extreme illiberality and meanness; and at last the ingratitude of his country, or rather of his times, was consummated by his dismissal in 1718 from his place of surveyor of public works. He was at this time in the eighty-sixth year of his age. This great and good man died at Hampton Court on the 25th of February, 1723, in the ninety-first year of his age. His remains were accompanied by a splendid attendance to their appropriate resting-place, under the noble edifice which his genius had reared; and over the grave was fixed a tablet with the inscription in Latin (since placed in front of the organ), "Beneath is laid the builder of this church and city, Christopher Wren, who lived above ninety years, not for himself, but for the public good. Reader, if thou seekest for his monument, look around."

WYAT, SIR THOMAS, a distinguished courtier, who was born in 1503 at Allington Castle, Kent. He was educated at both Cambridge and Oxford, after which he travelled for some time on the continent. On his return Henry the Eighth knighted him, and retained him about his person. He also made him master of the jewel office, and employed him in several diplomatic missions. He died in 1541. He was the author of several poetical works of considerable merit. Sir Thomas's biographers are in general silent on the subject of his connexion with Lord Surrey. It is known, however, that they were closely allied by friendship, and similarity of taste and studies. Surrey's character of Wyatt is a noble tribute to his memory. The year following his death Leland published a volume of elegiac verses, some of which are very elegant, and all highly encomiastic.

WYON, THOMAS.—This eminent medallist was born at Birmingham in 1792, and acquired a knowledge of the art of engraving from his father at a very early age. The engraving of seals, and all the details of the heraldic art connected with this branch of the profession, of course became familiar to him; and after having acquired a competent knowledge of anatomy he commenced his career with a subject likely to interest all who are delighted with heroic actions in civil life, and take a warm interest in every thing connected with the cause of humanity. Such was his industry that, in the course of a few months, Mr. Wyon produced a head of Isis, which was so admirably executed, as not only to obtain the prize from the society of arts, but actually to become the die for a future prize-medal to others. His reward also was two-fold; for he not only was presented with the gold medal, but also with a liberal remuneration for his exquisite performance. A spirited medal of the duke of Wellington led to his employment at the Mint, as a probationer engraver, in 1811; and when the right honourable Wellesley Pole was made master, he was nominated chief engraver, with a fixed salary, in 1816, at which period he had not as yet attained his twenty-third year. This immediately connected his labours with the new coinage, but it

did not preclude his exertions in respect to national subjects, of which he produced a great number. On the victory obtained at Algiers two medals were executed; the latter of these was engraved by the two Wyons. It has, on the obverse, a portrait of his royal highness the prince regent, copied from a drawing by Sir Thomas Lawrence, and admirably engraved by the subject of the present memoir. The face is finished with truth and spirit, the hair with exquisite softness, while the draperies are not only very rich, but highly finished.

The regent is represented as clad in ancient armour, supposed to be that of Edward the Black Prince, finely ornamented. His honours, consisting of the order of the Golden Fleece, with a riband and jewel of the Garter, surmount this warlike dress; while on a mantle, falling over the left shoulder, are embossed four stars; those of the Garter, St. Andrew of Russia, the Black Eagle of Prussia, and the Holy Ghost of France.

This young artist intended to have engraved, in series, a medallion history of all the naval triumphs that have occurred during the long and memorable reign of George III. One, executed by way of specimen for the lords of the admiralty, was presented by that board to Captain Wooldridge, for his gallant action in Aix Roads. It may be here necessary to add, that Mr. Wyon also engraved a medal to commemorate the visit paid to Hatfield in 1814, by the duke of Wellington, when a very splendid fete was given by the marquis of Salisbury to the gentlemen and yeomanry of the county in his park. The medal has the duke's bust, with a suitable inscription on the reverse. Meanwhile the health of Mr. Wyon became first delicate, and then precarious. The best advice was recurred to in vain, but all agreed that a residence in or near the metropolis had become highly improper. Accordingly, a cottage in the neighbourhood of Hastings, in the county of Sussex, was selected, for the purpose of trying a change of air; but all human contrivance availed nothing, for he closed his mortal career there on the 23rd of September, 1817, in the twenty-fifth year of his age.

XENOCRATES, an ancient philosopher, who was born at Calchedonia, and educated in the school of Plato, whose friendship he gained, and whose approbation he merited. He was remarkable as a disciplinarian, and he required that his pupils should be acquainted with mathematics before they came under his care, and even rejected some who had not this necessary qualification, saying that they had not yet found the key of philosophy. He did not only recommend himself to his pupils by precepts, but more powerfully by example; and after the wonderful change he had made upon the conduct of one of his auditors, his company was as much shunned by the dissolute and extravagant as it was courted by the virtuous and the benevolent. Philip of Macedon attempted to gain his confidence with money, but with no success. Alexander in this imitated his father, and sent some of his friends with fifty talents for the philosopher. They were introduced and supped with Xenocrates. The repast was small, frugal, and elegant, without ostentation. On the morrow the officers of Alexander wished to pay down the fifty talents, but the philosopher asked them whether they had not perceived from the entertainment of the preceding day, that he was not in want of money. "Tell your master," said he, "to keep his money, he

has more people to maintain than I have." Yet, not to offend the monarch, he accepted a small sum, about the two hundredth part of one talent. His integrity was so well known that when he appeared in the court as a witness the judges dispensed with his oath. He died 314 B. C., in his eighty-second year, after he had presided in the academy for above twenty-five years.

XENOPHON, an Athenian general, an historian, and a philosopher. In the school of Socrates he received those instructions and precepts which afterwards so eminently distinguished him at the head of an army, in literary solitude, and as the prudent head of a family. He was invited by Proxenus, one of his intimate friends, to accompany Cyrus the younger in an expedition against his brother Artaxerxes, king of Persia; but he refused to comply without previously consulting his venerable master, and inquiring into the propriety of such a measure. Socrates strongly opposed it, and observed that it might raise the resentment of his countrymen, as Sparta had made an alliance with the Persian monarch; but, however, before he proceeded further, he advised him to consult the oracle of Apollo. Xenophon paid due deference to the injunctions of Socrates, but as he was ambitious, and eager to engage in a distant expedition, he hastened to Sardis, where he was introduced to the young prince, and treated with great attention. In the army of Cyrus, Xenophon showed that he was a true disciple of Socrates, and that he had been educated in the warlike city of Athens. After the decisive battle in the plains of Cunaxa, and the fall of young Cyrus, the vigour of his mind was called into action. The 10,000 Greeks who had followed the standard of an ambitious prince were now at the distance of above 600 leagues from their native home, in a country surrounded on every side by a victorious enemy, without money, without provisions, and without a leader. Xenophon was selected from among the officers to superintend the retreat of his countrymen, and though he was often opposed by malevolence, yet his persuasive eloquence and his activity convinced the Greeks that no general could extricate them from every difficulty better than the disciple of Socrates. He rose superior to danger, and, though under continual alarms from the sudden attacks of the Persians, he was enabled to cross rapid rivers, penetrate through vast deserts, gain the tops of mountains, till he could rest secure for a while, and refresh his tired companions. This celebrated retreat was at last happily effected; the Greeks returned home after a march of 1155 parasangs, or leagues, which was performed in 215 days, after an absence of fifteen months. The whole, perhaps, might now be forgotten, or at least but obscurely known, if the great philosopher who planned it had not employed his pen in describing the dangers which he escaped, and the difficulties which he surmounted. He was no sooner returned from Cunaxa than he sought new honours in following the fortune of Agesilaus in Asia. He enjoyed his confidence, he fought under his standard, and conquered with him in the Asiatic provinces as well as at the battle of Coronæa. His fame, however, did not escape the aspersions of jealousy; he was publicly banished from Athens for accompanying Cyrus against his brother, and, being now without a home, he retired to Scillus, a small town of the Lacedæmonians, in the neighbourhood of Olympia. In this solitary

retreat he dedicated his time to literary pursuits, and as he had acquired riches in his Asiatic expeditions, he began to adorn and variegate by the hand of art, for his pleasure and enjoyment, the country which surrounded Scillus. He built a magnificent temple to Diana in imitation of that of Ephesus, and spent part of his time in rural employments, or in hunting in the woods and mountains. His peaceful occupations, however, were soon disturbed—a war arose between the Lacedæmonians and Elis. The sanctity of Diana's temple, and the venerable age of the philosopher, who lived in the delightful retreats of Scillus, were disregarded, and Xenophon, driven by the Elians from his favourite spot, where he had composed and written for the information of posterity and honour of his country, retired to the city of Corinth. In this place he died, in the ninetyeth year of his age, 359 years before the Christian era. The works of Xenophon are numerous: he wrote an account of the expedition of Cyrus, called "The Anabasis," and as he had no inconsiderable share in the enterprise, his descriptions must be authentic as he was himself an eye-witness. Many, however, have accused him of partiality. He appeared often too fond of extolling the virtues of his favourite Cyrus, and while he describes with contempt the imprudent operations of the Persians, he does not neglect to show that he was a native of Greece. His "Cyropædia," divided into eight books, has given rise to much criticism, and while some warmly maintain that it is a faithful account of the life and actions of Cyrus the Great, and declare that it is supported by the authority of Scripture, others as vehemently deny its authenticity. According to the opinions of Plato and of Cicero the "Cyropædia" of Xenophon was a moral romance, and these venerable philosophers support that the historian did not so much write what Cyrus had been, as what every true, good, and virtuous monarch ought to be. His "Hæcæcæ" were written as a continuation of the history of Thucydides; and in his "Memorabilia of Socrates," and in his "Apology," he has shown himself, as Valerius Maximus observes, a perfect master of the philosophy of that great man, and he has explained his doctrines and moral precepts with all the success of persuasive eloquence and conscious integrity. These are the most celebrated of his compositions, besides which there are other small tracts, his eulogium given on Agesilaus, his oconomics, on the duties of domestic life, the dialogue entitled "Hiero," in which he happily describes and compares the misery which attended the tyrant with the felicity of a virtuous prince; a treatise on hunting, the symposium of the philosophers, on the government of Athens and Sparta, a treatise on the revenues of Attica, &c. The simplicity and the elegance of Xenophon's diction have procured him the name of the Athenian muse, and the bee of Greece, and they have induced Quintilian to say, "that the graces dictated his language, and that the goddess of persuasion dwelt upon his lips." His sentiments, as to the divinity and religion, were the same as those of the venerable Socrates; he supported the immortality of the soul, and exhorted his friends to cultivate those virtues which insure the happiness of mankind, with all the zeal and fervour of a Christian. He has been quoted as an instance of tenderness and of resignation to providence. As he was offering a sacrifice he was informed that Gryllus, his eldest son, had been killed

at the battle of Mantinea. Upon this he tore the garland from his head, but when he was told that his son had died like a Greek, and had given a mortal wound to Epaminondas, the enemy's general, he replaced the flowers on his head, and continued the sacrifice, exclaiming that the pleasure he derived from the valour of his son was greater than the grief which his unfortunate death occasioned.

**XERXES.**—This celebrated Persian monarch came to the throne 485 B. C. Of the transactions which occupied his reign of twenty-one years very little is known, except what has been recorded in the last books of Herodotus, who was born at Halicarnassus, in the second year of his reign. The first object of the young monarch was to punish the revolt of the Egyptians. For this purpose he completed his father's preparations for an expedition into Egypt. He also now confirmed to the Jews the decrees and grants which Darius had made in their favour. On this occasion Josephus has quoted an epistle from Xerxes to Ezra, in which he permits the return to Jerusalem of all Jews of whatever description. They are also allowed, out of the treasury of the empire, the cost of all the vessels of silver or gold which they desire to consecrate to the divine worship. "That God," adds the king, "may not be at all angry with me, or with my children, I grant all that is necessary for sacrifices to God, according to the law, as far as an hundred cori of wheat." In consequence of this indulgence, the historian relates, that not only the Jews in Babylon, but of those "that were in Media—many of them came with their effects to Babylon, being very desirous of going down to Jerusalem; but the body of the people of Israel," he adds, "remained in that country." These, consisting of "the ten tribes, are beyond Euphrates, and are an immense multitude, not to be estimated by numbers." The three following years of this reign were employed in preparations for the invasion of Greece, which Xerxes regarded as an easy acquisition. "He refused," says Plutarch, "to eat Attic figs that were brought for sale, waiting till they became his own, by the conquest of the country that produced them."

In the earliest great battle the Persians suffered a complete overthrow, two hundred of their ships being destroyed, and the rest driven to the coast of Asia, from whence they never ventured to return into Greece. It is well remarked by Raleigh, that "the scribes of Xerxes had a wearisome task of writing down many disasters which befel the Persian fleet; which ill acquitted itself that day, doing no one piece of service worthy the presence of their king or the registering of his notaries." Xerxes no sooner witnessed this disaster, than, fearing lest the victors should reach the Hellespont before him, he hastened the march of his army out of Europe, leaving Mardonius with 300,000 men to carry on the war. On this march, for which there had been no preparation, great hardships were endured during the forty-five days which it occupied. At length the king, impatient to escape, left his army, and hastened with a small retinue to a bridge, which he had previously erected, and which he found almost destroyed by a tempest. He was thus reduced to cross the Hellespont in a skiff. Xerxes waited for his army at Sardis, and thus ingloriously concluded the sixth year of his reign. To add to the king's disappointment, his allies, the Carthaginians, were about

the same time defeated by Gelo, the king of Sicily. He slew 150,000, and sold the same number, till all Sicily was filled with Carthaginian captives. Of their fleet only a small boat remained, in which a few escaped, to carry the dismal news to Carthage. Xerxes on returning to his home gave himself up to every species of debauchery, and was murdered in his bed, in the twenty-first year of his reign.

**XIMENES, DE CISNEROS FRANCIS.**—This celebrated Spanish statesman and ecclesiastic was born in Old Castile in 1437. He received an excellent education, and then entered the order of St. Francis, of which fraternity he remained a member till the end of his life. Ximenes stood deservedly high in the opinion of both Ferdinand and Isabella of Spain, and in 1507 he was made prime minister, and in the same year the pope gave him a cardinal's hat. On the death of his royal master he was appointed sole regent of Castile, till the return of Charles the Fifth from the Low Countries. The latter, however, treated him with neglect, and this circumstance hastened his death, which took place in 1517.

**YELVERTON, SIR HENRY,** a learned English lawyer, who was born in 1566, and after studying at the university of Oxford, he entered Gray's Inn, and in due course of time was called to the bar. His progress in his profession was rapid, and he was appointed in succession to fill the responsible offices of solicitor and attorney-general, with the honour of knighthood. His death took place in 1630. He published a collection of "Reports," which are very valuable in a legal point of view.

**YORK, FREDERICK, DUKE OF,** was the second son of his majesty George the Third and Queen Charlotte. He was born at Buckingham House on the 16th of August, 1763. About seven months

after the birth of his royal highness, a vacancy occurred in the bishopric of Osnaburgh, one of those secular dignities with an ecclesiastical jurisdiction which are peculiar to Germany. As the right of nomination at that time devolved upon the king of Great Britain, as duke of Lunenburg and elector of Hanover, he immediately caused his second son to be declared bishop of Osnaburgh. Prince Frederick was invested with the ensigns of the Bath in 1767, and installed in Henry the Seventh's Chapel in June 1772; he was elected a companion of the most noble

order of the Garter, and was installed at Windsor, in company with his two brothers, the prince of Wales and Prince Ernest Augustus. From his earliest age his royal highness was destined to the military profession, the study of which formed an essential part of his education. On the 1st of November, 1780, he was appointed, by brevet, a colonel in the British service; and on the 30th of the same month he left Buckingham House for the continent, accompanied by Colonel Richard Grenville. His royal highness continued abroad till 1787; his established residence, during that period, being Hanover, from whence he made excursions to various parts of Germany. While thus engaged abroad, his advancement at home was not neglected. On the 23rd of March, 1782, he was made colonel of the second horse grenadiers; and on the 22nd of November, in the same year, he received the appointment of major-general. In the ensuing year he entered into the possession of his bishopric of Osnaburgh, on which occasion there were great rejoicings among the Lutheran inhabitants of that principality. On the 27th of November, 1784, Prince Frederick, who had hitherto been generally known by the title of the bishop of Osnaburgh, was created duke of York and Albany in Great Britain, and earl of Ulster in Ireland.

On the 27th of November, 1787, his royal highness was introduced to the house of lords; but the first instance of his joining in the debates was on the 15th of December, 1788, when the settlement of the regency was under discussion. On this occasion he acted as the organ of his elder brother, who, having engaged his affections in early youth (for in their childhood they were remarkably attached), preserved that friendship unbroken to the last. His speech was heard with the greatest attention, and excited a vast degree of interest at the time; as did also a few sentences which he delivered on the 31st of January following, on representing the prince of Wales's and his own desire to have their names omitted in the commission for holding parliaments,—an example immediately followed by the dukes of Cumberland and Gloucester.

Amid the political agitations of the year 1791 the marriage of his royal highness to the princess royal of Prussia served to cement more closely the relations which the courts of St. James's and Berlin had found it their interests to contract, with the view of counterpoising the inordinate ambition and mighty projects of the restless empress of Russia. The treaty touching this alliance was signed at Berlin on the 26th of January. The whole royal dower furnished by Prussia was 20,000*l.*; and even this sum was, in the case of the princess's dying before the duke, to be repaid to Prussia. The princess was to have 20,000*l.* besides from England; 6,000*l.* to buy jewels; a private purse of 4,000*l.* a year; and a jointure of 8,000*l.* a year, with a residence and an establishment. On the 26th of September the king of Great Britain declared in council his consent to the contract, and it was on the following day that the duke of York was married. Their royal highnesses having spent some weeks in Germany, were, on their arrival in England, re-married at the Queen's House. By the duchess his royal highness had no issue. On the occasion of his marriage the duke of York had voted him by parliament the sum of 18,000*l.* per annum, and the king settled on him 7,000*l.* from his Irish revenue; which, in addition to the 12,000*l.* per annum he before enjoyed,

constituted a yearly income of 37,000*l.* In 1793 Holland was invaded by the French. The close and essential connexion between the Dutch and England was so well known to Europe, that an invasion of Holland differed only in the act from an invasion of Kent. It was a direct declaration of war against England. The entreaty of the states of Holland for assistance was answered with honour and promptitude. A British army was ordered for Flanders, to form part of the grand army under the prince of Saxe Cobourg. The duke of York was appointed to the command of that army, aided by Sir Ralph Abercrombie, Sir William Erskine, and other officers of distinction. The first military operations in which his royal highness assisted were eminently successful. The French were expelled from Holland; and in a series of fierce encounters, in which they felt the English intrepidity that had so often, in former days, made them fugitives on the same plains, were driven through Austrian Flanders, and forced over their own frontier. They were followed. The great fortified cities, the "iron barrier of France" erected by Vaban, were besieged and taken, and the road to the capital was laid open to a victorious army of a hundred thousand men. The rest of this campaign, however, was by no means successful, and having attempted to take Dunkirk the French compelled him to retire.

In March 1793, at the landing of the first British brigade in Holland, the French were masters of almost the whole country north from the Texel. In July they had been driven from every point of their conquests since the beginning of the war; the invaders were found unable to make head against invasion, and their scattered and dispirited corps looked on and saw their fortresses fall one by one. The siege of Valenciennes, the principal bulwark of the north, had been committed to the British under the duke of York, and its attack and capture exhibited the native gallantry of the troops in the most distinguished manner. The personal intrepidity of their royal commander has never been questioned, but it has been the popular habit to speak slightly of his military skill. Those who pronounce this judgment ought to have first looked over the map of that most difficult and extensive country which the army, headed by his royal highness, cleared of an enemy's footsteps within three months. The French fought desperately, yet they saw their conquests forced from them in every battle. They were masters of the country; every mill-race, farm-house, rivulet, and village was familiar to them. Yet with all this possession and knowledge, with all their multitudes with the trained soldiers of the former royal army with the population of France at their back, and with the guillotine recruiting for them in every town of a territory of 30,000,000 of men, the republicans were driven into France, tamed, and tracking every step they took with blood drawn by British steel.

From what has been since known of the state of France at that period there can be no doubt that the "march to Paris" would then have been the great it was the practicable policy. There was no force between Valenciennes and the very throne of the revolution. Paris lay in helpless terror. The republican government saw the sword of Europe flashing in their eyes. The peasantry were alienated by the merciless extortions of robbery under colour of law.

The friends of the old government, still powerful, were prepared to give weight to the blow that was to crush the head of the tyranny. In England the voice of some of the leading statesmen (and among them of that distinguished minister, who has had the fortune to see his early foresight and wisdom so splendidly realized even under his own administration) was loud for finishing the war by this one consummate blow. But the time for the deliverance of Europe was not yet at hand.

Valenciennes fell on the 26th of July. Having joined the main army, the duke of York co-operated, on the 7th and 8th of August, in the movements against the enemy's positions at the Camp de Cesar, Bois de Bourlon, &c., upon the line of the Scheldt, from all which they were dispossessed, or retired, although without material loss, owing to the indecision and slowness of the allied army, against which his royal highness had in vain remonstrated in frequent communications to Prince Hohenlohe, their quartermaster-general, who had objected to an earlier and more decided movement of the army on the 8th, by which the enemy's retreat would have been intercepted.

The prince of Cobourg, after these operations, laid siege to Quesnoy, and subsequently invested Maubeuge, while the duke of York continued his march in the direction of Orchies, Tourcoing, and Menin, with the British, Hanoverian, and Hessian troops, to which was added a body of Austrians, under the orders of Lieutenant General Alvintzy. The object of this separation was the siege of Dunkirk, which had been determined upon by the British cabinet, and which was viewed with regret, not only by the Austrian generals, but also by his royal highness, who had remonstrated against it as far as he could; although, when he found his representations unavailing, he proceeded with the utmost zeal to the execution of the measure.

But that fortune which is so seldom offered a second time to either men or armies, was past. France had recovered from her terror. The Jacobin government, respite from instant extinction, had roused up all the mad energies of the revolution. The levée-en-masse was called out, and the nation took the field. Twice the number of the besiegers could not have been adequate to the capture of Dunkirk, one of the strongest towns on the continent, and memorable for the obstinacy of its defences. After a succession of severe and sanguinary actions, fought by the besieging and covering armies with success, though without any positive effect, the principal of which occurred on the 24th of August (when the gallant General d'Alton fell), and on the 6th and 8th of September, the duke of York found himself under the necessity of raising the siege. His royal highness had contended with perseverance against numerous and increasing difficulties, arising from the rapid accumulation of the enemy's means of resistance, the delay on the part of the British government in forwarding the necessary ordnance and stores, and the neglect in providing any means of naval co-operation, even such as might secure his royal highness's positions from molestation by the enemy's small craft on the coast. The retreat was effected in good order, and without any other loss than that of the heavy iron ordnance, which, being on ship carriages, could not be removed; and the army re-assembled at Furnes and Dixmude.

His royal highness's corps after this was stationed on the frontiers of West Flanders (the head-quarters being at Dixmude and Thoraut), occasionally co-operating with General Beaulieu in repelling the enemy's attacks upon Menin and other points. Towards the middle of October his royal highness moved with 6000 men, chiefly British, to the support of the prince of Cobourg, then before Maubeuge. He made a rapid march to Englefontaine, where he arrived on the 16th, the day on which was fought the battle of Wattignies; in consequence of which, although both parties, considering the advantage to be with the enemy, had retired from the field, and although the Austrian army was superior in numbers and equality of troops, the prince of Cobourg thought fit to abandon the operation in which he was engaged.

The duke of York returned to Tournay, in which place, and the neighbourhood, he continued until the close of the campaign. After some trifling affairs, the army went into winter-quarters, the duke of York's head-quarters being at Ghent, whence, attended by General Mack, he proceeded to England, to concert with the British government the plan and measures for the ensuing campaign.

The campaign of 1794 opened with a succession of desperate encounters, in which the French were constantly defeated. It was in the month of February that his royal highness returned from England to Courtrai, to which place the British head-quarters had been removed, upon a former concentration of the cantonments. The troops under his royal highness's command moved successively to Tournay, St. Amand, and the plains of Cateau, where the greater part of the allied army was united, under the command of the emperor. On the following day a general and successful attack was made upon the enemy's positions at Vaux, Premont, Marets, Catillon, &c., and Landrecies was immediately invested. His royal highness commanded the right wing of the covering army during the siege. A detachment of cavalry from his corps gained a considerable advantage, on the 24th of April, near Villers-en-Cauchia, towards Cambrai; and on the 26th his royal highness completely defeated, near Troixville, with great slaughter, and the loss of thirty-five pieces of cannon, a corps of 30,000 men; which, under the orders of General Chapuy, attacked his position. General Chapuy was taken prisoner, with a considerable number of officers and men. On the 30th Landrecies surrendered. On the 10th of May the French, to the number of 30,000, under Pichegru, made a furious attack on the duke, near Tournay. They were repulsed. But in a subsequent engagement at the same place, they defeated the allies on the 14th. On the 18th the duke of York's division was attacked, and obliged every where to give way, and the duke himself was on the point of falling into the enemy's hands. It was with prodigious efforts that Generals Fox and Abercrombie found means to restore sufficient order among the troops to save them from total destruction and effect a retreat.

In February 1795 his majesty was graciously pleased to nominate the duke of York to the situation of commander in chief, an office not less important than at that time it had become arduous, from the deplorable effects of the inefficiency and abuse which prevailed in every branch and department of the military service. His royal highness undertook

the duties of this situation with a firm determination to correct the errors and abuses which had crept into the administration of the army; and the zeal and indefatigable attention with which he persevered in this arduous task were equalled only by the judgment which directed his labours.

In 1809 the duke of York became unfavourably distinguished, in the opinion of the nation, by the disclosures of a female named Mary Anne Clarke; but many of these charges remained unsubstantiated, and his royal highness speedily resumed his place in public opinion, which he retained till the time of his death. This was brought about by a general breaking up of his constitution, and occurred on the 5th of January, 1827.

YOUNG, EDWARD, a celebrated divine and poet, who was born at Upham in 1681. He was educated for the profession of the law, but his strong bias towards religion induced him to enter holy orders, and he obtained the living of Welwyn, in Herts, and a king's chaplaincy. His first attempt at poetry was when Queen Anne added twelve to the number of peers in one day. In order to reconcile the people to one at least of the new lords, Young published in 1712 "An Epistle to the Right Hon. George Lord Lansdowne." He was strongly pressed, but declined republishing the recommendatory verses which he prefixed to Addison's "Cato" in 1713, and the following year appeared his "Poem on the Last Day." Before the queen's death appeared his "Force of Religion; or, Vanquished Love," a poem founded on the execution of Lady Jane Grey and her husband Lord Guilford. This was ushered in by a flattering dedication to the countess of Salisbury, which he afterwards omitted, as he did soon after his extravagant panegyric on King George I.

Young began his theatrical career as early as 1713, but his tragedy entitled "Busiris" was not brought upon the stage till 1719, and was dedicated to the duke of Newcastle. This dedication he afterwards suppressed. In 1721 his most popular tragedy, "The Revenge," made its appearance. Young, about 1719, had been taken into the Exeter family as tutor to the young Lord Burleigh. This circumstance transpired on a singular occasion. After the duke of Wharton's death, whose affairs were much involved, among other legal questions, the court of chancery had to determine whether two annuities granted by Wharton to Young were for legal considerations. One was dated March 24, 1719, and the preamble stated that it was granted in consideration of advancing the public good by the encouragement of learning, and of the love he bore to Dr. Young, &c. This, as his biographer remarks, was commendable, if not legal. The other was dated July 10, 1722; and Young, on his examination, swore that he quitted the Exeter family, and refused an annuity of 100*l.* which had been offered him for his life if he would continue tutor to Lord Burleigh, upon the pressing solicitations of the duke of Wharton, and his grace's assurances of providing for him in a much more ample manner. It also appeared that the duke had given him a bond for 600*l.*, dated March 1721, in consideration of his taking several journeys, and being at great expenses in order to be chosen member of parliament at the duke's desire, and in consideration of his not taking two livings of 200*l.* and 400*l.* in the gift of All Souls' college, on his grace's promises of serving and advancing him in the world.

In 1719 Dr. Young published "A Paraphrase on Part of the Book of Job," prefaced by a dedication to the lord chancellor Parker, which he omitted afterwards. Of his "Satires" it is not easy to fix the dates. They probably came out between 1725 and 1728, and were afterwards published collectively under the title of "The Universal Passion." In his preface he says that he prefers laughing at vice and folly, a different temper than that in which he wrote his melancholy "Night Thoughts." These satires were followed by "The Installment," addressed to Sir Robert Walpole, and by "Ocean, an Ode," accompanied by an "Ode to the King, *pater patrie*" and an "Essay on Lyric Poetry," both afterwards omitted by him.

May 1731, he married Lady Elizabeth Lee, daughter of the earl of Lichfield, and widow of Colonel Lee. This lady died in 1741, and her death is said to have contributed to the mournful tenour of his much celebrated "Night Thoughts," which formed his next great publication, and that which will, in all probability, preserve his name the longest. The "Nights" were begun immediately after his wife's death, and were published from 1742 to 1744. It has long been a popular notion that his own son was the Lorenzo of this poem, but this is totally inconsistent with the unquestionable fact that in 1741 this son was only eight years old.

Of this work we know of no more eloquent eulogium than that by Dr. Johnson. "In his 'Night Thoughts,'" says the critic, "he has exhibited a very wide display of original poetry, variegated with deep reflections and striking allusions, a wilderness of thought, in which the fertility of fancy scatters flowers of every hue and of every odour. This is one of the few poems in which blank verse could not be changed for rhyme but with disadvantage. The wild diffusion of the sentiments, and the digressive sallies of the imagination, would have been compressed and restrained by confinement to rhyme. The excellence of this work is not exactness, but copiousness: particular lines are not to be regarded; the power is in the whole, and in the whole there is a magnificence like that ascribed to Chinese plantation, the magnificence of vast extent and endless diversity." By this extraordinary poem, written after he was sixty, it was the desire of Young to be principally known. He entitled the four volumes which he published himself, "The Works of the Author of the Night Thoughts." The composition of the "Night Thoughts" did not so entirely engross the author's mind as to prevent him from producing other compositions both in prose and verse. Among those is his prose work, entitled, "The Centaur Not Fabulous. In six letters to a friend, on the life in vogue."

In 1759 he produced "Conjectures on Original Composition." This was followed by "Resignation, a Poem," in which there is a visible decay of powers. In 1761 he was appointed clerk of the closet to her royal highness the princess dowager of Wales, which he did not long enjoy, as he died at Welwyn, April 1765, in the eighty-fourth year of his age.

YOUNG, THOMAS, a distinguished physician and natural philosopher, who was educated partly at the university of Edinburgh, and partly at Göttingen. At the latter university he took his medical degree. He was for some time lecturer at the royal institution, and in 1807 he produced a work of

great merit entitled "A Course of Lectures on Natural Philosophy and the Mechanical Arts," and appended to them an admirable "Catalogue of Books," relating to the subject of which they treat. He was also the author of "A System of Practical Nosology with an Introduction to Medical Literature," "An Analysis of the Principles of Natural Philosophy," and "A Syllabus of Lectures on the Elements of the Medical Sciences."

Dr. Young is, however, best known as a philologist and critic by his learned treatise on ancient Egypt, inserted in the supplement to the "Encyclopædia Britannica." It was in that celebrated article, which has been read and studied in every part of the civilized world, that he first exhibited a digest of those discoveries in Egyptian literature which have immortalized his name, and added a newly-explored region to the vast dominions of knowledge. And, in truth, none can know how much he achieved except those who have informed themselves how little was done before him. In the multitude of vain attempts which, in the course of nearly 2000 years had been made to decipher the inscriptions which cover the monuments, or are contained on the papyri found in the mummies of the ancient Egyptians, extravagance had succeeded extravagance, and absurdity had followed absurdity, until the subject had at length been abandoned as utterly hopeless and untractable. Men of sense had long been disgusted with the cabalistical ravings of Kircher, the wild vagaries of Pluche, and the burlesque fancies of Palin, who discovered the Psalms of David on monuments as old as the reign of Sesostris; and in the confusion produced by these conflicting follies it was rashly concluded that, because none had as yet succeeded in finding a true solution, the problem was insoluble. The accidental discovery of the tripartite inscription of Rosetta, indeed, revived the hopes of the learned; and it was expected that, with the aid of the accompanying Greek translation, the key which had been so long sought for might at last be found. But even this hope began at length to fade away; for, although the most exact copies of the inscription were taken and circulated all over Europe, ten long years elapsed without the least progress being made towards deciphering it, notwithstanding some of the first scholars of the age had tortured their ingenuity in repeated attempts to penetrate the mystery. At length, in 1814, Dr. Young gave his mind to the subject, and, availing himself of some hints thrown out by De Sacy and Akerblad,—hints which, had they known how to pursue them, might have enabled those ingenious persons to anticipate the discovery,—he soon succeeded in reading the whole of the demotic or enchorial part of the inscription, and immediately published his translation in the "Museum Criticum of Cambridge." And having achieved this, the most difficult part of his task, the remainder was easy; for the process or method he had employed in reading off the enchorial was, from its very nature, equally applicable to the hieroglyphical branch of the inscription, which he accordingly deciphered and published. The results thus obtained were exceedingly curious; for it was proved beyond the possibility of a doubt, that the proper names in this inscription were spelt alphabetically; that from these an alphabet might be formed; that in the demotic as well as in the hieroglyphic branch, particular groups of characters represented particular words; that these groups were susceptible of decom-

position; and that the system of writing used among the ancient Egyptians was not simple and uniform, but complex and composite, or, in other words, made up of characters, some of which were used symbolically, others mimetically, and a third class upon an arbitrary principle which it was then found impossible to explain. Dr. Young's death took place in the year 1829.

ZENO.—The founder of the sect of the stoics born at Citium in the island of Cyprus. The first part of his life was spent in commercial pursuits, but he was soon called to more elevated employments. As he was returning from Phœnicia a storm drove his ship on the coast of Attica, and he was shipwrecked near the Piræus. This moment of calamity he regarded as the beginning of his fame. He entered the house of a bookseller, and to dissipate his melancholy reflections he began to read. The book was written by Xenophon, and the merchant was so pleased and captivated by the eloquence and beauties of the philosopher, that from that time he renounced the pursuits of a busy life, and applied himself to the study of philosophy. Ten years were spent in frequenting the school of Crates, and the same number under Stilpo, Xenocrates, and Polemon. Perfect in every branch of knowledge, and improved from experience as well as observation, Zeno opened a school at Athens, and soon saw himself attended by the great, the learned, and the powerful. His followers were called Stoics, because they received the instructions of the philosopher in the portico called *stoa*. He was so respected during his lifetime that the Athenians publicly decreed him a brazen statue and a crown of gold, and engraved their decree, to give it more publicity, on two columns in the academy, and in the Lyceum. His life was an example of soberness and moderation, his manners were austere, and to his temperance and regularity he was indebted for the continual flow of health which he always enjoyed. After he had taught publicly for forty-eight years, he died in the ninety-eighth year of his age, 264 B. C., a stranger to diseases, and never incommoded by a real indisposition. He was buried in that part of the city called Ceramicus, where the Athenians raised him a monument.

ZEUXIS, a celebrated painter, born at Heraclea, which some suppose to be the Heraclea of Sicily. He flourished about 468 years before the Christian era, and was the disciple of Apollodorus, and contemporary with Parrhasius. In the art of painting he not only surpassed all his contemporaries, but also his master, and became so sensible, and at the same time so proud of the value of his pieces, that he refused to sell them, observing that no sum of money, however great, was sufficient to buy them. His most celebrated paintings were his Jupiter sitting on a throne surrounded by the gods; his Hercules strangling the serpents in the presence of his affrighted parents; his modest Penelope, and his Helen, which was afterwards placed in the temple of Juno Lacinia, in Italy.

ZIMMERMANN, JOHN GEORGE, a distinguished German writer, who was born in 1728. He was educated for the practice of medicine, in which he made considerable progress. He published his work "On Solitude" in 1786. One of the most distinguished incidents of Zimmermann's life was the summons which he received to attend the great Frederick in his last illness in 1786. It was at once evi-

dent that there was no room for the exercise of his medical skill, but he improved the opportunity which he thus enjoyed of confidential intercourse with that illustrious character, whose mental faculties were pre-eminent to the last; and he derived from it the materials of an interesting narrative which he afterwards published. The partiality of this prince in his favour naturally disposed him to a reciprocal good opinion of the monarch; and in 1788 he published "A Defence of Frederic the Great against the Count de Mirabeau," which, in 1790, was followed by "Fragments on Frederic the Great." After a long and painful illness, Zimmermann died, October 7th, 1795.

**ZOROASTER**, a king of Bactria, who is supposed to have lived in the age of Ninus, king of Assyria, some time before the Trojan war. According to Justin, he first invented magic, or the doctrines of the Magi, and rendered himself known by his deep and acute researches in philosophy, the origin of the world, and the study of astronomy. He was respected by his subjects and contemporaries for his abilities as a monarch, a lawgiver, and a philosopher; and though many of his doctrines are puerile and ridiculous, yet his followers are still found in numbers in the wilds of Persia and the extensive provinces of India. Like Pythagoras, Zoroaster admitted no visible object of devotion, except fire, which he considered as the most proper emblem of a supreme being; which doctrines seem to have been preserved by Numa, in the worship and ceremonies he instituted in honour of Vesta. According to some of the moderns, the doctrines, the laws, and regulations of this celebrated Bactrian are still extant, and they have been lately introduced in Europe in a French translation by M. Anquetil. The age of Zoroaster is so little known that many speak of two, three, four, and even six lawgivers of that name. Some authors, who suppose that two persons only of this name flourished, describe the first as an astronomer, living in Babylon 2459 years B. C., whilst the era of the other, who is supposed to have been a native of Persia, and the restorer of the religion of the Magi, is fixed 589, and by some 519 years B. C.

**ZOUCH, RICHARD**, a civilian, who was born in 1590, and published a number of Latin works. Having studied the civil law, he took his bachelor's degree in that faculty in June 1614, and in January 1618 was admitted at Doctors' Commons, where he became an eminent advocate. In 1625 he was appointed principal of St. Alban's Hall, being then chancellor of the diocese of Oxford, and afterwards made judge of the high court of admiralty by King Charles I. He had a considerable hand in drawing up the reasons of the university of Oxford against the solemn league and covenant and negative oath in 1647, having contributed the law part. Yet he chose to submit to the parliamentary visitors the following year, and therefore held his principal and professorship during the usurpation. On the restoration he was reinstated in his post of judge of the admiralty, and was made one of the commissioners for regulat-

ing the university, but did not survive that year, dying March 1, 1660.

**ZOUCH, THOMAS**, an English divine, who was born in 1737. He was educated at Cambridge, and in 1793 was chaplain to the master of the rolls and rector of Scrayingham. By the death of his elder brother, the Rev. Henry Zouch, in 1795, he succeeded to an estate at Sandal, where he resided till his death. On the demise of Dr. Smith, the master of Trinity college, one of the most learned mathematicians of his age, he was requested by the vice-master and senior fellows to deliver a Latin funeral oration in honour of his memory, which is said to have been much admired for the classical elegance of its language.

**ZUCCARELLI, FRANCIS**, a Florentine artist, who highly distinguished himself in this country during the last century. He came to England in 1752, and he met with much encouragement, and several of his pictures were engraved by Vivares. By the advice of some of his friends, he executed a collection of drawings which he disposed of by auction. They were well received, and produced a handsome sum. About 1773 he returned to Florence, and for some time relinquished his pencil, and lived upon his fortune; but part of that having been lost upon bad security, he again resumed his pencil, and was much employed by the English gentlemen who visited Italy. He died at Florence, at what time is not exactly known, but the event was confirmed to the royal academy in 1788. He was one of the original members, and consequently considered as one of the founders of the academy.

**ZUINGLIUS, ULRICUS**, a distinguished reformer, who was born in 1487. He studied philosophy at Vienna, and divinity at Basle, where he was admitted doctor in 1505. He began to preach with good success in 1506, and was chosen minister of Glaris, a chief town in the canton of the same name, where he continued till 1516. Then he was invited to Zurich, to undertake the principal charge of that city, and to preach the word of God there, where his extensive learning and uncommon sagacity were accompanied with the most heroic intrepidity and resolution.

After enduring considerable persecution from the ecclesiastical authorities, the diet of Nuremberg ordained by an edict "that he should go on to teach and preach the word of God, and the doctrine of the gospel, after the same manner that he had hitherto done; and that no pastors, either in the city or country, should teach any thing that could not be proved by the gospel, and should also abstain from accusations of heresy." From this time the reformation made the most rapid progress. But Zuinglius did not confine himself to preaching, as he wrote several books in support of the great cause in which he was engaged, and he died October 11, 1531, having been killed in an engagement between the catholics and protestants. His last words were—"Can this be considered as a calamity? They can indeed kill the body, but they are not able to kill the soul!"
